E-Posters

ORAL ABSTRACTS

POSTER ABSTRACTS

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1006 - Ultrasound-derived Fat Fraction is a Reliable Method to Grade Hepatic Steatosis in Patients with Chronic Liver Diseases: A Multicenter Study in a Population with Mixed Etiologies, Jiahao Han
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 1007 - Direct-Acting Antiviral Therapy Reduces Variceal Rebleeding and Improves Liver Function in HCV-Related Cirrhosis: A Multicenter Retrospective Study in Egypt, Atteyat A. Semeya
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1009 - Liver Resection versus Trans-arterial Chemoembolization for Huge Hepatocellular carcinoma (>10cm): A nationwide Propensity score adjusted analysis, Jai Young Cho
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 1010 - A Five-Year Retrospective Analysis of Hepatic Fibrosis and Steatosis Assessed by Transient Elastography in Patients Across the Glycemic Continuum, Maria Diana Manalili
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1011 - Predictors of non-response to antiviral therapy for hepatitis C in Almaty, the largest city of Kazakhstan, Arailym Maikenova
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1013 - Non-invasive prediction of hepatic inflammation grade in chronic hepatitis B patients based on multiple parameters non-enhancement MRI combined with clinical characteristics, Yuan Liu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1022 - SLC1A5-dependent glutamine transport regulates macrophage senescence and efferocytosis during liver regeneration, Hao Wang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 1023 - Real-world Clinical and Procedural Insights into Liver Abscesses: A Multidimensional Retrospective Analysis from a Tertiary Center in North India, Ajay Patwa
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 1025 - Real-time multidimensional system for predicting survival in patients with advanced biliary tract cancer treated with immuno-chemotherapy, Jun-Hao Mei
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 1029 - Global burden of hepatitis A virus 1990–2023: results from the Global Burden of Disease Study 2023, Changle Wu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1034 - Charting immune and cancer metabolism co-evolution during metastasis, Yingcheng Wu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 1035 - Targeting PAK1 on tumour-associated macrophages enhances the efficacy of immunotherapy in hepatocellular carcinoma, Na Fu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 1037 - Engineered Vesicle-Mediated Metabolic Regulation and Immune Targeting for the Treatment of Autoimmune Hepatitis, Mengyi Shen
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 1039 - Preoperative TACE with PD-1 Inhibitors and TKIs in Beyond "Up-to-Seven" Hepatocellular Carcinoma: A Propensity Score Matched Analysis, Deyuan Zhong Zhong
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1042 - Non-invasive detection of occult yet significant liver pathology in ALT-normal chronic hepatitis B: a multicenter study, Xinjie Li
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1045 - The Denizli Model: A Leading Strategy in the War on Hepatitis C, Tugba Sari
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1046 - EVALUATING THE PROGNOSTIC VALUE OF THE MELD 3.0 SCORE IN PREDICTING MORTALITY IN CIRRHOSIS PATIENTS WITH ACUTE VARICEAL BLEEDING, Thong Vo Duy
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1050 - Multicenter Study of Ultrasound-Guided Microwave Ablation for Hepatic Cystic Echinococcosis, Ruifang Wang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1051 - Physical performance is associated with severe liver fibrosis in patients with chronic liver disease, Ching Sheng Hsu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1056 - Development of a Predictive Formula for Hepatic Steatosis in Apparently Healthy Individuals: A Biopsy-Proven Study in Turkish Liver Transplant Donors, Eda Kaya
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 1065 - Epigenetic regulation and functional mechanisms of the ZSCAN23 gene in liver cancer, Xiaoyan Chi
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1067 - Clinical Profile and Short-Term Outcomes of Patients with Acute-on-Chronic Liver Failure: A Prospective Observational Study from a Tertiary Center in Southern India, SREEJITH OZHUKIL THEVARKALATHIL
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1069 - Gut Microbiota-Derived Butyrate Alleviates the Progression of Metabolic Dysfunction-Associated Steatohepatitis by Regulating Intrahepatic CD4⁺T Cell Immune Response, Baoju Wang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1071 - Prevalence of significant fibrosis and metabolic correlates in patients with Metabolic dysfunction Associated Fatty Liver Disease: A cross-sectional study from a tertiary centre, Jishnu Jayarajan
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1072 - Comparative evaluation of the level of oral microflora in patients with viral hepatitis C using heated tobacco product and cigarette smoking in Armenia: a pilot study, Vahe Azatyan
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1073 - Cognitive Impairment in Metabolic Dysfunction-Associated Fatty Liver Disease (MAFLD): A Systematic Review and Meta-analysis, Soe Thiha Maung
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1075 - Effectiveness of Semaglutide in Non-Alcoholic Steatohepatitis resolution A meta-analysis and systematic review, CLAUDINE FELICIANO
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1076 - Optimizing Risk Stratification of Esophageal Varices for Endoscopic Surveillance: Diagnostic Value of APRI, FIB-4, King, and Bonacini Scores in Hepatitis-Related Liver Disease, I Wayan Rendi Awendika
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1079 - Prognostic utility of the MELD score and AE model in predicting acute-on-chronic liver failure among patients with severe acute exacerbation of chronic hepatitis B., Ngan Le Thanh Quynh
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1080 - Comparative Features of Viral and Metabolically Associated Liver Cirrhosis, Sayfullo Avezov
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1085 - Radiomics on Gadoteric Acid HBP MRI to Distinguish Subclinical Hepatic Parenchymal Disease from Normal Liver, Fatih Işık
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 1096 - Triplet Therapy with Envafolelimab, Lenvatinib, and TACE Enables Curative Conversion and Pathological Response in Unresectable HCC: A Single-Arm Phase II study, Yuxin Liang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1098 - Disease burden of chronic hepatitis D virus (HDV) infection among people living with chronic hepatitis B virus (HBV) infection in a low-endemic city, Grace Wong
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1101 - Association of Serum ALT Levels with Histological Activity and Fibrosis in Chronic Hepatitis B, seda zor
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1102 - Natural History and Risk Factors of Metabolic Dysfunction-Associated Fatty Liver Disease in Chinese Cohorts: A Scoping Review, Jing Zhang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1103 - Unusual Partners in Anemia: Zieve's Syndrome and Beta-Thalassemia Trait in a Single Patient: A case report and literature review, Yusuf Bunyamin Ketenci
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 1110 - Effectiveness and safety of Fibrate Therapy in the treatment of adults with Primary Sclerosing Cholangitis: A Systematic Review and Meta-Analysis, Mark Angelo Pado
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1116 - Racial Disparities in Hepatocellular Carcinoma: A TCGA-Based Gene Expression Study of Caucasian and Asian Populations, Muhammad Rezki Rasyak
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1117 - ADH1B rs6850217 as a Novel Genetic Determinant of Hepatocellular Carcinoma Risk in Chronic Hepatitis B, Yun-Chieh Su
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 1118 - Targeting Premalignant Liver Lesions with Dietary Bioactive Compounds: From Multi-Targeted Mechanisms to Precision Prevention, Rui Zhao
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1121 - The first application and feasibility assessment of 5G-enabled remote robot-assisted hepatobiliary and pancreatic surgery in patients with malignant tumors, Xingru Wang
24 April 2026, Friday | 09:00 - 10:30 | ORAL PRESIDENTIAL SESSION
- 1123 - From Cirrhosis to Cancer: End-to-End Deep Learning Surveillance on Non-Contrast CT, Shifan Liu
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 1125 - Development of an Explainable Hybrid Artificial Intelligence System for Early Detection of Chronic Liver Diseases, Hatice OGUR
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 1126 - Development of a Dual-Module Artificial Intelligence System for Non-Invasive Staging of Liver Fibrosis Using Blood Tests and Ultrasound Images, Helin ÖZALKAN
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1127 - Development of a Multi-Modal Artificial Intelligence Assistant for Early Diagnosis of Hepatocellular Carcinoma Using Imaging and Laboratory Data, Beyzanur BAYIR
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1130 - Effects of COVID-19 Vaccines on HBV Replication in Patients with Chronic Hepatitis B: A Comparative Analysis of mRNA and Inactivated Vaccines, Mehmet Raşit Ayte
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1132 - POTENTIAL HERB-DRUG INTERACTIONS IN CHRONIC HEPATITIS B TREATMENT: A CASE SERIES, Zeynep Tekin Taş
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1133 - A Novel HFE Mutation C.1006+1G>A Disrupts Iron Homeostasis and Drives Hereditary Hemochromatosis Pathogenesis, Xueyan Lin
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1139 - Sequential Application of the Fibrosis-4 Index and Serum Gamma-Glutamyl Transferase for Enhanced Detection of Advanced Fibrosis in Type 2 Diabetes Mellitus Patients with Metabolic Dysfunction-Associated Steatotic Liver Disease, Shamsul Mohd Zain
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1140 - EEF1E1 sustains EGFR signaling to drive immune evasion and tumor progression in hepatocellular carcinoma, Liying Ren
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1141 - Sequential met inhibition from crizotinib to capmatinib in a patient with advanced met-amplified intrahepatic cholangiocarcinoma: a case report, Xianglong Chen
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1144 - The GREM1-BMP7 axis orchestrates apoptosis-driven fibrotic remodeling in biliary atresia, Akshit Vats
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1147 - Global, regional, and national burdens of cirrhosis in adolescents and young adults from 1990 to 2021, Zeyi Zhang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1149 - Dead-box helicase1 promote cancer stemness of hepatocellular carcinoma by enhancing FSCN1 mRNA translation, Yao Yang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1153 - A Pilot Program of Community Volunteers to Improve Adherence to Hepatitis B Medications in Kiribati, David Hilmers
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1156 - Contrast-enhanced Ultrasound Features of Combined hepatocellular carcinoma and cholangiocarcinoma (cHCC-CC): A Case Series Report, Qiao Wei
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 1157 - Predictive Model for Targeted Combination Immunotherapy Efficacy in Unresectable Hepatocellular Carcinoma Patients Based on Multimodal MRI Radiomics (MC-hccAI 007): A Multicenter Study, Jialin Chen
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1158 - Donor Isolated Hyperbilirubinemia and Post-Liver Transplant Survival: A Propensity-Matched Analysis, Mohamad Jamalnia
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1159 - Gut Microbiota-Derived CoQ8 Improves Hepatic Lipid Metabolism via GPR120, Lujie Liu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 1162 - Study on the Mechanism of Samhd1 Mediated NEMO Polyubiquitination in Liver Ischemia-Reperfusion Injury, Xianzhang Luo
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1163 - One-Pot Assay Based on CRISPR/Cas13a Technology for HEV RNA Point-of-Care Testing, Zihao Fan
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1164 - Study on the Mechanism of TRIM55 Mediating K63 Polyubiquitination of Bcl10 Protein to Aggravate Liver Ischemia-Reperfusion Injury, Zhenghua Luo
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1167 - SERPINE2 mitigates hepatic ischemia-reperfusion injury via a SUMO-ubiquitin rheostat, Penghong Song
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1168 - Peginterferon alpha-2b and nucleos(t)ide analogs combination therapy for chronic hepatitis B patients with high HBsAg level at the end of treatment (52 weeks) from ongoing CREATED Excellent Study, Feng Ren
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1170 - Nurse-led lifestyle modification intervention to improve self-efficacy, illness perception, self-management behaviours and liver steatosis among adults with metabolic dysfunction associated steatotic liver disease: A pilot randomised controlled trial, Angel Cho Kan Ma
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1172 - EMMPRIN Loss Promotes Fatty Acid Transport Protein FATP2 Lactylation in MAFLD via the MCTs-lactate Axis, Linying Lai
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 55
- 1173 - Unfolding Clinical Research Landscape on Bacterial Infections in Cirrhosis: Trends, Hotspots, and Analytical Insights, Xiaoxin Wu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1174 - A Ten-Year Comparative Analysis of Open vs. Laparoscopic Anatomical Hepatectomy for Right-Sided Complex Hepatocellular Carcinoma: A Large-Sample, Nationwide Multicenter Real-World Study, Qingyun Xie
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1176 - METTL16 drives MAFLD progression by regulating lipid synthesis and immune responses, Guixin Li
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1179 - Association of Urinary Spot Sodium-Potassium Ratio with Acute Kidney Injury in Decompensated Cirrhosis, MANISH KUMAR
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 1185 - Perioperative Management, Ethical Concerns, and Outcomes of Pediatric Domino Liver Transplants from Maple Syrup Urine Disease Donors, Vipul Gautam
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 1189 - VISTA deficiency exacerbates the development of acute-on-chronic liver failure by promoting Tc1 Differentiation, YAO ZHANG
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1190 - Macrophage Nrf1-Foxo1-KLF6 Axis Drives Mitochondrial Dysfunction and Inflammatory Progression in Liver Fibrosis, Qiong Wu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1195 - MMP-9 Suppresses the Anti-HBsAg B Cell Response During Chronic HBV Infection, Jia Liu Liu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 1196 - Prevalence and severity of chronic atrophic gastritis in cirrhotic patients versus dyspeptic controls, Aizirek Abdikaiyrova
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 1197 - Enhancement of Liver Regeneration in Mice through DDX3X-CD36 Pathway-Mediated Promotion of Hepatic Lipid Accumulation, Ling Xu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1201 - Outcomes of Living Donor Liver Transplantation in Patients with or without Acute-on-Chronic Liver Failure: A Single Centre Experience, Bandar Aljudaibi
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1204 - Sequential therapy with anti-PD-1 antibody and pegylated interferon-alpha promoted HBsAg reduction and enhanced T cell response in patients with chronic hepatitis B, Taiyu He
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1209 - Therapeutic Effects of Qinggan Huatan Huoxue Prescription on Metabolic Dysfunction-Associated Steatohepatitis via Modulation of the CYP4a32-PPAR α -CD36 Signaling Axis, Feixiang Xiong
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1215 - Oxysterol-Binding Protein-Related Protein 2 Drives Sterol Accumulation and Neutrophil Dysfunction in Sepsis Associated with Alcoholic Cirrhosis, GAURAV TRIPATHI
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 1226 - Metabolic dysfunction-associated steatotic liver disease by fibrosis stage in China and Japan: a 20-year model, Carolyn Wallace
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1229 - PD-1 is required for the early expansion of HBV-specific CD8⁺ T cells and does not suppress their effector function during the acute phase of HBV infection, Jia Liu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 09
- 1232 - Preoperative Viral Hepatitis Screening: Evaluation of the Consultation Chain, EMİN EDİZ TÜTÜNCÜ
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1233 - Predictors of response to ursodeoxycholic acid treatment and non-invasive identification of autoimmune hepatitis tendencies in primary biliary cholangitis, Li Zhang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 1237 - Novel Trends in Liver Transplantation for MASLD and ALD: Emerging Epidemiology, Allocation & Post-Transplant Challenges, Ekram Hasanin
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1238 - Awareness of Primary Biliary Cholangitis Among Turkish Physicians: An Online Survey, Hasan Eruzun
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 1239 - Study on the Value of Antithrombin III Activity Combined with COSSH-ACLF Score in Predicting the Prognosis of HBV-ACLF Patients in the Intensive Care Unit, xueshi zhou
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1243 - Liver Transplantation Outcomes in Primary Sclerosing Cholangitis Patients With and Without Ulcerative Colitis: A Comparative Analysis, Seyed Mohammad Amin Dashti
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1245 - Combined Application of Serum Alpha-Fetoprotein and PIVKA-II Levels for Prognostic Stratification in Patients With Hepatocellular Carcinoma, Chien-Wei Su
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 16
- 1250 - Identifying MASLD Patients with MASH or Significant Fibrosis : The Role of Lower ALT Thresholds, Jie Liu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1252 - Clinical Trajectories of Acute Decompensation in Cirrhosis: The First Prospective PREDICT-Based Study from India, Dr Kapil Kumar Kumar
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1257 - Si-Ni-San, a traditional Chinese herbal formula, ameliorates cholestatic liver injury by targeting the calcium-sensing receptor (CaSR)/MAPK pathway, Yu Huang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1263 - The Paradox of Size: A Non-Linear Relationship Between Liver Size and Fibrosis Stage in Acute Autoimmune Hepatitis, Yusuf Bünyamin Ketenci
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 1265 - Risk factors for advanced liver fibrosis in psoriasis patients with metabolic dysfunction-associated steatotic liver disease (MASLD), Chen-Te Huang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1266 - The quality and reliability of short videos about liver cirrhosis on Bilibili and TikTok: Cross-sectional study, Liwei Zeng
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1272 - Comparing two intervention strategies to improve hepatitis B virus deoxyribonucleic acid testing rate among hepatitis B surface antigen-positive hospitalized patients, Qinzhi Deng
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1277 - Evaluation of Treatment Response in Chronic Hepatitis C Patients Receiving Sofosbuvir/Velpatasvir/Voxilaprevir: A Multicenter Real-World Experience from Türkiye, Orçun Barkay
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1278 - Small lesion oriented early hepatocellular carcinoma segmentation via a hybrid-attention deformable U-Net, Mucong Yu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1280 - Tislelizumab plus lenvatinib versus tislelizumab monotherapy as adjuvant therapy for hepatocellular carcinoma patients at high risk of recurrence : a prospective, multicenter cohort study, Jia-Yong Su
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1281 - Short-Term Gains, Long-Term Challenges: A Pilot Randomized Controlled Trial for Time-Restricted Feeding Versus Caloric Restriction in Significant MASLD, Katelyn Chiu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1283 - Diagnostic Performance of Non-Invasive Serum Biomarkers for Fibrosis in Hepatocellular Carcinoma Patients With Metabolic Dysfunction-Associated Steatotic Liver Disease, Chun-Ting Ho
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1284 - Antifibrotic Efficacy and Renal Safety of Pemafibrate in MASLD: A Multicenter Randomized Controlled Study, Hirokazu Takahashi
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1286 - Clinical characteristics of diabetic patients with limited improvement in elevated ALT following tirzepatide initiation, Akio Moriya
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1289 - Computed tomography-based hepatosplenic volumetry can predict all-cause and liver-related mortality in patients with cirrhosis, Rui Huang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13
- 1305 - Fenofibrate and ursodeoxycholic acid in treatment-naïve primary biliary cholangitis: a pilot randomized trial with integrated multi-omics analysis, Yansheng Liu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 1308 - KDM5A-Driven Epigenetic Reprogramming of IL1B⁺ CD14⁺ Monocytes Mediates Resistance to Anti-PD-1 Therapy in Advanced Hepatocellular Carcinoma by Suppressing T Cell-Mediated Antitumor Immunity, Wenying Qiao
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1310 - Creb1-regulated slc39a1 attenuates alcoholic liver disease by orchestrating autophagy and mitophagy, Xianwei Liu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 1311 - Liver-Centric Therapeutic Profiling of 2β-Hydroxybetulinic Acid-3β-Caprylate (HBAC): A Phyto-Derived Modulator of Hepatic Redox Balance, Gluconeogenesis and Lipotoxic Stress in Experimental Diabetes, Danish Ahmed
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1312 - Multiparametric magnetic resonance imaging to risk-stratify patients with chronic liver disease: Descriptive results from the ELEGANCE study, Yi-Chun Wang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 13

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1326 - Repurposing Resmetirom suppresses MASH-associated hepatocellular carcinoma and mechanistic implications of MDK/LRP1-mediated metabolic reprogramming and immunosuppression, Irene Oi-Lin Ng
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1327 - VDAC1-ACSL3-mediated aberrant lipid droplet-mitochondria crosstalk to promote HCC in CHB and MASLD coexistence, Zhe Dai
24 April 2026, Friday | 13:40 - 15:10 | APASL - IASL JOINT MEETING
- 1328 - CRISPR Prime Targeting of Interleukin 1 Receptor Type 1 (IL1r1) in Stellate Cells Identifies a Pathogenic Inflammation-to-Fibrosis Axis in the Liver, Hiba Al Lawati
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1331 - Evaluation of Hepatitis B Serology, Vaccination Rate, and Reactivation in Hepatitis C Patients Treated with Direct-Acting Antivirals, Emrullah ATAŞ
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1334 - Time-Restricted Feeding Improves Hepatic Fibrosis in Advanced MASLD: Preliminary Results from a Randomised Controlled Trial, Katelyn Chiu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 19
- 1335 - A 7-item discharge risk index predicts 12-month decompensation in HDV cirrhosis: derivation and external validation, Adela Turcanu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 1336 - Can poor sleep signal fatty liver disease? Evidence from a rural population in North India, Tushar Prabhakar
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1337 - Analysis of Factors Associated with Liver Fibrosis in Type 2 Diabetes Patients and the Predictive Value of CHI3L1 for Liver Fibrosis, Qing Ye
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1338 - Validation of the 2025 Global Expert Panel Consensus Definition of ACLF in Real-World Hospitalized Patients With Cirrhosis, Jingjing Chen
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1341 - Screening of new active molecules derived from ursodiol in the treatment of primary biliary cholangitis and ursodeoxycholic acid, Engin Altinkaya
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1344 - A single VRON-0200 prime dose induced sustained and/or continued HBsAg declines up to one-year post dosing, and rapid HBsAg declines with addition of antiviral agents, in chronically HBV-infected patients, SL Currie
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1346 - A Ductless Dilemma: Pembrolizumab Induced versus Paraneoplastic Vanishing Bile Duct Syndrome, Gabriel Daniel Alcantara
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 1349 - Enhanced detection of hepatocellular carcinoma using combined biomarker panels including alpha-fetoprotein, alpha-fetoprotein-L3, des-gamma-carboxyprothrombin and the galad score, Van Trung Huynh
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1350 - Metabolic Syndrome is Independently Associated with 1-Year Readmission of Patients with Alcohol-Associated Cirrhosis, Jiarui Zheng
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 1352 - Evaluation of Liver Fibrosis Using FIB-4 and ARFI in Non-Diabetic NAFLD Patients, Dang Toan Vo
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1353 - 30% of Inactive HBsAg Carriers Achieved Clinical Cure at 48 Weeks with Pegylated Interferon Alpha-2b Therapy: A Multicenter Real-World Study (STARHB Project in China)- 3 years Data Update, Shan Ren
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1356 - Severe Hepatic Steatosis Impairs PEG-IFN Response in HBsAg Clearance-Favorable Chronic Hepatitis B: A Retrospective Cohort Study, Pengxuan Wu
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 1361 - L-Taurine for Fatigue in Decompensated Cirrhosis: A Randomized Controlled Trial, Swarup Sasidharan
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1362 - Cell-Microcapsule-Loaded Potent Nanoenzymes Alleviate Drug-Induced Liver Injury via Dual Strategies, Xiaoyu Huang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 1375 - Multidimensional analysis of diagnosis and treatment status of chronic hepatitis B, Yujuan Guan
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1377 - Computed tomography-based sarcopenic obesity can predict cardiovascular and cerebrovascular mortality in patients with cirrhosis, Yanhua Chen
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1378 - Leucine-rich alpha-2-glycoprotein 1 turnover imbalance impairs regenerative signaling in Alcohol-associated Hepatitis, Nupur Sharma
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1380 - The SAFE-DILI Model for the Dynamic Prediction of Liver Transplantation or Death in Idiosyncratic Drug-Induced Liver Injury, Mengmeng Zhang
24 April 2026, Friday | 09:00 - 10:30 | ORAL PRESIDENTIAL SESSION
- 1384 - Hepatitis A and E Guidelines created by the Japan Agency for Medical Research and Development (AMED) HAV and HEV Study Group, Tatsuo Kanda
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1385 - Direct chemical reprogramming of urine-derived stem cells from acute-on-chronic liver failure patients into hepatocyte-like organoids to attenuate liver injury, Pengfei Yu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 01
- 1387 - The transcription factor PRDM5 is a novel pro-fibrotic factor in liver fibrosis, Chaiyaboot Ariyachet
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1389 - Variability of Presentation of Cholelithiasis in Relation to Etiology and Stages of Cirrhosis of Liver in a Tertiary Care Hospital in Dhaka City, M Golam Azam Azam MG
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1393 - Optimal timing of hepatectomy after conversion therapy and stratification by risk of recurrence in patients with hepatocellular carcinoma: a multicenter retrospective investigation (GUIDANCE005), Da-Long Yang
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1396 - Exploring the efficacy of Systemic Inflammatory Markers in predicting outcomes post Transarterial Chemoembolization (c TACE & deb TACE), RAJAT PRABHAKAR PANDE
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1399 - Trajectory-Based Multidimensional Risk Scoring in a Single-Center Retrospective Cohort: Exploratory Development for Predicting Poor HBsAg Seroclearance Response in Chronic Hepatitis B Functional Cure, Lin Tuo
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1401 - Effects of the secondary metabolites of Terminalia arjuna on non-alcoholic fatty liver disease in experimental mice model, Mst. Rejina Afrin
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1408 - Predicting Recompensation and Exploring the Prognostic Benefit of its Durability in patients with HBV-related decompensated cirrhosis, Yuwei Wang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1410 - Characterization of Serum Cytokine Profile and Its Early-Warning Value in Elderly Patients with Hepatitis E, Zhao Qian
23 April 2026, Thursday | 17:10 - 18:30 | ORAL PRESENTATION 11
- 1414 - Multi-omics integration analysis identifies Molecular Signatures of Liver Stress in preclinical model of Acute Hypoxia, Sanju Yadav
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 1416 - PPAR γ Activation Restores GSDME Pyroptosis to Reverse Anti-PD-1 Resistance in HCC, Peng Chen
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1417 - The Clarity Trial: Prospective evaluation of pemafibrate therapy in MASLD, Takefumi Kimura
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1418 - Efficacy of Sulfasalazine in Patients with Primary Biliary Cholangitis and Incomplete Response to Ursodeoxycholic Acid, Li Wei
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 1419 - Evodiamine alleviates liver fibrosis by targeting the ANXA2/PI3K/AKT/CCND1 axis in hepatic stellate cells, Zongyi Liu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1422 - Unveiling the pathogenesis and early warning biomarkers of acute liver failure associated with disulfidptosis through bioinformatics analysis and experimental validation, Li Bai
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1423 - Characterisation of people living with chronic hepatitis B virus infection in China and stratification by HBsAg levels, Myriam Drysdale
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1426 - Double plasma molecular adsorption system improves 90-day survival in patients with acute-on-chronic liver failure, Xiao Che
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1431 - Persistent sarcopenia confers a cumulative risk of fibrosis progression and liver-related events in biopsy-proven metabolic dysfunction-associated fatty liver disease, Siru Wu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1436 - HBV Inhibits Stress Granule Formation by Hijacking SG Core Proteins into the Nucleocapsids, Yi Wang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 26
- 1447 - N acetyl cysteine plus corticosteroid versus corticosteroid alone for treatment of acute severe autoimmune hepatitis: a randomized clinical trial, Ahad Eshraghian
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 1456 - Determination of Ankyrin Repeats Domain (ANK) of RNASE L Gene in Hepatitis C Patients and its effects on Viral Load, anum LIAQUAT ALI
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1459 - Revisiting HepaScore: New Evidence for Non-Invasive Fibrosis Assessment in Indonesian Patients with Chronic Hepatitis B, Meti Metiani
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 1461 - A Retrospective Study on PD-1/CTLA-4 Bispecific Antibody Therapy Promoting Partial Functional Cure of Hepatitis B in Patients with HBV-Related Hepatocellular Carcinoma, Chuyue Xiong
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 1463 - Real-World Outcomes of Durvalumab Plus Tremelimumab (STRIDE) for Unresectable Hepatocellular Carcinoma in Japanese Patients, Yuta Maruki
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1466 - A new prediction model based on plasma ammonia and the Chinese Group on the Study of Severe Hepatitis B-ACLF-8545; score for patients with Hepatitis B virus-related acute-on-chronic liver failure., Yijing Cai
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 1468 - Multicenter evaluation of the efficacy and safety of rechallenge with immune checkpoint inhibitors in unresectable hepatocellular carcinoma, Jian-Hong Zhong
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 31
- 1469 - Targeting NEK9 in hepatocellular carcinoma to remodel immune microenvironment and enhance immunotherapy, Yulong Shang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1471 - Biomolecular Mapping of Circulating Extracellular Vesicles to Develop AI Driven Prognostic Panels for Stratifying Acute Liver Failure Patients at Risk of Early Mortality, Neha Sharma
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1472 - Divergent immune resolution and protracted immuno-metabolic memory in hepatitis E revealed by cross-species multi-omics, Xiaoman Liu
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 1473 - Dominant Neoantigens in Liver Cancer Malignant Ascites, Dongbo Chen
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1476 - Prediction of microvascular invasion in HCC using spatiotemporal radiomics of contrast-enhanced ultrasound: a deep learning model with tumor microenvironment correlation, Chuan Pang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1481 - Development and validation of brain age clock from psychometric hepatic encephalopathy score for early detection of hepatic encephalopathy, Xin Wen
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 1482 - From Gene Expression Profiles to Functional Networks: A Multi-Omics Integrative Analysis of Methyl Eugenol Promoting Cholangiocarcinoma Development, Jing Liang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 1484 - Exploring the Anticancer Effects of Spirulina Extract in Human Hepatocellular Carcinoma Cells, Ceylan KÜPELİ
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 1486 - Serum bile acids profile analysis predicts severity and progression of liver disease, Yanpei Mai
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 1493 - Clinical determinants of treatment response in Asian hepatocellular carcinoma undergoing lenvatinib therapy: the impact of non-viral liver disease etiologies, Lu Li
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1494 - Distinct Clinical Profile of Wilson Disease-Related Cirrhosis: Insights from a Propensity Score-Matched Multicenter Study, Zhenhua Zhang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1497 - A Phase I Clinical Trial Evaluating the Safety and Efficacy of the QH-1A Combination Bio-artificial Liver Support System Incorporating Ex-vivo Mesenchymal Stem Cells for the Treatment of ACLF patients, Liang Peng
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1507 - Hyperammonemia in pre-hepatic and intrahepatic portal hypertension: comparable levels, different clinical outcomes, Maria Nadinskaia
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1516 - Serum HBP as a Mechanistic Predictor of Primary Resistance to Atezolizumab plus Bevacizumab in HCC., Satoshi Narahara
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1517 - Hepatitis B serology and vaccine response in uveitis patients treated with adalimumab: effects of the 1998 national hepatitis B vaccination program in Turkey, Fatma Merve Kocak
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 1525 - A Multi-Sectoral Co-Payment Model to Reduce Hepatitis C Treatment Costs and Advance Elimination Among Low-Income Populations: Experience from Yangjiang, China, Yuelong Lin
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 1526 - Transcriptional Activity of cccDNA in HBsAg-Negative Individuals with a History of Hepatitis B Virus Infection, Yanfei Feng
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 1527 - Development and Validation of an Early Diagnostic Model to Distinguish Bacterial Infection in Patients with Acute-on-Chronic Liver Disease (AoCLD) and Systemic Inflammatory Response Syndrome (SIRS), Ruochan Chen
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1528 - Palliative care reduces disease time burden but is under-utilized in terminal-stage hepatocellular carcinoma, Matthew Shing-Hin Chung
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1529 - CD39 Promotes Angiogenesis and Poor Prognosis in Hepatocellular Carcinoma via Activation of the PI3K/AKT Signaling Pathway, Zhengnan Cao
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1531 - Dynamic changes in gut microbiota associated with HBsAg decline in chronic hepatitis B patients undergoing IFN treatment, Demin Yu
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1533 - Sex differences in cirrhosis among untreated chronic hepatitis B: a 10-year longitudinal cohort study from China, Qiao Tang
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1542 - Mechanistic Insights into the Protective Effects of Faecalibacterium prausnitzii and Its Metabolite Short Chain Fatty Acids on Biliary Injury in Primary Biliary Cholangitis, Qi Wang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 1551 - Non Invasive Detection of Esophageal Varices in Compensated Cirrhotic Patients, Mohamed Abdel-Samiee
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1552 - Multi-Omics Integration Identifies a Prognostic Signature Guiding Precision Survival in Advanced HCC, Fengna Yan
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1555 - Concordance Between Ultrasound Steatosis Grading and Elastography-CAP Classification: A Case Series of Chronic HBV Patients on TAF Therapy, Elif Nur Özbay Haliloğlu
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1559 - SIRPA as a Novel Regulator of T Cell Apoptosis in Hepatocellular Carcinoma: Implications for Immunotherapy, Xue Zhang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1560 - Correlation between transient elastography and liver biopsy in CHB patients with elevated HBV DNA with normal ALT, Dr Arifa Tasnim
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1564 - Second-line Therapy after Immunotherapy for Unresectable Hepatocellular Carcinoma: a Multicenter Data Registry Analysis, Takeshi Okamoto
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1565 - The Efficacy and Safety of Pegylated Interferon Alpha Treatment in Patients with HBV Related Cirrhosis and HCC after Radical Surgery (1 Year Data from the TERMINATOR Project), Qiuju Sheng
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1567 - Multi-omics Analysis of Bile Acid Dysregulation in Hepatitis E virus Infection, Conglin Zhao
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1568 - Role of CD146-High Endothelial Cells in Vascular Remodeling and Fibrosis Progression in Cirrhotic Liver: A Single-Cell Transcriptomic Study, Bingqing Yang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 28
- 1573 - Comparison of ALBI, PALBI, MELD, and Child-Pugh Scores in Chronic Liver Disease: Evidence from Bangladesh, A B M Shakil Gani
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 1576 - Qilingxiaoji formula and the effective ingredients inhibit hepatocellular carcinoma progression by inhibiting miR32/GPR180 signaling pathway, Yilan Yang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 35
- 1580 - Prognostic Evaluation of Hepatocellular Carcinoma: Impact of Etiological Factors on Survival Outcomes, ALİ ÇAĞRI ORAL
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1581 - Continuing or Switching Systemic Therapy Combined with Locoregional Therapy Defines a Personalized Strategy for Oligoprogression in HCC: A Multicenter Retrospective Study, Hongli Yu Yu
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1587 - Remodeling of the bile acid connectome across the hepatitis-cirrhosis-hcc axis: network analysis reveals stage-specific hubs and potential therapeutic targets, Qinshuo Wang
24 April 2026, Friday | 09:00 - 10:30 | ORAL PRESIDENTIAL SESSION
- 1588 - Role and Mechanism of TGF β /pSAP Signaling in Regulating Hepatocyte-Macrophage Crosstalk in Metabolic Dysfunction-Associated Steatohepatitis, Zheng Liu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1589 - Intermittent therapy restores anti-HBV efficacy of T_H1 by reducing elevated dysfunctional HLA-DR+CD38hiCD8+ T lymphocytes, Yanjie Lin
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1592 - Fibroscan role in determining the patients who are at high risk for developing HCC in 1000 cirrhotic Egyptian patients., Abdel Ghani Atef Abdel Ghani Badran
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1596 - ABT score based clinical model predicts prognosis in unresectable hepatocellular carcinoma treated with TACE combined with Bevacizumab and Sintilimab therapy, Minjun liao
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1598 - Pneumonia incidence and pathogen spectrum in liver transplant recipients: a decade-long retrospective analysis comparing pre-coronavirus disease 2019 and pandemic-era temporal patterns and risk factors, Zehra İkbāl Karabal
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1602 - The Association Analysis of Metabolic Comorbidities and the 10-Year Prognosis of Hepatic Events in Chronic Hepatitis B Patients, Xuejie Zhang
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 29
- 1603 - FcγR2b mediates CD8+ T cells dysfunction in Hepatocellular Carcinoma, Qianting Guan
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1607 - From Dysbiosis to Prediction: A Novel Gut Microbiota-Derived Index for Spontaneous Bacterial Peritonitis in HBV-Related Cirrhosis, Zhewen Zhou
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1608 - Two-Year Follow-up of a Dose-Escalation Trial of Mesenchymal Stromal Cell Therapy for Decompensated Liver Cirrhosis, Lei Shi
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1609 - Prediction of Liver-Related Events Using Non-invasive Fibrosis Scores in Patients with Metabolic Dysfunction-Associated Fatty Liver Disease, Yankun Gao
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1615 - Mechanistic Study of Celiac Sympathetic Denervation in the Treatment of Metabolic Dysfunction-Associated Steatohepatitis (MASH), Yi Xu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1619 - Safety and Effectiveness of Peginterferon Alfa-2b Combined with Tenofovir Amibufenamide in Patients with Chronic Hepatitis B, Qing-Lei Zeng
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1624 - A Noninvasive Model Based on Liver and Spleen Microcirculatory Perfusion Parameters for Predicting High-Risk Varices in CHB-Related Cirrhosis, Chenglin Sun
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1625 - Alcohol Consumption Accelerates Liver Fibrosis in Chronic Hepatitis B: Evidence from Mendelian Randomization and a Prospective Cohort Study, Yu Zhang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1629 - Analysis of Risk Factors and Establishment of a Predictive Model for Liver Disease Severity in Non-Alcoholic Fatty Liver Disease, Ziyu Zhang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 37
- 1634 - Integrated Plasma and Fecal Metabolic Profiling in Alcoholic Cirrhosis: Association with Gut Microbiota Dysbiosis, Yifan Xu
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1640 - The 4-hydroxybutyrylation modification of ACSL4 inhibits the growth of hepatocellular carcinoma, Xiangchang Zeng
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1642 - Heme oxygenase-1 inhibiting mitochondrial apoptosis in metabolic associated fatty liver disease, Wen Zhao
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1646 - Mapping the Global Network of Viral Hepatitis A, B, C and E: Unveiling Disease-Specific Epidemic Architectures through Complex Network Analysis, Yuxi Shi
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1647 - Antiviral Therapy in Patients with HBV Infection in the HBeAg-Negative Indeterminate Phase, Mingyang Feng
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1649 - Platelet-Albumin-Bilirubin (PALBI) Score: A non-invasive Predictor of Esophageal Varices in Patients with Liver Cirrhosis Compared to Child-Turcotte-Pugh (CTP) Score, ZANNATUL HABIBA
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 1652 - Investigating the Role of Gut Microbiota-Derived Valine in Treating MAFLD through PPAR Signaling, minshan huang
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 1653 - Efficacy of sofosbuvir/velpatasvir in patients with hepatitis C virus genotype 3 infection, Menghan Jin
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1656 - Analysis on the differences of clinicopathological characteristics in drug-induced liver injury patients with positive or negative autoantibodies and different clinical types, Suwen Jiang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 1661 - Clinical Characteristics of Autoimmune Hepatitis in Patients with Hepatitis B-D Coinfection: A Case Series, Zain Majid
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1662 - Socioeconomic Disparities and Potential Impact of Delayed Presentation on the Burden of Portal Hypertension in a Bangladeshi Tertiary Care Setting, Md. Sabbir Hossain
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1664 - Matrix Stiffness Suppresses Hepatitis B Virus Replication via YAP-Mediated Intrinsic Antiviral Signaling, Hua-xiang Yang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1672 - Hepatic steatosis in Wilson disease: phenotype or metabolic comorbidity?, Veronica Cumpata
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1673 - Towards hepatitis B elimination in Ghana: vaccination coverage and its predictors among informal sector workers in Kejetia, Kumasi, Ghana, Pius Takyi
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1676 - Predictive Factors of Tyrosine Kinase Inhibitor Response in Patients with Advanced Hepatocellular Carcinoma, Hayriye Dilan Çağlar
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1677 - Establishment of the TBRI Biobank for Liver Diseases: Advancing Research Translation and Precision Medicine in Hepatology, Eman El-Ahwany
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 1679 - PASSIVE TOBACCO SMOKE INDUCED CHANGES IN THE EXPRESSION OF IRON METABOLISM GENES IN MOUSE PUPS, Naseer Kawish
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1690 - Off-Therapy Outcomes After Long-Term Nucleos(t)ide Analogue Treatment in HBeAg-Negative Chronic Hepatitis B, Petek Şarлак Konya
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1694 - Non-Invasive Evaluation of Fibrosis Regression in HBV and HCV: A Real-World Comparative Analysis, Hamza Benazzouz
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 46
- 1698 - Etiological Predictors of Portal Vein Thrombosis in Patients with Porto-Sinusoidal Vascular Disease, rajaa boukhraiss
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 1708 - Males are emerging as the primary high-risk population for gallbladder and biliary tract cancers, Xiaoxiao Wang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06
- 1713 - Hepatocyte myb-like swrm and mpn domains 1 exacerbates liver fibrosis by stabilizing gelsolin via k29-linked deubiquitination, Han Ding
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1715 - THE OUTCOME PREDICTION ROLE OF RED CELL DISTRIBUTION WIDTH IN 1000 HOSPITALIZED CIRRHOTIC EGYPTIAN PATIENTS, Eman Abdelsameea
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1717 - A new switch for lactate accumulation in metabolic dysfunction-associated steatotic liver disease, Miaomiao Tian
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1722 - Paraneoplastic Hyperbilirubinemia in Hodgkin's Lymphoma: An Uncommon Presentation with Significant Diagnostic and Therapeutic Challenges, Jasmin Gondayao
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 1725 - Suboptimal sensitivity of quantitative HBcrAg assay for managing HBeAg-negative chronic hepatitis B, Ruifeng Yang
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1726 - Glucagon-like peptide-1 receptor agonists and reduced liver and non-liver complications in patients with type 2 diabetes and viral hepatitis, Xinrong Zhang
24 April 2026, Friday | 13:40 - 15:10 | APASL - IASL JOINT MEETING
- 1727 - Diagnosis of the differentials of ascites in low-resource settings., Riad Mohammad Moshaed Hossain
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1729 - The expression of Fmn1 in monocyte-derived macrophages promotes hepatic inflammation in MAFLD, Zilong Wang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1732 - Associations of sweetened beverages consumption with the risk of MASLD and its related outcomes across genetic risk profiles: a prospective population-based cohort study, Jian Zhao
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1735 - Policy Blind Spots and Clinical Realities: Determinants of Continued Alcohol Use in Alcohol-Associated Liver Disease at India's First Integrated AUD-ALD Clinic, Mohit Varshney
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1738 - Combination Therapy with Toll-like receptor 7 Agonist and Programmed Death Ligand 1 Antibody Restores HBV-Specific CD8+T Cells in Virally suppressed Chronic Hepatitis B, Yuying Chen
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1747 - Predictive Biomarkers for Hepatitis E Virus-Related Acute Liver Failure Based on Lipidomics and Transcriptomics, Jian Wu
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1753 - Allogeneic Umbilical Cord Mesenchymal Stem Cell Transplantation in Patients with Cirrhosis Caused by Hepatitis B: A Single-Center Case Series, Jason Phowira
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1754 - The mechanism of TMBIM5 in ameliorating alcohol-related liver disease by regulating mitochondrial dynamics, Qi Shen Shen
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 1757 - Impact of etiology on outcomes with atezolizumab plus bevacizumab in advanced hepatocellular carcinoma: A multicenter propensity-matched analysis, Yeo Wool Kang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1758 - Predictive Role of Spleen Stiffness in Gastrointestinal Bleeding for Patients with Unresectable Hepatocellular Carcinoma Undergoing Systemic Therapy, Yue Huang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 53
- 1768 - ALT Trajectories Differentiated by Early Treatment Response Determine Long-Term Outcomes in Autoimmune Hepatitis, Chao Cai
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 1769 - Admission NLR and APRI as Practical, Low-Cost Predictors of Severity in Cirrhosis: Data from an Indian Tertiary Center, UDIT VAISH
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48
- 1771 - Our Journey Towards a Dedicated Transjugular Intrahepatic Portosystemic Shunt (TIPSS) Service: Teamwork Makes the Dream Work, Hak Keith Leung
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 48

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1775 - Longitudinal Analysis Reveals Comparable ALT Trajectories and Achievement of Biochemical Remission Regardless of Baseline Fibrosis in Autoimmune Hepatitis, Wenxuan Shang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 1776 - Immune characteristics of peripheral blood cells in inactive hepatitis B surface antigen carriers treated with interferon, Sujun Zheng
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1781 - An Endothelial-Related Gene Signature Derived from Integrative Transcriptomics Predicts HCC in Cirrhosis, Jiahao Yuan
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 1782 - An Evaluation of the Effectiveness of Entecavir in Patients with Acute Chronic Hepatitis B liver Failure, Sharker Mohammad Shahadat Hossain
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1783 - LLGL1 Loss Attenuates Hippo Signaling and Sustains Pro-oncogenic YAP Activity in Hepatocellular Carcinoma Cells, Soner KARABULUT
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1785 - Automatic Detection of Hepatocellular Carcinoma on MRI Using a Lesion-Aware Fine-Tuning Framework, Cong Wang
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 1798 - East Asian subgroup analysis of the global Phase 3 GLISTEN study of linerixibat for the treatment of cholestatic pruritus in patients with primary biliary cholangitis (PBC), Atsushi Tanaka
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 1802 - Hesperidin inhibits HBV via promoting macrophage M1 polarization through activation of the NF- κ B/CXCL/TNF α pathway, Man Li
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1804 - LOXL1 G153D Mutation Impairs Liver Fibrosis Regression by Enhancing Extracellular Matrix Stabilization, Wen Zhang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 1805 - Clinical Validation and Diagnostic Value Assessment of Plasma GSTM3 as a Novel Biomarker for Liver Fibrosis, Chenxue Hou
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 1812 - Clinical characteristics and influencing factors of porto-sinusoidal vascular disease patients with metabolic dysfunction-associated steatotic liver disease, Weihua Cao
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 1813 - Unmasking the unknown: the unexpected discovery of hepatic epithelioid hemangioendothelioma, Johanna Lynne La Rosa-Rimorin
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1815 - Efficacy of Silybin Phospholipid Complex in Metabolic-Associated Fatty Liver Disease, Qianli Zhao
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1816 - The roles of THBS2-SPP1 axis in hepatic stellate cells activation and liver fibrogenesis, Hong Li
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 1818 - Selective Inhibition of Hepatic Stellate Cell-Derived Microfibril-associated glycoprotein 4 Attenuates Liver Fibrosis, Wenye Wu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 1819 - Impact of the expanded program on immunization on Hepatitis B elimination efforts: Insights from a Turkish reference center, Ahmet Sertçelik
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1820 - Downstaging by Atezolizumab plus Bevacizumab in Advanced Hepatocellular Carcinoma: Identifying Candidates for Conversion Therapy Based on Tumor Biology and Vascular Invasion Patterns, Chihiro Miwa
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 1821 - Adolescent MASLD Incidence Trends, 1990–2023: Global and National Perspectives, Tianyuan Yang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1822 - Blood biomarkers for non-invasive diagnosis of advanced fibrosis or compensated cirrhosis in chronic hepatitis B, Xin Wang
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 50
- 1824 - Utility of EUS-guided Liver Biopsy in Liver Disease., NIVEDITA NIVEDITA
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 1832 - An Unexpected Turmoil: Hepatitis B Reactivation with Atypical Serology Following Neoadjuvant Capecitabine-Oxaliplatin in an Unsuspected Patient with Gastric Adenocarcinoma: A Multidisciplinary Management Complexity, ADRIAN BUGAYONG
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1834 - The national burden of acute liver failure from 2019 to 2022: A Thailand nationwide population-based cross-sectional time series study, Rungfah Saehan
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1836 - Trends in hepatitis B-related diseases in Asia, 1990-2023: an analysis of the Global Burden of Disease 2023 update, Jingran Jiao
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 05
- 1837 - Early Ablation for Sub-centimeter Hepatocellular Carcinoma: Divergent Outcomes in Primary vs Recurrent Tumors over 10 Years, Yan Zhou
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1843 - Gut-Liver Axis Mechanisms Underlying Spontaneous Reversal of Liver Fibrosis: A Gut Microbiota-Metabolomics Analysis, Yuanying Zhao
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 1846 - Patient-Derived Liver Organoids as a Translational Platform to Validate Targeted Nanoparticles for Image-Guided Liver Cancer Surgery, Zulihumaer Aizimuaji
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 18
- 1848 - Metastatic Liver Involvement from Primary Adamantinoma-like Ewing Sarcoma of the Lung in an Elderly Male: A Rare Case Presentation, Daniele Alek Calda
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1849 - Yangyin Fuzheng Jiedu Prescription Reduces Recurrence Risk in Patients with Small Hepatocellular Carcinoma after Minimally Invasive Treatment: a Pragmatic Randomized Controlled Trial, Huiwen Yan
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1851 - Inhibiting PPM1D facilitates the phosphorylation and oligomerization of VDAC2 to elicit immunogenic tumor destruction by activating cGAS-STING-IFN response, Liang Zhang Zhang
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1857 - Therapeutic Role of N-Acetylcysteine in Acute Liver Failure Secondary to Anti-Tuberculosis Drug-Induced Liver Injury: Insights From Indonesia, Alfiyyah Rizqy
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1861 - Test, Treat!: A Small Step For The World, A Big Step For Us; Hepatitis C Microelimination Efforts in a Small City in Türkiye, HATUN ÖZTÜRK ÇERİK
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1867 - Identification of benefit subgroups from heterogeneous effects of adjuvant transarterial chemoembolization in hepatocellular carcinoma using causal model, Tianyi Xia
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1883 - Early-Onset PSC With Recurrent Cholangitis Requiring Early Transplant Evaluation: A Five-Year Case Trajectory and Prelude to the Transplant Course, Christine Velasquez
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 1886 - The role of Alix and VPS4A in autophagy and endosomal pathways and their relation to HBV replication, Mengji Lu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1889 - Liver Fibrosis: Explainable Deep learning Network for Automated Staging by Using Equilibrium Enhanced Phase MR Images, Junhao Zha
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1890 - Deep Learning CT Signature for Predicting Occult Liver Metastases and Neoadjuvant Therapy Benefit in Pancreatic Ductal Adenocarcinoma: A Multicenter Retrospective Study, Yaoyao Yu
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1895 - Add on traditional Chinese medicine for hospitalized acute on chronic liver disease, Yufei Bi
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1897 - Genotype-Phenotype Correlation of ATP7B Mutations in Wilson Disease, Sujun Zheng
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1899 - Exploring the value of imaging indicators in predicting TACE resistance in hepatocellular carcinoma based on contrast-enhanced CT, Ying Lei
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1903 - Performance of FIB-4 and MAFLD Fibrosis Score vs. Transient Elastography in a Filipino Cohort, Rafael Emmanuel Mendoza
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 1906 - A Fe-Curcumin-based Strategy to Reinvigorate CAR-T Cells by Reversing Exhaustion and Senescence in Liver Cancer, Yuchan Xue
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 59
- 1908 - Performance of Baveno VII Criteria in Predicting Clinically Significant Portal Hypertension in Burned-Out MAFLD, Adinda Amalia
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1909 - A Diagnostic conundrum in a Case of Obstructive Jaundice in Biliary Hamartoma, Cleo Christille Lynn Lom-oc
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06
- 1912 - Association Between Fatty Liver and Risk of Liver Failure in Patients with Acute Hepatitis B: A Retrospective Cohort Study, Xiao-hao Wang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1916 - Restoration of ATP7B Trafficking and Biliary Function in Wilson Disease Hepatocytes through CRISPR/Cas9-Mediated Gene Correction, Jiaqi Li
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1918 - Solving a Recurrent Hepatic Abscesses Through Discovery of a Cholecystoduodenal Fistula resulting from an Over-the-Scope Clip closure of Duodenal Perforation as a complication of Microwave Ablation for HCC, James Manuel Medalla
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 1920 - A New Noninvasive Marker Predicting Liver Fibrosis in Patients with Chronic Hepatitis B, ESMA ASLIHAN AYDEMİR
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1923 - Women's Perspective on Non-Antibiotic Interventions for rUTI Prevention: Meta-Analysis of Efficacy, Safety, and Clinical Implications, Wenjing Wang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 1926 - Hepatitis and HIV Seroprevalence in Individuals with Substance Use Disorders: A 25-Year Retrospective Analysis, Sümeyra İstek
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1934 - Comprehensive Evaluation of Demographic, Endoscopic, and Ultrasonographic Characteristics in First Episode Variceal Bleeding, Hakan Demiröz
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 1935 - Neuropilin-1 alleviates metabolic dysfunction-associated fatty liver disease by promoting lysosomal degradation of toll-like receptor 4 in macrophages, Yinuo Yang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1938 - Prediction of Esophageal Varices in Primary Biliary Cholangitis: What Is the Role of Non-Invasive Tests?, ikram aluahabi
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 1940 - Dual SGLT2-DPP-4 Inhibition Synergistically Restores Hepatopancreatic Integrity in Experimental Diabetes, MOHD. IBRAHIM KHAN
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15

ABSTRACTS' LIST

ORAL ABSTRACTS

- 1941 - Predictors and Immune Signatures of Baveno-VII–Aligned Recompensation in Pediatric Wilson Disease with Decompensated Cirrhosis, Anmol Anmol
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 1943 - Investigation of the Therapeutic Effects of α -Adrenergic Stimulation on Paracetamol-Induced Acute Liver Damage, Seydanur Avci
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1945 - Impact of Microbiome in Obese vs Lean Steatotic Liver Disease in Children, Betül Tunç Demirci
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 63
- 1949 - Development and Evaluation of Polyherbal Chitosan Nanoparticles: Antioxidant and Cytotoxic Effects on HepG2 Cells, Mohammad Shariq
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 1950 - Decellularized Liver Matrix from Healthy versus Acute Liver Failure Livers Possesses Distinct Structural and Functional Properties, Chen Zhou
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 20
- 1954 - Effects of Obinutuzumab on Cecal Ligation and Puncture Induced Septic Liver Injury in Rats, Fatih Albayrak
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 1965 - Modeling the burden of steatotic liver disease and its subcategories in people living with HIV, Maurice Michel
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 1967 - Hepatitis C Virus MicroRNA elimination in the Hospital Setting: What Results Have We Achieved?, Lu Zhang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1968 - Investigation of the Effects of Vasopressin V2 Receptor Inhibition on Aquaporin Expression and Liver Functions in Sepsis-Induced Hepatic Injury, Elif Cadirci
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 1973 - Prognostic Utility of baseline and SVR12/24 M2BPGi for Liver-Related Events in hepatitis C patients, Haiying Zhang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 1984 - Comparative Efficacy of Entecavir and Tenofovir Disoproxil Fumarate in Preventing HBV Reactivation in Patients Receiving Biologic Disease-Modifying Antirheumatic Drugs, Gule Cinar
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 1985 - Effects of Linalool–Regorafenib Combination on Anticancer Activity in HUH-7 Cells, Aysegül Öztürk
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 1989 - Post-Polypectomy Bleeding in Patients with Cirrhosis: A Systematic Review of Risk, Predictors, and Procedure-Related Factors, TALAL BHATTI
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2000 - Efficacy of Yangyin Fuzheng Jiedu Prescription for Hepatocellular Carcinoma with Portal Vein Tumor Thrombosis: An Evaluation Using Five Propensity Score Methods, Wanxin Shi
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2002 - Acute Hepatitis B Infection Following Long-Acting Injectable Antiretroviral Therapy Drug Switch in HIV, Jacky Man Chun Chan
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 12
- 2006 - Phenotypic Pattern of Acute Liver Injury in Crimean-Congo Hemorrhagic Fever Among Patients with Chronic Hepatitis B in an HBV-Endemic Region, Faruk Karakeçili
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2012 - Eliminating Viral Hepatitis by 2030: Goals and Gaps from a Large-Scale Community-Based Study in Shenzhen, China, Deliang Huang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2019 - Cardiometabolic Risks in Elderly Individuals With Fatty Liver Living in Mid-Mountain Regions of Central Asia, Nurgul Toktogulova
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2023 - Impact of Liver Fat Contents on Brain Structure and Cognitive Functions in Patients with MASLD, Zhuoru Jiang
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2028 - sepsis, Peng Qu
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2039 - Modelling liver fibrosis and MASH with humanized immune system mice, Clothilde Philouze
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2041 - A Rare Presentation of Salmonella enteritidis Bacteremia With Coronary Mycotic Aneurysm and Non-Cirrhotic Portal Hypertension, Ferdinand Anzo
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 2047 - Controlled expansion stent-grafts in TIPS: a real-world analysis of in vivo diameter change and early hepatic encephalopathy, Zizhen Ye
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 2065 - Comprehensive multiomics study of ballooned hepatocytes in MASH: Insights into cellular adaptation to metabolic overload, Yan Wang
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2066 - Phenotypic Age is a Hepatocentric Marker of Biological Aging: Stronger Associations of Liver-Related and Metabolic Outcomes over Cardiovascular Events in Steatotic Liver Disease, SHUN LI
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2067 - Hepatic Arterial Infusion Chemotherapy Combined with Donafenib and PD-1 Inhibitor for Advanced Hepatocellular Carcinoma with Lung Metastases: A Multicenter Retrospective Study, Jinpeng Li
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2068 - The impact of implementing the expanded antiviral therapy eligibility for HBsAg-positive pregnant women in China: a modelling study, Ruixuan Hong
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 2081 - Late Presentation and Poor Outcomes of Hepatocellular Carcinoma in a Resource-Limited Setting: An Observational Study in a Tertiary Care Hospital, Bangladesh, Mohammad Forhad Abedin Abedin
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2083 - Targeting STK40 unleashes anti-tumor immunity by triggering tumor vulnerability and T cell reinvigoration, Cun Wang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2087 - CD146 Regulates Hepatocyte Lipotoxicity through Modulation of Mitochondrial Energy Metabolism and Inflammatory Response, Yixue Shu
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2092 - Paris-II Outperforms Other UDCA Response Criteria to predict Transplant-Free Survival in Asian PBC Patients, Yu Jun Wong
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 2094 - Inhibition of Aurora B Induces Senescence and Potentiates Immunotherapy in Hepatocellular Carcinoma, Xuhui Ma
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2100 - From Organ to Surface: Perforating Disorders in Chronic Liver Disease, Maisam Akroush
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2102 - Temporal Trends and Outcomes of AMA-Negative Primary Biliary Cholangitis in a Multi-Centre South-East Asian Cohort, Abhimati Ravikulan
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 2104 - A Longer Way to Go: Chronic Hepatitis B Burden and Trends Across the Asian-Pacific Region, Zhengzhao Lu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2105 - Breaking the habit: Evaluating the routine use of SBP prophylaxis, Shauna MADIGAN
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2107 - COVID-19 pandemic had minimal impact on the diagnostic and treatment uptakes for HCV – a territory-wide study, Terry Cheuk+Fung Yip
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2110 - THE RISING THREAT OF MASLD IN YOUNG ADULTS: A COMPREHENSIVE METABOLIC AND HEPATIC ASSESSMENT FROM SOUTH ASIA, Abdul Samad
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2113 - Unveiling occult squamous commitment as a clinical fate determinant in cholangiocarcinoma, Chen Yang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2117 - Clinical Characteristics and Short-Term Outcomes of Patients with Cirrhosis and Subclinical Decompensation, Tong Bu
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 14
- 2121 - Eliminating Viral Hepatitis in Pakistan: A Comprehensive Strategic Framework, Hassan Mahmood
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2124 - GENDER DISPARITIES IN HEPATOCELLULAR CARCINOMA: A COMPARATIVE ANALYSIS, Abdul Samad Bhatti
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 54
- 2125 - Efficacy and Safety of Magnesium Isoglycyrrhizinate in Checkpoint Inhibitor-Induced Liver Injury in Patients with Advanced Solid Tumors: An Exploratory Study, Yong Liu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 2130 - Predictors and impact of complete pathological response to pre-transplant immune checkpoint inhibitors in hepatocellular carcinoma: Findings from the Global LIFT-HCC consortium, Ju Dong Yang
24 April 2026, Friday | 09:00 - 10:30 | ORAL PRESIDENTIAL SESSION
- 2132 - Leveraging Decentralization, Integration, and Task-Shifting to achieve Micro-elimination of Hepatitis C among prisoners in Northern India, Ajeet Singh Bhadoria
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 2134 - Iron Metabolism Defects in Wilson Disease Suspects - A Real-World Two-Phase Molecular Epidemiology Study, Yue Han
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 2137 - Protective and Therapeutic Roles of Vitamin D in Reducing Chlorpyrifos Induced Liver Fibrosis Through Modulation of Fibrotic Pathways, Dr. Aftab Abbasi
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2143 - A model, screen test and treat hepatitis C elimination project among under-served communities in Islamabad the federal capital of Pakistan, Huma Qureshi
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2145 - Gestational cholestasis: single center experience, Ahmet Uyanikoglu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06
- 2148 - B-Cell Depletion Therapy Shows Efficacy in Steroid-Refractory Autoimmune Hepatitis, YunLong Yao
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 2150 - Early Skeletal Muscle Loss Predicts Poor Outcomes in Advanced Hepatocellular Carcinoma Treated with Hepatic Arterial Infusion Chemotherapy, Asahiro Morishita
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2152 - Circulating cell-free mitochondrial DNA predicts prognosis and triggers macrophage STING-dependent inflammation in acute-on-chronic liver failure, Qiankun Hu
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2161 - Circulating Tumor DNA Analysis Enables Early Detection of Hepatocellular Carcinoma in High-Risk Patients, Xi Zhang
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2168 - Colorectal Carcinoma in Young patients, single Centre study from Karachi, Pakistan., Ghulam Mohiuddin
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2172 - The coexistence of MAFLD exacerbates liver fibrosis in patients with chronic hepatitis B., Alaa M. Mostafa
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 2185 - Nonthermal Histotripsy Enables Complete Ablation of Perivascular Liver Tumors While Preserving Adjacent Vessel Patency, KAI-WEN HUANG
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2188 - Personalised Risk-Based HCC Surveillance in HCV-Related Advanced Fibrosis/Cirrhosis After SVR: Real-World Evidence of Cost Effectiveness., Gamal Shiha
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2189 - HBsAg Dynamics and Seroclearance Maintenance After Interferon Cessation in Chronic Hepatitis B Patients, Shanshan Zhu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2192 - Neutrophil recruited CD38hi cytotoxic CD8 T cells characterize the T cell infiltrate in checkpoint inhibitor-mediated cholangitis, Xinghuan Fu
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 2195 - 3D Radiomics Analysis Based on Liver CT Imaging for Predicting Hepatic Encephalopathy in HBV-ACLF Patients, Xueyun Zhang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2201 - Prospective Evaluation of Factors Affecting Measurement Quality in Liver Elastography, Murat Taner GÜLŞEN
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2215 - Innovative Insights: Hepatic Stellate Cells activation and ROS-Gene Signatures Predicting Prognosis and Immunotherapy Response in Hepatocellular Carcinoma, Ning Wang
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2218 - Nucleos(t)ide Analogue Treatment History Stratifies Prognosis in Hepatitis B Virus-Related Acute-on-Chronic Liver Failure, Shan Zhong
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2225 - Infected Choledochal Cysts Masking as Liver Abscesses in an Adult Male: A Case Report, Emerald T. Gersava
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 2226 - Impact of Diabetes on Fibrosis Progression in NAFLD: A Systematic Review and Meta-analysis, Javaria Younas Muhammad Younas
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2229 - Discrepancies in the indeterminate phase in patients with chronic hepatitis B between two updated international guidelines, Shaoqiu Zhang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2240 - Hepatitis B Management in Primary Care: Nationwide Survey Highlights Knowledge and Practice Gaps Among Family Physicians in Türkiye, Imran Hasanoglu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 34
- 2241 - Diagnostic Value of Liver Biopsy in Unexplained Liver Enzyme Elevations: A Tertiary Center Experience, Serap Türk
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2244 - Early Experience with Endoscopic Ultrasound-Guided Gastric Variceal Obliteration at an Australian Quaternary Referral Centre, Rajit Gilhotra
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 2245 - Unravelling the placebo response in pharmacological trials for metabolic dysfunction-associated steatotic liver disease: a systematic review and meta-analysis, Kiavash Semnani
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2254 - Prognostic Impact of Sarcopenia Assessed by Handgrip Strength and Skeletal Muscle Index in Hepatocellular Carcinoma Patients Receiving Atezolizumab plus Bevacizumab Therapy, Hiroki Tai
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2255 - Role of Metabolic Risk Factors in the Early Detection of Metabolic-Associated Steatotic Liver Disease (MASLD) in Young Adults: A Cross-Sectional Study, Muhammad Siddique Chohan
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 60
- 2256 - Efficacy of Combined Nutritional and Physical Activity Intervention in Reversing Early MAFLD, Hafsa Abdul Waheed Jadgal
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2268 - Interpretable AI That "Reads the Liver From the Face": A 3D-Face Digital Biomarker for Ultrasound-Confirmed NAFLD, Haoran Sun
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 2274 - Blood-Stasis Constitution Drives Hepatic MDSC Accumulation in MASLD;;
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2276 - Long-Term Outcomes of Treatment-Induced Versus Spontaneously Achieved HBsAg <100 IU/mL in Chronic Hepatitis B, Jian Wang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2282 - SIRT2 restrains HDV-associated hepatic macrophage pyroptosis by deacetylating NLRP3 and suppressing NF- κ B signaling, Leer Shen
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2290 - Coffee Consumption and Hepatocellular Carcinoma: An Umbrella Review of Meta-Analyses involving Over 12 Million Population, Nitesh Kumar Karna
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2291 - The Antagonism between Demographic Shifts and Epidemiological Progress: A Decomposition Analysis of the Liver Cancer Burden in the Asia-Pacific, 1990–2023, Wenxin Yan
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2292 - Analysis of Clinical Characteristics and Treatment Outcomes in HBV - Related Liver Failure Patients with or without Diabetes Mellitus, lufeng Li
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2294 - Comparison of the Effects of Tenofovir Alafenamide and Entecavir on Lipid Profiles in Anti-HBc Positive Kidney Transplant Recipients, Elif Gucyetmez
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2296 - From Campaign to Validation: Operationalizing Egypt's National Sustainability Plan for Viral Hepatitis Elimination (2025–2030), Mohamed Abd Allah
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 2297 - Ischemia-Modified Albumin in MASLD: Correlation With Ultrasonographic Steatosis Grade and Elastography-Based Liver Stiffness, Kubra Koken
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2300 - Old Drugs, New Targets: Repurposing Proton Pump Inhibitors for Autoimmune Liver Diseases: Molecular Docking Insights into the TLR4/MD-2, NLRP3, and C5aR1 Axes, Mehmet Yildiz
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 03
- 2302 - Stiffness Regression Fundamentally Alters Mortality Patterns and Improves Survival in Advanced Fibrosis After SVR: A Cause-Specific Outcome Analysis, Shuntaro Obi
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2306 - Study on Key Inflammatory Proteins of Antiviral Treatment in Children with Chronic Hepatitis B, Yanwei Zhong
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2309 - Zonal Restoration and Inter-Cellular Signaling in Fibrosis Regression: Single-Cell Transcriptomics Decodes the Pericentral Hepatocyte-HSC Axis, Thi Thanh Thuy Le
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2310 - NAFLD promotes early hepatocellular carcinoma recurrence via MDSC metabolic reprogramming: Insights from a two-phase recurrence model in mice, Li Mingming
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2311 - LOXL1 Regulates Lipid Metabolism to Promote Hepatic Stellate Cell Activation via Ubiquitin-Mediated FASN Degradation, Xuzhen Yan
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2314 - Gilbert syndrome increases the risk of gallstone disease: a cross-sectional study based on health examination data from 338,372 adults, Sujun Zheng
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 08
- 2318 - Gut Microbiota Transfer and Integrated Omics Identify Streptococcal Collagen-Like (Scl1) Protein as a key fibrogenic driver in Alcohol associated liver disease., Manisha Yadav
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2320 - Liver meta-proteome and kinome reveal *Pseudomonas aeruginosa* –pPKC; axis as a driver of steroid resistance in severe alcohol related hepatitis, Jaswinder Maras
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 2326 - Asia-Pacific expert consensus on GAAD for hepatocellular carcinoma surveillance, Teerha Piratvisuth
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2328 - Fatty Liver as a Key Risk Modifier for Adenoma Detection in FIT-Positive Young Adults: A Systematic Review of the Available Evidence, DESIREE JANE LACUIN
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2329 - Multi-omics analyses identify a novel hepatocellular carcinoma subtype with better response to immune checkpoint inhibitor therapies, Junjie Xu
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2336 - Lean MAFLD in Chronic Hepatitis B: Clinical Characteristics, Fibrosis Risk and antiviral response in a Pakistani Cohort, Farhana Kayani
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 2340 - Metabolic Fatty Liver Masks Hepatitis B Activity: Implications for ALT-Based Treatment Decisions, a study from PAKistan, Jalal Khan
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 2347 - Semaglutide demonstrates efficacy in improving liver fibrosis across diverse subpopulations in part 1 of the ESSENCE trial – outcomes in Asian and non-Asian populations, Jacob George
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2349 - Study on the Anti-Liver Cirrhosis of Luteolin: Targeting the PPAR; Axis to Regulate Macrophage Fatty Acid Metabolic Reprogramming, Xuemei WANG
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2350 - Generation of Macro-Scale Engineered Biliary Trees with P-gp Efflux Function and Enhanced Injury Resistance, Shiwen Ma
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 2351 - A-HOC Study on Patients Under Real-time Surveillance for Liver Cancer in Mongolia, Amarsanaa Jazag
24 April 2026, Friday | 17:10 - 18:30 | ORAL PRESENTATION 32
- 2353 - Analysis of Aggressive Phenotypes in Hepatocellular Carcinoma Using Transcriptomic Data: A Machine Learning Framework for Biological Signature Discovery, Erdi Şeker
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2359 - Stage-Specific Survival in Hepatocellular Carcinoma: A Multiregional Analysis Across Japan vs Non-Japan Cohorts in the Asia-Pacific Region, Kyoko Oura
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2360 - Amlodipine activates an adaptive endoplasmic reticulum stress response in Huh-7 hepatocellular carcinoma cells, Neslihan Başgöz Karagüç
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 2361 - L-canavanine selectively inhibits hepatocellular carcinoma cell proliferation and induces apoptosis in vitro, Ahmet Ozan Kaleci
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 24
- 2364 - Hepatic Involvement and Drug-Induced Liver Injury in Brucellosis, Oğuzhan Acet
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 2368 - Dynamic Metabolic Reprogramming Drives Adipose Fibrosis in a High-Fat Diet-Induced Obesity in Mice Model, Abhishak GUPTA
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 2369 - AGIUS Score Predicts Re-bleeding Risk after Endoscopic Variceal Ligation in Cirrhotic Patients Introduction, Fei Wang
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 30
- 2374 - Non-Invasive Assessment of Steatosis and Stiffness in MASLD: Links to Body Composition and Dyslipidemia in High-Risk Metabolic Groups, Abdulvahap Hohluoğlu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2375 - Achieving Recompensation with Low-dose Diuretics in HBV-related Cirrhosis: An Expanded Baveno VII Strategy Yields Similar Long-Term Prognosis in A Multicenter Cohort Study, Zhiying He
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 2377 - Efficacy Differences of Interferon Combined with Nucleos(t)ide Analogs in Treating HBeAg-Positive Chronic Hepatitis B Stratified by Baseline Liver Fibrosis Indicators, Yaqin Zhang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2378 - Metabolic Dysfunction-Associated Liver Disease and Lung Injury: A Decade of Progress Toward Mechanistic Integration and Translational Insight, Tong Chen
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 2385 - HECTD3 Mediates PRDX4 Stabilization via K63-Linked Ubiquitination to Ameliorate Hepatic Steatosis, Inflammation, and Fibrosis in MASH, Rui Jin
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2386 - Immunosuppressive Medication Non-adherence in Liver Transplantation Adult Recipients in Vietnam, Anh Nguyen Thi Van
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 2389 - Towards Individualized Interferon Therapy in Hepatitis B: HBsAg Kinetics and Seroclearance upon Baseline HBsAg Levels and Treatment Duration, Qiran Zhang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2390 - Ultrasonographic evaluation of gallbladder motor function in the diagnosis and prognosis of intrahepatic cholestasis of pregnancy, Zhen Tian
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 2394 - Demystifying primary hepatic Langerhans Cell Histiocytosis (LCH)- From pattern recognition to molecular diagnosis, Deepa Janakiraman
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 2395 - Multicohort fecal metagenomes analysis contributes to non-invasive diagnosis for cholangiocarcinoma, Zhigang Ren
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06
- 2398 - Etiology-Specific Patterns of Liver Stiffness and Steatosis Assessed by Transient Elastography in a Tertiary Referral Center in Southern Philippines, Mark Siñagan
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2404 - Development and validation of a dynamic nomogram for predicting significant liver injury in chronic hepatitis B patients with indeterminate phase, Chao Jiang
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2406 - Benefit of treatment expansion: A Comparative Analysis of EASL 2025, AASLD 2025, and APASL 2026 Clinical Practice Guidelines for Management of Chronic Hepatitis B, Jing Chen
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 2410 - Hepatitis B Virus Core Antibody Seroconversion and Risk of Hepatitis B Reactivation after Allogeneic Hematopoietic Stem Cell Transplantation, Ruirui You
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2418 - AFP trajectories in HCC after ablation treatment: a 15 year retrospective study, Maria Fleurdeliz Goco-Siatan
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2422 - Diagnostic Accuracy of Portal System Duplex Sonography Findings Among Filipinos with and Without Liver Cirrhosis; The DupLiCs Study, Yrah Damiene Fernandez
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 2426 - Association of Immune Nutritional Status with Histological Stage and Mortality in Patients with Metabolic Dysfunction-Associated Steatotic Liver Disease: A Population-Based Cohort Study, Yixuan Zhu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2427 - Endoscopic Ultrasound-Guided Portosystemic Pressure Gradient Measurement To Determine Candidacy For Simultaneous Liver-Kidney Transplantation Vs Renal Transplant Alone In End-Stage Renal Disease Patients With Compensated Advanced Chronic Liver Disease or, Arka De
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2432 - Endoscopic Ultrasound Guided Ablative Therapies For Hepatocellular Carcinoma, Arpit Shastri
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 2433 - Diagnostic performance of non-invasive fibrosis scores in treatment-naïve patients with autoimmune hepatitis, Mubin Ozercan
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 04
- 2438 - Long-term Serial Liver Stiffness Monitoring, Histological Fibrosis, and HVPG as Determinants of Disease Progression and Decompensation in MASLD, ANKUR JINDAL
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 2439 - A silent threat: A case of infiltrative cholangiocellular carcinoma developing without detectable mass, Abdullah Tanrikulu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06
- 2440 - Clinical outcomes and treatment response in primary biliary cholangitis with and without autoimmune hepatitis features: a Thai multicenter 10-year cohort, Kedsiree Sanit
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 2441 - MACHINE-LEARNING MODELS IMPROVES MORTALITY AND ANTIMICROBIAL RESISTANCE PREDICTION IN CULTURE-PROVEN SPONTANEOUS BACTERIAL PERITONITIS IN CIRRHOSIS: A MULTICENTER COHORT STUDY, Nipun Verma
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 2443 - Histological severity is not associated with clinical presentation or outcome in children with autoimmune hepatitis, Aditya Soni
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 2450 - A rare case: Sporadic Burkitt lymphoma presenting with high serum-ascite albumin gradient and low ascite glucose, Abdullah Tanrikulu
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 56
- 2454 - Anticancer Effects of Bromelain on HUH7 Hepatocellular Carcinoma Cells through Modulation of the EGFR/PI3K Pathway, ONUR DURNA
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2457 - Impact of the national Hepatitis B vaccination program on HBsAg seroprevalence in pregnant women and comparison with migrant pregnant women, Yelda Ögütmen
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 52
- 2460 - Comparative Efficacy of Lenvatinib Versus Sorafenib in Advanced Hepatocellular Carcinoma: A Meta-Analysis of Meta-Analyses, Akshyata Osti
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2461 - Early GI/Hepatology Subspecialty Access in Cirrhosis and Survival: A Retrospective Cohort Analysis, Mohamed Elsaid
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 2463 - Association of Long-Term Glycemic Control with the Risk of Developing Cirrhosis in Type 2 Diabetes Mellitus: A 5-Year Multi-Center Retrospective Cohort Study of Liver Outcomes and Predictive Factors, Paul Miguel Perez
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2483 - Endoscopic treatment for esophagogastric variceal bleeding in acute-on-chronic liver failure patients, Yanan Sun
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 2484 - CT-based Vasomics model for noninvasive diagnosis of Porto-sinusoidal vascular disease in patients with portal hypertension, Yanna Liu
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 21
- 2488 - SAFETY OF MIDAZOLAM AND NALBUPHINE IN CIRRHOTIC PATIENTS WHO UNDERGO UPPER GASTROINTESTINAL ENDOSCOPY, Lajpat Rai
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2491 - Hepatocellular Carcinoma in Armenia: Liquid Biopsies and Primary Assessment of Molecular Alterations Prevalence, Hasmik Ghazinyan
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2496 - Development and validation of an artificial intelligence driven convolutional neural network for automated stool colour classification to facilitate early diagnosis of biliary atresia, Arjun Maria
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2499 - Wilson disease mutation pattern with genotype-phenotype correlations in paediatric cohort in south India, Sindhuja Thatti Audikesavalu
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 2504 - Long-term outcomes of patients with Hepatitis D recurrence after liver transplantation, Devrim Muge Ozari Gulnar
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 2505 - Lonafernib as finite treatment for chronic hepatitis D: Long-term follow-up data, Cihan Yurdaydin
24 April 2026, Friday | 09:00 - 10:30 | ORAL PRESIDENTIAL SESSION
- 2506 - Evaluation of anti-HCV positivity, HCV RNA testing, and treatment status among individuals presenting to the hospital, Selma Tosun
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2507 - High Treatment Adherence Reduces HCC in Cirrhosis, with Additional Benefit from TAF Running title : Adherence Lowers HCC Risk in Cirrhosis, Jeong-Ju Yoo
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2508 - Midodrine with albumin improves ascites control in Acute-on-chronic liver failure: A Double Bind Randomized trial (MIDAS trial), Anand Kulkarni
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2510 - Efficacy of PegIFN α 24; Add-on Therapy in Treatment-Experienced CHB Patients with Low-Level Viremia: A Large Prospective Cohort Study, Bei Jiang
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2511 - Diagnostic accuracy of blood-based non-invasive tests for screening of varices in children with portal-hypertension: A systematic review and meta-analysis, Kalpana Panda
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 2514 - Long-term Clinical Outcomes of Delta Hepatitis in A Single Center Experience, Furkan Kirsoy
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2518 - Antinuclear Antibodies Positivity Indicates a High-inflammatory Phenotype in Primary Biliary Cholangitis: A Multicenter Retrospective Analysis, shasha li
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06
- 2519 - The long term results of EUS guided coil application for fundal varices, Sercan Kiremitci
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 2525 - Adherence to an Admission Care Bundle and Its Impact on Outcomes in Decompensated Cirrhosis: A Multicenter Analytical Cross-Sectional Study, Federico Peralta
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 2527 - Prognostic Stratification of Non-Ischemic Acute Liver Injury in the Emergency Department: A Retrospective Cohort Study, Pelin Telli
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 42
- 2531 - Evaluation of Leptospirosis Cases in the Şanlıurfa Region, Velat AYTEKİN
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2533 - Cross-study analysis of HBsAg rebound following treatments of elebsiran/BRIL-179 in combination with peginterferon alfa, Jidong Jia
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2534 - ASSESSMENT OF ACCURACY OF PLATELET COUNT/SPLEEN DIAMETER RATIO IN PREDICTING THE PRESENCE OF ESOPHAGEAL VARICES IN FILIPINO PATIENTS WITH CIRRHOSIS AT SLMC-QC, ALYSSA CHAN
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2541 - Alcoholic Liver Transplants Performed Due to Liver Disease: A Single-Center Experience, Hasan Buran
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 2543 - Prevalence and risk factors of esophageal and gastroesophageal varices in myeloproliferative neoplasm patients with portal hypertension in a tertiary government hospital: a 5-year cross-sectional study, Sam Fandood
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2553 - EUS guided liver biopsy for diffuse liver diseases is an emerging alternative to percutaneous liver biopsy, Hakan Şentürk
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 25
- 2554 - A Preclinical study on Protective Effects of Atorvastatin Against Methotrexate-Induced Hepato-Renal Toxicity: Role of Oxidative Stress and Inflammation, Jayadevan K
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2559 - Evaluation of a FIB-4-Based Clinical Pathway for Fibrosis Assessment in Patients with Coronary Heart Disease, Chenlu Yang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 38
- 2560 - Predictive potential of hypermethylation of RASSF1A and CCND2 promoters in hepatitis B virus-induced hepatocellular carcinoma, Raad Rahmat
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2562 - Successful Endoscopic Ultrasound-Guided Ethanol Ablation of a 7-mm Non-Functional Pancreatic Neuroendocrine Tumor in a High-Risk Surgical Candidate, Irshad Batool
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2564 - The relationship between the systemic immune-inflammation index and hepatitis C virus infection: NHANES 2005 to 2012, Yuyu Zeng
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2572 - Short-Course Adjuvant Tislelizumab plus Tyrosine Kinase Inhibitor Following Curative Ablation for Early-Stage Hepatocellular Carcinoma: A Prospective Cohort Study, Fanping Meng
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2574 - Plasma microRNA-based non-invasive stratification of clinically significant and advanced fibrosis in metabolic dysfunction-associated steatotic liver disease among Arab adults, Ammal Metwally
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2576 - Point-of-care HBcrAg testing to identify high viral replication in chronic hepatitis B: a tool for supporting the WHO simplified treatment strategy in resource-limited settings, Takako Inoue
25 April 2026, Saturday | 13:40 - 15:10 | ORAL PRESENTATION 58
- 2577 - Using Rose to Improve the Accuracy of Diagnosis of Biliary Tract Diseases through ERCP guided Biopsy, Yunzhi Shen
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 2579 - YTHDF1high cancer-associated fibroblasts-derived kynurenine promotes tumor progression by supplying an immunosuppressive niche, Liren Zhang
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2580 - PYGL: A novel non-invasive biomarker for diagnostic and prognostic of HEV-ALF patients, Luyu Wang
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2583 - Head-to-Head Comparison Between MRI and A Novel Portable VCTE Device (Liverscan): A Pilot Study, Zhuoru Jiang
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2590 - The Predictive Value of Platelet-Derived Growth Factor for Evaluating Antiviral Therapy Response and Liver Stiffness Trajectory in Chronic Hepatitis B, Fadhyl Zuhry Lubis
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2593 - Spermidine suppresses liver fibrosis by remodeling the communication signal between liver sinusoidal endothelial cells and hepatic stellate cells Running title: Spermidine suppresses liver fibrosis by downregulation of LSEC-derived BGN, Cheng Zeng
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2594 - Risk factors for low-level viremia in Tenofovir Disoproxil Fumarate (TDF)-treated patients with chronic hepatitis B complicated by advanced hepatic fibrosis/compensated liver cirrhosis, Runling Zhang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2596 - Baseline Determinants of Inadequate Ursodeoxycholic Acid Response in Primary Biliary Cholangitis: A POISE-Based Real-World Cohort Study, Phool Chand
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 06

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2600 - Hepatitis B virus recurrence in liver transplant recipients receiving subcutaneous hepatitis B immunoglobulin, Muhsin Murat Muhip HARPUTLUOĞLU
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2601 - Diagnostic Accuracy and Long-Term Prognostic Value of FIB-4 Index and De Ritis Ratio in Chronic Hepatitis C Patients: A Comparative Kaplan-Meier Analysis with MELD 3.0, İLYAS ETHEM ŞENOCAK
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2602 - Effect of Midodrine on Short Term Mortality and Liver Function in Patients with Cirrhosis and Ascites: A Systematic Review and Meta-analysis, GİZEM DAĞCI
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 2604 - Research on artificial liver support system for non-hepatocellular carcinoma patients with severe immune checkpoints related liver injury, Hua Liu
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 2605 - Mobile Ablation for Secondary Hypersplenism in Hepatocellular Carcinoma Patients with Liver Cirrhosis: A Safety and Efficacy Study, Yang Liu
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2606 - A Simple Five-Variable Model Integrating GWAS Variants Predicts Chronic Outcomes in Drug Induced Liver Injury, Rongtao Lai
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 2607 - Inhibition of FKBP10 attenuates hepatic stellate cell activation and liver fibrosis via RAS signaling, Jingyu Zhang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2608 - Optimizing Pegylated Interferon Consolidation Therapy and Predicting Recurrence After Functional Cure in Chronic Hepatitis B: A Study Based on Updated Definitions, Xiaoping Wu
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2609 - Acetylation modification of PKM2 promotes macrophage reprogramming and accelerates the progression of MAFLD, Huiling Cao
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2612 - Accuracy of D-dimer Levels in Predicting Clinical Outcomes of Patients with Decompensated Liver Cirrhosis in a Philippine Tertiary Hospital, SAUL SUAYBAGUIO
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2614 - A Cross-Section Study on the Co-prevalence of MAFLD and HBV Infection Among Adult Residents in Maojian District, Shiyan City., Zhongji Meng
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2617 - Spirulina Prevents Hepatic Steatosis by Promoting Macrophage M2 Polarization via Gut Microbiota-Derived 2-Hydroxy-3-Methylbutyrate, Feihu Bai Bai Feihu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2620 - The Gut Fungus Rhizopus microsporus var. rhizopodiformis Exacerbates Metabolic-associated Fatty Liver Disease by Impairing Intestinal Barrier Integrity, Daya Zhang Zhang Daya
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2623 - Transcriptomic Profiling Identifies Anti-Inflammatory and Anti-Steatotic Programs Mediated by ShenGe Formula in MAFLD, ZHU XIAONING
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2625 - Procedural-Related Bleeding Among Patients with Liver Cirrhosis in a Tertiary Hospital in the Philippines: A Five-Year Review, Jeremie Manarang
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 49
- 2626 - Clinical characteristics of colorectal polyps in patients with non-alcoholic fatty liver disease in high altitude areas, Chunyan Wang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2627 - ZIP1⁺ CAFs Shape the Immunosuppressive Microenvironment to Drive Hepatocellular Carcinoma Progression, Wang Hao
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2630 - Single-cell transcriptomes reveal the immune characteristics of patients with chronic hepatitis B at different stages of disease progression, Liu Yang
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2634 - A Novel Murine Model of MetALD Recapitulates the Synergistic and Aggressive Phenotype of Combined Metabolic Dysfunction and Alcohol Consumption, Yingying Nie
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2635 - Endothelial RGS16 Attenuates Hepatic Fibrosis by Restricting Pathological, Yuzhu Song
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2639 - Machine learning(ML) based models predict beta-blocker response using non-invasive tests(NITs) in patients with acute variceal bleed -BE-RESPONSE STUDY, Harsh Vardhan Tevethia
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2640 - Necrolytic migratory erythema without glucagonoma: An unusual association with chronic pancreatitis and hepatic dysfunction, Mehmet Demir
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2641 - Prevalence of Metabolic-Associated Fatty Liver Disease in Patients with Rheumatoid Arthritis: A Cross-Sectional Study, Eman Fares
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2643 - IL-24 attenuates hepatocyte apoptosis and ameliorates metabolic-associated steatohepatitis by activating the autophagy-lysosome pathway, Jiawei Cui
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 39
- 2644 - FKBP10⁺ CAFs Shape the Immunosuppressive Microenvironment to Drive Hepatocellular Carcinoma Progression, Liu Jiangxi
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 17
- 2647 - Quercetin ameliorates MASLD progression through the inhibition of the hexosamine biosynthesis pathway-mediated TAB2 protein O-GlcNAcylation, Yang Yang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2649 - Microsomal Glutathione S-Transferase 2 Links Copper Toxicity to Hepatic Inflammation via Leukotriene C4 in Wilson's Disease, Jie Bai
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 2654 - Comparison of the diagnostic accuracy of magnetic resonance elastography, FibroScan, and serum fibrosis models for detecting liver fibrosis and cirrhosis in chronic liver diseases: a multicohort study across all aetiologies, Qiang Li
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2660 - The Silent Summer Threat: Significant Seasonal Worsening of Electrolyte Imbalance in Cirrhosis Patients in a Tropical Climate Calls for Dynamic Diuretic Dosing, Md. Shakhawat Hossain
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 2663 - High Prevalence of MASLD and MASH in Chronic Hepatitis B Patients: A Cross-Sectional Study, Müge Toygar Deniz
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2664 - Integrating genetic omics and functional omics to identify clinically actionable gut microbiota–host interface targets in MASLD, Jiyuan Zhou
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2666 - Outcomes of cholangiocarcinoma (ICC) or combined hepatocellular-cholangiocarcinoma after liver transplantation, Dali Zhang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2670 - Endoscopic Ultrasound-Guided Partial Splenic Embolization in Hypersplenism: A Novel Approach Validated in a pilot study, Changqing Guo
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2671 - Mechanistic Study of Resmetirom in Treating MAFLD Mouse Model: Gut Microbiota Remodeling and Metabolic Regulation, hang chen
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2672 - Predictors of Post-TIPS Persistent Ascites, JAYASHREE BISWAS
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2673 - Parallel Comparison of Two HBV pg RNA Detection Assays, Yuyuan Jia
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 45
- 2678 - HBV recurrence in patients with hepatocellular carcinoma and cholangiocarcinoma following liver transplantation, Xi He
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2679 - Outcomes of cholangiocarcinoma (ICC) or combined hepatocellular-cholangiocarcinoma after liver transplantation, Dali Zhang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2681 - Characteristics of Autoimmune Hepatitis in elderly patients, Lili zhao
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 2690 - TACE plus Lenvatinib and Envafolelimab for Conversion Therapy in Unresectable HCC: A Prospective, Phase II Study, Yuhao Su
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2691 - Splenic Stiffness Measurement to PREDict Decompensation in Patients with Compensated Advanced Chronic Liver Disease in India (SPRED-c-ACLD study), Sayan Malakar
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 2693 - Muscle Matters: Impact of Sarcopenia on Mortality and Clinical Outcomes in Pediatric Liver Transplantation, Jyoti Bhutani
25 April 2026, Saturday | 10:50 - 12:10 | ORAL PRESENTATION 57
- 2695 - Candidemia in Liver Transplant Recipients: A Ten-Year Retrospective Study, Adem Kose
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 2699 - RAPID Procedure Enables Safe Use of Small Left Lobe Grafts: A Two-Center Experience, emre aray
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 2700 - Does Primary Biliary Cholangitis and Autoimmune Hepatitis Increase the Risk of Precancerous Colon Polyps?, Ayse Sena Oguz
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 2706 - A Novel Non-invasive Model to Identify High Risk Varices in Patients with HBV-related Cirrhosis, Haiyu Wang
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2711 - Related Factors for Low-Level Viremia and the Comparative Efficacy of Management Strategies in Treatment-Naïve Chronic Hepatitis B Patients Receiving Entecavir or Tenofovir Amibufenamide: A Real-World Study, Xiucheng Pan
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2714 - Exposure to Legacy and Replacement PFAS Is Associated with Metabolic Dysfunction-Associated Steatotic Liver Disease in Women, Guanjing Lang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2729 - Lactate triggers HBV-Specific CD8+ T cell exhaustion through mitophagy suppression mediated mitochondrial dysfunction, Yuhao Wang
23 April 2026, Thursday | 09:00 - 10:30 | ORAL PRESENTATION 10
- 2731 - Tbx1 alleviated hepatic encephalopathy by promoting meningeal lymphangiogenesis and drainage of senescent astrocytes via a CCL21-dependent manner, Chihao Zhang
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2733 - Joint Association of C-Reactive Protein and the Triglyceride Glucose-Chinese Visceral Adiposity Index with Incident Chronic Liver Disease: A National Cohort Study, Runci Jiang
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2736 - Thalidomide reduces transfusion requirements due to gastrointestinal vascular malformations in patients with liver cirrhosis, Manu Rajeev
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 43
- 2739 - D-TACE Combined with HAIC Versus D-TACE in BCLC Stage C HCC: A Randomized Controlled Trial, Xuhua Duan
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2742 - PREDICTION OF NOSOCOMIAL INFECTION DEVELOPMENT REMAINS SUBOPTIMAL DESPITE USING MACHINE LEARNING TECHNIQUES IN A PROSPECTIVE GLOBAL COHORT OF HOSPITALIZED CIRRHOSIS PATIENTS, Jasmohan Bajaj
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 2748 - A Retrospective Cohort Study on the Adherence to American Association for the study of Liver Diseases (AASLD) Quality Measures in Cirrhosis for Variceal Bleeding and its Association with Clinical Outcomes, Mario Rafael Estella
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2753 - Clinical and biochemical predictors of Hepatocellular Carcinoma: A Five-Year Cohort Study from a Tertiary Care Center in Pakistan, Gulzar khan
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2756 - Locoregional Therapy Combined with Continuing or Switching Systemic Therapy for Intrahepatic Oligoprogression in Hepatocellular Carcinoma: A Multicenter Retrospective Study, Hongli Yu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2759 - miR-945-KB downregulates miRNA-363-3p and targets SERCA2b to alleviate hepatic endoplasmic reticulum stress and steatosis in MAFLD, da wang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2760 - Real-world Biochemical Responses to First-line Azathioprine versus Mycophenolate and Upon Switching from Azathioprine to Mycophenolate in Autoimmune Hepatitis Patients, Astrid Amador
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 23
- 2762 - The Effects of Nomenclature Change on the Epidemiology of Fatty/Steatotic Liver Disease, Danielle Lucero
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2765 - Disability Adapted Digital Therapeutics as a Precision Strategy for MASLD Risk Modulation: Longitudinal Neuromuscular in Lower Limb Amputees, Muh syaiful akbar
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2773 - Mechanistic Role of MFN2-FSP27 Mediated Lipid Droplet-Mitochondria Interactions in Metabolic Dysfunction-associated Steatohepatitis, QIQANQIAN ZHENG
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2774 - Adipose-derived FABP5 drives myeloid bias in hematopoietic stem cells and promotes tumor progression., Wanyue Cao
23 April 2026, Thursday | 18:30 - 20:00 | ORAL PRESENTATION 15
- 2779 - Re-evaluation of Liver Biopsy Specimens Performed for Presumed Chronic Hepatitis B and Investigation of the Prevalence of MASLD, Ammar ALRAMADAN
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 62
- 2781 - Dual noninvasive prediction of esophageal varices in cirrhosis using transient elastography and echocardiographic parameters: an interim machine learning analysis, EINA MARIE LI
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2784 - The Effect of HALP Score on Predicting Post-Transplant Outcomes in Patients with Hepatocellular Carcinoma, Fuat Aksoy
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2785 - Metabolic Dysfunction Increases the Risk of Liver-related Events in Virologically Suppressed HBV Related Compensated Cirrhosis: Refining Prognostication with the Baveno VI-SSM Model, Huan Cheng Cheng
24 April 2026, Friday | 13:40 - 15:10 | APASL - IASL JOINT MEETING
- 2789 - Comparison of the Safety and Efficacy of Tailored versus Fixed-Dose Albumin in Cirrhosis with Sepsis-Associated Acute Kidney Injury: A Randomised Controlled Trial, SHREYAS SARVESH
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 2793 - 4-1BB Costimulation Restore Tfh1 Function to Augment HBV-Specific Humoral Immunity in Chronic Infection, Yanchen Ma
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 2796 - Interferon- γ programs HBsAg-specific humoral immunity through the monocyte-IL6-Tfh cell axis to facilitate functional cure of hepatitis B, Shihong Zhong
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2799 - Cathepsin K Attenuates Liver Fibrosis by Suppressing TGF- β /Smad Signaling via TLR-1/2 Degradation, Zhandong Lin
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2809 - Long-Term Survival in De Novo Liver-Metastatic Colorectal Cancer: A Descriptive Cohort Study, Sati Coşkun Yazgan
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 36
- 2810 - Sodium Glucose Co-Transporter 2 Inhibitors Use in Diabetic Patients with Cirrhosis Improves Liver-related Outcomes and Survival, Sajid Jalil
25 April 2026, Saturday | 09:00 - 10:30 | ORAL PRESENTATION 51
- 2814 - Etiological distribution, clinical phenotypes and six-month outcomes of drug-induced liver injury: a single-center cohort study, Duygu Birinci
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 07
- 2815 - Associations Between Dietary recommendations/ diet quality and Steatotic Liver Disease Prevalence and Severity in U.S. Adults 2017–2023, Nicholas Dunn
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 2818 - Updated results of the observational study to assess virological effectiveness, safety, and tolerability of NVR/RTV+SOF combination in HCV infected people living with HIV, Emilia Krasavina
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 2832 - Immune-Excluded CD4⁺ and CD8⁺; T-Cell Depletion Predicts Early Recurrence in Hepatocellular Carcinoma with Microvascular Invasion, Rino Alvani Gani
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 47
- 2833 - Hyperinsulinemia Establishes a Pathogenic Feedback Loop between Pyroptotic Hepatocytes and MDSCs in MAFLD, Huilian Shi
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 2834 - Epidemiologic and Clinical Trends in Hepatocellular Carcinoma: A Glimpse Through the Lens of Systemic Therapy Availability, Ma. Angelica Goldamier Cannu
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 2839 - CAN EARLY CHANGES IN ALPHA-FETOPROTEIN PREDICT RADIOLOGIC RESPONSE AND OVERALL SURVIVAL IN IMMUNE CHECKPOINT INHIBITOR-BASED THERAPY OF HEPATOCELLULAR CARCINOMA?, Jann Christian Solis
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 2841 - PLPP2 drives liver repair and regeneration via remodeling phosphatidylethanolamine metabolism after acute liver injury, Fan Li
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 2844 - AARS1 promotes tumor progression and immune evasion via ATF6 lactylation-mediated tryptophan metabolism in hepatocellular carcinoma, Yiming Wang
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 2848 - Physician–Patient Dual-Track Follow-Up Care Bundle in Hepatology: A Multidisciplinary Practice Model Integrating Clinical Care and Research Coordination, Hong-Li Liu
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 41
- 2851 - From Synthetic to Clinical: The Effect of Domain Shift on Decision Support Systems, Sümeyye AĞIR
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2859 - Profile of Hepatocellular Carcinoma in India: A Five-Year Prospective Study, Dr. ANAND V KULKARNI
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 2860 - Advances in Artificial Intelligence for Liver Disease Research: Algorithmic Applications and Technical Challenges, YAO YUNLONG
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2871 - Genetic Variants in Bile Transporter Genes in Prolonged Cholestatic Jaundice Associated with HAV and Drug-Induced Liver Injury, KRISHNAKANTH SARDA
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 65
- 2874 - Dynamic evolution of the gut microbiome predicts the therapeutic response in liver cancer: A large-scale longitudinal study with a cross-cohort meta-analysis, Jie Han
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61

ABSTRACTS' LIST

ORAL ABSTRACTS

- 2876 - Immune Checkpoint Inhibitor-Induced Hepatitis in HCC: Poor Response to Immunosuppression., DEEPAK JHA
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 2877 - The Effect of Portal Vein Tumor Trombosis on Survival in Patients with Hepatocellular Carcinoma Treated with Different Therapies, Hikmet Akkız
25 April 2026, Saturday | 15:30 - 17:00 | ORAL PRESENTATION 61
- 2878 - From Stool to Personalized Screening Approach: A Comprehensive Meta-analysis of Metagenomic Gut Microbiota Assessment in Patient with MAFLD and Control Cohort, Krisanto Tanjaya
24 April 2026, Friday | 18:30 - 20:00 | ORAL PRESENTATION 40
- 2879 - AARC score predicts survival in patients with Acute on Chronic Liver Failure due to Severe Alcoholic Hepatitis undergoing Plasma Exchange, Jaifrin Daniel
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 2881 - Impact of an AI-Supported Triage System on the Diagnostic Workflow of Focal Pancreatic Lesions: A Real-World Clinical Utility Analysis, Bo WANG
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 22
- 2886 - Comparative Analysis of Epidemiological Research Output: Metabolic Dysfunction-Associated Steatotic Liver Disease vs. Alcohol-Associated Liver Disease, Pavithra Senadheera
25 April 2026, Saturday | 07:30 - 09:00 | ORAL PRESENTATION 44
- 2888 - Evaluation of selected Plasma Long Non-Coding RNAs as predictive Biomarkers in HBV-Related Hepatocellular Carcinoma, Munira Jahan Jahan
24 April 2026, Friday | 07:30 - 09:00 | ORAL PRESENTATION 27
- 2894 - Splenic probe (100 KPa) is superior to liver probe (75 KPa) in assessment of liver stiffness and predicting outcomes in Acute on chronic liver failure patients, Sudhir Verma
23 April 2026, Thursday | 07:30 - 09:00 | ORAL PRESENTATION 02
- 2897 - Integrative Metabolomic and Cytokine Profiling Reveals a "Metabolic-Inflammatory" Signature in Chronic Hepatitis B Combined with Metabolic Dysfunction-Associated Fatty Liver Disease, Yichen Peng
25 April 2026, Saturday | 17:10 - 18:30 | ORAL PRESENTATION 64
- 2904 - Clinical Analysis of Liver Transplantation in Patients With Severe Liver Disease, Jinzhen Cai
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33
- 2905 - A clinical study on the reduction of donor lymphocyte chimerism rate in recipient tissues after liver transplantation by extracorporeal perfusion of anti-thymocyte globulin via portal vein, Jinzhen Cai
24 April 2026, Friday | 10:50 - 12:10 | ORAL PRESENTATION 33

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1002 - Assessing the Utility of Serum Kallistatin in the Diagnosis of Liver Cirrhosis: A Meta-analysis, Dr Rukesh Yadav
- 1003 - Is drug- induced autoimmune hepatitis being underdiagnosed?, Thanh Quynh NGAN Le
- 1004 - An acute flare of chronic hepatitis B in a patient with eosinophilic ascites and diabetic ketoacidosis represents a clinical challenge, Ngan Le Thanh Quynh
- 1005 - Drug- induced autoimmune hepatitis, three case reports., Ngan Le Thanh Quynh
- 1008 - Efficacy and Safety of Terlipressin versus Octreotide for esophageal variceal bleeding: A retrospective study at a tertiary hospital in the UAE, Thaer Swaid
- 1012 - Thromboangiitis obliterans in a Non-Smoker Complicated by Budd-Chiari Syndrome: A Rare Case of Visceral Thrombosis, Ziad W. Elmezayen
- 1014 - Validation of the CLIF-SIG score in patients with HBV-related acutely decompensated cirrhosis, Jiyang Chen
- 1015 - Gut Microbial Succession and Escalating Antibiotic Resistance from Chronic Hepatitis B to Acute-on-Chronic Liver Failure: A Metagenomic Study, Jiyang Chen
- 1016 - Single-cell analysis identifies RETN+ monocyte-derived resistin as a therapeutic target in hepatitis B virus-related acute-on-chronic liver failure, Xianbin Xu
- 1024 - Comparison of effectiveness of mycophenolate mofetil associated with standard dosage or reduced-dose tacrolimus for liver transplantation immunosuppression, Ulil Albab Habibah
- 1026 - EXPLORING LABORATORY VARIATIONS IN CIRRHOSIS ETIOLOGIES: A COMPARATIVE ANALYSIS OF CBC AND LIVER SYNTHETIC FUNCTION BETWEEN PATIENTS WITH ALCOHOLIC LIVER DISEASE AND OTHER ETIOLOGIES, Lilit Harutyunyan
- 1027 - Long-term follow-up of HCV patients who treated with DAA [Direct-Acting Antivirals], Eliza Vashakidze
- 1028 - Chronic viral hepatitis [HCV, HBV] course and outcome in patients with severe COVID 19], Eliza Vashakidze
- 1030 - A case of drug-induced liver injury caused by salt-fleshed psoralea corylifolia, Chaojian He
- 1031 - Idiopathic Inflammatory Myopathy Presenting as Hepatic Injury: A Case Report, Chaojian He
- 1032 - Drug-Induced Liver Injury from Shenbao Tablets in an Elderly Patient: A Case Report, Chaojian He
- 1033 - A Rare Case of Peptic Ulcer Perforation Associated with Lenvatinib in Hepatocellular Carcinoma, Zyrhah Lou Samar
- 1036 - Two cases of drug-induced liver damage in the elderly caused by Tusanqi (Gynura japonica), Chaojian He
- 1038 - Comparative Analysis of Epidemiological Characteristics of Hepatitis A and Hepatitis E in Beijing from 2015 to 2024, Chao WANG
- 1040 - Small Intestinal Bacterial Overgrowth: A Missing Link in Gut–Liver Axis Dysregulation of MASLD, Ziteng Wang
- 1041 - Controlled Attenuation Parameter Factors and Steatosis Grading in Metabolic Dysfunction-associated Steatotic Liver Disease, Ningrui Su
- 1043 - Non-invasive detection of occult yet significant liver pathology in ALT-normal chronic hepatitis B: a multicenter study, Xinjie Li
- 1044 - Multifactorial Anemia Unveiling Gastric Antral Vascular Ectasia in a Stage IV Breast Cancer Survivor: Endoscopic Resolution with Argon Plasma Coagulation, John Derek Clutario
- 1047 - Comparative Analysis of Epidemiological Characteristics and Co-infection of Hepatitis B and Hepatitis C in Beijing from 2010 to 2024, Gang Li
- 1048 - Analysis of the Epidemiological Characteristics of Hepatitis B in Beijing from 2008 to 2024, Quanyi Wang
- 1049 - Rifaximin to reduce the risk of overt hepatic encephalopathy in patients undergoing TIPS - real world experience in a diverse population, Charles Gallaher
- 1052 - Pan-cancer analysis identifies hemopexin as a tumor suppressor in HCC via TNF-alpha-mediated mitochondrial apoptosis, Liying Ren
- 1053 - Development and validation of the FAAP model for prognostic stratification in HCC patients treated with TACE, sintilimab plus bevacizumab: a multicenter study, Liying Ren
- 1057 - Serum N-glycomics for non-invasive detection of significant liver pathology across clinical phases of treatment-naïve chronic hepatitis B, Xinjie Li

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1058 - Serum N-glycomics for non-invasive detection of significant liver pathology across clinical phases of treatment-naïve chronic hepatitis B, **Xinjie Li**
- 1059 - The predictive value of different frailty assessment tools for the prognosis of hospitalized patients with liver cirrhosis, **huiling zhu**
- 1060 - Transitional Hepatocytes and Mortality-Associated Gene Programs Drive NASH-Associated Liver Cancer Revealed by Single-Cell Transcriptomics, **Firdian Makrufardi**
- 1061 - Integrative AI-Based Multi-Omics Approach to Uncover Endothelial Diversity and Predict Cholestatic Liver Disease Across Vulnerable Populations, **Firdian Makrufardi**
- 1062 - GALNT7-Mediated Glycosylation of TAZ at Serine 307 Promotes Gallbladder Cancer Progression via Stabilization and Feed-Forward Activation, **Peng Qiu**
- 1063 - Paraspinal Vein Shunt: A Potential Key Factor Leading to Hepatic Myelopathy, **Yuhong Suo**
- 1064 - Analysis of clinical characteristics and risk factors of liver injury in treatment-naïve patients with lung cancer, **Yaqian Mao**
- 1066 - Efficacy of laparoscopic-assisted Microwave Ablation for treating giant hepatic hemangioma: a retrospective controlled study, **Changle Wu**
- 1068 - Gut Microbiota-Derived 3-Methylxanthine Regulating T-Cell Immune Response to Inhibit Viral Replication and Liver Injury in Chronic Hepatitis B comorbid with Metabolic Dysfunction-associated Fatty Liver Disease, **Baoju Wang**
- 1070 - Analysis of Epidemiological Characteristics and Risk Factors of Liver Function Impairment Among Middle-Aged and Older Community Residents in Beijing, **Quanyi Wang**
- 1074 - Mediating role of BMI in alcohol-linked liver enzyme elevation among adults at a tertiary care hospital in South India, **Arivarasan Barathi**
- 1077 - Performance of BAVENO VI and BAVENO VII Criteria for Excluding High-Risk Esophageal Varices in Compensated Cirrhosis with Hepatocellular Carcinoma, **Benjaphol Panyapornsakul**
- 1078 - "When Treatment Triggers Disease: Hepatic Abscess as a Paradoxical Reaction to Antitubercular Therapy", **REBEKA SULTANA MOUSUMI**
- 1081 - Risk factors and outcomes of carbapenem-resistant enterobacteriaceae infection in liver transplant patients: a systematic review and meta-analysis, **Kapil Khanal**
- 1082 - Prediction of Hepatic Functional Reserve Using a Novel "Severity Index" on Hepatobiliary Phase Gadoteric Acid-Enhanced MRI, **Fatih Işık**
- 1083 - Functional Liver Imaging Score on Gadoteric Acid-Enhanced MRI: Correlation with MELD-Na, ALBI, FIB-4 and Clinical Status in Chronic Liver Disease, **Fatih Işık**
- 1084 - Long-Term Virological Response Dynamics and Clinical Outcomes in HBV-Related Cirrhosis: A Real-World Cohort Study, **Yuwei Wang**
- 1086 - COVID-19 Pandemic's Impact on the Global Disease Burden of HBV-related Hepatocellular Carcinoma in the Elderly, **Yuwei Wang**
- 1087 - Bibliometric Analysis and Research Trends of Specialty Theses on Cirrhosis in Turkey, **AHMET UYANIKOGLU**
- 1088 - The cGAS-STING-IFITM3 Axis Drives Monocyte Phenotypic Shift and Immune Dysregulation in Acute-on-Chronic Liver Failure, **JUNYI WANG**
- 1089 - CEP290: a primary cilium-related gene as the positive feedback regulator of Nrf2 that modulates liver cancer cells ferroptosis, **Ruilian Ma**
- 1090 - Hermansky-Pudlak syndrome (HPS), **Vedat Goral**
- 1092 - Triple A (Allgrove) Syndrome, **Vedat Goral**
- 1093 - Towards HCV Elimination: Time for Clinical and Laboratory Collaboration, **Burcu Çalışkan Demirkıran**
- 1094 - Oxidative Stress-Immunotherapy Gene Signatures Define Prognosis and Immune Subtypes in Hepatocellular Carcinoma, **Yuxin Liang**
- 1095 - Efficacy and safety of postoperative adjuvant HAIC combining lenvatinib with or without PD-1 inhibitors in solitary large HCC: A multicenter retrospective study, **Yuxin Liang**
- 1097 - The Roadtrip : PEERS AND MEDICAL STAFF IS THE BEST MATCH TO TEST AND TREAT DRUG USERS FOR HEPATITIS C, **juliette PONT**
- 1100 - MRI differential diagnosis of hepatic metastasis of choroidal melanoma in the patient with hepatitis B cirrhosis, **Chenxi Liu**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1105 - Comparative Efficacy of NSAIDs and Opiates in Alleviating Pain Associated with Mild to Moderate Pancreatitis: A Randomized Controlled Trial, **Asif Khan**
- 1106 - BEDSIDE NUTRITIONAL ASSESSMENT IN PATIENTS WITH LIVER CIRRHOSIS USING MINI NUTRITIONAL ASSESSEMENT PROFORMA, **Asif Khan**
- 1107 - Serum fibroblast growth factor 21 as a novel biomarker of cachexia in chronic liver disease, **Takatsugu Tanaka**
- 1108 - Comparison of Liver Biopsy with Shear-Wave Elastography and Other Non-Invasive Fibrosis Markers in Chronic Hepatitis B, **Fatih Albayrak**
- 1109 - Stereotactic body radiation therapy as an add-on to targeted agents in patients with locally advanced hepatocellular carcinoma, **Mohamed Hamouda Elkasaby**
- 1111 - Effectiveness and safety of Fibrate Therapy in the treatment of adults with Primary Sclerosing Cholangitis: A Systematic Review and Meta-Analysis, **Mark Angelo Pado**
- 1114 - Detection of HBV and HCV seroprevalence using rapid point-of-care tests among earthquake survivors in Southeastern Türkiye, **Muhammed Bekçi**
- 1115 - Effectiveness and Follow-up Challenges of Sofosbuvir/Velpatasvir in HCV/HIV Co-infected Patients: A Real-world Experience from a Chinese Cohort, **Wei Lv**
- 1119 - Metabolic Associated Fatty Liver Disease in Obese and At-Risk Children and Adolescents in Türkiye: A Meta-Analysis of Prevalence, **Eda Kaya**
- 1120 - Research Trends of Targeted Drugs for Nonalcoholic Fatty Liver Disease: A Bibliometric Analysis (2004–2024), **Xingru Wang**
- 1124 - Single-arm meta-analysis and systematic review on clinical cure of chronic hepatitis B after hematopoietic stem cell transplantation: immunoregulatory mechanisms and clinical translational insights, **He Ma**
- 1128 - Zinc-alpha 2-glycoprotein (ZAG) emerges as a diagnostic biomarker for Hepatitis B virus-related acute-on-chronic liver failure (HBV-ACLF), **Daxian Wu**
- 1129 - Efficacy of albumin infusion for hypoalbuminemia in post-operative period in living donor liver transplantation – An open label randomized controlled trial, **Vipul Gautam**
- 1131 - Dietary Total Antioxidant Capacity and Metabolic Dysfunction-Associated Steatotic Liver Disease: a cross-sectional study, **Yani Zhou**
- 1135 - Impact of Low-Dose Rifaximin on Gut Antibiotic Resistance Genes in Patients with Decompensated Cirrhosis, **Zhiyuan Hao**
- 1136 - Catastrophic unmasking: Fatal tuberculosis-associated Immune Reconstitution Inflammatory Syndrome presenting as acute liver failure in pregnancy, **Carmela Bianca Villacete**
- 1138 - Peripheral Single-Cell Immune Profiling of HBsAg Loss in HBV-Related Hepatocellular Carcinoma Receiving Anti-PD-1 Therapy, **Pengyuan Kang**
- 1142 - From Naïve to Non-Responders under DAA Pressure: Unveiling NS5A and NS5B Resistance Associated Substitutions in HCV Genotype 3a from Bangladesh, **Mahmuda jahan Jahan**
- 1143 - Association between AST/ALT ratio and Hemodynamic Parameters of Carotid Arteries in Patients with Primary Aldosteronism: A Cross-Sectional Study, **Mengbo Wu**
- 1145 - Targeting Cancer-Associated Fibroblast Subpopulations and Metabolic Pathways to Enhance Immunotherapy in Hepatocellular Carcinoma, **Xin Song**
- 1146 - Treatment with direct-acting antivirals in HCV-infected patients after liver transplantation, **Dorota Zarębska-Michaluk**
- 1148 - Deciphering the Mechanism of Aristolochic Acid I-Driven Hepatocellular Carcinoma through Integrated Network Toxicology and Bioinformatics, **Yuling Liang**
- 1150 - Evaluation of high-sensitivity HBcrAg and HBsAg assays as biomarkers for occult HBV infection and hepatocellular carcinoma risk, **Yi-Chung Hsieh**
- 1151 - HDV Screening Practices in Chronic Hepatitis B: Real world Data from a Decision Support App in the Context of Global Guidance, **Grace Wong**
- 1152 - Clinical Efficacy of Robot-Assisted Biliary-Enteric Reconstruction in Radical Resection of Hilar Cholangiocarcinoma: Single-Center Practical Experience, **Yang Wang**
- 1154 - Clinical and epidemiological profile of Hepatitis A outbreak among medical students at Shaheed Ziaur Rahman Medical College hostel: cross-sectional study, **Abu Saleh Md Sadequul ISLAM**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1155 - MASLD AND GLYCEMIC IMPROVEMENT AFTER SUSTAINED VIROLOGIC RESPONSE IN TYPE 2 DIABETES PATIENTS WITH CHRONIC HEPATITIS C: A THREE-YEAR FOLLOW-UP STUDY, Ching-Chu Lo
- 1160 - Study on the Mechanism of Samhd1 Mediated NEMO Polyubiquitination in Liver Ischemia-Reperfusion Injury, Xianzhang Luo Luo
- 1161 - Recurrence and Post-Liver Transplant Outcomes in Hepatocellular Carcinoma: Experience from the Main Center of Iran, Mohamad Jamalnia
- 1166 - Endoplasmic Reticulum Stress-Mediated PPAR α -DDX3X Interaction Modulates Con A-Induced Liver Injury in Mice, Feng Ren
- 1169 - Associations between glycaemic indices and non-invasive markers of hepatic steatosis and steatohepatitis in Chinese adults with prediabetes, Victoria To
- 1171 - Optimizing Renal and Urological Outcomes in Liver Transplant Recipients: A Urologist-Driven Peri-Transplant Care Pathway at a Tertiary Transplant Center, Ojas Vijayanand Potdar
- 1175 - First Clinical Evidence of Temperature-sensitive Liquid-Embolic Agent TACE Remodeling Immune Microenvironment in Unresectable HCC: Multicenter Propensity-Weighted Cohorts Study, Qingyun Xie
- 1180 - Study of Serum Trace Elements (Zn, Cu, Mg) in Hepatic Encephalopathy, MANISH KUMAR
- 1181 - Familial Mediterranean Fever as a cause of hepatic amyloidosis and decompensated liver cirrhosis, Edmond Baghdasaryan
- 1182 - The NF- κ B-TNFAIP3 axis attenuates MAFLD via activation of hepatocyte autophagy, Guixin Li
- 1183 - Study on the Mechanism of FBXW5 Inducing MKRN1 Ubiquitination and Degradation in Reducing Liver Ischemia-Reperfusion Injury, Zhenghua Luo
- 1184 - Study on the Mechanism of TRIM69 Binding to CRYAB Promoting TRAF6 Autoubiquitination and Aggravating Liver Ischemia Reperfusion Injury, Lei Dou
- 1186 - Timing Transplantation versus Medical Treatment in Acute Liver Failure and Associated Outcomes: Insights from an Indian High-Volume Transplant Centre, Vipul Gautam
- 1187 - Optimized Outcomes Using the Medial Reduction Technique for the Left Lateral Segment in Infants Undergoing Living Donor Liver Transplantation, Vipul Gautam
- 1188 - Role and Mechanism of membrane CD100 in Regulating the Activation and Differentiation of HBV-Specific CD8 T Cell, Jia Liu
- 1191 - Identification of Metabolic Dysfunction-Associated Steatotic Liver Disease (MASLD) and Risk Factors in People Living With HIV, Sila Akhan
- 1192 - Incidental Diagnosis of Rotor Syndrome in an Adolescent Presenting with Osteoporosis, Yusuf Bünyamin Ketenci
- 1193 - Magnesium Isoglycyrrhizinate for Preventing Novel Antitumor Drug-Induced Liver Injury in Patients with Hematologic Malignancies: A Multicenter, Retrospective Study, Chen Liang
- 1194 - The Silent Summer Threat: Significant Seasonal Worsening of Electrolyte Imbalance in Cirrhosis Patients in a Tropical Climate Calls for Dynamic Diuretic Dosing, Md Shakhawat Hossain
- 1198 - Multidimensional Burden of Hepatic Encephalopathy and Overt Hepatic Encephalopathy among U.S. Patients with Cirrhosis, Arun B Jesudian
- 1199 - Efficacy of Endoscopic band ligation versus argon plasma coagulation in Gastric Antral Vascular Ectasia management, Hishan Abdelaal
- 1200 - CAD-LT Score and Outcomes after Liver Transplantation: Insights from a Middle Eastern Cohort, Bandar Aljudaibi
- 1202 - A 10-year Cohort Study of The Overall Survival and Treatment Outcomes in Patients with Primary Biliary Cholangitis A Single-Centered Retrospective Cohort Study, Chitchai Rattananukrom
- 1203 - PIVKA-II Monitoring to Predict Response of The First Transarterial Chemoembolization (TACE) in Intermediate Stage of Hepatocellular Carcinoma, Chitchai Rattananukrom
- 1205 - Real-World Experience of 25 Years of Lamivudine Therapy: Highlighting Favorable Long-Term Outcomes in Chronic Hepatitis B, Jaejun Lee
- 1206 - Neurophysiological, neuropsychological characteristics and natural history of liver cirrhotics with minimal and grade 1 hepatic encephalopathy, Lalit Chandra Kummetha
- 1207 - Comparison of inflammatory markers, magnetic resonance spectroscopy findings and outcomes in cirrhotic patients with minimal and grade 1 hepatic encephalopathy: a prospective observational study, Shrey Bhatt
- 1208 - Insights from the ELPA European Liver Screening Week 2025, Milan Mishkovikj

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1210 - Prevotella-Derived Butyrate Inhibits CD8⁺ T Cell Glycolysis via AKT/mTOR signal to Alleviate MASH, Fengna Yan
- 1211 - Differential Impact of Antiviral Therapy on Bimodal Recurrence Patterns in HBV versus HCV-related Hepatocellular Carcinoma Following Radiofrequency Ablation, Makoto Moriyama
- 1213 - Treatment Efficiency of Bulevirtide in Chronic Hepatitis Delta: Number Needed to Treat Analysis From the MYR301 Phase 3 Trial, Celine Der-Torossian
- 1216 - Microbial hippurate promotes GLRA2 activation, immune exhaustion and development of shock in ACLF patients, GAURAV TRIPATHI
- 1217 - Integrated Plasma Multi-Omics Identifies Fungal Dysbiosis and Lipid Remodelling as Major Determinants of Sepsis and Shock in Alcohol-Related Cirrhosis, GAURAV TRIPATHI
- 1218 - Development and Validation of a Nomogram to Predict Surgical Resection After Conversion Therapy in Initially Unresectable Hepatocellular Carcinoma, Yuhao Su
- 1220 - Efficacy and Safety of Sofosbuvir/Velpatasvir/Voxilaprevir for the Retreatment of Chronic Hepatitis C Patients Relapsed after DAA Treatment, Jun Chen
- 1221 - Neoadjuvant radiotherapy for resectable hepatocellular carcinoma with vascular invasion: A systematic review and meta-analysis, Yuhao Su
- 1222 - Efficacy and Safety of Radiotherapy Combined with PD-1 Inhibitors and Targeted Therapy for Unresectable Hepatocellular Carcinoma: A Real-World Multicenter Study, Weixuan Xu
- 1223 - Prevalence and topographic extent of gastric intestinal metaplasia in cirrhosis versus dyspeptic controls: Implications for premalignant risk, Aizirek Abdikayrova
- 1224 - Clinical significance of Helicobacter pylori infection in cirrhotic patients: Implications for the development of premalignant gastric lesions, Aizirek Abdikayrova
- 1227 - Comparative analysis of serum amino acid levels and their potential as biomarkers in liver cirrhosis: A Systematic Review and Meta-Analysis, Ying Xiao
- 1228 - Role of Angiotensin Receptor Blockers in the Treatment of Hepatic Fibrosis in Patients with Metabolic Dysfunction Fatty Liver Disease: A Meta-Analysis, JOSE FERNANDO OBILLOS
- 1230 - Treatment outcome of radiotherapy for elderly hepatocellular carcinoma patients with comorbidity, Sun Hyun Bae
- 1231 - A Simplified HCV care whole pathway model improves HCV diagnosis and treatment rate in hyperendemic areas : experience in Xing'an country from China, Huanwen Chen
- 1234 - Associations of PNPLA3 and MBOAT7 Genetic Variants with Risk of Steatotic Liver Disease and Visceral Fat Accumulation in Adolescence, Akira Kado
- 1235 - Comparative Efficacy of Emerging Metabolic Therapies for MASLD and MASH: A Systematic Review and Network Meta-analysis of Randomized Controlled Trials, Alaa Ramadan
- 1236 - Multi-center analysis of HDV seroprevalence and epidemiological profile in Chinese HBsAg-positive inpatients, Huaguo Xu
- 1240 - Impact of Hand Grip Strength on the Clinical Course of Patients with Acute Variceal Bleeding: A Single-Center Prospective Observational Study, Hasan Eruzun
- 1241 - Liquid Biopsy-Based Detection Of TP53 And TERT Gene Mutations In HBV-Induced Chronic Liver Disease and Hepatocellular Carcinoma Patients: Evidence From Bangladesh, Sharmin Sultana
- 1242 - Hormone therapy and metabolic risk interact to influence metabolic dysfunction associated steatotic liver disease incidence across the menopausal transition: a 10 year longitudinal cohort study, I-Jung Feng
- 1244 - Cabozantinib as Third- or Later-Line Therapy After ICI Failure: Real-World Outcomes of Reduced-Dose Strategies in Advanced HCC, Teiji Kuzuya
- 1246 - TRENDS IN HEPATOCELLULAR CARCINOMA INCIDENCE IN MONGOLIA: A DECADE OF NATIONAL DATA (2014–2024), Purevsod Lkhagvasuren
- 1247 - Clinical characteristics and prognosis of patients with primary biliary cholangitis: a single center experience in Lanzhou city, China, Junfeng Li
- 1248 - Progress Toward WHO 2030 Hepatitis B Mortality Target in the Asia-Pacific Region, Ying Shen
- 1249 - RE-LIVE Study (Re-Linkage to Pan-Viral Hepatitis): Interim Results from a Multicenter Observational Study on Care Engagement in Chronic Viral Hepatitis, Jae Hyun Yoon
- 1251 - ANXA4 Deficiency Ameliorates Acetaminophen-Induced Acute Liver Injury, Shengjiang Deng
- 1253 - Clinical Trajectories of Acute Decompensation in Cirrhosis: The First Prospective PREDICT-Based Study from India, Kapil Kumar

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1255 - Chenodeoxycholic Acid Modulation via *Bacteroides intestinalis* AM1 underscores a Novel Approach in Acute Liver Failure, **SUSHMITA PANDEY**
- 1256 - Evaluation of Information Quality and Reliability of Chronic Hepatitis B-Related Short Videos on TikTok and Bilibili, **Yu Huang**
- 1258 - The Liver in Systemic Diseases: A Key Metabolic Regulator, **春润 李**
- 1259 - The Central Role of Liver Dysfunction in Systemic Metabolic and Cardiovascular Diseases Remaining characters, **春润 李**
- 1260 - Mitochondrial Dysfunction in NAFLD: A Public Health Perspective Remaining characters, **春润 李**
- 1261 - Single-Cell Atlas Reveals Immunometabolic Drivers of NAFLD-HCC Transition Remaining characters, **春润 李**
- 1262 - Gut Microbiota-Derived Metabolites Predict Advanced Fibrosis in MAFLD: A Machine Learning Approach Remaining characters, **春润 李**
- 1264 - Efficacy of Percutaneous Microwave Ablation in Exophytic Hepatocellular carcinoma, **Hishan Abdelaal**
- 1267 - Clinical Characteristics and Prognostic Analysis of Patients with Primary Biliary Cholangitis Complicated with Hepatic Granulomas, **WEN GAO**
- 1268 - CURRENT SITUATION OF ACUTE VIRAL HEPATITIS IN MONGOLIA: A DECADE OF NATIONAL DATA, **Enkhtaivan Odmaa**
- 1269 - RISK FACTORS AND CLINICAL FEATURES OF ACUTE HEPATITIS D IN MONGOLIA, **Badamnachin Batsukh**
- 1270 - Treatment Outcomes of HCV Genotype 1b with Ledipasvir/Sofosbuvir and the Role of Resistance-Associated Substitutions in Mongolia, **Lkhagvasuren Purevsod**
- 1271 - CLINICAL AND LABORATORY CHARACTERISTICS OF CHRONIC HEPATITIS D VIRUS INFECTION IN MONGOLIA, **Ganbaatar Khorolgarav**
- 1273 - Community-based interventions for hepatitis C virus elimination among people who use drugs in Shanghai, China, **Xiaoxiao Yu**
- 1274 - Constructing a dual-dimensional scoring system by integrating tertiary lymphoid structures and monocyte/lymphocyte ratio to optimize recurrence risk stratification in hepatocellular carcinoma: a multicenter cohort study, **Jia-Yong Su**
- 1275 - Development and validation of an explainable machine learning model for predicting the recurrence of adjuvant PD-1 inhibitors in hepatocellular carcinoma patients at high risk of recurrence: a multicenter cohort study, **Jia-Yong Su**
- 1276 - Autoimmune hepatitis triggered by acute *Coxiella burnetii* infection: a case report, **Yusuf Bünyamin Ketenci**
- 1279 - Multicenter cohort study comparing adjuvant PD-1 inhibitors with active surveillance in hepatocellular carcinoma at high-risk of recurrence: Benefit in early, but not late recurrence, **Jia-Yong Su**
- 1282 - Understand Current Treatment Experience, Unmet Needs, and Attitudes Toward Functional Cure in China Among Patients With Chronic Hepatitis B, **Guanzhu Lu**
- 1285 - Safety and Outcomes of Allogeneic Hematopoietic Stem Cell Transplantation from HBsAg-Positive Donors: A Case-Control Study from a Tertiary Care Centre., **Faisal Aba-Alkhail**
- 1287 - Using Community Partnerships to Achieve HCV Micro-elimination in Vancouver's Inner-city, **Brian Conway**
- 1288 - Strategies for reducing the time from HCV diagnosis to treatment initiation: Lessons from Vancouver, BC, Canada, **Brian Conway**
- 1290 - Safety and Tolerability of SIRT and Sorafenib in Advanced Hepatocellular Carcinoma in Mongolia, **Oidov Baatarkhuu**
- 1291 - Comparison between SIRT and Sorafenib in Advanced Hepatocellular Carcinoma in Mongolia, **Oidov Baatarkhuu**
- 1292 - Comparative Study of Tenofovir Alafenamide and Tenofovir Disoproxil Fumarate in Chronic Hepatitis B in Mongolia, **Tuvshinbayar Narangerel**
- 1293 - Evaluating ALBI Score for Risk Stratification in Acute Hepatitis B and D in Mongolia, **Badamnachin Batsukh**
- 1294 - Clinical Features and Outcomes of Acute Hepatitis B and Delta in Mongolia: A One-Year Prospective Follow-Up Study, **Badamnachin Batsukh**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1295 - HCC associated with hepatitis B and C Mongoloid and Caucasians of North-East Asia, **Buyankhishig Nomin**
- 1296 - Efficacy and Safety of Tenofovir Alafenamide in the Management of Chronic Hepatitis B in Mongolia, **Oidov Baatarkhuu**
- 1297 - Clinical Characteristics of HBV- and HCV-Related Hepatocellular Carcinoma: A Comparative Study in Mongolia, **Oidov Baatarkhuu**
- 1298 - Long-Term Outcomes of Ledipasvir/Sofosbuvir Treatment in Hepatitis C: Viral Suppression, Hepatocellular Carcinoma, and Mortality in Mongolia, **Oidov Baatarkhuu**
- 1299 - Hepatitis C virus infection in Mongolia: Updated provincial data on prevalence, genotype distribution, and age-specific risk factors, **Oidov Baatarkhuu**
- 1300 - Epidemiology, Clinical Features, and Laboratory Findings of Acute Hepatitis B and D Virus Infection Among Children Under Five Years of Age in Mongolia, **Khorolgarav Ganbaatar**
- 1301 - Clinical and Metabolic Features of MAFLD Among Individuals With Chronic HCV, **Purevsod Lkhagvasuren**
- 1302 - ASSOCIATION BETWEEN METABOLIC RISK FACTORS, HEPATIC STEATOSIS, AND QUALITY OF LIFE AMONG PATIENTS WITH CHRONIC HCV INFECTION ASSESSED USING THE HCV-SIQv4 QUESTIONNAIRE, **Purevsod Lkhagvasuren**
- 1303 - Impact of Sleep Disturbances and Psychological Distress on Quality of Life in Mongolian Patients with Acute and Chronic Hepatitis C, **Purevsod Lkhagvasuren**
- 1304 - MiR-551a drives cholesterol metabolic reprogramming and sorafenib resistance in hepatocellular carcinoma, **Yuanjun Lu**
- 1306 - MAFLD in Chronic HBV: The Dominant Role of Metabolic Dysfunction Over Viral Load, **Purevsod Lkhagvasuren**
- 1307 - Assessment of Clinical Status and Liver Function as Predictors of Lenvatinib Efficacy in Hepatocellular Carcinoma: A Single-Center Study at Dr. Mohammad Hoesin Hospital Palembang (January–December 2025), **Anton Purnomo bin Djailani**
- 1309 - Unlocking CTNNB1 hotspot mutations from cell-free DNA (cf-DNA) in hepatitis B virus induced hepatocellular carcinoma: A cross-sectional study from Bangladesh, **Farzana Laila Laila**
- 1313 - Combination of radiotherapy and durvalumab/gemcitabine/cisplatin therapy improve survival in biliary tract cancer (especially extrahepatic bile duct cancer) patients, **Sang Youn Hwang**
- 1314 - SDHA Deficiency in Hepatocellular Carcinoma Promotes Tumor Progression through Succinate-Induced M2 Macrophage Polarization, **Xinyang Li**
- 1315 - Clinical characteristics and combined pathogen spectrum of patients with influenza A in winter: a retrospective study based on targeted high-throughput sequencing detection, **Wenjing Wang**
- 1317 - Association Between Clinical Predictors And Albumin Billirubin Score In Hepatocellular Carcinoma Patients Receiving Lenvatinib At Dr. Mohammad Hoesin General Hospital, Palembang, During 2025, **Adhitya Wicaksana**
- 1318 - Atezolizumab and bevacizumab therapy combined with expanded NK cells significantly prolongs survival in vivo hepatocellular carcinoma model., **Sang Youn Hwang**
- 1319 - Integrated Proteomic and Metabolomic Profiling Reveals Distinct Immune and Metabolic Landscapes in Occult Hepatitis B Infection, **Hua-xiang Yang**
- 1320 - Impact of Long-Term Oral Antiviral Treatment on Hepatocellular Carcinoma Risk in Patients With Chronic Hepatitis B Who Are Hepatitis B e Antigen Positive Using the PAGED-B Score, **Leland J. Yee**
- 1321 - Predictors of undetectable hepatitis delta virus RNA at 48 weeks after end of treatment with bulevirtide monotherapy in the MYR 301 study, **Akin Kose**
- 1322 - COMPARISON OF SEROLOGICAL FIBROSIS MARKERS WITH LIVER BIOPSY FIBROSIS STAGES IN CHRONIC HEPATITIS B PATIENTS, **ESMA ASLIHAN AYDEMİR**
- 1323 - Final results of MYR301 Phase 3 study evaluating the efficacy and safety of up to 144 weeks of bulevirtide monotherapy for chronic hepatitis delta and 96 weeks of posttreatment follow-up, **Akin Kose**
- 1324 - Synergistic effects of type 2 diabetes and alcohol consumption on all-cause and liver-related mortality among patients with steatotic liver disease, **Ruoqi Zhou Zhou**
- 1325 - Serum metabolomic characteristics and their predictive value for ninety-day prognosis in patients with acute-on-chronic liver failure, **Ying Xiao**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1329 - Multi-center analysis of HDV seroprevalence and epidemiological profile in Chinese HBsAg-positive inpatients, **Shiyang Pan**
- 1330 - Dapsone Syndrome Relapse: Unraveling a Complex Case, **Pukar Thapa**
- 1332 - Socioeconomic Factors Among Chronic Liver Disease Patients :Experience From Largest Tertiary Care Hospital Of Pakistan, **bushra shahid**
- 1333 - Impact of Prior Treatment Response on Survival Outcomes of Subsequent Systemic Therapies Following First-line Atezolizumab plus Bevacizumab in Patients with Unresectable Hepatocellular Carcinoma, **Jiwon Yang**
- 1339 - Clinical Investigation on Hepatocellular Carcinoma Complicated with Esophageal and Gastric Variceal Bleeding, **Qing Ye**
- 1340 - Akkermansia muciniphila Regulating Cholangiocyte Pyroptosis via the Bile Acid-TGR5 Axis, **Kaicen Wang**
- 1342 - Exposure to Tenofovir Alafenamide and Tenofovir Disoproxil Fumarate and the Risk of Hepatocellular Carcinoma, **Leland J. Yee**
- 1343 - Impact of Long-Term Tenofovir-Based Treatment on Hepatocellular Carcinoma Risk in Patients With Chronic Hepatitis B Using the reREACH-B Score, **Leland J. Yee**
- 1345 - Association of MASLD with Prevalence and Severity of GERD in Primary Care, **Minseong Kim**
- 1347 - Efficacy and safety of tenofovir amibufenamide in patients with chronic hepatitis B:An observational study, **Jiarui Zheng**
- 1348 - Activation of the 5-lipoxygenase in myeloid immune cells is associated with systemic inflammation in acute-on-chronic liver failure, **Huilan Tu**
- 1351 - Evaluation Of Hepatitis B Recurrence In Liver Transplant Recipients In Vietnam, **Cam Linh Le**
- 1354 - Prognostic value of alpha-fetoprotein and hepatic reserve in hepatocellular carcinoma patients receiving lenvatinib: real-world evidence from Dr. Mohammad Hoesin Hospital Palembang, **Anton Purnomo**
- 1355 - Adipocyte-derived Extracellular Vesicles Propagate Hepatic Metabolic Inflammation Remaining characters, **春润 李**
- 1357 - Expression of the FCGBP Gene in Hepatocellular Carcinoma Tissues and Its Role in Prognostic Assessment, **Hang Wang**
- 1358 - CORRELATION OF INTERLEUKIN-17 SERUM LEVELS WITH DEGREE OF LIVER FIBROSIS IN CHRONIC HEPATITIS B PATIENTS AT MOHAMMAD HOESIN HOSPITAL PALEMBANG, **Lingga Gumelar**
- 1360 - Gender-specific clinical characteristics and care cascade of HCV in east China: a multicenter, retrospective study, **Honglian Gui**
- 1363 - Combination therapy with HT-101 and HT-102 achieves rapid and progressive HBsAg loss in HBeAg-negative, nucleos(t)ide analogues-suppressed patients: 24-week results from an ongoing multicentre, open-label phase Ib/Ila study, **Jinlin Hou**
- 1364 - Exploring the Impact of Gut Microbiota on Itch in Cholestasis, **Chengxuan Yao**
- 1365 - Sequential combination therapy of PD1 antibody and PEG-IFN α promotes HBsAg clearance and the restoration of specific T-cell response, **Junliang Fu**
- 1366 - Spatial Transcriptomics Uncovers Niche Driving Liver Fibrosis Remaining characters, **春润 李**
- 1367 - TCM Constitution Types Predict MAFLD Risk and Pathology Remaining characters, **春润 李**
- 1368 - Phlegm-Dampness Constitution Alters Gut Microbiome in MAFLD, **春润 李**
- 1369 - Qi-Stagnation Constitution Primes Pro-inflammatory Liver Macrophages Remaining characters, **春润 李**
- 1370 - Qi-Stagnation Constitution Primes Pro-inflammatory Liver Macrophages Remaining characters, **春润 李**
- 1371 - 消耗流量: 707字/单词846/5000 字符 Multi-omics analysis reveals key mediators of 90-day prognostic predictive value in patients with acute-on-chronic liver failure, **Ying Xiao**
- 1372 - Survival Outcomes and Prognostic Nomogram in Primary Hepatic Angiosarcoma: Insights From a Population-Based Analysis, **AHMED ALMEZAIN**
- 1373 - Constructing and Implementing a New Model for Viral Hepatitis Screening in Guangzhou's Primary Communities, **Yujuan Guan**
- 1374 - Prognostic Influence of Histopathological Subtypes and Patient Characteristics in Hepatocellular Carcinoma: A Comprehensive Population-Based Evaluation, **AHMED ALMEZAIN**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1376 - GP73: A novel non-invasive biomarker for diagnostic and prognostic of HEV-ALF elderly patients, Jian Wu
- 1379 - Synergistic effects of type 2 diabetes and alcohol consumption on all-cause and liver-related mortality among patients with steatotic liver disease, Ruoqi Zhou
- 1381 - From Crisis to Control: Acute HCV-Triggered Acute-on-Chronic Liver Failure With HRS Successfully Stabilized With Early Sofosbuvir–Velpatasvir and Hemoperfusion: A Case Report, NATHANIEL CAMANGON
- 1382 - SARS-CoV-2 Spike Protein Promotes HBV Replication via Autophagy and Enhances Inflammatory Responses in Chronic Hepatitis B Patients with Liver Dysfunction and Metabolic Disorders, Yufen Jiang
- 1383 - Prognostic Impact of Cardiometabolic-Kidney Dysfunction on Patients with Metabolic dysfunction–associated steatotic liver disease (MASLD), Daniel Yi Nin Tung
- 1386 - Real-World Clinical Experience with Long-Term Albumin Therapy in Advanced Liver Disease: A Case-Based Perspective from Asia, Bibek Gyanwali
- 1388 - External Validation of a Preoperative Microvascular Invasion Risk Prediction Model Using Gadoxetate-Enhanced MRI for Predicting Early Recurrence After Surgical Resection in Patients With Single Hepatocellular Carcinoma, Sunyoung Lee
- 1390 - A study on clinical factors influencing the recurrence of hepatitis B surface antigen following clearance after long-term nucleoside analogue therapy in patients with hepatitis B virus infection, JinNi Huang
- 1391 - Integrated Multi-omics Liquid Biopsy: Advancing Early Detection and Precision Management of HCC, Xinhao Gao
- 1392 - Feasibility of achieving a tumor- and drug-free state through conversion therapy followed by curative hepatectomy for patients with initially unresectable hepatocellular carcinoma, Jian-Hong Zhong
- 1394 - Clinical landscape, Mutation mapping, Quality of life and Treatment outcomes in Adolescent and Adult Wilsons disease patients in a South Indian cohort., RAJAT PRABHAKAR PANDE
- 1395 - Four-Year Management of Unresectable Hepatocellular Carcinoma: Sustained Tumor Control and Cumulative Multi-Organ Toxicities, Yuerong Zhang
- 1397 - Ammonia-Seeking Zinc Micromotors for Active Ammonia Scavenging in Hepatic Encephalopathy, Hua-xiang Yang
- 1398 - A Study to assess the relationship of Frailty and Myosteatorsis in Cirrhotic patients, Joemon M George
- 1400 - The Silent Risk of Steroid Therapy: A Case of HBV Reactivation, Ediz Tütüncü
- 1402 - Safety, Tolerability, Immunogenicity, and Antiviral Efficacy of GS-2829 and GS-6779, a Novel, Arenaviral-Vectored, Therapeutic Hepatitis B Vaccine: Phase 1b Study Results From Virally Suppressed Patients With Chronic Hepatitis B, Leeland Yee
- 1403 - Developing Blood-based Lipid Biomarker for Hepatocellular Carcinoma Risk Prediction in Non-cirrhotic MAFLD Patients, Fatema Safri
- 1404 - A Model for Prediction Hepatic Nodules Development to Hepatocellular Carcinoma in Patients with HBV-Related Cirrhosis on Antiviral Therapy, Yaxin Li
- 1405 - Impact of Smoking on the Longitudinal Progression of Liver Fibrosis, Hyuk Kim
- 1406 - Assessing the Efficacy of donor-derived cell-free DNA (ddcfDNA) Measurement in Liver Transplant Recipients for Rejection Diagnosis and Therapeutic Response Evaluation : A case report, So Kyung Yoon
- 1407 - Osteoclast-like giant cell tumor of the intrahepatic bile duct: a rare neoplasm with a stable clinical course: A case report, So Kyung Yoon
- 1409 - Alcohol-Associated Liver Cancer Burden Among Young Adults: Comparing China With Global Trends From GBD 2021, Yaxin Li
- 1411 - Impact of gut microbiota on the aggravation of NAFLD development in high-fat diet mice with circadian rhythm disruption, Mengxia Sun
- 1412 - Lactobacillus acidophilus Modulates the Gut–Liver Axis and Ameliorates MASLD and Type 2 Diabetes–Related Metabolic Dysregulation, Hee Jin Park
- 1413 - Bile fungal diversity correlated with severity and is predictive of carcinoma in patients with CAGB, Sanju Yadav
- 1420 - Machine learning model based on systemic metabolic factor for mortality prediction in acute hepatitis E virus infection: development and validation from a dual-center cohort, Haoshuang Fu
- 1421 - Pharmabiotics, Phocaeicola dorei, ameliorates liver fibrosis by alleviating macrophage efferocytosis of neutrophils, Ki Tae Suk

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1424 - Comparing two intervention strategies to improve hepatitis B virus deoxyribonucleic acid testing rate among hepatitis B surface antigen-positive hospitalized patients, [Qinzhi Deng](#)
- 1425 - Fibroblast activation assessed by PRO-C3 and PRO-C6 is associated to accumulation of key bile acids - A hallmark of fibrosis initiation and mortality in alcohol-related liver disease, [Morten Karsdal](#)
- 1427 - Protein-tyrosine phosphatase 1B promotes hepatic stellate cell activation via SRC signaling, [Bootsakorn Boonkaew](#)
- 1428 - Surgical Resection Versus Non-Surgical Treatment for Hepatocellular Carcinoma with Portal Vein Tumor Thrombosis: A Comprehensive Systematic Review and Meta-Analysis, [Sang-Hoon Kim](#)
- 1429 - Meta analysis of efficacy and safety of CAR-NK cell in the treatment of primary liver cancer, [Guoyun Xuan](#)
- 1430 - Fibrosis non-invasive test panel (FIB-NIT): A novel biomarker panel for investigating fibrosis dynamics through individual components of fibrogenesis (PRO-C3), fibrolysis (CTX-III), and clinical outcomes (PRO-C6) in alcohol-related liver disease, [Rune Vestermarck](#)
- 1432 - Longitudinal Changes in Skeletal Muscle Index Among Patients With Cirrhosis: A Mixed-Effects Analysis in an Observational Cohort, [Qian Wang](#)
- 1433 - Functional changes following hepatocyte transplantation in mice with liver injury, [Yuki Tamaki](#)
- 1434 - Awareness and Treatment Status of Patients with Chronic Hepatitis B: Results from a Single Center Patient Survey in Hunan province, China, [Jun Chen](#)
- 1435 - Individualized nutrition support improves outcomes in hepatitis B virus-related acute on chronic liver failure patients at nutritional risk: a randomized controlled trial, [liang Peng](#)
- 1437 - Efficacy of Sequential or Combined Tenofovir Alafenamide in Entecavir-Treated CHB Patients with Low-Level Viremia and Its Impact on Lipid Levels, [YIJING ZHANG](#)
- 1438 - Efficacy and safety of seladelpar in patients with primary biliary cholangitis previously treated with fibrates or obeticholic acid, [Akin Kose](#)
- 1439 - Liver stiffness-based assessment of fibrosis stages in chronic hepatitis B patients in Georgia: associations with viral, clinical and demographic factors, [Lela Inaishvili](#)
- 1440 - Prevalence and predictors of hepatitis B virus infection among sellers and workers at West Africa's largest market, Kejetia, Ghana: a cross-sectional study, [Clinton Owusu Boateng](#)
- 1441 - Disease control as evidenced by transient elastography in the ASSURE study: 36 months of seladelpar treatment is associated with stable or improved liver stiffness in patients with primary biliary cholangitis, [Akin Kose](#)
- 1442 - Combination Therapy Using DPCAS Mode and DPMAS Mode of Artificial Liver Support System for Severe Liver Injury with Sepsis: A Case Report, [Yue Kong](#)
- 1443 - Seladelpar is associated with sustained reductions in cholestatic markers and a consistent safety profile in patients with primary biliary cholangitis up to 48 months in the ongoing, open-label ASSURE study, [Akin Kose](#)
- 1444 - Sustained and clinically meaningful improvements in moderate to severe pruritus patients with primary biliary cholangitis treated with seladelpar: results from the ASSURE study up to 30 months, [Akin Kose](#)
- 1445 - Sirtuin 3 ameliorates acute-on-chronic liver failure via the glutathione peroxidase 4/mixed lineage kinase domain-like protein-mediated ferroptosis-necroptosis interplay, [Yuhong Liu](#)
- 1446 - Metabolic dysfunction-associated steatotic liver disease in patients with diabetes mellitus is linked with the severity of metabolic disorders., [Alexey Goncharov](#)
- 1448 - Insights from 10 years of Hepatitis C testing in Vancouver's inner-city, [Brian Conway](#)
- 1449 - Efficacy of low-dose versus standard-dose terlipressin in patients with variceal hemorrhage: systematic review and meta-analysis of randomized controlled trials., [Marybel Garcia-Rodriguez](#)
- 1450 - The Impact of Hepatic Steatosis on Viral Load and Liver Fibrosis in Patients with Chronic Hepatitis B, [Ying Zhu](#)
- 1451 - Diagnostic challenge in a young male patient presenting with feeling of upper abdominal lump and recent onset of black terry stool, [Ponkaj Naha](#)
- 1452 - Evaluation of Urinary Hepatitis E virus Antigen Colloidal Gold Immunochromatographic Assay in Clinical Diagnosis of Hepatitis E virus Infection, [Conglin Zhao Zhao](#)
- 1453 - The Impact of a Hospital-Wide Alert and Referral Program on the Management of Hepatitis B Virus (HBV) Infection in Non-Specialist Departments: A Before-and-After Study, [Yijing Cai](#)

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1454 - Impact of Autoimmune Phenomena on the Clinical Presentation and Prognosis of Wilson's Disease: A Retrospective Cohort Study, **Sujun Zheng**
- 1455 - Cardiovascular Outcomes of GLP-1 Receptor Agonists vs SGLT2 Inhibitors in Metabolic-Associated Steatotic Liver Disease and Type 2 Diabetes: A Real-World Comparative Effectiveness Study, **Po-Yu Huang**
- 1457 - Predictors for re-hospitalization in liver cirrhosis: the first longitudinal cohort study in the Republic of Moldova, **Adela Turcanu**
- 1458 - DIAGNOSTIC ACCURACY OF PIVKA-II IN DETECTING HEPATOCELLULAR CARCINOMA AMONG AFP-NORMAL PATIENTS: A SYSTEMATIC REVIEW AND META-ANALYSIS, **John Derek Clutario**
- 1460 - Dysregulated S100A8/A9-Monocyte Pathway in Cirrhosis-Associated Immune Dysfunction and Its Reversal by Mesenchymal Stromal Cells, **Lei Shi**
- 1462 - Effectiveness and safety of tenofovir alafenamide for chronic hepatitis B patients with decompensated cirrhosis: a retrospective study in Qinghai province, **Baohua Wu**
- 1464 - Liver Fibrosis and Cardiovascular Health Jointly Predict Mortality in NAFLD and MAFLD, **Jing Liang**
- 1465 - Impact of metabolic dysfunction-associated steatotic liver disease on young hepatocellular carcinoma patients following curative resection, **Chia-Jung Ho**
- 1467 - Clinical and instrumental profile of patients with Cryptogenic steatotic liver disease, **Alexey Goncharov**
- 1470 - Hepatitis E virus orchestrates mitochondrial fusion to drive viral replication through mechanistic coupling of pro-viral autophagy and innate immune evasion, **Xiaoman Liu**
- 1474 - Deciphering the mechanistic underpinnings of hepatitis E severity: a tale of T cell exhaustion and maladaptive cDC2 activation at single-cell resolution, **Xiaoman Liu**
- 1475 - Serum cystathionine γ -lyase (CTH) as a novel noninvasive biomarker for occult nonalcoholic steatohepatitis, **Bobin Hu**
- 1477 - A post-authorization study to evaluate the safety and efficacy of sofosbuvir/velpatasvir/voxilaprevir in the retreatment of chronic hepatitis C patients in Taiwan, **Yu-Ju Wei**
- 1478 - Unveiling Pyruvate Metabolism: A Prognostic and Immunotherapeutic Beacon in Hepatocellular Carcinoma, **Ning Wang**
- 1479 - Disulfidoptosis in Acute Liver Failure: Roles, Molecular Mechanisms, and Potential Clinical Applications, **Li Bai**
- 1480 - Baseline Screening and Epidemiological Characteristics of First-Degree Relatives of HBV-Related Hepatocellular Carcinoma Patients: A Multicenter Prospective Study in Jiangsu China, **Weifeng Zhao**
- 1483 - Epidemiological Survey of Liver Cirrhosis in Tianjin: Ten-Year Data, **Qing Ye**
- 1485 - Integrated Multi-omics Liquid Biopsy: Advancing Early Detection and Precision Management of HCC, **Xinhao Gao**
- 1487 - Sphingosine Attenuates Steatosis but Exacerbates Fibrosis Risk in Metabolic-Associated Fatty Liver Disease (MAFLD) via Hepatic LDLR Modulation, **Meng Li**
- 1488 - Eicosapentaenoic Acid Prevents the Short-term High-fat Diet-Enhanced Severity of Concanavalin A-Induced Liver Injury, **Eri Nanizawa**
- 1489 - Transcriptomic profiling of liver biopsy tissues reveals γ -T Cell activation and differentiation are associated with Idiosyncratic drug-induced liver injury, **Zhi-xiang Du**
- 1490 - South Asian metabolic phenotype and fibrosis discordance in lean and obese metabolic dysfunction-associated steatotic liver disease: insights from a Sri Lankan tertiary cohort, **Prabhath Dasanayaka**
- 1491 - Dynamic network collapse in decompensated hepatic cirrhosis, **Yanpei Mai**
- 1492 - Evaluating the accuracy of the histological diagnosis in unexplained liver injury: A retrospective study, **Lingling Yang**
- 1495 - Electrolytes as predicting factor on outcome in patient with cirrhosis: Study from low socioeconomic south-east Asian population., **Muhammad Fahad Zakir**
- 1496 - Systemic Immune-Inflammation Index as a Predictive Biomarker for Non-Response to Ursodeoxycholic Acid in Primary Biliary Cholangitis, **28304; 21776;**
- 1498 - A Case of Idiopathic Caroli Syndrome Misdiagnosed as Cholangiocarcinoma, **Lingling Yang**
- 1499 - A case of drug-induced autoimmune hepatitis with negative serum markers, **Lingling Yang**
- 1500 - Endogenous Endophthalmitis Associated With Liver Abscess Caused By Klebsiella pneumoniae, **Dinh Thang Nguyen**
- 1501 - Are third generation cephalosporin still considered first choice for ascitic fluid infection? in decompensated cirrhotic patients: Study from largest tertiary care hospital Pakistan., **Muhammad Fahad Zakir**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1502 - Chronic hepatitis B with autoimmune hepatitis in a male patient, [Lingling Yang](#)
- 1503 - Clinical Features and Prognostic Assessment of MAFLD-Related Cirrhosis: Pathological vs. Clinical Diagnosis, [Ying Wang](#)
- 1505 - The Mechanistic Basis of ASH1L's Oncogenic Role in Hepatocellular Carcinoma, [Jihyun An](#)
- 1506 - Effect of Semaglutide Therapy on Hepatic Steatosis and Liver Stiffness in Patients with Nonalcoholic Fatty Liver Disease (NAFLD): A Quasi-Experimental Study, [Dr. Md. Tanveer Rahman Rashed](#)
- 1508 - Minimal Hepatic Encephalopathy in Portal Vein Thrombosis: An Underrecognized but Common Complication, [Kseniya Gulyaeva](#)
- 1509 - When Pressure Matters More Than Parenchyma: Gut Dysbiosis in Different Types of Portal Hypertension, [Kseniya Gulyaeva](#)
- 1510 - INTEGRATED BIOINFORMATIC ANALYSIS OF THE ROLE OF SLC35B2 IN HEPATOCELLULAR CARCINOMA, [Wei Hou](#)
- 1511 - A PAN-CANCER ANALYSIS OF THE ROLE OF OXCT1 IN HUMAN CANCERS, [Wei Hou](#)
- 1512 - COMPREHENSIVE ANALYSIS OF THE ROLE OF TUMOR-ASSOCIATED ANTI-LMNB1 AUTOANTIBODY IN HEPATOCELLULAR CARCINOMA, [Wei Hou](#)
- 1513 - PAN CANCER ANALYSIS OF HACD FAMILY AND UNRAVELLING THE ONCOGENIC ROLE IN HEPATOCELLULAR CARCINOMA, [Wei Hou](#)
- 1514 - AN INTEGRATED ANALYSIS OF THE ROLE OF tsRNA-Asp-5-0002 IN HUMAN TUMORS ACROSS MULTIPLE CANCER TYPES, [Wei Hou](#)
- 1515 - Investigating the Hidden Link: How Common Is MAFLD Among Cataract Patients?, [Safaa M Abdelhalim](#)
- 1518 - Performance of Non-Invasive Techniques for Quantifying Hepatic Steatosis: Limitations of Conventional MRI Compared with FibroScan in a Preliminary Moroccan Cohort, [Oumaima Azzaoui](#)
- 1519 - Real world outcomes of atezolizumab and bevacizumab according to clinical risk factors for unresectable hepatocellular carcinoma: A multicenter CLCSG cohort study, [Young Eun Seo](#)
- 1520 - Hole in the Wall: A Rare Case of Lenvatinib-Associated Peptic Ulcer Perforation in Hepatocellular Carcinoma, [Zyrah Lou Samar](#)
- 1521 - Risk Factors for Liver Fibrosis Severity in Patients with Nonalcoholic Steatohepatitis: A Study Based on Liver Pathology, [pengyu pan](#)
- 1522 - Efficacy and safety of hepatic arterial infusion chemotherapy sequential therapy versus Atezolizumab/Bevacizumab in infiltrative hepatocellular carcinoma with portal vein thrombosis: A cohort study with Propensity score matching, [Sung Bum Cho](#)
- 1523 - Anserine promotes Antibacterial Defense in Cirrhosis via the Mup11+ Hepatocyte-CD44+ pDC Crosstalk and CCL5-CCR5 Axis Short title: Anserine Promotes Antibacterial Defense via CCL5-pDC in Cirrhosis, [Ruochan chen](#)
- 1524 - Carbamazepine-induced cholestatic hepatitis with rapid fibrosis progression and biopsy-confirmed pure red cell aplasia in a young woman, [Prabhath Dasanayaka](#)
- 1530 - Integrative lipidomic and transcriptomic analyses reveal glycosphingolipid remodeling in metabolic dysfunction-associated fatty liver disease-related advanced fibrosis, [Xiao Han](#)
- 1532 - A Rare Case Of Acute Liver Failure (ALF) Secondary To Clozapine-Induced Autoimmune Hepatitis, [Pei Zheng Lee](#)
- 1534 - FABP4 Exacerbates Drug-Induced Cholestatic Liver Injury via NLRP3/GSDMD-Dependent Pyroptosis, [Yuelin Xiao](#)
- 1535 - Multimodal In-Hospital Alert Intervention Significantly Improves HBV-DNA Testing and Antiviral Treatment Rates among HBsAg-Positive Patients in Non-Specialty Departments, [Shaorui Hao](#)
- 1536 - Diagnosis and treatment of occult primary hepatocellular carcinoma presenting with ovarian metastasis as the initial manifestation: a case report, [Xiaoxin Wu](#)
- 1537 - Targeting the Cholangiocytes Vitamin D/TXNIP Pathway to Attenuate Ductular Reaction and Liver Fibrosis, [Hua-xiang Yang](#)
- 1538 - Development and Validation of a RF-LASSO-Cox-Derived Nomogram Incorporating Inflammatory Markers to Predict Long-Term Survival in Early-Stage Hepatocellular Carcinoma after Microwave Ablation, [Wenying Qiao](#)
- 1539 - The FABP4/CD36/FXR Axis Regulates Bile Acid Homeostasis in Drug-Induced Cholestasis, [Yuelin Xiao](#)
- 1540 - Pruritus and Its Impact on Quality of Life in Primary Biliary Cholangitis: A Study of Patients on Long-Term Ursodeoxycholic Acid Treatment, [jing liang](#)

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1541 - Development and Validation of a Nomogram for Predicting Postoperative Survival in Patients with Multifocal Hepatocellular Carcinoma, **Wenying Qiao**
- 1543 - Endothelial RUNX1 Controls Acetaminophen-Induced Liver Injury by Regulating LSEC Dysfunction and Pathological Angiocrine Signaling, **Wei Cheng**
- 1544 - Alterations in gut microbiota and metabolism are correlated with the severity of PBC., **Qi Wang**
- 1545 - Significant Burden of Liver-Related Outcomes in DM-MASLD despite Low Fatty Liver Index: Results from Two Nationwide Cohort Studies, **Moon Haeng Hur**
- 1546 - Tranexamic acid on risks of rebleeding in acute variceal bleeding: a retrospective cohort study on local data in Hong Kong, **Aaron Tsz-Wang Lo**
- 1547 - Micro-RNAs (−122, −34a and −99a) as Potential Predictive Biomarkers for MAFLD, **Mohamed Abdel-Samiee**
- 1548 - The Potential Role of A Gut Hormone in MAFLD, **Mohamed Abdel-Samiee**
- 1549 - Retrospective Audit of Terlipressin Use in Hepatorenal Syndrome – Acute Kidney Injury (HRS-AKI), **Rachel Teo**
- 1550 - VCTE Radiomics for Non-Invasive Assessment of Hepatic Fibrosis in Metabolic Dysfunction-Associated Steatohepatitis, **Shuying Song**
- 1553 - Hepatic G3BP1 Acts as a Critical Role Integrating Autophagy and Lipogenesis to Suppress MASLD Progression, **Hua-xiang Yang**
- 1554 - Micro-RNA Gene Polymorphisms in Egyptian Cirrhotics who developed Hepatocellular Carcinoma, **Mohamed Abdel-Samiee**
- 1556 - Serum kallistatin level in comparison to other noninvasive panels for potential portal hypertension Evaluation in Egyptian cirrhotics, **Mohamed Abdel-Samiee**
- 1557 - AADN score: Predicting Response to transarterial chemoembolization, sintilimab and lenvatinib in patients with hepatocellular carcinoma, **Xue Zhang**
- 1558 - Detection of Small Fiber Neuropathy Changes by Sudoscan in Hepatitis C Virus Infected Cirrhotics, **Mohamed Abdel-Samiee**
- 1561 - Cell-type-specific bidirectional modulation of Zfp36l2 by a Chinese herbal formula reverses T cell exhaustion to suppress hepatocellular carcinoma, **Zimeng Shang**
- 1562 - Evaluation of HBV RNA as a predictive biomarker to determine intrahepatic HBV activity among chronic hepatitis B virus infected patients, **Munira Jahan**
- 1563 - Dynamics of Fibrosis Regression and Long-term Liver-related Events in Patients with Compensated Cirrhosis: A 13-year Prospective Cohort on Entecavir Therapy, **Xinyu Liu**
- 1566 - Enrichment of intratumoral Cutibacterium acnes in Advanced Hepatocellular Carcinoma and its promotive role in tumor progression, **Huan Liu**
- 1569 - Impact of Thrombophilia on the Extent of Portal Vein Thrombosis at Diagnosis, **Ismail Qarch**
- 1570 - Gadoteric Acid-Enhanced MRI Parameters for Functional and Volumetric Assessment in Chronic Liver Disease Stratification, **Fatih Işık**
- 1571 - Impact of Hepatitis B Virus Infection on Surgical Conversion and Survival in Unresectable Hepatocellular Carcinoma Treated With TACE, Targeted Therapy, and PD-1 Inhibitors, **Yuhao Su**
- 1572 - Comparison of Long-term Efficacy and Renal Safety between Entecavir and Tenofovir Alafenamide Fumarate in Treatment-naïve Patients with Chronic Hepatitis B, **Ao Chen**
- 1574 - Aeromonas Infections in Hepatic Hospital: Source-Specific Distribution and Antimicrobial Resistance Profiles Over Two Decades, **zhen cai**
- 1575 - Metastatic Hepatic Pleomorphic Liposarcoma with Ruptured vascular mass: A case report, **DEBBY GRACE JARDIOLIN**
- 1577 - Long-Term HBsAg Kinetics and Prognostic Significant in Patients with Compensated Cirrhosis: A 13-year Prospective Cohort on Entecavir Therapy, **Mingyue Ma**
- 1578 - Construction of a Predictive Model for Adverse Outcomes in Patients with Acute Decompensated Cirrhosis Based on PBMC Transcriptomic Analysis, **Zelu Meng**
- 1579 - Comparative Outcomes of Subsequent-Line Therapies Following First-Line Atezolizumab Plus Bevacizumab for Advanced Hepatocellular Carcinoma in a High-Volume Korean Center, **Ye Rim Kim**
- 1582 - Proteomic Profiling and Clinical Correlation of Prognostic Proteins in Advanced Hepatocellular Carcinoma with Hyperbilirubinemia, **jianing wang**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1583 - Effect Of Polyethylene Glycol Versus Lactulose on Hepatic Encephalopathy In Patients With Liver Cirrhosis: A Randomized Clinical Trial (PEG-HE Trial), [Abhishek Lal](#)
- 1584 - Drug-related hepatic steatosis associated with antineoplastic drugs: A pharmacovigilance study from the FDA adverse event reporting system (FAERS), [Yanjie Lin](#)
- 1585 - 20(s)-ginsenoside Rg3 inhibits hepatocellular carcinoma via akkermansia-driven regulation of intestinal microbiota and bile acid metabolism, [Xuemei Zhang](#)
- 1586 - Construction and validation of a nomogram for predicting survival in hepatocellular carcinoma patients with hyperbilirubinemia receiving targeted immunotherapy, [jianing wang](#)
- 1590 - Decoding the Genetic Overlap: A Pathway to Early Diagnosis of AKI in Cirrhotic Patients, [Ning Wang](#)
- 1591 - Circulating Hypermethylated RASSF1A as a Possible Marker of Hepatocellular Carcinoma in Chronic HCV patients, [Eman Abdelsameea](#)
- 1593 - Geniposide alleviates ALD by reducing CXCR2+neutrophil infiltration through inhibiting FKBP5/CXCL1 signaling pathway, [Man Li](#)
- 1594 - A machine learning model for predicting hepatocellular carcinoma in patients with MASLD, [Han Ah Lee](#)
- 1595 - Development and validation of a non-invasive model for predicting advanced liver fibrosis in patients with metabolic dysfunction-associated fatty liver disease and dysglycemia, [Xuejie Zhang](#)
- 1597 - Glycyrrhizin Preparations in Liver Diseases: A Systematic Review of Mechanisms and Therapeutic Potential, [Minghui Li](#)
- 1599 - Budd-Chiari Syndrome and Predictive Factors for Recanalization, [Aymane Souili](#)
- 1600 - Liver Fibrosis Activity on MRI (cT1) Predicts Incident Neurological Events Independent of Brain MRI Metrics in the UK Biobank, [Wen Hui Lim](#)
- 1601 - Interventional outcome of Endoscopic retrograde cholangio-pancreatography versus Percutaneous transhepatic cholangiography in malignant biliary strictures, [Muhammad Fahad Zakir](#)
- 1604 - Liver MRI Biomarkers of Fibro-inflammation and Steatosis Predict Long-term Liver Outcomes and Mortality in the General Population, [Darren Tan](#)
- 1605 - Clinical Characteristics and Epidemiological Features of Hepatitis E Virus Infection Among People Living with HIV in Shanghai, China, [Conglin Zhao](#)
- 1606 - Marked HBsAb elevation in anti-HBc-positive cancer patients receiving PD-1 inhibitors: two case reports and literature review, [Chaoqian Huang](#)
- 1610 - STING Aggravates Liver Fibrosis in Chronic hepatitis B concurrent with Metabolic Dysfunction-Associated Steatotic Liver Disease by Modulating Gut Microbiota and Inducing Macrophage-Derived Lysozyme Expression, [Xiaoqing Wang](#)
- 1611 - Irreversible Electroporation (NanoKnife) in the Management of Refractory Recurrent Hepatocellular Carcinoma: A Systematic Review of Diagnostic and Therapeutic Advances, [Mengjiao Xu](#)
- 1612 - Kuan-Sin-Yin potentiates PD1 blockade in hepatocellular carcinoma by enhancing B cell derived Granzyme B mediated apoptosis, [Shuoshuo Ma](#)
- 1613 - History of Abdominal Surgery and of Treatment for Esophagogastric Varices Are Risk Factors for Portal Vein Thrombosis in Patients with Cirrhosis, [Chao Ma](#)
- 1614 - Autoimmune hemolytic anemia complicated by portal vein thrombosis in a pediatric liver transplant recipient, [Zehra İkbāl Karabal](#)
- 1616 - SNX10 Promotes Lipid Accumulation in Hepatocytes by Inhibiting Autophagic Flux, [Shiyan Chen](#)
- 1617 - Impact of post Kasai steroid-based protocol in Biliary Atresia: Real World Data From India, [Anmol Anmol](#)
- 1618 - Optimizing Nucleos(t)ide Analogs Combined Peg-IFN γ Regimen for CHB with Low-Level Viremia: Efficacy and Predictors, [Shiyu Wang](#)
- 1620 - Precision Treatment and Frontier Advances of Glycyrrhizin Preparations in Drug-Induced Liver Injury, [Minghui Li Li](#)
- 1621 - Establishment and assessment of a nomogram for predicting hepatic parasites disease, [YANUO CHEN](#)
- 1622 - Impact of Tuberculosis Co-infection on All-Cause Mortality in Patients with Viral Hepatitis: A Propensity Score-Matched Retrospective Study, [Jianyun Wang](#)
- 1623 - Molecular Association of Circadian Rhythm and Tryptophan Metabolism Pathway in the Pathogenesis of Chronic Hepatitis B, [Chunfeng Mei](#)
- 1626 - Baseline Gut Microbiota Signatures Associated with Interferon Response and Functional Cure in Chronic Hepatitis B, [Siqi Sun](#)

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1627 - Clinical and Serological Predictors of Virological Response to Nucleos(t)ide Analogue Therapy in Chronic Hepatitis B: A 7-Year Cohort Study, **chaimaa ELMAJOUDI**
- 1628 - A Prospective Study on a Group Mindfulness-Based Intervention for Patients with Metabolic Dysfunction-Associated Fatty Liver Disease: Effects on Liver Steatosis and Psychological Symptoms, **Qianqian Wang**
- 1630 - The effect of hepatic steatosis on the efficacy of immune-based integrative treatment for viral HCC, **YANUO CHEN**
- 1631 - Noninvasive preoperative prediction of major pathological response in unresectable hepatocellular carcinoma treated with conversion therapy using a clinical-CT radiomic model: a multicenter, retrospective study, **Jian-Hong Zhong**
- 1632 - Predictive Value of INR and DBIL for Short-Term Prognosis after the First Artificial Liver Support System Treatment in Patients with Acute-on-Chronic Liver Failure, **Yue Kong**
- 1633 - MVPS and Thrombophilic Abnormalities as Leading Causes of Non-Tumoral Portal Vein Thrombosis: Epidemiological and Evolutionary Insights from a Cohort of 83 Patients, **chaimaa ELMAJOUDI**
- 1635 - Predictors of Incomplete Biochemical Response to Ursodeoxycholic Acid in Primary Biliary Cholangitis: Insights from a Moroccan Cohort, **Rajae BELHOCINE**
- 1636 - Metabolic Dysfunction-Associated Steatotic Liver Disease in Normal-Weight Individuals: Clinical, Biological, Fibrosis, and Autoimmune Profiles in a Moroccan Cohort, **Imane EL Mouatamid**
- 1637 - The impact of serum lipids metabolism on the prognosis of hepatitis B virus related acute-on-chronic liver failure, **Jing Lai**
- 1638 - Indole-3-carbaldehyde mitigates fibrosis progression in MASH with T2DM via the SIRT1/TGF- β /SMAD signaling pathway, **Lu Li**
- 1639 - TRPV4 Cooperates with HBx to Promote HBV Replication Through a Calcium-Mediated Positive Feedback Loop, **Yu Zhang**
- 1643 - PREDICTIVE SCORING MODEL FOR HEPATOCELLULAR CARCINOMA AMONG FILIPINO PATIENTS: A 10-YEAR RETROSPECTIVE STUDY, **Jessica Kristy Quiza**
- 1644 - Epidemiological, Clinical, and Therapeutic Profile of Chronic Hepatitis B in a North African Cohort: Determinants of Advanced Fibrosis, **Rajae BELHOCINE**
- 1645 - The dynamic of APRI and FIB-4 scores over a 10 year period in HCV cirrhotic patients after virological cure with direct-acting antivirals therapy, **Violeta Molagic**
- 1648 - Predictive factors of complications and treatment response in patients with autoimmune hepatitis: A 8-Year Single-Center Study, **Ouafae Dahri**
- 1650 - A Pilot Study on Hepatitis B Core Related Antigen (HBcrAg) as a Novel Marker for Monitoring Antiviral Therapy in Chronic Hepatitis B Patients, **Pravinkumar Rejilwal**
- 1651 - The dynamic of alpha-fetoprotein in patients with hepatitis C cirrhosis after direct-acting antivirals therapy over a 10 year period, **Anca Saran**
- 1654 - Long-Term Prognosis of Acute HBV Cases, **SELMA TOSUN**
- 1655 - Alcoholic Liver Disease with Sarcopenia: Association with Increased Fall Risk and Impaired Activity of Daily Living, **Yingying Zhao**
- 1657 - Research on gut microbiota characteristics of PBC patients at different ALBI grades based on machine learning, **Han Shi**
- 1658 - Exploring Factors Influencing Public Intention to Receive Hepatitis E Vaccination Based on the Theory of Planned Behavior, **Chaoqian Huang**
- 1659 - Efficacy Analysis of Prednisone Tablets Combined with Azathioprine in the Treatment of Autoimmune Hepatitis: A Single-Center Retrospective Cohort Study, **Menyao He**
- 1660 - Four-Year Survival in Giant Hepatocellular Carcinoma: A Case Report on Long-Term Disease Control Following Multimodal Therapy, **Lu Zhang**
- 1663 - Diagnostic prediction model of porto-sinusoidal vascular disease patients with gamma-glutamyl transferase elevation, **Weihua Cao**
- 1665 - ADAR2 Deficiency Ameliorates Metabolic Dysfunction-Associated Steatohepatitis (MASH) and Fibrosis in Mice, **Yun-Wen Chen**
- 1666 - Diagnostic Performance of Non-Invasive Fibrosis Scores Compared with Liver Biopsy in Chronic Hepatitis B, **Hasan Yilmaz**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1667 - Combination of carvedilol and variceal band ligation is superior to carvedilol alone in primary prophylaxis of variceal bleed in cirrhotics with high-risk varices: A randomized controlled trial, JATA SHANKAR KUMAR
- 1668 - Metabolic Steatosis in Chronic Hepatitis B: High Prevalence but No Impact on Fibrosis or Antiviral Response in a Moroccan Cohort, Ismail Qarch
- 1669 - "Serum Prothrombin Induced by Vitamin K Antagonist-II (PIVKA-II) Biomarker in diagnosis of Hepatocellular Carcinoma", Dr SOURAV KUMAR SAHA sabuj
- 1670 - Evaluation of anti-HBs titers in children who received vaccine + HBIG at birth because their mothers were HBsAg positive in subsequent years, SELMA TOSUN
- 1671 - "Bitter Remedy, Bitter Consequence": Mahogany Seeds Causing Herb-Induced Liver Injury, Dr.Kartik Chaudhary
- 1674 - CMV Hepatitis Masquerading as Prolonged Cholestatic Phase of Hepatitis A, Dr.Kartik Chaudhary
- 1675 - Magnitude of Clostridium Difficile Infection in Hospitalized Egyptian Cirrhotic Patients, Mohamed Abdel-Samiee
- 1678 - Identification and validation of cuproptosis-related genes for early warning of acute liver failure, Xiaoxuan Liu
- 1680 - Artificial Intelligence Predicts Sex-Specific Risk of Metabolic Dysfunction-Associated Steatotic Liver Disease, Mohamad Jamalnia
- 1682 - AWARENESS OF HEPATITIS B VIRUS REACTIVATION AMONG PHYSICIANS MANAGING PATIENTS RECEIVING IMMUNOSUPPRESSIVE THERAPY: A CROSS-SECTIONAL STUDY OF 150 PHYSICIANS, ECE DEMİRKIRKAN
- 1683 - Hepatic Steatosis Beyond Fat: A Clinical, Anthropometric and Metabolic Exploration of an At-Risk Population, Chaima Hsain
- 1684 - Patient-reported health is decreased in high-risk MASH defined by noninvasive biomarkers of fibro-inflammation in Japanese Adults, Elizabeth Shumbayawonda
- 1685 - Chronic Portal Vein Thrombosis and Risk of Decompensation: Experience of a Moroccan Center, Chaima Hsain
- 1686 - Preoperative volume estimation versus actual graft weight in living donor liver transplantation: a retrospective analysis, Zehra İkbāl Karabal
- 1687 - Validation of Agile 3+ and Agile 4 for MASLD with advanced fibrosis and cirrhosis in a Canadian cohort, Keyur Patel
- 1688 - Evaluation of HBsAg, anti-HBcIgG, anti-HBs, and anti-HCV test results for individuals who visited primary-level Family Health Centers (12 years of data covering the province of İzmir and its districts), SELMA TOSUN
- 1689 - Rapidly Progressive Acute Liver Failure Caused by Infiltrative Hepatic Amyloidosis: A Case Report, Hakan Demiröz
- 1691 - Effects of biological agents on hepatitis B virus reactivation in patients who are negative for hepatitis B surface antigen and positive for antibodies against hepatitis B core antigen, Atiye Ayrik Demir
- 1692 - Fibrosis Regression Patterns in Chronic Hepatitis B: Evidence from Longitudinal Non-Invasive Biomarkers, Hamza Benazzouz
- 1693 - Evaluation of Artificial Intelligence in Clinical Decision Support: Application to Chronic Hepatitis B Cases According to the 2025 EASL Guidelines, Meriem Amine
- 1695 - CHATGPT FOR PATIENT QUESTIONS ABOUT CIRRHOSIS: USEFUL BUT NOT INFALLIBLE, Meriem Amine
- 1696 - Characterizing Primary Biliary Cholangitis in Men: Clinical, Biological and Histological Profile, Rajaa Boukhraiss
- 1697 - Combined use of fibrate and statin to reduce the risk of hepatocellular carcinoma: a population-based cohort study, Won Sohn
- 1699 - Endoscopic Management of Complications from Ruptured Hepatic Hydatid Cysts into the Bile Ducts, Meriem Amine
- 1700 - Artificial intelligence-based prediction of ursodeoxycholic acid response in primary biliary cholangitis: comparison of two large language models, Jaouhara Lahsini
- 1701 - Seronegative primary biliary cholangitis: clinical, biochemical and histological profile with comparison to seropositive disease, Jaouhara Lahsini

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1702 - Combining Interferon- γ and Nucleos(t)ide Analogues to Enhance Early Virological Response in Chronic Hepatitis B, **Weihua Cao**
- 1703 - First Case Report of Tenofovir Disoproxil Fumarate-Induced Perichondritis: A Case Study from the Perspective of Seronegative Autoimmune Processes, **Gölce Eylül Aldemir**
- 1704 - Case Report of Hematopoietic Disorder Complicated by Severe Liver Injury: Clinical Features and Mechanistic Insights into the Co-occurrence of Hemophagocytic Syndrome and Aplastic Anemia, **Linmei Yao**
- 1705 - Development of a Novel Animal Model for Acute-on-chronic liver failure (ACLF) in Metabolic dysfunction-associated steatotic liver disease: Confirmed the progression to ACLF in a non-cirrhotic liver disease stage, **Rui Zhao**
- 1706 - Bushen granule plus entecavir improved the effectiveness for HBeAg negative chronic hepatitis B: A multicenter, randomized, double-blind, placebo-controlled clinical trial, **Man Li #**
- 1707 - Analysis of Risk Factors and Fibrosis Severity in Type 2 Diabetic Patients with Metabolic Associated Fatty Liver Disease: A Cross-Sectional Study, **Taolong Zhou**
- 1709 - Neck circumference and the risk of metabolic dysfunction-associated steatotic liver disease in non-obese individuals without visceral obesity, **Kyoung A Ko**
- 1710 - Mn-Tannic Acid Immunomodulators Potentiate PDGFR α ; CAR-T Cell Function Through Enhanced proliferation for Synergistic Anti-Hepatic Fibrosis Therapy, **Qiang Zhu**
- 1711 - Rougan Formula Alleviates Liver Fibrosis by Suppressing Macrophage Glycolysis via Downregulation of the Tenascin-C / HIF-1 α / PFKFB3 Pathway, **Man Li**
- 1712 - Implementation of a Bidirectional Protection Model for Infection Control in a Dedicated Chronic Hepatitis B Outpatient Clinic: A Comprehensive Approach to Break the Chain of Bloodborne Transmission, **Yanzhi Duan**
- 1714 - Development and External Validation of Machine Learning-Based Prognostic Model for Liver Transplant Patients with HCC, **Yeongseok Hwang**
- 1716 - Hemoperitoneum as Initial Presentation of Hepatocellular Carcinoma in Chronic Hepatitis C: A Case Report, **Federico Peralta**
- 1718 - Pediatric MASLD prevalence in the NHANES from 2017 to 2020 and the role of aging-related factors, **Mengfei Liu**
- 1719 - Real-world Analysis of HBV pgRNA Dynamics and Its Correlation with Conventional Markers in CHB Management, **Wei Wang**
- 1720 - Integrated experimental and transcriptomic analyses reveal the therapeutic mechanisms of the herbal formula WenQingYin against intrahepatic cholangiocarcinoma, **Yue Chen**
- 1721 - Longitudinal Changes in Fibrosis Marker: Monitoring Fibrosis Progression in People with HIV and Metabolic Dysfunction-Associated Steatotic Liver Disease: A Longitudinal Cohort Study, **Yinzhong Shen**
- 1723 - Impact of empagliflozin on liver fibrosis in adults with type 2 diabetes and nonalcoholic steatohepatitis, **Sarker Mohammad Sajjad Sajjad**
- 1724 - Some biochemical characteristics among viral hepatitis associated HIV- positive people in Mongolia, **Indra Altankhuyag**
- 1728 - T Lymphocyte Subsets Participate in the Pathogenesis of Primary Biliary Cholangitis, **WEN GAO**
- 1730 - Histone deacetylase inhibitor givinostat attenuates metabolic dysfunction-associated steatotic hepatitis and liver fibrosis, **heming huang**
- 1733 - The ATP7B c.1543+40G>A Splice-Site Variant was Confirmed as Pathogenic through Familial Segregation Analysis in the Genetic Diagnosis of Wilson Disease, **Xiangsha Kong**
- 1734 - Diminished protection of Vitamin E in pediatric MASLD with lipid disorder: findings from a national wide survey, **Zitian Ren**
- 1736 - An Increase in Regulatory B Cells and a Reduction in T Helper 17 Cells Play a Crucial Role in Achieving Tolerance in Liver Transplantation, **Sung Won Lee**
- 1737 - Prognostic Impact of Cirrhosis in Patients with Hepatocellular Carcinoma and Concurrent MASLD Undergoing Surgical Resection, **Shin-Yu Tsai**
- 1741 - Alcohol-Use-Related Outcomes Following Fecal Microbiota Transplantation in Steroid-Ineligible Severe Alcohol-Associated Hepatitis: A Secondary Analysis of a Randomized Controlled Trial, **Mohit Varshney**
- 1742 - Pretreatment neutrophil-to-Lymphocyte Ratio as a Predictive Marker for Tumor Response to Atezolizumab plus Bevacizumab in Hepatocellular Carcinoma: A Multicenter Retrospective Study, **Young Mi Hong**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1743 - Area deprivation and hepatitis C infection in Korea: A multilevel analysis, 2005-2020, **Hwa Young Choi**
- 1744 - Proteomics Biomarker for Predicting Responders to Atezolizumab and Bevacizumab Therapy in Hepatocellular Carcinoma, **Ji Hoon Kim**
- 1745 - Flare to Failure: Hemoadsorption Therapy for Acute-on-Chronic Liver Failure in Chronic Hepatitis B Infection Unmasked During Antikoch's Therapy, **NATHANIEL CAMANGON**
- 1746 - Decision Tree model using Exosomes to Predict Favorable Outcome of Atezolizumab and Bevacizumab Combination Therapy in Hepatocellular Carcinoma, **Eunho Choi**
- 1748 - Analysis on the differences of clinicopathological characteristics in drug-induced liver injury patients with positive or negative autoantibodies and different clinical types, **Suwen Jiang**
- 1749 - Seroprevalence and Epidemiological Features of Hepatitis E Virus Infection in South Korea: Analysis of KNHANES Serum Samples, **In Hee Kim**
- 1752 - Exploring the Associations of Liver PDFF with Mortality and Disease Incidence: A Prospective Study in the UK Biobank, **Yingxin Sun**
- 1755 - Role of IL-16 in autoimmune hepatitis, **WEN GAO**
- 1756 - Recombinant human thrombopoietin promotes platelet recovery in hepatocellular carcinoma patients receiving interventional therapy combined with targeted and immunotherapy (SYNERGY-TPOACT): a retrospective cohort study, **Lifu Zhu**
- 1759 - Value of Preoperative Contrast-Enhanced CT-based Radiomics for Predicting CK19-Positive Hepatocellular Carcinoma, **Yawen Wang**
- 1760 - Comparison of effectiveness between phentermine/topiramate and liraglutide in obese patients with metabolic dysfunction-associated steatotic liver disease, **Young Eun Chon**
- 1761 - Expression of ALOX15 in the Development and Reversal of Liver Fibrosis and Its Effects on Macrophage Inflammatory Cytokine Secretion, **Yuanying Zhao**
- 1762 - From Liver to Spine: Spinal Metastatic Compression as the Initial Manifestation of Hepatocellular Carcinoma, **Jason Phowira**
- 1763 - Cirrhosis in Transition: Rapid Metabolic and Alcoholic Rise with Declining Viral Burden in an Indian Tertiary Center, **Udit Vaish**
- 1764 - Multidisciplinary management of diffuse intraductal papillary neoplasm of the bile duct in an elderly patient with limited therapeutic options, **Edzil Marice Forteza**
- 1765 - Synergistic Hepatoprotection via SREBP-1c/PPAR- α , FXR/CYP7A1, and Insulin Signaling Modulation by Empagliflozin and Cholestyramine in STZ induced diabetic rats, **MOHD. IBRAHIM KHAN**
- 1766 - Association Between Baseline Hepatic Nodules and Their 3-Month Dynamic Changes with Hepatocellular Carcinoma Risk in HBV Cirrhosis Patients on Antiviral Therapy, **Yaxin Li**
- 1767 - Comparison of Treatment Efficacy and Safety Profile of Atezolizumab Plus Bevacizumab in BCLC B and C Patients with Hepatocellular Carcinoma, **Chan Joong Bae**
- 1770 - Serum HBV Markers Reflect Intrahepatic cccDNA and Transcriptional Activity in a Phase-Dependent Manner in Chronic HBV Infection, **Hye Seon Kim**
- 1772 - HLA Variants and Oral Microbiome Signatures Associated with Antibody-Mediated Rejection Post Living Donor Liver Transplantation, **Rosmy Babu**
- 1773 - Siwu Decoction Inhibits Hepatocellular Carcinoma via Tumor Necroptosis-Induced Suppression of Myeloid-Derived Suppressor Cells, **Zixin FENG**
- 1774 - An Innovative, Integrated "Screen-to-Treat" Model with a Three-Tier Network Significantly Enhances Viral Hepatitis Screening Efficiency and Linkage to Care in Zhuhai, China: A Comparative Study, **Xiaofang Peng**
- 1777 - Metabolic Dysfunction, Particularly Diabetes, Accelerates Liver Disease Progression in Chronic Hepatitis B, **Ke Yin**
- 1778 - Cirrhosis and low-fibrosis MASLD driving demand for outpatient hepatology services at a large Australian quaternary referral centre, **Enoka Gonsalkorala**
- 1780 - NHL3 Knockout Enhances Sorafenib Sensitivity by Promoting G1 Phase Accumulation in Huh-7 Hepatocellular Carcinoma Cells, **Soner KARABULUT**
- 1784 - Whole Exome Sequencing Identifies PNPLA3 and Rare ABCC8 Variants as Genetic Risk Factors for Metabolic Dysfunction-Associated Steatotic Liver Disease in South Asians, **Dr. Asma Shabbir**
- 1786 - Environmental Risk Factors and Comorbidity Profiles Associated With Autoimmune Hepatitis in Korea: A Nationwide Case-Control Study, **Kyung-Ah Kim**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1787 - Metagenomic Study on Adult Cases of Hepatitis of Unknown Etiology: No Consistent Novel Pathogen Identified Amidst Highly Heterogeneous Viral Communities, [Minghui Li](#)
- 1788 - Yinchenhao Decoction Suppresses Metabolic Associated Fatty Liver Disease Inflammatory Injury by Regulating Monocyte Superoxide Metabolism, [Yu Zhao](#)
- 1789 - Correlation Between Liver Stiffness and Cognition in MASLD Patients Based on MRE and Neurovascular Coupling Assessment, [Zhuoru Jiang](#)
- 1790 - Prognostic utility of the Ammonia-to-ULN ratio (AMM-ULN) for predicting 28-day mortality and liver related complications in hospitalized patients with decompensated cirrhosis., [Nikhil Nagre](#)
- 1791 - Formulation of the second viral hepatitis action plan in Hong Kong: carrying forward the achievements for final push towards elimination, [Bonnie Chun Kwan Wong](#)
- 1792 - Undiagnosed Metastatic Hepatocellular Carcinoma presenting as Breast Mass in an Adult Male: A Case Report, [Emerald T. Gersava](#)
- 1793 - Effectiveness and Safety of 96-Week Tenofovir Amibufenamide in Patients with Hepatitis B Virus-Related Hepatocellular Carcinoma: A Retrospective Real-World Study, [Qinglei Zeng](#)
- 1794 - Ferulic acid-loaded liposomes mitigate Hepatic Ischemia-Reperfusion Injury in a rat model associated with Liver Transplantation via altering apoptosis, mitochondrial function and TLR-4/NF-B/NLRP3 inflammatory pathway, [Deepika Singh](#)
- 1795 - Turning the Tide: Successful Management of a Complicated Case of Acute-on-Chronic Liver Failure with Double Plasma Molecular Adsorption System, [Emerald T. Gersava](#)
- 1796 - A novel flavonoid Galangin modulates hepatic ischemia-reperfusion injury and regulates TLR-4/NF- κ B/NLRP3 inflammatory pathway following orthotopic liver transplants in rat models., [Deepika Singh](#)
- 1797 - Stellate Cell-Derived Complement Component 7 as a Determinant of Fibrosis Progression and Liver-Related Events in MASLD: An Integrated Multi-Omics Study, [Naoyuki Fujimori](#)
- 1801 - Fibrotic Burden in Metabolic Dysfunction-associated Steatotic Liver Disease Identifies Cardiovascular and Mortality Risk in Type 2 Diabetes, [Tae Seop Lim](#)
- 1807 - Increased risk of decompensation in patients with clinically significant portal hypertension awaiting endoscopic variceal screening - a metropolitan Australian study, [Ashok Raj](#)
- 1808 - Overshadowed by Immunotherapy: Unmasking Chemotherapy-Related Hepatic Vascular Injury (SOS-Pattern) and Managing Catastrophic Hemorrhage, [Xinhua Ren](#)
- 1809 - Transcriptomic Deconvolution Characterizes Intrahepatic Neutrophils in On-treatment Chronic Hepatitis B Patients with Liver Fibrosis, [Wenyue Wu](#)
- 1810 - Regulatory Mechanism of EEF2 lactylation in Calcium Homeostasis Dysregulation of MASLD Hepatocytes, [Miaomiao Tian](#)
- 1811 - Combination with glucocorticoids during artificial liver support system treatment does not improve the survival rate of Acute-on-chronic liver failure patients: A retrospective cohort study, [TA FUXIA TA](#)
- 1814 - Weight Reduction and Its Association With CAP and Liver Stiffness in MASLD, [Seong Kyun Na](#)
- 1817 - Comparison between Plasma Exchange and Dual plasma molecular adsorption system combined with Plasma Exchange on Acute-on-Chronic Liver Failure: A retrospective cohort study, [TA FUXIA TA](#)
- 1823 - Study on Risk Factors for Hepatocellular Carcinoma in Chronic Hepatitis B Patients Treated with Interferon, [Huihui Lu](#)
- 1826 - Primary biliary cholangitis with concomitant fatty liver disease: a reappraisal of clinical features, UDCA treatment response, and prognostic implications, [Xinyue Ma](#)
- 1827 - Identification of Ferroptosis-Related Biomarkers and Hub Genes in Non-Alcoholic Fatty Liver; an *In Silico* Transcriptomic Analysis, [Nadeem Sheikh](#)
- 1828 - Association of CORE Score with Parenchymal Liver Disease in HBsAg-Positive Patients, [Gölnur Kul](#)
- 1829 - Clinical Challenges in Diagnosing Primary Testicular Lymphoma: Report of Two Cases in Elderly Patients, [Linhui Hu](#)
- 1830 - Integrative Analysis of Differentially Expressed Ferroptosis-Related Genes in Cell-Cycle Regulation of Hepatocellular Carcinoma, [Nadeem Sheikh](#)
- 1831 - Effect of epigallocatechin gallate on ochratoxin induced liver damage, [Elif Cadirci](#)
- 1833 - Multifunctional Dialysate for Renal, Hepatic, and Pulmonary Support, [Adrian Dominik](#)
- 1835 - Meta-Analysis of Ferroptosis-Related Differentially Expressed Genes in Hepatocellular Carcinoma, [Nadeem Sheikh](#)

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1838 - Predictive Value of the aMAP Score for Hepatocellular Carcinoma Risk in Chronic Hepatitis B Patients Treated with Interferon, **Huihui Lu**
- 1839 - Efficacy of long term albumin therapy in the treatment of decompensated cirrhosis., **Ayush Jasrotia**
- 1840 - Severe Hepatic Steatosis Attenuates Response to PEG-IFN alpha-2b in HBsAg Clearance-Favorable Chronic Hepatitis B Patients: A Retrospective Cohort Study, **Pengxuan Wu**
- 1841 - Timing of endoscopic hemostasis does not affect the short-term outcomes in acute variceal bleeding in liver cirrhosis patients., **Hee Bok Chae**
- 1842 - T-MSCs Alleviate Autoimmune Hepatitis in a ConA Mouse Model by Inhibiting IL-21-Driven Inflammatory Responses, **Long Xu**
- 1844 - Yunpilishi Formula attenuates high-fat diet-induced obesity and fatty liver via inhibiting tPA, **YIJING ZHANG**
- 1845 - Inositol Hexaphosphate Prevent WD/CCI₄-Induced Metabolic Dysfunction-Associated Steatohepatitis in Mice, **Zhao Chen**
- 1847 - The Clinical Significance and Optimization Strategies of HBeAg Sero-clearance in Chronic Hepatitis B Treatment, **Yaqin Zhang**
- 1850 - Curative Outcome in Hepatocellular Carcinoma: A Case Report on Complete Pathologic Response After Multimodal Therapy, **Jeremie Manarang**
- 1852 - Navigating Vascular Complexity: Successful Locoregional Treatment of HCC with a Hepatic Arterioportal Fistula, **Christine Velasquez**
- 1853 - Surgical Site Infections Following Hepatectomy and Associated Risk Factors in a Tertiary Liver Surgery Center, **Anh Nguyen Thi Van**
- 1854 - Cross-Border Collaboration in Primary Sclerosing Cholangitis: A Landmark Living Donor Liver Transplant by Makati Medical Center (Philippines) and Asan Medical Center (Korea), **Zyrah Lou Samar**
- 1855 - Genotype-Phenotype Correlation of ATP7B Mutations in Wilson Disease, **Siqi Zhang**
- 1856 - THE VALUE OF ALBI AND ALBI-PLT SCORE IN PREDICTING ESOPHAGEAL VARICES IN CIRRHOTIC PATIENTS, **Dinh Thang Nguyen**
- 1858 - Analysis of risk factors for portal hypertension in early histological primary biliary cholangitis, **Hongxiao Hao**
- 1859 - Unmasking Hepatic Tuberculosis: A Case Series on Its Hepatobiliary Mimicry, Diagnostic Hurdles, and Management Challenges, **Christine Velasquez**
- 1860 - The Great Imitator in the Liver: A Case of Syphilitic Hepatitis Presenting as Cholestatic Jaundice, **Cleo Christille Lynn Lom-oc**
- 1862 - Radiomics-Based Skeletal Muscle Model at L3 for Predicting 90-Day Mortality in Acute-on-Chronic Liver Failure: Superior to MELD Score, **Siqi Zhang**
- 1863 - Differentiating acute-onset autoimmune hepatitis from drug-induced autoimmune-like hepatitis: a multicenter study and score development, **Haoyu Wen**
- 1864 - HONEYCOMBED LIVER: HEPATIC MELIOIDOSIS, A RARE MIMICKER OF PYOGENIC ABSCESS IN A NON-EXPOSED, DIABETIC PATIENT, **Christine Velasquez**
- 1865 - Biliary Mass Mimicking Cholangiocarcinoma as a presentation of Hepatobiliary Tuberculosis in a Young and Immunocompetent patient., **BETTYNA ROSE RUSTIA**
- 1866 - Real-world evidence on albumin use in the management of patients with cirrhosis and ascites during paracentesis in Taiwan, **Cristina Coll-Ortega**
- 1868 - Phenobarbital-Induced DRESS with Acute Liver Injury: A Hepatology-Focused Approach Using Early Immunosuppression and Hepatoprotective Support, **Christine Velasquez**
- 1869 - Societal impact of cholestatic pruritus in patients diagnosed with primary biliary cholangitis: A cross-sectional survey in Japan, **Atsushi Tanaka**
- 1870 - SILENT STONES SERIOUS INFECTION: THE ROLE OF ASYMPTOMATIC CHOLELITHIASIS IN PYOGENIC LIVER ABSCESS, **Desiree Jane Lacuin**
- 1871 - ORAL SEMAGLUTIDE FOR WEIGHT MANAGEMENT AND GASTROINTESTINAL SAFETY IN METABOLIC DISEASE; A META-ANALYSIS AND NARRATIVE LIVER OUTCOME SYNTHESIS, **Christine Velasquez**
- 1872 - Circulating C1Q+ monocytes associate with lower HBsAg level in chronic HBV infection, **Fengge Zhu**
- 1873 - The Clinical Epidemiology and Treatment of Acute Hepatitis C Caused by Unsafe Clinical Practices, **Qing-Lei Zeng**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1874 - Research on the Mechanism of LSEC Functional Abnormalities Induced by TMAO in porto-sinusoidal vascular disease, Yadi Li
- 1875 - Circulating NCAN as a protective biomarker and causal modifier of multistage liver disease, Tianyi Xia
- 1876 - Beyond the Usual Course: Prolonged Cholestatic Hepatitis A in a 36-Year-Old Female, John Paul Dela Peña
- 1877 - Dynamic Increase in HBsAg during Long-Term Antiviral Therapy: The Role of HBV Integration and Clonal Hepatocyte Expansion, Luqi Tang
- 1878 - Association between the alkaline phosphatase-to-albumin ratio and all-cause mortality in critically ill patients with cirrhosis and sepsis: a retrospective study, Xuanxuan niu
- 1879 - PRIMARY MYELOFIBROSIS PRESENTING WITH VARICEAL BLEEDING: A RARE CAUSE OF NON-CIRRHOTIC PORTAL HYPERTENSION, Desiree Jane Lacuin
- 1880 - The predictive value of different attenuation assessment tools for clinical adverse outcomes in patients with cirrhosis, YuYu Li
- 1881 - Serum free T3/ free T4 ratio as a predisposing factor for the development of metabolic dysfunction-associated steatotic liver disease: a large-scaled cohort study of euthyroid state, Hyunwoo Oh
- 1882 - Safety and Effectiveness of Peginterferon Alfa-2b Combined with Tenofovir Amibufenamide in Patients with Chronic Hepatitis B, Qing-Lei Zeng
- 1884 - Variceal bleeding in toddlers: Is the endoscopic outcome in extrahepatic portal hypertension worse than chronic liver disease?, Ajay Aravind
- 1885 - The sweet protein brazzein in ice cream suppresses postprandial glucose elevation in patients with metabolic dysfunction-associated steatotic liver disease (MASLD) and diabetes mellitus (DM)., Alexey Goncharov
- 1887 - Dynamic changes of serum lipids metabolism in hepatitis B virus related acute-on-chronic liver failure, Jing Lai
- 1888 - An Optimized In-Hospital Management Model Enhances Linkage to Care for Non-Hepatology HBV-Infected Patients: Interim Analysis of Hot Wave Project 2.0, Liang Peng
- 1891 - Research progress on the association between metabolic dysfunction-associated fatty liver disease and gallstones, shihao Guo
- 1892 - Reactive Pericarditis Secondary to Cholangitic Abscess from a Neglected Biliary Stent: A Case Report, BETTYNA ROSE RUSTIA
- 1894 - AI-Driven Pathomics: Transforming Precision Medicine Across the Chronic Liver Disease-Hepatocellular Carcinoma Spectrum, Huiyang Fan
- 1896 - Xinjiang Uygur Autonomous Region Traditional Chinese Medicine Hospital, Menyao He
- 1898 - Successful Management of Hepatitis B Virus Reactivation-Induced Acute-on-Chronic Liver Failure with Integrated Traditional Chinese and Western Medicine: A Case Report, Lu Ziman Lu
- 1900 - Prevalence of Hepatitis B and C among Adolescents and Young Adults in Sindh, Pakistan: A Substudy of a Provincial Population-Based Survey, Abhishek Lal
- 1901 - A Modular Assembly of Urine-Derived Stem Cells and Hydrogel into a Therapeutic Ectopic Mini-Liver for Wilson's Disease, Jiaqi Li
- 1902 - Antiviral Therapy Leads to Virological Response and Functional Cure in Treatment-Naïve Indeterminate-Phase Chronic Hepatitis B with Normal ALT, Mengya Liu
- 1904 - High prevalence of Hepatic Steatosis in adolescence and Young Adults A crosssectional survey from Sindh Pakistan, Abhishek Lal
- 1905 - Partial Splenic Embolization in a Cirrhotic Patient with Refractory Variceal Bleeding and Portal Venous Thrombosis, Rafael Emmanuel Mendoza
- 1907 - Delayed diagnosis of intrahepatic cholestasis of pregnancy in North India: Uncovering health-system gaps through a mixed-methods approach, Tushar Prabhakar
- 1910 - A Bibliometric Analysis of the Diagnosis and Treatment of Portal Hypertension Based on the Web of Science Database, Hezhao Wang
- 1913 - Impact of air pollution to liver diseases, Bolor Beejin
- 1914 - Research progress on the association between metabolic dysfunction-associated fatty liver disease and gallstones, shihao Guo
- 1915 - Ibrutinib-Associated HBV Reactivation in Hematologic Malignancies: Clinical Experience From Our Center, SELMA TOSUN

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1917 - Association between the platelet/high-density lipoprotein cholesterol ratio and metabolic dysfunction-associated steatotic liver disease: A cohort study, **Weihua Cao**
- 1919 - Trends of Chronic Liver Disease and Cirrhosis Mortality in Medically Underserved Areas of Taiwan, 2015–2022, **Kuo-Chih Tseng**
- 1921 - Clinical spectrum and long-term adverse outcome of Infantile onset Extrahepatic Portal Vein Obstruction, **Ajay Aravind**
- 1922 - Clinical and therapeutic characteristics of patients infected with hepatitis B and D viruses in a tertiary center from Bucharest, Romania, **Isabela-Daniela Staicu**
- 1924 - Safety and feasibility of next-generation extracorporeal albumin detoxification/-dialysis for long-term bridging to liver transplantation in secondary sclerosing cholangitis, **Jan Stange**
- 1925 - Burden of metabolic dysfunction-associated steatotic liver disease in Saudi Arabia: Evidence from the first nationwide population-based cohort study, **Saleh A. Alqahtani**
- 1927 - The severity of diabetes mellitus in metabolic dysfunction-associated steatotic liver disease in the Saudi population, **Saleh A. Alqahtani**
- 1928 - Beyond the usual suspects: uncovering autoimmune hepatitis overlap with Wilson disease, **Basavaraj Patil**
- 1929 - hUC-MSC-Derived Exosomal miR-22-3p Attenuates Liver Fibrosis via Inhibition of the NLRP3 Inflammasome, **Wei Huang**
- 1930 - Outcomes of Percutaneous Interventions in Liver Abscess in children: 15-year experience from a tertiary care center, **Ajay Aravind**
- 1931 - Hepatitis B Surface Antigen Seroclearance in Chronic Hepatitis B Patients. A Multicenter Study From Türkiye, **Nazan Tuna**
- 1932 - Parkin perturbs Hepatocyte Mitochondria-associated Endoplasmic Reticulum Membranes Dynamics, **Zhong wen Wang**
- 1933 - Advancing Fibrosis Assessment in Chronic Hepatitis C Through Non-Invasive Approaches, **ikram aluahabi**
- 1936 - Generalized Anxiety Among the patients of Fatty Liver Disease: A Cross Sectional Study, **Imteaz Mahbub**
- 1937 - Evaluating Baveno-VII Recompensation in Children with Autoimmune Decompensated Cirrhosis: Clinical Predictors and Immune Axis Modulation, **Anmol Anmol**
- 1939 - Transient elastography versus the fibrosis-4 index for fibrosis detection in metabolic dysfunction-associated steatotic liver disease and metabolic dysfunction-associated steatohepatitis, **Shadan AlMuhaidib**
- 1942 - Long-term outcomes of chronic hepatitis B: Effect of metabolic risk factors on liver stiffness measurement by vibration controlled transient elastography, **BENGU TATAR**
- 1944 - Baveno VII-Defined Hepatic Recompensation in Children with Decompensated Cirrhosis: Frequency and Determinants, **Anmol Anmol**
- 1946 - Comprehensive Assessment of HBV Reactivation in Immunosuppressed Hematology Patients: Serological and Clinical Perspectives, **SELMA TOSUN**
- 1947 - Hepatocellular Carcinoma: A Seven-Year Cohort Revealing Large Tumor Size and Advanced Fibrosis Despite Early BCLC Staging, **SAMIA M'RABET**
- 1948 - Genetic and metabolic characteristics of metabolic dysfunction-associated steatotic liver disease in a pilot subset of a population-based cohort study in Saudi Arabia, **Saleh A. Alqahtani**
- 1951 - Clinical, Laboratory and Microbiological Profile of Post-ERCP Infections: A Retrospective Study from a Single Tertiary Referral Center, **Sibel Yıldız**
- 1952 - Performance of anti-HCV screening and identification of false-positive results in a real-life cohort, **Sena Nur Doğan**
- 1953 - Chronic Dexamethasone Drives Selective SNAT Remodeling to Fuel HNF4-Alpha-Mediated Gluconeogenesis, **Elif Cadirci**
- 1955 - The overlooked Threat on the Path to Hepatitis B Eradication: Delta Hepatitis, **ALPER GÜNDÜZ**
- 1956 - Comparative Evaluation of Serological, Virological, and Biochemical Outcomes in Chronic Hepatitis B Patients Receiving Tenofovir or Entecavir, **BENGU TATAR**
- 1957 - HBx Upregulates the Interferon Negative Regulator IFITM2 via Activating the JAK-STAT Pathway and Impairing Lysosomal Function, **Jiayi Wang**
- 1958 - Optimizing operator competency in transient elastography for metabolic dysfunction-associated steatotic liver disease screening: a multicenter study, **Faisal Abaalkhail**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1959 - Investigation of the Effects of Nintedanib in Liver Damage Induced by CCl₄ in Rats, **Elif Cadirci**
- 1960 - High risk of obstructive sleep apnea among adults with metabolic dysfunction-associated steatotic liver disease based on findings from a national population study, **Saleh A. Alqahtani**
- 1961 - HBV Reactivation in Rheumatology Patients With Resolved Hepatitis B Infection Receiving DMARD Therapy, **Ebru Taşpınar Şen**
- 1962 - Native liver survival in pediatric hyperacute liver failure: Is standard medical therapy effective ?, **Akash Nair**
- 1963 - Hepatitis B Screening Prior to Immunosuppressive Therapy in Patients with Multiple Myeloma, **Sabahat Çeken**
- 1964 - Nephropathy Following Portosystemic Shunt Surgery in Children with Extrahepatic Portal Venous Obstruction: A hitherto undescribed entity, **Akash Nair**
- 1966 - Investigating hepatitis B virus recurrence in post-liver transplant patients: a single-center retrospective cohort study, **Alara Apa**
- 1969 - Patients with Hepatocellular Carcinoma Undergoing Transarterial Therapies Have Higher Risk of Hepatic Decompensation With Transarterial Radioembolization and Are Linked to Worse Prognosis, **Saleh A Alqahtani**
- 1970 - Impact of metabolic dysfunction-associated steatotic liver disease on health-related quality of life among adults in a national Saudi population study, **Saleh A. Alqahtani**
- 1971 - Evaluation of HBV screening status and test results for mothers, fathers, siblings, spouses, and children of individuals who are HBsAg positive, **SELMA TOSUN**
- 1972 - Comparative Inpatient Outcomes and Comorbidity Profiles in Patients with Alcohol-Associated Liver Disease With and Without Metabolic Syndrome: Insights from a Nationally Representative US Database, **TALAL KHURSHID BHATTI**
- 1974 - Investigation of SNAT Gene Expression in Liver Tissue in an Experimental Diabetes Model, **Elif Cadirci**
- 1975 - NTCP S267F (rs2296651) in HBV Infection Among Asian Populations: A Systematic Review and Meta-analysis, **Alfiyyah Rizqy**
- 1976 - Advanced liver fibrosis in patients with metabolic dysfunction-associated steatotic liver disease (MASLD) impairs sensory perception of ice cream with the protein sweetener brazzein, **Alexey Goncharov**
- 1977 - PREVALENCE OF LIVER FIBROSIS AMONG A COHORT OF PATIENTS WITH METABOLICALLY ASSOCIATED STEATOTIC LIVER DISEASE (MASLD) FOLLOWED AT AN URBAN SETTING: IMPACT OF UTILIZATION OF FIBROSCAN., **Elkhashab Magdy**
- 1978 - Clinical characteristics and one-year survival of patients with hepatocellular carcinoma linked to metabolic dysfunction-associated steatotic liver disease: findings from a comprehensive institutional registry, **Saleh A Alqahtani**
- 1979 - Squamous cell carcinoma of the gallbladder: A case report, **Houda Chehboune**
- 1980 - SPLEEN-STIFFNESS MEASUREMENT AS A FAVORABLE PREDICTOR OF PORTAL HYPERTENSION IN A COHORT OF PATIENTS WITH CHRONIC LIVER DISEASE FOLLOWED AT AN URBAN LIVER CENTRE IN TORONTO (TLC), **Elkhashab Magdy**
- 1981 - Improving Elimination in Albumin-Dialysis Liver Support: Different Responses of Water-Soluble and Albumin-Bound Toxins, **Stine Koball**
- 1983 - Unmasking Cryptogenic Cirrhosis: Extreme Low LDL-C as a Critical Clue for Adult-Onset Familial Hypobetalipoproteinemia, **Yusuf Bünyamin Ketenci**
- 1986 - Polymeric Nanoparticle-Mediated Delivery of miR-221 as a Novel Therapeutic Approach for Hepatocellular Carcinoma, **Eman El-Ahwany**
- 1987 - The Economic and Health Burden of Liver Cancer in Saudi Arabia: An Analysis of Costs, Health Outcomes, and the Advantages of Early Detection, **Saleh A Alqahtani**
- 1988 - Research on Biomarkers of Liver Injury in Patients with Hepatocellular Carcinoma under Combined therapies Based on ICIs, **yiheng tang**
- 1990 - Description of a Cohort of patients with chronic Liver disease of various etiologies characterized by TEE (Fibroscan): Toronto Liver Centre (TLC)-Real-world experience.HIGH PREVALENCE OF MASLD, **Jumshaid Qureshi**
- 1991 - Advances in early detection of hepatocellular carcinoma: a systematic review of novel diagnostic approaches, **Saleh A. Alqahtani**
- 1992 - Sustained Virologic Response After Only One Week of Glecaprevir/Pibrentasvir: A Rare Ultra-Short Treatment Success, **Hatun Öztürk Çerik**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 1994 - Effects of biological agents on hepatitis B virus reactivation in patients who are negative for hepatitis B surface antigen and positive for antibodies against hepatitis B core antigen, **Atiye Ayrik Demir**
- 1995 - Ethnic Variation in FibroScan-Detected Fibrosis and Steatosis in a Large Multi-Ethnic Canadian Cohort: Implications for Targeted MASLD Screening, **Ilya Abedi**
- 1996 - Triple Threat: A Rare Case of Drug-Induced Liver Injury Triggering Autoimmune Hepatitis and Overlapping Systemic Lupus Erythematosus, **Yrah Damiene Fernandez**
- 1997 - Hepatic resection versus stereotactic body radiation therapy as first-line treatment for BCLC stage 0 hepatocellular carcinoma: a propensity score-weighted analysis, **Sang Min Yoon**
- 1998 - The Efficacy of Atezolizumab and Bevacizumab Combination in real world for Advanced Hepatocellular Carcinoma, **JI HOON KIM**
- 1999 - Malnutrition and its association with mortality in liver cirrhosis: a prospective nutritional assessment in northern Iran, **Fariba Yadollahi**
- 2001 - Retrospective Analysis of Clinical and Genetic Characteristics in 68 Adult Patients with Gilbert Syndrome from a Tertiary Hospital in Southwest China, **Ning Han**
- 2003 - Mechanism-Based Efficacy and Advantage of Traditional Chinese Medicine in Treating Anemia Associated with HBV-Related Hepatocellular Carcinoma from an Inflammatory Perspective, **Wanxin Shi**
- 2005 - The positive impact of the national HBV vaccination program implemented in Turkey on the prevalence of HBV among health school students, **SELMA TOSUN**
- 2007 - A Survey on Awareness of Antiviral Therapy Among CHB Patients, **Yanqin Du**
- 2009 - A research on gastroesophageal varices in patients with liver cirrhosis of different etiologies, **Yuerong Zhang**
- 2011 - Integrated Multi-omics Liquid Biopsy: Advancing Early Detection and Precision Management of HCC, **Xinhao Gao**
- 2013 - Projected health and economic impact of physical activity on metabolic dysfunction-associated steatotic liver disease in Saudi Arabia: A Markov modeling study, **Saleh A Alqahtani**
- 2014 - Longitudinal Changes in Non-Invasive Fibrosis Markers and Risk Factors for Fibrosis Progression in People with HIV and Metabolic Dysfunction-Associated Steatotic Liver Disease, **Yinzhong Shen**
- 2015 - A research on gastroesophageal varices in patients with liver cirrhosis of different etiologies, **Yuerong Zhang**
- 2016 - Comparing Protein Induced by Vitamin K Absence II and Alpha-Fetoprotein in Hepatocellular Carcinoma: Clinical and Tumor-Related Correlations in a Filipino Cohort, **Matthew Joseph Po**
- 2017 - The Cost Changes in Hepatitis C Patients Before and After the Introduction of Direct-Acting Antivirals in Korea, **Hwa Young Choi**
- 2020 - FOXK1 aggravates acute liver failure through HIF-1 α -mediated histone lactylation at H4K16, **Chengcheng Li**
- 2021 - Sex-related differences in clinical and immunologic phenotype of male primary biliary cholangitis: a retrospective cohort study, **Xia Liu**
- 2022 - Xiaozhi Huaxian Formula Ameliorates Type 2 Diabetes-Associated Metabolic Dysfunction-Associated Steatohepatitis via the Gut-Derived Acetate-Hepatic GPR43 Axis, **Xin Wang**
- 2024 - Coronary heart disease is an independent risk factor for liver fibrosis progression in patients with MAFLD, **Yuqing Zhao**
- 2025 - Targeting the Gut-Liver Axis Novel Strategies for Liver Cirrhosis Intervention, **Fan'e Cheng**
- 2026 - A Bibliometric Analysis of Medicinal Food in Chronic Liver Disease Research, **Fan'e Cheng**
- 2030 - İrritabl Bağırsak Sendromu Olan Reprodüktif Dönemdeki Kadınlarda Yaşam Kalitesinin Değerlendirilmesi, **ahmet uyanıkoğlu**
- 2031 - Global Burden and Trends of Primary Liver Cancer Attributable to Comorbid Type 2 Diabetes Mellitus Among People Living with NASH: An Observational Trend Study from 1990 to 2021, **Xinyu Zhao**
- 2032 - The Therapeutic Potential of Traditional Chinese Medicine in the Management of Chronic Hepatitis B, **Fan'e Cheng**
- 2033 - Risk stratification of chronic kidney disease using noninvasive tests in metabolic dysfunction-associated steatotic liver disease, **Seung Up Kim**
- 2034 - Pathomorphological characteristics of the marginal gingiva in patients with viral hepatitis B, **Vahe Azatyan**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2036 - Targeting T-Cell Exhaustion in Chronic Hepatitis B: Therapeutic Potential and Mechanisms of Traditional Chinese Medicine and natural products, Xinyu Zhao
- 2037 - Assessment of hemoglobin A1c in hemodialysis patients with diabetes before and after erythropoietin treatment, Mohamed abdelmegeed ahmed
- 2038 - Normal FIB-4 values do not exclude advanced fibrosis in Egyptian MASLD patients, Mohamed Abd Elmaged Ahmed
- 2040 - Analysis of Clinical Characteristics in Patients with Early-Stage Primary Biliary Cholangitis Complicated by Portal Hypertension, Hongxiao Hao
- 2042 - Prevalence and Risk Factors of Metabolic Dysfunction-Associated Fatty Liver Disease in the Adult Georgian Population: A Nationwide Multiregional Clinic-Based Study, Tatia Khachidze
- 2043 - Effects of immunosuppressants on HAV replication in human hepatoma cell lines, Tatsuo Kanda
- 2044 - Spatiotemporal Changes in the Burden of Viral Hepatitis and the Influence of COVID-19 in China: A 20-Year Analysis, Yuan-Hai Zhou
- 2046 - Clinical Characteristics and Outcomes for Hepatocellular Carcinoma with Extrahepatic Metastases, wei lun tsai
- 2048 - INVESTIGATION OF THE RELATIONSHIP BETWEEN SUBCUTANEOUS AND VISCERAL FAT TISSUE MEASUREMENTS AND NON-INVASIVE FIBROSIS SCORES (FIB-4, APRI, AAR) IN THE EVALUATION OF LIVER DAMAGE ASSOCIATED WITH CELIAC DISEASE, Sedat ÇİÇEK
- 2049 - Zinc acetate enhances glucose-regulated protein 78 and anti-HAV activity of ribavirin in vitro, Tatsuo Kanda
- 2050 - Long-term Outcomes of Tenofovir Therapy in Vietnamese Chronic Hepatitis B Patients: A 5-Year Retrospective Cohort Study, Hien Chu Thi My
- 2051 - PILOT STUDY ON LONG-TERM EFFECTIVENESS OF THE KARLOVY VARY THERMAL SPRING DRINKING CURE FOR MASLD, Ladislav Spisak
- 2052 - A Young Patient Presenting With Hepatocellular Carcinoma and Portal Vein Thrombosis Developing on a Background of Non-Cirrhotic Hepatitis B: A Case Report, Ahmet Uyanikoglu
- 2054 - Association of SGLT2 Inhibitors with Reduced Hepatocellular Carcinoma Risk in Patients with Type 2 Diabetes, Jonggi Choi
- 2055 - Cost-Effectiveness Evaluation of Elmetenovir in the Treatment of Chronic Hepatitis B, Gao Chen
- 2057 - Application Value of HBV RNA Quantitative Detection in Antiviral Treatment Monitoring for Chronic Hepatitis B Patients, Gao Chen
- 2058 - Clinical Application Value of HBV RNA Detection in HBV DNA-Negative Chronic Hepatitis B Patients, Gao Chen
- 2059 - Application Value of HBV RNA Detection in Assessing the Risk of Relapse After Discontinuation of Antiviral Treatment in Patients with Chronic Hepatitis B, Gao Chen
- 2060 - Efficacy and Safety of Tenofovir Amibufenamide in the Treatment of Elderly Patients with Chronic Hepatitis B and Liver Cirrhosis, Gao Chen
- 2061 - Real-World Study of Tenofovir Amibufenamide in the Treatment of Hepatitis B-Related Liver Cirrhosis, Gao Chen
- 2062 - Clinical Significance of Prognostic Nutritional Index for Prognostication of Decompensated Liver Cirrhosis: A Retrospective Cohort Study, Kevin Rae Lumunsad
- 2063 - Research Trends and Hotspots in Autoimmune Hepatitis: A Bibliometric Analysis, Jiatu Zhong
- 2064 - Early Antibiotic Exposure Shortens Progression-Free Survival in Unresectable Intermediate-Advanced HCC Treated With ICI Plus TKI and TACE: A Propensity-Score Matched Study, Xiucheng Pan
- 2069 - Effects of Angelicae Sinensis Radix Combined with Paeoniae Radix Alba on Enterogenous Endotoxin and Hepatic Toll-like Receptor 4 Signaling Pathway in Mice with High-Fat Diet-induced Metabolic Dysfunction-Associated Steatohepatitis (MASH), Yuhan Wang
- 2070 - THE USE OF A MODIFIED GREAT SAPHENOUS VEIN FOR HEPATIC VEIN RECONSTRUCTION IN RIGHT-LOBE LIVING DONOR LIVER TRANSPLANTATION, Zhambyl Ospan
- 2071 - PORTAL FLOW MODULATION IN LIVING DONOR LIVER TRANSPLANTATION, Maxat Doskhanov
- 2072 - Role of TRIM37/IKK α ; axis in hepatic ischemia/reperfusion injury, Qin Luo
- 2073 - FAM49B inhibits TRAF6 ubiquitination and alleviates liver ischemia reperfusion injury, Qin Luo
- 2074 - Prediction of Non-Alcoholic Fatty Liver Disease by Machine Learning Algorithms, Chia-Yen Dai

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2075 - Efficacy and safety of transarterial chemoembolization plus dual immune and anti-angiogenic blockers for unresectable hepatocellular carcinoma: a systematic review and meta-analysis, **Omar Elkoumi**
- 2076 - Xiaozhi Huaxian Formula ameliorates type 2 diabetes mellitus-associated metabolic dysfunction-associated steatohepatitis through modulating hepatic interleukin-23/interleukin-17 Axis, **Ning Yao**
- 2077 - Xiaozhi Huaxian Formula ameliorates type 2 diabetes mellitus-associated metabolic dysfunction-associated steatohepatitis through modulating hepatic interleukin-23/interleukin-17 Axis, **Ning Yao**
- 2078 - Highly Discriminative Risk Stratification for Long-Term Liver-Related Mortality in MASLD Patients, **Pei-Chien Tsai**
- 2079 - Clinical characteristics of patients with primary biliary cholangitis across various disease stages, **Weihua Cao**
- 2080 - Comparing Care Settings for Sofosbuvir/ Ravidasvir Delivery in Hepatitis C: Nested Cohort Findings from the EASE Trial, **Muhammad Firdaus Md Salleh**
- 2082 - Time to Viral Load Suppression with 8- versus 12-Week Ravidasvir/Sofosbuvir Regimens among Chronic Hepatitis C Patients in Malaysia, **Muhammad Firdaus Md Salleh**
- 2084 - Workflow Optimization to Reduce Chemotherapy Drug Waiting Time in Inpatient Settings, **Shu-Hua WANG**
- 2085 - Inhibition of Aurora B Induces Senescence and Potentiates Immunotherapy in Hepatocellular Carcinoma, **Xuhui Ma**
- 2088 - The Effect of Semaglutide on Liver Histology in Metabolic Dysfunction Associated Steatohepatitis: A Systematic Review and Meta-Analysis of Randomized Controlled Trials, **Angelica Mariano**
- 2089 - Secondary Biliary Cirrhosis Following Iatrogenic Bile Duct Injury, **Mohammed Tozammel Haque Haque**
- 2090 - Integration of Microbial Signatures into Machine Learning Models Significantly Improves Prediction of Adverse Outcomes in Patients with Hepatitis B-Related Cirrhotic Ascites, **Jiaran Sun**
- 2091 - Treatment outcome of interferon based therapy versus sofosbuvir ribavirin therapy in chronic hepatitis C genotype 3 and compensated liver cirrhosis, **mainuddin ahmed**
- 2093 - Effects of Extracellular Vesicles Secreted by Gut Microbiota on the Function of Peripheral CD8+ T Cells and Regulatory T Cells in Patients with Hepatocellular Carcinoma, **Zhao yiru Zhao**
- 2095 - Preliminary Evaluation of Real-World Efficacy and Safety of Tenofovir Prafulvate Tablets in the Treatment of 16 Patients with Chronic HBV Infection, **Xiaohong Gao**
- 2096 - Case Report of Decreased Cholinesterase Levels During Treatment with Prifosfamide Mesylate in a Patient with Chronic HBV Infection, **Xiaohong Gao**
- 2097 - Improving Elimination in Albumin-Dialysis Liver Support: Different Responses of Water-Soluble and Albumin-Bound Toxins, **Stine Koball**
- 2098 - An Observational Study on the Early Intervention Treatment of Fuzheng Huayu Capsule Combined with Antiviral Drugs in High-Risk Populations of HBV-Related Hepatocellular Carcinoma, **Xiaohong Gao**
- 2099 - Clinical Analysis of Early Renal Injury in HBV-Infected Patients Treated with Nucleos(t)ide Analogues, **Xiao Hong Gao**
- 2101 - A Non-invasive Diagnostic Prediction Model for AMA-Negative Patients with Primary Biliary Cholangitis, **Weihua Cao**
- 2103 - Association of MR elastography parameters with prognostic indices, neutrophil-to-lymphocyte ratio, hepatocyte function, and cholestasis parameters in chronic liver disease, **Diğdem Kuru Öz**
- 2106 - Disease burden of chronic hepatitis B among pregnant women increased dramatically with age – a territory-wide study, **Terry Cheuk-Fung Yip**
- 2108 - Post-Liver Transplant Outcomes and Donor Safety in Bangladesh: A Nationwide Questionnaire-Based Observational Study, **Mohammad Forhad Abedin Abedin**
- 2109 - Soluble CD14 Predicts Prognosis, Diuretic Response, and Acute Kidney Injury in Decompensated Cirrhosis with Refractory Water Retention, **Masato Nakai**
- 2111 - Prevalence of Liver Enzyme Abnormalities in PCR-Confirmed Respiratory Viral Infections: A 321-Patient Cohort, **Sinan Mermer**
- 2112 - Core genes with opposite expression changes and their inflammation-related regulatory network during the progression and regression of NASH liver fibrosis, **Bingqing Yang**
- 2114 - Targeted Activation of Lipophagy Attenuates MASH Progression in a Murine Model, **Qian Wang**
- 2115 - Determinants of severe liver fibrosis in patients with MASLD: a five-year retrospective cross-sectional study, **Frances Melissa Cielo**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2116 - Acute liver failure after transarterial embolization of hemorrhaging hepatocellular adenoma, Frances Melissa Cielo
- 2118 - Hepatitis B and C Prevalence Among Transgender Individuals and Men Who Have Sex with Men in Pakistan, Hassan Mahmood
- 2119 - Introducing Hepatitis B Birth Dose Vaccination Within 24 Hours of Birth: A Pilot Project in Pakistan, Huma Qureshi
- 2120 - GLP-1 receptor agonists associated with reduced risk of digestive cancers in patients with diabetes: global real-world evidence, Chun-Ying Wu
- 2122 - Effect of a Porous Glass-Membrane Emulsification Method on Radiological Response in Epirubicin-Lipiodol cTACE for HCC, Shinya Endo
- 2123 - Efficacy and safety of glucocorticoids in multi-etiology liver injury: a single-center real-world retrospective cohort study, Xiao Lin
- 2126 - Pemphigus vulgaris in immunotherapy of hepatocellular carcinoma and response to treatment, Eman Rewisha
- 2127 - Association of copper exposure with fatty liver progression and mediation by perturbation of metabolic pathways, Ying Lu
- 2128 - Triglycerides and high-density lipoprotein cholesterol are primary lipid determinants of steatosis severity in metabolic dysfunction-associated fatty liver disease, Jinjin Liu Liu
- 2129 - Bile Duct Reduction Without Ductular Reaction: A Key Pathological Feature of Alagille Syndrome, Hong-Li Liu
- 2131 - PROGNOSTIC VALUE OF SERUM AMMONIA FOR SHORT-TERM MORTALITY IN CIRRHOSIS: A SYSTEMATIC REVIEW, PRONNOY PEREIRA
- 2133 - Hepatitis (B, C & D) and HIV Seroprevalence Survey in Sindh Province, Pakistan, Huma Qureshi
- 2135 - Assessing HCV Re-infection Rates and Linkage to Care among Transgenders and MSM in Pakistan: A Follow-up Study, Hassan Mahmood
- 2136 - Implementing a Micro-Elimination Program for Hepatitis C and Hepatitis B Diagnosis and Referral in Khairpur District, Sindh Province, Pakistan: A Pilot Project for National HCV Elimination Initiative, Hassan Mahmood
- 2138 - Evaluation of the Elecsys HCV Duo Assay for Screening and Testing of Hepatitis C Virus in Pakistan, Huma Qureshi
- 2139 - Multi-Omics Biomarkers for Early Detection of Metabolic Dysfunction-Associated Fatty Liver Disease, Yunlong Yao
- 2140 - A cost-effective analysis of transportation of blood for HCV RNA using the plasma preparation tube vs the plasma separation card, Huma Qureshi
- 2141 - Environmental Toxicity-Related Metabolic Signatures and Disease Severity in MAFLD, YunLong Yao
- 2142 - Artificial Intelligence-Assisted Ultrasound Imaging for Non-Invasive Assessment of Liver Fibrosis, YunLong Yao
- 2144 - Beyond complete response of advanced hepatocellular carcinoma to immunotherapy, what can we do?, Yosra Khalifa
- 2146 - Inhibition of TGF- β Signaling Attenuates Liver Fibrogenesis in an Experimental Cirrhosis Model, YunLong Yao
- 2147 - Single-Cell Transcriptomics Reveals Distinct Hepatic Stellate Cell Subpopulations Driving Liver Fibrogenesis, YunLong Yao
- 2149 - Hepatitis E Vaccination in Women of Childbearing Age: outcome and Implementation Challenges., Bushra Shahid Shahid Hussain
- 2151 - HBV infection accelerates hepatocyte senescence and induces T cell exhaustion via SASP secretion pathway, Ran Zhao
- 2153 - When the Heart Fails, the Liver Breaks: Congestive Cholestasis Presenting as ACLF, A Case Report and Literature Review, NATHANIEL CAMANGON
- 2154 - "Saroglitazar in MASLD: Translating Clinical Trials into Practice Through Liver Metrics, Rakesh Sugathan Sugathan
- 2155 - Gut Microbiota Dysbiosis Correlates with Disease Severity in Autoimmune Hepatitis, Xi Zhang
- 2156 - Combination Immune Checkpoint Inhibition and Antiangiogenic Therapy Improves Survival in Advanced Hepatocellular Carcinoma, Xi Zhang

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2157 - A Rare etiology of Liver mass in a patient of chronic Hepatitis C, Ghulam Mohiuddin
- 2158 - "Evaluating the Early Biochemical Impact of Saroglitazar on Liver Function Tests in MASLD Patients, Rakesh M Nair
- 2159 - A rare lymphoproliferative disorder in teenagers with spontaneous resolution on PET scan., Ghulam Mohiuddin
- 2160 - Finite versus indefinite nucleos(t)ide analogue therapy in HBeAg-negative chronic hepatitis B: Meta-analysis of Randomized Trials., Demver Gomez
- 2162 - A rare cause of Gastric malignancy with liver metastasis in a young Patient., Ghulam Mohiuddin
- 2163 - A rare etiology of Liver mass in a patient of chronic Hepatitis C, Ghulam Mohiuddin
- 2164 - AAV-Mediated ATP7B Gene Therapy Corrects Copper Metabolism in a Wilson's Disease Mouse Model, Xi Zhang
- 2165 - A rare lymphoproliferative disorder in teenagers with spontaneous resolution on PET scan., Ghulam Mohiuddin
- 2166 - Whole-Genome Sequencing Identifies Novel Genetic Mutations in Unexplained Pediatric Cholestatic Liver Disease, YunLong Yao
- 2169 - Multiple Cutaneous and Gastrointestinal Hemangiomas Presenting with Iron Deficiency Anemia: A Rare Case Report of Blue Rubber Bleb Nevus Syndrome., Ghulam Mohiuddin
- 2170 - PROBABLE ASHWAGANDHA-INDUCED HEPATITIS IN A HEALTHY YOUNG ADULT: A CASE REPORT, Abdulwahab Alqahtani
- 2171 - HBV RNA as a Predictor of Hepatocellular Carcinoma in Antiviral-suppressed Chronic Hepatitis B: A Systematic Review and Meta-analysis, Federico Peralta
- 2173 - Dietary Recommendations for Patients with Chronic Liver Diseases: The Need for Increased Awareness Among Non-Hepatologist Physicians, Alaa M. Mostafa
- 2174 - MAFLD aggravates Colorectal Cancer Progression: A quantitative MRI-PDFF-based study, Alaa M. Mostafa
- 2175 - High Prevalence of Unrecognized Advanced Fibrosis in Patients with MAFLD, Alaa M. Mostafa
- 2176 - Metabolic predictors of Liver fibrosis across MAFLD phenotypes: A cross-sectional study using Transient Elastography, Alaa M. Mostafa
- 2177 - MAFLD-CKM: Modified score better predicts long-term all-cause mortality, Yasser Fouad
- 2178 - Predictors and gaps in hepatocellular carcinoma staging and management: A multicenter, prospective study in Bangladesh, Md Yasir Arafat
- 2179 - Correlation analysis of HBVRNA and hepatitis B virological and biochemical indicators in treated chronic HBV-infected patients, Du Leilei
- 2180 - The value of serum HBV RNA in the diagnosis, treatment and prognosis of chronic hepatitis B, Du Leilei
- 2181 - Analysis of the clinical efficacy of sequential combined Peg-IFN treatment after NAs treatment in CHB patients, 雷雷 杜
- 2182 - Comparison of multiple drugs for metabolic dysfunction-associated fatty liver disease: A systematic review and network meta-analysis, Xin Ai
- 2183 - Predictors of HBsAg Clearance and Development of a Nomogram in Chronic Hepatitis B Patients with Low-Level Viremia Treated with Pegylated Interferon α-2b, Shiyu Wang
- 2184 - Related factors of fever after endoscopic treatment of variceal bleeding in patients with liver Cirrhosis complicated with esophageal variceal bleeding: A retrospective study, Yingying Zhao
- 2186 - Demographic Characteristics and Treatment Status of Primary Biliary Cholangitis: A Single-Center Study from Xinjiang, China., Xiaobo Lu
- 2187 - Budd-Chiari Syndrome Secondary to Combined Protein C, Protein S, and Antithrombin III Deficiencies in a Young Filipino Woman: A Rare Case Report, Dave Christian Ong
- 2190 - A novel intratumoral microbial risk score predicts survival and characterizes the immunosuppressive microenvironment in hepatocellular carcinoma, Hui Huang
- 2191 - Evolution of hepatocellular carcinoma staging within Egypt's national surveillance system: a success story (2019–2024), Mohamed AbdAllah
- 2193 - Serum sIL-2R Predicts Significant Histological Disease in Indeterminate Phase Chronic Hepatitis B, Xinghuan Fu
- 2194 - A case of hepatocellular carcinoma developed after antiviral treatment cessation due to HBsAg seroclerance., Youngnam Kim

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2196 - Early Risk Prediction of Hepatocellular Carcinoma in Cirrhosis Patients Based on Non-Contrast CT, Shifan Liu
- 2197 - A survey of the current status of research on the diagnosis and treatment of hepatitis C virus antibody-positive pregnant women, Xin Yue
- 2198 - "When Natural Becomes Toxic: Herbal Medicine-Induced Acute Liver Failure Treated With Double Plasma Molecular Adsorption System", LEAMSI GAY ARPON
- 2199 - Bridging numerical scores and lived experience in acute and chronic liver failure, Shuo Huang
- 2200 - Acute Liver and Gastric Injury Complicated by Acute Kidney Injury Following Massive Ferrous Sulfate Overdose: A Case Report, LEAMSI GAY ARPON
- 2202 - Bridging numerical scores and lived experience in acute and chronic liver failure, Shuo Huang
- 2203 - Why definitions of acute on chronic liver failure matter for trials and everyday decisions, Shuo Huang
- 2204 - Fragmented collaboration between liver and addiction services in alcohol related liver disease, Shuo Huang
- 2205 - Misaligned clinical and patient defined recovery in alcohol related liver disease, Shuo Huang
- 2206 - Silent degradation of artificial intelligence tools for liver disease in routine care, Shuo Huang
- 2207 - Making artificial intelligence in hepatology more holistic and aligned with clinical reasoning, Shuo Huang
- 2208 - How endocrine information is missing from contemporary chronic liver disease research, Shuo Huang
- 2209 - Overlapping metabolic reproductive and hepatic disturbance in women with fatty liver disease, Shuo Huang
- 2210 - "Demographic Characteristics of MAFLD with Emphasis on Young-Onset Disease in Pakistan, Anam Shakeel
- 2211 - Frequency of metabolic dysfunction associated steatotic liver disease (MASLD) amongst patients with inflammatory bowel disease (IBD), Md.Musab Khalil
- 2212 - Regorafenib as a second line therapy for Egyptian patients with an advanced stage HCC: real life data from a single center, Eman Rewisha
- 2213 - Pain Management Gaps in Hepatocellular Carcinoma: A Cross-Sectional Survey Study of Patient Perceptions, Misconceptions, and Unmet Needs, Jina Park
- 2216 - Gut-derived microbial nucleic acids modulate hepatic innate immune responses in steatotic liver disease, Akira Uchiyama
- 2217 - The Impact of Prophylactic Antibiotics on the Prognosis of Patients with Cirrhosis and Upper Gastrointestinal Bleeding, Lisha Shi
- 2219 - Higher matrix stiffness accelerates liver fibrosis by modulating fatty acid oxidation via PPAR γ /CPT1A signaling axis in hepatic stellate cells, Guanyue Su
- 2220 - Prospective Study on Prognostic Improvement and Suppression of Hepatocellular Carcinoma Development after Zinc Supplementation in Patients with Liver Cirrhosis Background and Aim, Atsushi Hosui
- 2221 - FABP4 as a Prognostic Biomarker and Its Clinical Relevance in Drug-Induced Cholestasis, Tianhui Zhou
- 2222 - The correlation between autoantibody spectrum and clinical pathological phenotype of Primary Biliary Cholangitis Patients, Weihua Cao
- 2223 - Hepatic IGFBP3 Attenuates Osteoblastic Differentiation in Cirrhotic Liver's Bone Axis via NF κ B Signaling, Xiaoli Ma
- 2224 - Hepatitis D-related liver disease as a major indication for liver transplantation: experience from a new liver transplant program in pakistan, Darayus Percy Gazder
- 2227 - Unilateral Sialadenosis as Initial Presentation of Alcoholic Hepatitis: A Case Report, Emerald Gersava
- 2228 - HBsAg Levels as Predictors of Fibrosis in Chronic Hepatitis B: A Systematic Review and Meta-analysis, Javaria Younas Muhammad Younas
- 2230 - HBsAg Levels as Predictors of Fibrosis in Chronic Hepatitis B: A Systematic Review and Meta-analysis, Javaria Younas Muhammad Younas
- 2231 - Hepatocellular Carcinoma Surveillance among Chronic Hepatitis C patients after successful SVR: Systematic Review and Meta-analysis of Economic Evaluation Studies, Soe Thiha Maung
- 2232 - Diagnostic Accuracy of FIB-4 Score for Detecting Advanced Fibrosis in NAFLD: A Systematic Review and Meta-analysis, Javaria Younas Muhammad Younas
- 2233 - Real-World Two-Year Outcomes of Atezolizumab and Bevacizumab in Unresectable Hepatocellular Carcinoma Single-Center Experience, Shahira El-Etreby

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2234 - Preliminary results of STRIDE regimen in Egyptian HCC patients: A Single-Center Real-World Experience, Shahira El-Etreby
- 2235 - Association Between HbA1c Levels and Risk of Liver-Related Events in NAFLD Patients: A Systematic Review and Meta-analysis, Israr Ullah Abdul Qadeem
- 2236 - Cimicifugae Rhizoma Suppresses Hepatoblastoma Proliferation by Downregulating G6PD Expression, Jiajia Zhou
- 2237 - RSRC1 Promotes Hepatocellular Carcinoma Progression by Mediating Homologous Recombination Repair and Regulates Sensitivity to PARP Inhibitors, Chunyan Ruan
- 2238 - UNCOVERING THE ONCOGENIC ROLE OF PKMYT1 IN HEPATOCELLULAR CARCINOMA THROUGH INTEGRATED BIOINFORMATICS, Wei Hou
- 2239 - The ratio of GGT to PLT indices is a predictive factor for the progression of liver fibrosis in NA-treated chronic hepatitis B patients with advanced fibrosis plus PEG-IFN α 2a therapy, Xiucheng Pan
- 2242 - Dynamic Survival Prediction and Treatment Adjustment System for Advanced Biliary Tract Cancer, Jie Liu
- 2243 - Qutan huoxue decoction alleviates MASH-induced fibrosis by regulating LC3-mediated macrophage mitophagy, Hongliang Liu
- 2246 - Sulforaphane Inhibits N-Nitrosodimethylamine induced Hepatocellular Carcinoma Stem Cell Properties via ZNF652/Sonic Hedgehog axis, Jinyi Wu
- 2247 - ASSESSMENT OF HEPATOCELLULAR CARCINOMA RISK USING COMBINED SERUM FERRITIN, AFP, AND PIVKA-II BIOMARKERS, Delgermurun Batkhurel
- 2248 - ER α -FGF13-PROX1 cascade regulates fatty acid β -oxidation to mediate sexual dimorphism in MAFLD, Xiang Huang
- 2249 - Maternal High-Fat Diet Induces Lifelong Epigenetic Priming and Trained Immunity Driving Offspring Susceptibility to MASLD, Hyun Phil Shin
- 2250 - Piezo1 mediates matrix stiffness-induced hepatic stellate cell activation by inhibiting mitophagy in liver fibrosis, Wenlong Miao
- 2251 - Multisystem Involvement Of Salmonella Infection: Liver Abscess With Secondary Pleural Effusion In Diabetes Mellitus, Mery Friyanti Pandiangan
- 2253 - Discrepancies in Treatment Eligibility Across Different International Guidelines for Chronic Hepatitis B, Jian Wang
- 2257 - Construction and Validation of a 90-Day Prognostic Prediction Model for Patients with Acute-on-Chronic Liver Failure After Artificial Liver Support Therapy, Shuxian Zang
- 2258 - DNA Methylation Profiles Predict MASLD Progression, α 26149; α 28070; α 26446;
- 2259 - Managing Portal Hypertension Complications in Hepatic Arteriportal Fistula: The Role of Transcatheter Arterial Embolization, Lijuan Chen
- 2260 - Comparative Analysis of MAFLD in Diabetic vs. Non-Diabetic Patients: Metabolic and Fibrotic Profiles, Hafsa Abdul waheed jadgal
- 2261 - UNVEILING THE ONCOGENIC AND PROGNOSTIC ROLE OF KRT17 IN HEPATOCELLULAR CARCINOMA, Wei Hou
- 2262 - Circadian Clock Disruption Drives MAFLD Through Bile Acid Dysregulation, α 26149; α 28070; α 26446;
- 2263 - Social Jetlag Disrupts Pituitary Hormone Rhythm to Drive MASLD, α 26149; α 28070; α 26446;
- 2264 - Impact of Updated International Guidelines on Treatment Eligibility for Chronic Hepatitis B, Jian Wang
- 2265 - Construction and Validation of a 90-Day Prognostic Prediction Model for Patients with Acute-on-Chronic Liver Failure After Artificial Liver Support Therapy, Na Fu
- 2266 - Yang-Deficiency Constitution and Altered Bile Acid Metabolism in MAFLD, α 26149; α 28070; α 26446;
- 2267 - Qi-Stagnation Constitution Predisposes to Hepatic Microcirculatory Dysfunction in MAFLD, α 26149; α 28070; α 26446;
- 2269 - Hepatoduodenal fistula as a complication of Hepatobiliary tuberculosis: A case report, Odessa Pekas
- 2270 - TweakR promotes hepatic fibrosis via NF- κ B signaling in metabolic dysfunction-associated fatty liver disease and intervention by obacunone, Yuanye Ji
- 2271 - Machine Learning Predicts MASLD Fibrosis Risk via TCM Constitution Clusters, α 26149; α 28070; α 26446;

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2272 - Interventional Embolization of Spontaneous Portosystemic Shunts Improves Survival in Decompensated Cirrhosis: A Retrospective Matched Analysis, Hongbin Zhu
- 2273 - Yin-Deficiency Constitution Predisposes to HCC via Gut-Immune Dysregulation, 春润 李
- 2275 - Dampness-Heat Constitution Impairs Adipose Browning in MASLD, 春润 李
- 2277 - Balanced Constitution Maintains HPA Axis and Hepatic Gluconeogenesis, 春润 李
- 2278 - Spatiotemporal Transcriptomics Decodes Constitution-Specific Liver Zonation, 春润 李
- 2279 - Constitution-Specific Gut Flora Directs Liver Epigenome in MAFLD, 春润 李
- 2280 - Atopic Constitution Primes Hepatic ILC2-Macrophage Axis in MASLD, 春润 李
- 2281 - Reversing Qi-Deficiency Slows Hepatocyte Senescence via AI, 春润 李
- 2283 - Phlegm-Dampness Constitution Disturbs Hepatic Circadian Rhythms in MASLD, 春润 李
- 2284 - Stomach-Heat Constitution Impairs Postprandial Hepatic Metabolic Flexibility, 春润 李
- 2285 - Blood-Stasis EVs Reprogram Hepatic Stellate Cells via YAP, 春润 李
- 2286 - Atopic Constitution Primes Liver Metastasis via Gut-EV Immunomodulation, 春润 李
- 2287 - Bioactive Folate Supplementation Mitigates Valproic Acid-Induced Liver Injury and Steatosis in a Rat Model, Naila Naz
- 2288 - Adverse reaction report of Peg - IFN - α - 2b in 14 cases of compensated hepatitis B liver cirrhosis patients treated with NAs, Xiaohong Gao
- 2289 - Tumor burden score combined with alpha-fetoprotein stratification: Evaluating efficacy of triple conversion therapy in unresectable hepatocellular carcinoma – A multicenter retrospective study, Jian-Hong Zhong
- 2293 - Rhabdomyolysis-triggered acute-on-chronic liver failure in alcohol-related cirrhosis: a rapidly fatal multiorgan failure case, Ilknur Cakmak
- 2295 - Acute methyl ethyl ketone peroxide poisoning presenting with polycythemia, Serhat Akpınar
- 2298 - Divergent Oncologic and Survival Implications of Stiffness Regression After SVR: A Decade-Long Longitudinal FibroScan Study in Advanced Fibrosis, Shuntaro Obi
- 2299 - Shifting hepatitis A virus seroprevalence among healthcare workers and the general population, Selma Tosun
- 2301 - Gastric Variceal Rupture due to Sinusoidal Obstruction Syndrome after Oxaliplatin Chemotherapy, Soichiro Hase
- 2303 - Predictive Value of Peripheral Blood T Cell Counts for HBsAg Clearance in Pediatric Patients with Chronic Hepatitis B Receiving Antiviral Therapy, Yanwei Zhong
- 2304 - Hepatocellular carcinoma detection using pre-transplant triphasic computed tomography and correlation with explant pathology, Dr Darayus Percy Gazder
- 2305 - Transcriptomic Characteristics of Peripheral Blood T Cells in Pediatric Chronic Hepatitis B with Different Antiviral Therapy Outcomes, Yanwei Zhong
- 2307 - The Thirteen-Year Shadow: Delayed Biliary Cirrhosis Following Gallbladder Tuberculosis in a Young Filipino Female, DESIREE JANE LACUIN
- 2308 - Application of Anti-HBc in Clinical diagnosis for Pediatric Hepatitis B, Yanwei Zhong
- 2312 - A Rare Case Report of Primary Hepatic Lymphoma Complicated by Hemophagocytic Lymphohistiocytosis, Airu Liu
- 2313 - The role of hepatic CD36 in metabolic dysfunction-associated steatotic liver disease, Yan Wang
- 2315 - Epidemiological and clinical characteristics of hepatocellular carcinoma: a 10 year registry from tertiary private cancer centre hospital, Cathleen Kenya
- 2316 - Precision ablation with nanosecond pulsed electric field (nsPEF) in early hepatocellular carcinoma: a phase I trial integrating multi-omics analysis, Haiyu Wang
- 2317 - The identification of a novel compound suppressing the early stages of Hepatitis B Virus (HBV) infection, Esraa Kamal
- 2319 - The Cancer Cell-Hepatocyte Interface in Colorectal Cancer Liver Metastasis: Mechanisms and Clinical Translation, Shaodong Li

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2321 - A novel prognostic model to predict mortality in patients with drug induced liver injury in intensive care unit, a study from Pakistan, Farhana Kayani
- 2322 - Gut Microbiota Modulation on Non-Alcoholic Fatty Liver Disease Progression: A Systematic Review and Meta-Analysis from Human Trials, SAUL SUAYBAGUIO
- 2323 - RNAi Therapies for HBsAg Reduction in Chronic Hepatitis B: A Systematic Review and Meta-Analysis of Early-Phase Trials, SAUL SUAYBAGUIO
- 2324 - Association of Serum Amylase and Lipase with Clinical Outcomes of Leptospirosis Patients at a Philippine Tertiary Government Hospital: A Retrospective Cohort Study, SAUL SUAYBAGUIO
- 2325 - Rhabdovirus Inhibits Toll-Like Receptor 4-Dependent Helper T Lymphocytes Infiltration in the Liver of Type 2 Diabetes-Associated Metabolic Dysfunction-Associated Steatohepatitis Mice, Ning Yao
- 2327 - Impact of Metabolic Dysfunction-Associated Fatty Liver Disease on Severity and Recovery of Drug-Induced Liver Injury: Experience from a Pakistani Cohort, Farhana Kayani
- 2330 - Dietary omega-3 and omega-6 Polyunsaturated Fatty Acid Intake and Mortality Among Individuals with Metabolic Dysfunction-Associated Steatotic Liver Disease: A Prospective Cohort Study, Jialu Yang
- 2331 - Prognosis of ursodeoxycholic acid-treated patients with primary biliary cholangitis: A single-center cohort study from China, Qin Xiao
- 2332 - Hepatocellular carcinoma without cirrhosis in Australasia: an under-represented but high-risk population, Aparna Morgan
- 2333 - Evaluation of Liver Fibrosis Before and After Treatment of Chronic Hepatitis B, Manal Cherkaoui Malki
- 2334 - US-guided liver biopsy: Fine-needle aspiration versus semi-automatic cutting needle, Manal Cherkaoui Malki
- 2337 - Diagnostic challenges at the interface of drug-induced autoimmune hepatitis and classical autoimmune hepatitis : a case report, ian yang Liew
- 2338 - Association between Glycemic Control (HbA1c) and Liver Transaminase Levels (ALT and AST) in Mongolian patients, Amarsanaa Jazag
- 2339 - The metagenomics-derived gut mycobiome biomarker for non-invasive diagnosis of early hepatocellular carcinoma, Shanshuo Liu
- 2341 - Correlation Between tumor markers (AFP, CA19-9, CEA), Amarsanaa Jazag
- 2342 - Performance of Non-invasive Baveno Seven Criteria for Predicting Clinically Significant Portal Hypertension in Burned-out Metabolic Dysfunction-associated Fatty Liver Disease, Adinda Amalia
- 2343 - Gut Microbiome Dysbiosis in Metabolic Associated Fatty Liver Disease: A Systematic Review and Meta-Analysis , Pakistan, Jalal Khan
- 2344 - Is Pneumococcal Vaccination Safe in Patients with Liver Cirrhosis?, Kübra Bağır
- 2345 - Gut Microbiota Alterations in Patients with Chronic Hepatitis B and Metabolic Associated Fatty Liver Disease: Implications for Fibrosis Progression, Farhana Kayani
- 2346 - Correlation Between Liver Biomarkers and Hemoglobin Levels in Mongolian Patients, Amarsanaa Jazag
- 2348 - Observational study comparing Hepatocellular carcinoma patients on HCC surveillance with those not on surveillance at diagnosis., Dr. Shoumeta Damle
- 2352 - The Economic Burden of Cirrhosis: Financial Classification and Disease Severity as Key Predictors of Direct Hospital Costs in the Philippines, a Retrospective Analysis, Ron-Daniel Gison
- 2354 - COMPARATIVE STUDY OF THE ETIOLOGY OF LIVER CANCER AND THE MANIFESTATION OF HEPATIC ENCEPHALOPATHY, Amarsanaa Jazag
- 2355 - A Machine Learning-Based Screening Tool for Population-Level Screening of MASLD to identify outlier patients current tools miss, Charlene Cheong
- 2356 - Mechanism research of -Amyrin targeting Sirt1/PGC-1/PPAR axis to regulate fatty acid metabolism reprogramming against liver fibrosis, Xuemei Wang
- 2357 - Pediatric Seronegative Autoimmune Hepatitis has a comparable clinical and laboratory profile to Seropositive Disease, Aditya Soni
- 2358 - Serum HBV RNA as a Marker of Occult HBV Infection in Patients with Hepatocellular Carcinoma, Aziza Khikmatullaeva
- 2362 - Gallstone Disease in Pediatric Wilson Disease: Prevalence, Risk Factors and Outcome, Aditya Soni
- 2363 - An Innovative Digital Oncology Platform for Enhanced Precision Management of Hepatocellular Carcinoma in China, HuiChuan Sun

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2365 - Cholangioscopy-Guided Diagnosis of Acquired Biliary Web in a Pediatric Patient: A Case Report, Darryl John Pasamba
- 2366 - Sex Disparities in Hepatocellular Carcinoma in a Korean Nationwide Cohort, Do Seon Song
- 2367 - Hepatic arterial infusion chemotherapy sequential transarterial embolization combined with lenvatinib and tislelizumab in patients with high-risk unresectable hepatocellular carcinoma: an update analysis of a phase 2 trial, Jian-Hong Zhong
- 2370 - Comparison of surgical resection, percutaneous ablation, and transarterial chemoembolization for hepatocellular carcinoma in patients with recompensated cirrhosis: a multicenter, retrospective, cohort study, Can Zhang
- 2371 - Prevalence and Significance of Portal Tract Histological Changes in Metabolic Dysfunction–Associated Steatohepatitis, Archana Rastogi
- 2372 - Refractory Cytomegalovirus Colitis Complicating Ulcerative Colitis After Liver Transplantation: The Role of Serial Intestinal Ultrasound, Sylwan Rahardja
- 2373 - One-step in-hospital HCV screening using a qualitative dual-detection immunoassay for HCV core antigen and antibodies (Elecys HCV Duo): initial implementation and performance, Rihwa Om
- 2376 - PNPLA3 I148M and E434K Variants drive Lipid Dysregulation in Pre-diabetes and Diabetics, Abhishak GUPTA
- 2379 - Exploring The Inflammatory-Cancer Transformation From MASLD To Hepatocellular Carcinoma Using Multi-Omics And Machine Learning, Yunzhi Zhang
- 2380 - The Unexpected Twist: Distal Esophageal Obstruction After Rubber Band Ligation in a 51-Year-Old Woman with Decompensated Liver Cirrhosis, LEAMSI GAY ARPON
- 2382 - A Novel VExUS-Based Model Integrating Renal Venous Congestion and Mesenteric Hemodynamics for Noninvasive Risk Stratification of High-Risk Esophageal Varices in Cirrhosis, Zhen Tian
- 2383 - Multikingdom and functional gut microbiota markers for cholangiocarcinoma, Zhigang Ren
- 2384 - Key T Cell Characteristics Associated with Suboptimal Treatment Responses in Pediatric Chronic Hepatitis B, Yanwei Zhong
- 2387 - A Comprehensive Ultrasound Model Integrating Gastrointestinal and Hemodynamic Parameters for Non-Invasive Risk Stratification of Esophageal Varices, Zhen Tian
- 2388 - Serum ATX Predicts Posthepatectomy Recurrence in HBV-Related HCC, Yanwei Zhong
- 2391 - Apilarnil Alleviates Potassium Dichromate-Induced Hepatotoxicity in Rats by Modulating the Ferroptosis Pathway (GPx4/TFRC), Mehmet Yildiz
- 2392 - Plug Assisted Retrograded Transvenous Obliteration for Gastric Varices Treatment, Seok Hyun Kim
- 2393 - Lipopolysaccharide Inhibits Autophagy and Promotes Inflammatory Responses via p38 MAPK-Induced Proteasomal Degradation of Atg13 in Hepatic Stellate Cells, Zhen Tian
- 2396 - Comparison of Bevacizumab Treatment Outcomes by Hepatitis Virus Infection, Gender, and Age Group, Ariunzaya Munkhchuluun
- 2397 - Immune Profiling Reveals Distinct Cytokine Signatures in Autoimmune Hepatitis Flares, Xi Zhang
- 2399 - Trends in Cholangiocarcinoma Mortality and Incidence in Asia, 2000–2023: Insights from Joinpoint Analysis, Jing Chen
- 2400 - Rituximab Achieves High Remission Rates in Steroid-Refractory Autoimmune Hepatitis: A Controlled Pilot Trial, YunLong Yao
- 2401 - A Model Incorporating Serum N-Terminal Propeptide of Type III Collagen and Platelet Count Predicts Advanced Fibrosis in Chronic Hepatitis B, Xue Bai
- 2402 - Association Between Three-Month Average Blood Glucose Levels and Hepatic Steatosis and Liver Fibrosis, Oyunselenge Baatarmunkh
- 2403 - Optimizing Community-Based Hepatitis C Screening Strategies: Package of Point-of-care Testing, Reflex Testing and Big Data-Based Risk Concentration, Qiran Zhang
- 2405 - Predictors of Relapse After Immunosuppressive Therapy Withdrawal in Autoimmune Hepatitis, YunLong Yao
- 2407 - Comparison of Bevacizumab Treatment Outcomes (Measured by Number of Courses) with Biopsy Characteristics, Ariunzaya Munkhchuluun
- 2408 - ASSOCIATION BETWEEN SERUM IRON LEVELS AND HEPATIC STEATOSIS, Tserendulam Dorjsuren
- 2409 - Deep Learning-Assisted Ultrasound Improves Early Hepatocellular Carcinoma Detection in Cirrhosis, YunLong Yao

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2411 - A Machine Learning Model Predicts Hepatic Decompensation Risk in Compensated Cirrhosis, YunLong Yao
- 2412 - Influence of clinical stages of decompensated cirrhosis on optimal portal pressure decrease to control ascites while minimizing hepatic encephalopathy after TIPS, Ping Lv
- 2413 - Breath Volatile Organic Compounds and Machine Learning Enable Non-Invasive Detection of Early MAFLD, Xi Zhang
- 2414 - COMBINED ASSESSMENT OF FERRITIN, AFP, AND PIVKA-II IN THE DIAGNOSIS OF HEPATOCELLULAR CARCINOMA, delgermurun batkhurel
- 2415 - Fenofibrate Add-On Therapy Improves Biochemical Response in Primary Biliary Cholangitis Patients with Incomplete UDCA Response, Xi Zhang
- 2416 - Oral Vancomycin Therapy in Primary Sclerosing Cholangitis: A Pilot Study Demonstrates Biochemical Improvement, Xi Zhang
- 2417 - Clinical Course and Short-Term Outcomes of Acute Hepatitis B in a Tertiary Liver Transplant Center, Oğuzhan Acet
- 2419 - Generalized Pustular Psoriasis Complicated by Metabolic Dysfunction-Associated Fatty Liver Disease and Immunosuppressive Therapy-Associated Transaminitis: Highlighting the Skin-Liver Inflammatory Axis, Adinda Amalia
- 2420 - Autoimmune Hepatitis-Primary Biliary Cholangitis Overlap Syndrome: Clinical Characteristics and Comparative Outcomes, YunLong Yao
- 2421 - When Etiologies Intersect: Concomitant Hepatitis B Reactivation, Hepatic Tuberculosis, and Choledocholithiasis in a Filipino Male Presenting with Jaundice, ADRIAN BUGAYONG
- 2423 - Snat1-Mediated Glutamine Reprogramming in Macrophages Accelerates MAFLD-Associated Colorectal Cancer Liver Metastasis, Jing Zhou
- 2424 - Sustained virologic response 4 testing as a measure of hepatitis C virus cure in re-treated patients following direct-acting antiviral failure: A sustained virologic response 4/12 concordance evaluation from POLARIS trials, Stacey Scherbakovsky
- 2425 - POST ERCP DUODENAL HEMATOMA AS A CAUSE OF GASTRIC OBSTRUCTION, Yrah Damiene Fernandez
- 2428 - Glucocorticoid Therapy Modulates HMGB-1 and K18 Levels in Chronic Drug-Induced Liver Injury, Yu-Ting Xiong
- 2429 - Effects of Switching from Tenofovir Alafenamide Fumarate to Tenofovir Disoproxil Fumarate or Entecavir on Lipid Parameters and Atherosclerotic Cardiovascular Disease Risk, Hanife Nur Karakoc parlayan
- 2430 - HBsAg Quantification-Based Models for Predicting Hepatocellular Carcinoma Risk in Patients with Chronic Hepatitis B: The HCC-HBsAg Score, Yi-Fan Guo
- 2431 - Metabolomics Reveals Metabolic Reprogramming and Novel Biomarkers in Glucocorticoid-Treated Chronic DILI, Yu-Ting Xiong
- 2434 - Clinical HCC Predictors in HBV-related Cirrhosis: A Real-World Study, Yancai ZHOU
- 2435 - Safety and Efficacy Analysis of Argon-Helium Cryoablation Combined with Targeted Drugs and Programmed Death Receptor 1 Monoclonal Antibody in Elderly Patients with Unresectable Hepatocellular Carcinoma, Shujuan Gong
- 2436 - Causative Pathogens of Intra-abdominal Abscesses Following Whipple Procedure and Comparison with Expected Abdominal Flora, ÖZLEM BAYRAKTAR SARAL
- 2437 - Advancing Pediatric Care in Gastroenterology: Endoscopic Ultrasound in Pediatrics at a Referral Endoscopy Center in Pakistan, Asma Yaseen
- 2442 - Comparison of gestational age and birth weights of infants born to HBsAg-positive and HBsAg-negative pregnant women, Selma Tosun
- 2444 - Bioinformatics Mapping of Ferroptosis Pathways in NAFLD Progression, Aayan Shaheer Sheikh
- 2445 - Ferroptosis-Linked Cell-Cycle Hub Genes Reveal New Therapeutic Angels in Sepsis, Aayan Shaheer Sheikh
- 2446 - Shared and stage-Specific ferroptosis related biomarkers Across NAFL and NASH: An RNA-seq Analysis, Aayan Shaheer Sheikh
- 2447 - Hepatitis B reactivation secondary to rituximab treatment, Kadir Gisi
- 2448 - DNA microarray-based identification of ferroptosis-related biomarkers in alcoholic hepatitis, Aayan Shaheer Sheikh

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2449 - Real-World Barriers to Post-SVR Monitoring in HCV: Insights from a Physician Survey, Safaa M Abdelhalim
- 2451 - Late T-cell mediated Rejection (TCMR) in liver allograft biopsies: Impact of heterogeneity on the progression to chronic TCMR, Archana Rastogi
- 2452 - Efficacy of Intermittent Fasting on Hepatic Enzymes, Fat Content, and Fibrosis in Patients with Non-Alcoholic Fatty Liver Disease: A Systematic Review and Meta-Analysis of Randomized Controlled Trials, Nitesh Kumar Karna
- 2453 - Impact of Prior Drug Allergies on severity of drug-induced liver Injury , a study from tertiary care hospital Pakistan, Dr Sameera Sameera
- 2455 - Diabetes association with liver diseases and prognostic risk factors of liver-related complications in diabetic patients., Javaria Younas Muhammad Younas
- 2456 - Rurality and Neighborhood Socioeconomic Deprivation as Predictors of Hepatocellular Carcinoma Surveillance Adherence Among Adults with Cirrhosis in the United States, Mohamed Elsaid
- 2458 - Wilson's Disease in Oman: A National Cohort Study of Clinical Spectrum, Diagnostic Delay, and Long-Term Outcomes, Said A. Al-Busafi
- 2459 - Superinfection with Hepatitis Delta Virus Elevates the Risk of Hepatocellular Carcinoma in Individuals with Chronic Hepatitis B Virus Infection, Mohamed Elsaid
- 2462 - Prevalence, risk factors, and demographic insights of sickle cell hepatopathy in Omani adolescents and adults: A retrospective analysis, Said A. Al-Busafi
- 2464 - Beyond Liver Function: Albuminuria and a novel Child-Turcotte-Pugh-AlbU score improve mortality prediction in medical intensive care unit patients with hepatic encephalopathy, Said A, Al-Busafi
- 2466 - Real-World Impact of Cardiovascular Comedications on DDI risk in Patients receiving direct-acting antiviral (DAA) Hepatitis C Therapy, Dilip Makhija
- 2467 - A case of acute hepatitis C that resolved spontaneously, Kamuran Türker
- 2468 - Antipsychotic Comedication and Drug-Drug Interaction Risk in US Patients Treated with HCV DAAs: Focus on PWUD, Healthcare Resource Use Impact, and AASLD Algorithm Implications, Dilip Makhija
- 2469 - Study on Patients Undergoing Triple Therapy for Liver Steatosis in Mongolia, Amarsanaa Jazag
- 2470 - Causes of New Hepatitis Virus Infections in Mongolia, Amarsanaa Jazag
- 2471 - Comparative Study of Liver Indicators in Patients with and without Diabetes Mellitus, Azjarga Maidar
- 2472 - Correlation Between the Degree of Liver Steatosis and Liver Enzyme (ALT, AST, GGT) Levels, Agnist Bazarbadnaa
- 2473 - Correlation Between Blood Triglyceride and Cholesterol Levels in Individuals with Liver Steatosis, Urantzaya Enkhtuvshin
- 2474 - Determining Risk by Glucose and Triglyceride Ratio in Individuals with Liver Steatosis, Davaajan Munkhdelger
- 2475 - Correlation Between Liver Fat Accumulation Level and Body Mass Index, Soyol-Erdene Agchvayabazar
- 2476 - The Impact of Changes in Liver Enzymes and Body Mass Index on Liver Fibrosis, Bujin-Ujin Badam
- 2478 - Association of MAFLD with joint lifestyle exposures Background & aims, Saddiqa saeed Saeed Ahmed
- 2479 - Epidemiological, Clinical, and Paraclinical Profile of Decompensated Liver Cirrhosis at Khmer-Soviet Friendship Hospital, a Tertiary Hospital in Cambodia, NEANG NOV
- 2482 - Comparative Efficacy and Safety of Second-Line and Later Systemic Therapies After First-Line Treatment Failure in Hepatocellular Carcinoma: A Systematic Review and Meta-Analysis, Han Ah Lee
- 2485 - Hepatic Dysfunction in Critically Ill Children: Prognostic Value of PRISM III and PELOD-2 Scores in the Pediatric Intensive Care Unit, Tuğba Gürsoy Koca
- 2486 - Targeting a Cytosolic Nucleotide Pyrophosphatase Suppresses Malignant Phenotypes of Hepatocellular Carcinoma, Jae Youn Cheong
- 2487 - Clinical and Laboratory Profile of Ascites in Decompensated Liver Cirrhosis and Prevalence of Spontaneous Bacterial Peritonitis: A Retrospective Study at Khmer-Soviet Friendship Hospital, CHHIT Dimanche
- 2489 - HEPATOCELLULAR CANCER RISK IN CHRONIC HEPATITIS D AND CHRONIC HEPATITIS B PATIENTS WITH EFFICIENT TREATMENT: A PROPENSITY WEIGHTED ANALYSIS, Ozgur Aktas
- 2490 - A Rare Case of Zieve's Syndrome in a cirrhotic patient: Hemolytic Anemia Associated with Alcoholic Liver Disease and Hyperlipidemia, Hasmik Ghazinyan
- 2492 - Development and validation of an artificial intelligence driven convolutional neural network for automated stool colour classification to facilitate early diagnosis of biliary atresia, Arjun Maria

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2493 - Impact of continuous renal replacement therapy on survival and ammonia clearance in pediatric acute liver failure with advanced hepatic encephalopathy: a two-centre retrospective cohort analysis, **Arjun Maria**
- 2494 - Clinically significant weight loss through combination of glp-1 agonist and sedation-free swallowable intragastric balloon in prader-willi syndrome with severe cardiopulmonary risk, **Arjun Maria**
- 2495 - Non-destructive Epstein Bar Virus-associated post transplant lymphoproliferative disorder presenting with gastrointestinal bleeding in a post-liver transplant child: diagnostic and therapeutic challenges, **Arjun Maria**
- 2497 - Hepatic Hemodynamics Detected by Ultrasound Localization Microscopy is Improved after Transjugular Intrahepatic Portosystemic Shunt, **Jiahao Han**
- 2498 - Liver disease severity and comorbidity in HBV mono-infection versus HBV/HDV co-infection: a population-based study, **Heejoon Jang**
- 2500 - Adipokine dysregulation in adipose tissue in cirrhosis, **Sanal MG**
- 2501 - Evaluation of the Effect of the National Hepatitis B Vaccination Programme on Hepatitis B Seroprevalence (Healthcare worker and community-based assessment), **Selma Tosun**
- 2502 - Turkish Real-World Effectiveness and Safety of Bulevirtide in Chronic Hepatitis Delta: A Multicentric Experience with Long-Term Follow Up, **Devrim Muge Ozari Gulnar**
- 2503 - Tumor Lysis Syndrome Following Atezolizumab–Bevacizumab Therapy in Advanced Hepatocellular Carcinoma: A Rare and Life-Threatening Complication, **Ahmed Nagy**
- 2509 - Feasibility And Limitations Of Living Donor Liver Transplantation In Armenia, **Hayk Harutyunyan**
- 2512 - Evaluation of the 24-year prognosis of patients with inactive HBsAg carriage, **Selma Tosun**
- 2516 - Evaluation of the 24-year prognosis of patients with inactive HBsAg carriage, **SELMA TOSUN**
- 2517 - Is primary biliary cholangitis excluded in patients negative for PBC-specific autoantibodies and without cholestatic features?, **shasha li**
- 2520 - A RARE CASE IN LIVING DONOR LIVER TRANSPLANTATION: GRAFT-TO-GRAFT OF PORTAL VEIN ANASTOMOSIS, **Mehmet Hadin Karadağ**
- 2521 - A novel clustered regularly interspaced short palindromic repeats-based assay for intrahepatic hepatitis B virus covalently closed circular DNA quantification, **Pattida Kongsomboonchoke**
- 2522 - Triple Trouble: A Case of Hepatocellular Carcinoma in a Patient with Previous Renal and Colonic Malignancies, **Cleo Christille Lynn Lom-oc**
- 2523 - HepPlus: Protocol for a multicenter study of a web-based platform to support hepatitis B and C management in Thailand, **Ketsarapohn Sudchit**
- 2524 - Baseline Albumin Structural Defects and Soluble Inflammatory Markers Identify Poor Responders to Albumin Therapy in Cirrhosis, **Zhujun Cao**
- 2526 - Differences between non-alcoholic liver disease and alcoholic liver disease-related HCC, **Jiwoong Jang**
- 2528 - Gut Microbiota Dysbiosis and Its Role in the Pathogenesis of Metabolic Dysfunction-Associated Steatotic Liver Disease, **Tatia Khachidze**
- 2529 - Clinical Manifestationsof of the Oral Mucous in Patients with Viral Hepatitis C in Armenia 2025 Years, **Vahe Azatyan**
- 2530 - Fibroblast- and macrophage-derived thrombospondin-1 orchestrates the fibroinflammatory niche in metabolic dysfunction-associated steatohepatitis-induced fibrosis, **Sung Woo Cho**
- 2532 - COMPARISON OF ATTENUATION PARAMETER AND LIVER STIFFNESS MEASUREMENT BETWEEN HEPATUS AND FIBROSCAN IN PATIENTS WITH CHRONIC LIVER DISEASE: A PROSPECTIVE STUDY, **Ram Prasad Sinnanaidu**
- 2535 - Regulation and Clinical Translation of m⁶A Modification in Intrahepatic Cholangiocarcinoma, **LingYu Kong**
- 2536 - ANTIFIBROTIC EFFECTS OF ANGIOTENSIN RECEPTOR BLOCKERS IN ORGANOPHOSPHATE (CHLORPYRIFOS) INDUCED LIVER FIBROSIS, **Dr. Aftab Abbasi**
- 2537 - Correlation of interleukin-17 serum levels with degree of liver fibrosis in chronic hepatitis B patients at Mohammad Hoesin Hospital Palembang, **Lingga Gumelar**
- 2538 - Comparison of sensitivity and specificity of vascular endothelial growth factor and alpha-fetoprotein levels in detecting hepatocellular carcinoma in patients with hepatitis b-related liver cirrhosis at Mohammad Hoesin Hospital Palembang, **Lingga Gumelar**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2539 - Association Between Clinical Predictors And Albumin Billirubin Score In Hepatocellular Carcinoma Patients Receiving Lenvatinib At Dr. Mohammad Hoesin General Hospital, Palembang, During 2025, **Adhitya Wicaksana**
- 2540 - Fulminant Hepatic Failure Following Antiviral Therapy Discontinuation in Chronic Hepatitis B: A Fatal Case, **Kübra YILDIRIM**
- 2542 - Construction of an imaging-omics machine learning prediction model for post-liver transplantation recurrence of liver cancer based on ECV, **Xiaoyong Ye**
- 2544 - Comparison of Predictive Accuracy of Monocyte-to-Lymphocyte Ratio (MLR), Neutrophil-To-Lymphocyte Ratio (NLR), and Systemic Immune-Inflammation Index (SII) for Colonoscopic and Clinical Outcomes among Patients with Gastrointestinal Tuberculosis (GITB), **Sam Fandood**
- 2545 - COMPARISON OF CLINICAL OUTCOME AND ENDOSCOPIC FINDINGS BETWEEN ACIDIC AND ALKALI CAUSTIC INJURIES IN A TERTIARY REFERRAL HOSPITAL, **Sam Fandood**
- 2546 - Use of Double Plasma Molecular Adsorption System (DPMAS) in Intrahepatic Cholestasis of Pregnancy Refractory to Medical Management: A Case Report, **Sam Fandood**
- 2547 - When the Liver Speaks for the Vessels: A Diagnostic Odyssey of a rare case of Non-HBV-Associated Polyarteritis Nodosa Presenting with Jaundice and Transaminitis, **Sam Fandood**
- 2548 - Multiverse of Upper Gastrointestinal Tuberculosis: A case series of GITB with involvement of Esophagus, Gastric and Duodenal TB, **Sam Fandood**
- 2549 - Outcome Of Patients Presenting With Upper Gastrointestinal Bleeding: A Single High Volume Center Prospective Study, **Sabir Ali**
- 2550 - PROGNOSTIC VALUE OF THE ALBUMIN-BILIRUBIN SCORE FOR VARICEAL REBLEEDING AND HEPATIC ENCEPHALOPATHY-RELATED HOSPITALIZATION IN CIRRHOTIC PATIENTS WITH CHRONIC HBV INFECTION, **Anjab Akmal Sya'roni**
- 2551 - Noninvasive Detection of Metabolic dysfunction-associated steatohepatitis and Fibrotic Burden Using Ultrasound-Derived LIID and liver stiffness measurement in Metabolic dysfunction-associated steatotic liver disease: A Multicenter Study., **Feng Gao**
- 2552 - DPMAS-Induced Stabilization in a Terminal Patient: Short-Term Benefit in the Face of Terminal Prognosis, **ALYSSA CHAN**
- 2555 - : A Preclinical study on Protective Effects of Atorvastatin Against Methotrexate-Induced Hepato-Renal Toxicity: Role of Oxidative Stress and Inflammation, **Jayadevan K**
- 2556 - Clinical Benefit of Perioperative Prophylactic Antibiotics in Hepatocellular Carcinoma (HCC) Patients Undergoing Transcatheter Arterial Chemoembolization (TACE), **Junying Li**
- 2557 - Silybin Attenuates Liver Fibrosis by Suppressing Hepatic Stellate Cell Activation, **Jie Li**
- 2558 - Diagnostic Performance of Baveno VII Criteria in a Real-World, Multicenter Cohort Across Liver Disease Etiologies, **Yali Ji**
- 2561 - Correlation Between Platelet Derived Growth Factor-BB As Liver Fibrosis Biomarker and Degree Of Liver Fibrosis Based On Fibroscan On Chronic Hepatitis B, **Adhitya Wicaksana**
- 2563 - Is Laparoscopic Cholecystectomy Necessary at an Asymptomatic Stage?, **Jong Jin Hyun**
- 2566 - Serum DCP and GALAD Score Reflect Tumor Burden and Stage Progression More Accurately Than AFP-Based Markers in Intermediate and Advanced Hepatocellular Carcinoma, **Van Trung Huynh**
- 2567 - Prediabetes as an Early Clinical Indicator of Advanced Liver Fibrosis in Non-Diabetic MASLD Patients: A Non-Invasive Risk Stratification Study, **Van Trung Huynh**
- 2568 - Gut-Liver Axis-Mediated Dysbiosis in the Pathogenesis of Liver Fibrosis and Intervention Strategies, **gaomin gao**
- 2569 - Clinical Characteristics and Complication Patterns in Hospitalized Elderly Patients with Liver Cirrhosis: A Single-Center Retrospective Analysis of 1,736 Admissions, **Jing Wang**
- 2570 - Improving HBV Screening and Prophylaxis in Rituximab-Treated Patients: A Quality-Improvement Study, **ilkay bozkurt**
- 2571 - Predicting key components and mechanisms of silymarin in treating sepsis-related liver injury using GraphBAN, **Dianliang Fang**
- 2573 - NRF2-Mediated Gsta3 Transcriptional Activation Protects Against Sepsis-Associated Liver Injury, **Peng Qu**
- 2575 - Acute Pancreatitis Secondary to Tirzepatide Therapy, **Ahmet Biçici**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2578 - Integrated Multi-omics Liquid Biopsy: Advancing Early Detection and Precision Management of HCC, Xinhao Gao
- 2581 - Association between Acid Suppressant Use and Hepatic Encephalopathy in Patients with Liver Cirrhosis: An Inverse Probability of Treatment Weighting Analysis, Keiichi Katayama
- 2582 - Neurological Outcomes and Survival in Hepatic Myelopathy A Multicenter Cohort Study, Wenhao Xue
- 2584 - Cytopenia Following Albendazole Use: A Real-World Observation, shufang pan
- 2585 - Clinical Characteristics of Non-Cirrhotic Portal Hypertension Associated with Oxaliplatin, Jie Gao
- 2586 - The traditional Chinese medicine prescription Danjin Shugan Formula exerts anti-fibrotic effects by regulating the mTOR-S6K1/4E-BP1 signaling pathway and YAP/TAZ proteins, Shiheng LIU
- 2587 - Genetically Confirmed Dubin-Johnson Syndrome Presenting as Long-Standing Isolated Conjugated Hyperbilirubinemia, Trung Huynh Van
- 2588 - Epidemiology of Delta Virus Infection in Turkey: Current Seroprevalence, Pinar Korkmaz
- 2589 - Adult-Onset Wilson Disease Without Classical Features: Diagnostic Value of ATP7B Genotyping and Leipzig Scoring, Trung Huynh Van
- 2591 - AMA-negative Primary Biliary Cholangitis Diagnosed by a Reproducible Dechallenge-Rechallenge Response to Ursodeoxycholic Acid, Trung Huynh Van
- 2592 - Ultra-High HBV Viral Load Not Equivalent to the Immune-Tolerant Phase., Jie Liu
- 2595 - A case of artificial liver support system for Wilson's disease related acute-on-chronic liver failure complicated with hyperthyroidism, Hua Liu
- 2597 - Asthenia-Anaemia-Liver cirrhosis-Brucellosis, Jingjing Wang
- 2598 - Research on Artificial Liver Treatment for Non-Hepatocellular Carcinoma Patients with Severe Immune Checkpoints Related Liver Injury, Hua Liu
- 2599 - Residual metabolic and steatotic risk in chronic viral hepatitis: real world evidence from the Italian PITER cohort, Loreta A. Kondili
- 2603 - Prevalence and Diagnostic Variability in Cirrhotic Cardiomyopathy: A Meta-analysis, GİZEM DAĞCI
- 2610 - Comparative Efficacy of Combined Targeted and Immunotherapy Regimens in Unresectable Hepatocellular Carcinoma: Impact on Survival and Conversion Surgery Outcomes, Yan Xu
- 2611 - Pre-emptive Transjugular Intrahepatic Portosystemic Shunt Improves Survival in Advanced Cirrhosis Patients with Gastric Fundal Variceal Bleeding: A Multicenter Cohort Study, Jie Xue
- 2613 - Development and validation of a time-stratified risk model for acute variceal bleeding in hepatocellular carcinoma, jiao qin
- 2615 - Liver graft rejection after liver transplantation in Kazakhstan: a single center experience, Malika Khassenova
- 2616 - The influence of hepatitis HBV, HCV and HDV viruses on the development of sarcopenia in patients with liver cirrhosis, Ramilya Abdieva
- 2618 - Alistipes putredinis Alleviates Metabolic-Associated Fatty Liver Disease via the Acetate-GPR43 Axis by Suppressing Neutrophil ROS Generation, Feihu Bai Bai Feihu
- 2619 - Enterotoxigenic Bacteroides fragilis Exacerbates Alcoholic Liver Disease by Driving Host Metabolic Reprogramming via the Tryptophan-Kynurenine-Retinol Pathway, Daya Zhang Zhang Daya
- 2621 - Construction and Evaluation of a Nobiletin Hepatic-Targeted Nanodelivery System for the Treatment of MASLD, 妍 娄
- 2622 - Itaconic acid improves MASH through regulating ferroptosis by Nrf2/HO-1, Shaoya Li
- 2624 - Risk Factors for Liver Fibrosis Severity in Patients with Nonalcoholic Steatohepatitis: A Study Based on Liver Pathology, pengyu pan
- 2628 - Effect of Rifaximin on Platelet Count in Hepatitis C-Related Liver Cirrhosis: A Randomized Controlled Clinical Trial, Eman Fares
- 2629 - Clinical characteristics and risk factors for early liver function abnormalities in young adults with MAFLD, Songting Wu
- 2631 - High ammonia promotes EHHADH-dependent pyrimidine degradation to induce inflammatory cell death in HCC, Jinhui Wei
- 2632 - Study on the Efficacy and Mechanism of the Spleen-Strengthening and Lipid-Regulating herbal formula in Treating MAFLD: An Exploration Based on the PPAR Pathway, da wang
- 2633 - Chylous Ascites in Liver Cirrhosis: Diverse Mechanisms, Diagnostic Challenges, and Multidisciplinary Management — A Case Series, Christine Velasquez

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2636 - Macrophage ACAT1 aggravates alcoholic hepatitis by inducing mitochondrial damage and NLRP3 activation, **Xi Zhao**
- 2637 - Predictors of minimal clinically important improvement in cardiorespiratory fitness following unsupervised exercise training in metabolic dysfunction-associated steatotic liver disease, **Ping-Lun Hsieh**
- 2638 - Machine learning prediction of functional cure to pegylated interferon-alpha therapy in two HBV populations: advantaged populations and HBeAg-negative patients, **Jiajie Li**
- 2642 - Design, development, and pilot evaluation of a comprehensive liver disease registry in the Philippines, **Abegail Jayne Amoranto**
- 2645 - Traditional Medicine Yiqi Huoxue Relieves Nonalcoholic Steatohepatitis by Remodeling Intestinal Microbiota and Metabolites, **Yaoyao Mao Mao**
- 2646 - Exploring the Predictive Value of the DiabetesLiver Score for Liver Fibrosis in Patients with Type 2 Diabetes Mellitus and MAFLD Based on the Dual Disease Nursing Management Model, **Xing Liu**
- 2648 - Comparative Analysis of WHO 2024, EASL 2025, AASLD/IDSA 2025, and APASL 2026 CHB Treatment Guidelines: Implications for Treatment Eligibility and Antiviral Management Strategies, **Jing Chen**
- 2650 - The Evolving Role of Vitamin D in Metabolic Dysfunction-Associated Steatotic Liver Disease (MASLD): From Pathogenesis to Clinical Practice – An Updated Synthesis for 2026, **Hongxia Chen**
- 2651 - A Systems Cross-omics Framework Uncovers Microbiota-Driven Molecular Targets for MAFLD Therapy, **Jiyuan Zhou**
- 2652 - A retrospective study on nirmatrelvir/ritonavir and azvudine in treating COVID-19 in patients with cirrhosis, **Wenli Jiang**
- 2653 - From Prediction to Decision: A Dynamic Multi-Modal Causal Machine Learning System for Optimized Clinical Management of Chronic Hepatitis B in a 150,000-Patient Longitudinal Cohort, **Peng Hu**
- 2655 - Single-Cell Trajectory and Communication Profiling Reveals a Metabolic-Death Switch Driven by Macrophage Polarization in Hepatocellular Carcinoma Radioresistance, **shiji wu**
- 2656 - Relationship of liver fibrosis risk score (FIB-4) with echocardiographic findings in myocardial infarction with non-obstructive coronary artery disease (MINOCA), **Liza Thomas**
- 2657 - Clinical characteristics and influencing factors for recompensation in patients with first-time decompensated hepatitis B cirrhosis with esophageal and gastric variceal rupture and bleeding in the Western Region of, **Li Wenting Li**
- 2658 - Real-world impact of 48-week tenofovir amibufenamide therapy on lipid profiles in chronic hepatitis B, **Jingjing Wang**
- 2659 - Agenesis of the Dorsal Pancreas Caused by HNF-1 α Gene Mutation Presenting with Abnormal Liver Function as the Initial Manifestation: A Case Report, **Shi-Heng Liu**
- 2661 - Macrophage metabolic reprogramming mediated by PKM2 deacetylation in liver fibrosis, **Yufeng Xing**
- 2662 - Exploring the Dose-Response of Shugan Xiaozhi Formula Granules and MRI Radiomics-Based MAFLD Prediction, **Jing Chen**
- 2665 - Evaluation of the Egyptian Club of Ascites Diagnostic Algorithm for Etiological Diagnosis of Ascites: A Single-Center Study", **Eman Fares**
- 2667 - HBV recurrence in patients with hepatocellular carcinoma and cholangiocarcinoma following liver transplantation, **Xi He**
- 2668 - Efficacy and Safety of Elobixibat in Patients with Chronic Constipation: A Meta-Analysis of Randomized Controlled Trials, **Daniele Alek Calda**
- 2669 - Multicohort metagenomic analysis of cholangiocarcinoma: non-invasive diagnosis and functional validation of key microbes, **Zhigang Ren**
- 2674 - Model combining MELD-ICG R15 and systemic immune-inflammation index predicts 28-day clinical progression in hepatitis B virus-related acute-on-chronic liver failure patients, **lei luo**
- 2675 - The Mechanism of Necroptosis in Metabolic dysfunction-associated Fatty Liver Disease and related targeted therapy, **Yufeng Xing**
- 2676 - the Mechanism of Ruangan Formula in Regulating Macrophage Glycolysis for the Prevention and Treatment of Liver Fibrosis via SIRT1-Mediated PKM2 Deacetylation, **Bo Yang**
- 2677 - Barriers and Facilitators to Chronic Hepatitis B Management in Primary Care: A Systematic Review from Patient and Physician Perspectives, **Jing Chen**
- 2680 - Evaluation of NLR as a novel Predicting biomarker for Disease Severity and Clinical Outcomes in Acute Hepatitis A and E, **Md. Shakhawat Hossain**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2682 - Isolated Pancreatic tuberculosis masquerading as Malignancy in a patient with drug-induced liver injury: A case report, [Lili Zhao](#)
- 2683 - Prior Tyrosine Kinase Inhibitor Therapy Is Associated with an Increased Risk of Hepatitis B Virus Reactivation in HBV-Related Hepatocellular Carcinoma Patients with Undetectable HBV DNA Receiving PD-1 Inhibitor-Based Combination Therapy, [Yang Li](#)
- 2684 - Hydrogen sulfide donor S-Propargyl-cysteine remodels the HCC microenvironment and enhances immunotherapy efficacy: an integrated metabolomic and molecular analysis, [Yuxin Liang](#)
- 2685 - Early diagnostic and analysis of the high risk factors of covert hepatic encephalopathy, [Pin Han](#)
- 2686 - Multisystem Crosstalk in MAFLD: An Integrative Perspective from Organ Dialogue to Hepatic Pathology, [ZiWei Yuan](#)
- 2687 - The Mediating Roles of HOMA- β and TG/HDL-C in the Associations of General and Central Adiposity with metabolic dysfunction-associated fatty liver disease: A Cross-Sectional Study, [Guangqi Zhu](#)
- 2688 - Immediate Improvement in HCV RNA Testing Following Active In-Hospital Management: An Interrupted Time Series Analysis, [lei luo](#)
- 2692 - Predictors of recompensation in autoimmune hepatitis related decompensated cirrhosis following immunosuppressive therapy in India, [Sayan Malakar](#)
- 2694 - Comparison of Diagnostic Performance of Non-Invasive Steatosis and Fibrosis Scores and Ultrasound versus FibroScan in Metabolic-Associated Fatty Liver Disease, [Eman Fares](#)
- 2696 - Map of Digestive and Liver Diseases in Egypt, [Eman Fares](#)
- 2697 - Demographic Profile and Clinical Indications of Patients Undergoing Liver Elastography in a Tertiary Government Hospital: A Pilot Study, [ALONZO, UZZIEL ROMAR S. ALONZO](#)
- 2698 - Model combining MELD-ICG R15 and systemic immune-inflammation index predicts 28-day clinical progression in hepatitis B virus-related acute-on-chronic liver failure patients, [lei luo](#)
- 2701 - MSC-mediated Modulation of the IL-4/CD39 Axis in Treg cells Restores Immune Tolerance and Improves Treatment Outcomes in Steroid-Resistant Autoimmune Hepatitis, [Wanwan Shi](#)
- 2702 - Modified Leipzig (Leipzig-U) score is equally helpful for the early diagnosis of Wilson disease in children presenting with liver disease, [Sanjeevani Kaul](#)
- 2703 - Sequential plasma adsorption and therapeutic plasma exchange for extreme hyperbilirubinemia in Budd-Chiari syndrome with acute-on-chronic liver failure, [Petr Piza](#)
- 2704 - Differences between non-alcoholic liver disease and alcoholic liver disease-related HCC, [Jiwoong Jang](#)
- 2705 - Early Expansion of CCR7⁺PD-1⁺ NK Cells and HBsAg Decline Predict Interferon-Induced Immune Reconversion in Chronic Hepatitis B, [Yan Yan](#)
- 2707 - Microbial metabolism dysfunction induced by transarterial chemoembolization aggravates postprocedural liver injury in HCC, [Liteng Lin](#)
- 2708 - Risk Factors and Development of a Predictive Model for Chronic Kidney Disease in Patients with Metabolic Dysfunction-Associated Steatotic Liver Disease, [Jiaojiao Zhu](#)
- 2709 - Machine Learning-Based Prediction of Incomplete UDCA Response in Primary Biliary Cholangitis: Model Development and Assessment, [Wenjun Du](#)
- 2710 - Construction of nomogram based on inflammatory markers to predict recurrence and survival of single small hepatocellular carcinoma after radiofrequency ablation, [Ping Li](#)
- 2712 - Development and Validation of a Nomogram Incorporating Thyrotropin and Metabolic Parameters for Predicting Metabolic Dysfunction-Associated Steatotic Liver Disease Risk: A Cross sectional study, [Siqian Lu](#)
- 2713 - TRAF2 Deficiency Aggravates Mitochondrial Dysfunction Through PI3K-AKT Pathway Inhibition in Acetaminophen-Induced Liver Injury, [Yelei Cen](#)
- 2715 - Va-Cur@Lips Inhibits the Metastasis of Hepatocellular Carcinoma by Targeting the Peri-Tumoral Fibrotic Microenvironment, [Qi Yang](#)
- 2716 - Preoperative prediction power of radiomics and non-radiomics fusion model based on US-CEUS for microvascular invasion of hepatocellular carcinoma: A multicenter study, [Qi Yang](#)
- 2717 - Clinical Profile Comparison Between HBeAg-Positive and HBeAg-Negative Hepatocellular Carcinoma Patients: Highlighting Advanced BCLC Staging and Low Antiviral Treatment Uptake in an Indonesian Cohort Analysis, [Saut Horas H Nababan](#)
- 2718 - Interpretable Deep Learning model to Predict Multi-Outcome Trajectories of MASLD Using Whole Slide Images and Time-Series Data: A Retrospective, Multicentre Study, [Hao Shen](#)

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2719 - Periportal Arginine Deficiency Drives Macrophage Senescence to Blunt Aged Liver Regeneration, Haoran Hu
- 2720 - PRE-EXISTING ANEMIA INVERSELY RELATED TO RIBAVIRIN INDUCED ANEMIA IN CIRRHOTIC PATIENTS WITH VIRAL HEPATITIS C INFECTION, Siwanon Nawalerspanya
- 2721 - Prevalence, Characteristics, and Prognostic Value of Pituitary-Target Gland Axis Dysfunction in Decompensated Cirrhosis: A Prospective Cohort Study, Lu Bai
- 2722 - The predictive value of serum ferritin for Biochemical Non-resolution (BNR) in DILI, Ping Li Li
- 2723 - The Impact of Metabolic Dysfunction-Associated Steatotic Liver Disease on Liver Stiffness in Chronic Hepatitis B Patients: A Cohort Study, Lei Luo
- 2724 - Silybin Capsules Protected Hepatocytes by Regulating Mitochondrial Homeostasis in the Organoid Model of Metabolic Dysfunction-Associated Steatotic Liver Disease, Xiaohui Zhang
- 2725 - Suppression of gene expression of cholesterol in liver by royal jelly, Chi Wang
- 2726 - Endothelial peroxisome proliferator-activated receptor α ; prevents acetaminophen hepatotoxicity via maintenance of endothelial junctional integrity, Lu Peng
- 2727 - HBV enforces interferon refractoriness by hijacking LUBAC-mediated IRF9 linear ubiquitination, Peng Chen
- 2728 - Secretory ECM1a restores HBV-specific CD8 α ; T Cell response via integrin α ;1 blockade to promote HBsAg loss in chronic HBV infection, Peng Chen
- 2730 - Association of monocyte-to-high-density lipoprotein cholesterol ratio with liver histopathology in chronic hepatitis b, Yildiz Buse Koreli
- 2732 - Comparative evaluation of paper and digitized cognitive tests for diagnosis of hepatic encephalopathy in patients with liver cirrhosis, Alexander Nersesov
- 2734 - A Multidimensional Prognostic Signature Integrating a 4-Gene Panel, Immune Contexture, and Radiomic Features Predicts Progression-Free Survival in Hepatocellular Carcinoma, wei xiang
- 2735 - Significance of fibrinogen,D-dimer,albumin and NLR in the progression of Acute-on-Chronic pre-liver failure, Jun Lu
- 2737 - Effect of peginterferon alfa-2b with or without nucleos(t)ide analogues on long-term outcomes in chronic hepatitis B: Preliminary 48-week results from the multicenter, prospective VISION study in China, Qing-Lei Zeng
- 2738 - Causal Machine Learning-Guided Personalized Immunochemotherapy Strategies in Intrahepatic Cholangiocarcinoma, Jun-Hao Mei
- 2740 - Hepatocyte TrkB acts as a gatekeeper against MASH-related liver fibrosis by suppressing the TGF β /CCL2 axis and macrophage infiltration, yueying chen
- 2741 - Magnetic Resonance Cholangiopancreatography-Based Radiologic Evaluation of Biliary Complications in Living Liver Donors: A Single-Center Imaging Study, Diğdem KURU ÖZ
- 2743 - Immune Signatures Across Chronic Hepatitis B Phases: Serum IFN- γ ; and CD8 $^{+}$ T-Cell Counts in Untreated Patients at Dr. Mohammad Hoesin Hospital, Palembang, Indonesia, Ninda Septia Yuspar
- 2744 - Paracaval Triangle: A Novel Anatomic Landmark for Central Hepatectomy, Qin-qin Liu
- 2745 - Laparoscopic Anatomical liver resection using ICG-positive staining combined infrared laser-guided, Qin-qin Liu
- 2746 - Sofosbuvir/Velpatasvir/Voxilaprevir in Chronic Hepatitis C: A Systematic Review and Meta-Analysis, Marrium Sultan Dar Dar
- 2747 - Hepatic Artery Pseudoaneurysm Presenting Overt Obscure Gastrointestinal Bleeding, Chelsea Colleen Paris
- 2749 - Beyond the Stomach: Rapunzel Syndrome Presenting with Sepsis and Multi-organ Failure, Nida Rasool
- 2750 - Role of "PAST-F model" in predicting advanced liver fibrosis in Autoimmune Hepatitis, Nida Rasool
- 2751 - Fucoidan Alleviates MASH by Inhibiting JNK Phosphorylation-Mediated Hepatocyte Apoptosis, Jingyi Si
- 2752 - Protein phosphatase regulatory subunit enhances scaffold protein expression through an RNA binding protein and promotes invasion and immune remodeling in intrahepatic cholangiocarcinoma, Zhuomiaoyu Chen
- 2754 - THE CONTRIBUTION OF MRCP IN DETERMINING THE NEED FOR ENDOSCOPIC INTERVENTION IN ANASTOMOTIC BILE DUCT STRICTURES IN LIVER TRANSPLANT RECIPIENTS, Diğdem Kuru Öz
- 2755 - The Ptn-Sdc2 axis regulates meningeal fibrosis and lymphatic function in hepatic encephalopathy, Chihao Zhang

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2757 - Diagnostic Accuracy of Leukocyte Esterase Dipstick Test in Early Detection of Spontaneous Bacterial Peritonitis in Cirrhotic Patients, **Tanveer Hussain**
- 2758 - Mutation Profiles of three selected driver genes from Circulating cfDNA as Non-Invasive Prognostic Biomarkers in HBV-Induced Hepatocellular Carcinoma, **Afzalun Nessa Nessa**
- 2761 - CORRELATION OF NON-INVASIVE FIBROSIS TEST RESULTS WITH THE NUMBER OF METABOLIC RISK FACTORS IN PATIENTS WITH METABOLIC DYSFUNCTION-ASSOCIATED STEATOTIC LIVER DISEASE, **Danielle Lucero**
- 2763 - Comparison of Body Composition Parameters Between Cirrhotic and Non-Cirrhotic MASLD patients, **Rohit Shetty**
- 2766 - Association of radiotherapy with atezolizumab plus bevacizumab with survival in advanced hepatocellular carcinoma, **Hyunjae Shin**
- 2767 - Diagnostic value of homocysteine combined with IgG in differentiating drug-induced liver injury and autoimmune hepatitis, **Xue Jiao**
- 2768 - Diagnostic Value of the SS-FIB-VT Model Integrating Spleen Stiffness, Fibrinogen, and Retinal Vessel Tortuosity for High-risk Esophageal Varices in Liver Cirrhosis, **GUO Feng**
- 2769 - "Diabetic Ketoacidosis After Laparoscopic Cystectomy for Hydrosalpinx: A Case Illustrating Postoperative Metabolic Vulnerability", **Mery Friyanti Pandiangan**
- 2770 - The Value of Serum Immature Granulocyte Levels in Predicting Disease Activation in Patients with Ulcerative Colitis, **Esra Taşgetiren**
- 2771 - Infliximab as Salvage Therapy in Multidrug-Resistant Autoimmune Hepatitis: A Seven-Year Clinical Course, **Arif Mansur Cosar**
- 2772 - Development of a new nutritional screening score in hospitalized patients with cirrhosis., **Antony Kahwagi**
- 2775 - Circadian Rhythm Disruption Induces Abnormal Serine Metabolism and Immune Suppression to Promote Hepatocellular Carcinoma Progression, **Liming Zheng**
- 2776 - Serum Vitamin A, D and B12 Levels and Their Association with Disease Severity and Treatment Response in Chronic Hepatitis C, **Ammar ALRAMADAN**
- 2777 - Profile of HSD17B13 rs72613567 TA allele Variant in Indonesian Patients With Metabolic Dysfunction-Associated Fatty Liver Disease and Type 2 Diabetes Mellitus and Its Association With Liver Steatosis Severity, **Andry Kurniawan**
- 2778 - A Novel Non-Invasive Index for Predicting Non-Alcoholic Fatty Liver Disease in Patients with Chronic Hepatitis B: The Hatay Index, **Ammar ALRAMADAN**
- 2780 - Antiviral therapy in treatment-naïve patients with hepatitis B-related cirrhosis and low-level or undetectable viremia: long-term outcomes, **Gulziba Kurax**
- 2782 - Liver Cirrhosis Promotes Hepatocellular Carcinoma Progression by Regulating Myeloid Differentiation in Spleen, **Junkai Ma**
- 2783 - Methyldopa -induced acute liver failure successfully managed with drug withdrawal and supportive care - A case report, **Janaka Subasinghe**
- 2786 - Restoring sleep in cirrhosis: A prospective three arm double blind randomized clinical trial of lemborexant efficacy and hepatic safety, **pitt akbar**
- 2787 - Variceal bleeding due to stride - immunotherapy induced or cirrhosis driven ?, **Vamsi krishna Ankam**
- 2788 - Double plasma molecular adsorption system (DPMAS) for liver failure: early institutional experience at a tertiary hospital in the Philippines, **Paul Ian Banchiran**
- 2790 - Prevalence and clinical correlates of metabolic burden and fibrosis severity among non-cirrhotic HBsAg-positive patients, **Ammar ALRAMADAN**
- 2791 - Research on Resveratrol-loaded Tetrahedral Framework Nucleic Acids and Their Therapeutic Mechanisms for Metabolic Dysfunction-Associated Fatty Liver Disease, **YiFan Gao**
- 2792 - Risk of Hepatitis B Reactivation Among HBsAg-Negative, Anti-HBc-Positive Breast Cancer Patients Undergoing Chemotherapy, **Sabihat Çeken**
- 2794 - Extending Resectability in Fibrolamellar Hepatocellular Carcinoma Through Associating Liver Partition and Portal Vein Ligation for Staged Hepatectomy (ALPPS): A Case Report, **Leo Francis Gerardo**
- 2795 - Achieving Recompensation in Hepatitis B Cirrhosis via Targeted Albumin Infusion: A Multicenter Randomized Controlled Trial Protocol, **Wanting Yang**

ABSTRACTS' LIST

E-POSTER ABSTRACTS

- 2797 - Incidental Multifocal Hepatic Masses in an Asymptomatic Patient: A Neuroendocrine Tumor in Disguise, Leo Francis Gerardo
- 2798 - Small Bowel Obstruction Secondary to Post-Operative Adhesions and Gastrointestinal Vasculitis in Systemic Lupus Erythematosus: A Rare and Challenging Case, Leo Francis Gerardo
- 2800 - An observational study to evaluate the incidence, clinical profile, risk factors of biliary complications in adult post-liver transplant recipients., Mahesh kumar Choudhary
- 2801 - A Rare Cause of Massive Painless Hematochezia: Acute Hemorrhagic Rectal Ulcer Syndrome in a Critically Ill Patient, Leo Francis Gerardo
- 2802 - Melatonin Ameliorates LPS-Induced Acute Liver Injury via Upregulating Sirtuin 4(SIRT4) Expression and Inhibiting Macrophage Extracellular Trap(MET) Formation, Jun Zheng
- 2803 - Medical Knowledge and Therapeutic Practices Regarding Hepatitis B and C: A Study Among Lebanese Physicians, Ghadi Dagher
- 2804 - Sequential liver transplantation after combined therapy for hepatocellular carcinoma: rejection risk and management, Zhouying Zheng

ORAL ABSTRACTS

1006 - Ultrasound derived Fat Fraction is a Reliable Method to Grade Hepatic Steatosis in Patients with Chronic Liver Diseases A Multicenter Study in a Population with Mixed Etiologies

Jiahao Han¹, Jia Li¹, Zuowei Bao², Lixin Yang³, Kexin Lou⁴

Zhongda Hospital Southeast University, Department Of Ultrasound, Nanjing-China¹ Changzhou Third People's Hospital, Department Of Ultrasound, Changzhou-China² The Second Hospital Of Nanjing, Department Of Ultrasound, Nanjing-China³ Xuzhou Central Hospital, Department Of Ultrasound, Xuzhou-China⁴

Background / Hypothesis: To investigate the performance of ultrasound derived fat fraction (UDFF) on grading hepatic steatosis in CLD patients applying liver biopsy as the gold standard. Also, the potential factors that affect the diagnostic performance of UDFF will also be analyzed.

Materials and Methods: This prospective study enrolled patients suspicious for or confirmed CLD, and scheduled for liver biopsy from October 2024 to June 2025 at four tertiary care centers. UDFF was measured on the same day of liver biopsy and the region of interest (ROI) contained the biopsy site. The performance of UDFF on detecting hepatic steatosis $\geq S1$, $\geq S2$, and $=S3$ was analyzed by ROC curve.

Results: A total of 255 patients with CLD were included in the final analysis, with a mean age of 52.00 (14.00) years old. The counts of patients with hepatic steatosis of S0, S1, S2, and S3 were 146(57.25%), 40(15.69%), 30(11.76%), and 39(15.30%). The AUCs of UDFF on detecting hepatic steatosis $\geq S1$, $\geq S2$, and of S3 were 0.914 (0.873 ~ 0.946), 0.950 (0.916 ~ 0.974), 0.916 (0.875 ~ 0.947). The optimal cutpoints of UDFF to grade hepatic steatosis $\geq S1$, $\geq S2$, and of S3 in this cohort were $\geq 7\%$, ≥ 11 , and $\geq 18\%$. The AUC of UDFF on detecting hepatic steatosis $\geq S1$ in patients with inflammation of G2~3 is significantly higher than those with G0~1 [0.969 (0.929 ~ 0.990) vs. 0.888 (0.805~0.945), $p = 0.043$].

Conclusions: UDFF is a reliable method to noninvasively grade hepatic steatosis in CLD patients regardless of the etiology, stage of inflammation as well as fibrosis.

Keyword(s) : chronic liver disease; ultrasound; hepatic steatosis; liver biopsy

HCV Related Cirrhosis A Multicenter Retrospective Study in Egypt

Atteyat A. Semeya¹, Raafat S.a. Abdel Hafez², Rasha Elgamal³, Amira A.a. Othman⁴
Benha Teaching Hospital, Hepatology, Gastroenterology And Infectious Diseases Department, Benha-Egypt¹ Damanhour Teaching Hospital, Internal Medicine Department,, Damanhour-Egypt² Faculty Of Medicine, Suez University, Suez, Clinical Pathology Department, Faculty Of Medicine, Suez University, Suez-Egypt³ Faculty Of Medicine, Suez University, Suez, Internal Medicine Department,, Faculty Of Medicine, Suez University, Suez-Egypt⁴

Background / Hypothesis:

HCV infection remains a major public health issue in Egypt, with a high prevalence of genotype 4. Direct-acting antivirals (DAAs) achieve >95% sustained virologic response (SVR), but their impact on variceal rebleeding in genotype 4 cirrhotic patients is underexplored. This study evaluated the association between DAA therapy and variceal rebleeding in Egyptian patients with HCV-related cirrhosis.

Materials and Methods: A multicenter retrospective cohort study included HCV genotype 4 cirrhotic patients from five Egyptian centers with a first variceal bleeding episode. Patients were divided into DAA-treated (Group A) and non-treated (Group B) groups and followed for 5 years. Propensity score matching, Cox regression, and competing risk analysis were adjusted for confounders.

Results:

DAA treatment significantly reduced variceal rebleeding (HR 2.57; 95% CI 1.39–4.72; $p = 0.002$), ascites development over 5 years (6.8% vs. 27.1%, $p = 0.006$), and hepatic dysfunction progression. During treatment, it improved liver function (lower MELD, stable Child-Pugh class) and reduced complications. All Group A patients achieved SVR by PCR, while Group B remained HCV positive, likely contributing to the observed reductions in rebleeding and hepatic decompensation. These benefits persisted over 5 years, with longer survival without rebleeding (4.5 vs. 3.2 years), lower MELD (7 vs. 12, $p < 0.001$), and reduced hepatic

1007 - Direct Acting Antiviral Therapy Reduces Variceal Rebleeding and Improves Liver Function in

ORAL ABSTRACTS

decompensation (Child-Pugh progression: 5.1% vs. 35.6%, $p < 0.001$). At 5 years, the DAA group had better liver function (higher albumin, lower INR, improved platelets), while the non-DAA group worsened. PSM confirmed these findings (HR: 0.45, 95% CI: 0.27–0.75, $p = 0.002$), and competing risk analysis showed sustained protection (sub distribution HR: 0.44, 95% CI: 0.26–0.74, $p = 0.002$). Endoscopy revealed variceal regression with DAA but progression in the non-DAA group. DAA therapy significantly reduced variceal rebleeding, hepatic decompensation, and mortality (8.5% vs. 20.3%, $p = 0.045$), with survival benefits linked to sustained virologic response (SVR). Additionally, it was associated with improved survival, with a lower 5-year mortality rate in the DAA group (8.5% vs. 20.3%, $p = 0.045$).

Conclusions:

DAA treatment in HCV-related cirrhosis significantly reduces variceal rebleeding, ascites development, and hepatic dysfunction progression. The 5-year follow-up data demonstrate sustained improvements in liver function and hematologic parameters, underscoring the long-term benefits of DAA therapy.

Keyword(s) : Direct-acting antivirals (DAAs), variceal rebleeding, portal hypertension, sustained virologic response (SVR), genotype 4, Egypt.

1009 - Liver Resection versus Trans arterial Chemoembolization for Huge Hepatocellular carcinoma (>10cm) A nationwide Propensity score adjusted analysis

Boram Lee ¹, Jai Young Cho ¹, Hae Won Lee ¹, Hyelim Joo ¹, Seung Yeon Lim ¹
Seoul National University Bundang Hospital, Surgery, Seongnam-South Korea ¹

Background / **Hypothesis:**
The treatment of hepatocellular carcinoma (HCC) > 10 cm remains controversial. The ongoing debate regarding the treatment of patients with HCC > 10 cm is partly due to the necessity of tailoring treatment to individual patient conditions. This study aims to address the important controversy regarding the management of large HCC, focusing on providing insights into the comparative effectiveness of liver resection (LR) and Transarterial Chemoembolization (TACE).

Materials

and

Methods:

Patients registered in the Korean Primary Liver Cancer Registry (KPLCR) were selected. The KPLCR is a random sample consisting of approximately 15% of patients newly diagnosed with primary liver cancer registered in the Korean Central Cancer Registry (KCCR), which is a nationwide cancer registry and includes more than 95% of all cancer cases in Korea. The study design utilizes data from the KPLCR covering the years 2008 to 2017 to investigate the treatment outcomes for HCC larger than 10 cm. Starting with 15,307 cases, the study identified 9,310 HCC patients with follow-up data, excluding those with missing initial treatment data ($n=5,863$) and follow-up loss ($n=132$). From these, 7,662 patients with single HCC were selected, further excluding cases with multiple HCC ($n=1,394$) and distant metastasis ($n=254$). This refined the cohort to 504 patients with HCC tumors larger than 10 cm, who were then divided into two treatment groups: 122 patients underwent liver resection (LR), and 382 patients received TACE.

Results:

After PSM, the baseline characteristics showed no significant differences between the LR group ($n=99$) and the TACE group ($n=99$). Before propensity score matching (PSM), the hazard ratio (HR) for LR was 3.41 (95% CI: 2.62–4.43, $p<0.001$), indicating a significantly better survival probability for the LR group compared to the TACE group. After PSM, the HR for LR was slightly reduced to 3.06 (95% CI: 2.18–4.29, $p<0.001$), but the survival advantage of LR over TACE remained highly significant. Before PSM, the HR for LR was 3.29 (95% CI: 2.59–4.17, $p<0.001$), indicating a markedly better recurrence-free survival (RFS) for the LR group compared to the TACE group. After PSM, the HR for LR increased slightly to 3.37 (95% CI: 2.43–4.68, $p<0.001$), maintaining the significant survival advantage of LR over TACE.

Conclusions:

This study provides a comprehensive analysis of treatment outcomes for HCC > 10 cm, comparing LR and TACE using data from the KPLCR. The results indicate that LR is associated with significantly better OS and RFS compared to TACE, both before and after PSM.

Keyword(s) : HCC, Hepatectomy, Prognosis, Survival

1010 - A Five Year Retrospective Analysis of Hepatic Fibrosis and Steatosis Assessed by Transient Elastography in Patients Across the Glycemic Continuum

Maria Diana Manalili ¹, Marilyn Te ¹, Edwin Alfonso ¹,

ORAL ABSTRACTS

Roberto Lopez¹, Diana Payawal¹
Fatima University Medical Center, Internal Medicine,
Valenzuela City-Philippines¹

Background / Hypothesis: Liver fibrosis and steatosis are key prognostic markers in metabolic dysfunction-associated fatty liver disease (MAFLD), which is now the leading cause of chronic liver disease worldwide. Since the liver is central to glucose and lipid metabolism, a two-way link exists between MAFLD and diabetes mellitus, with each condition raising the risk of the other. This study aimed to explore the relationship between glucose tolerance, liver stiffness, and steatosis measured by transient elastography (FibroScan), while also evaluating related metabolic parameters.

Materials and Methods: We conducted a five-year retrospective analysis of 564 adults who underwent FibroScan between 2020 and 2024. Participants were categorized by glucose status into normoglycemic, prediabetic, and diabetic groups. One-way ANOVA, chi-square tests, multinomial logistic regression, and multivariate analysis of covariance were used to analyze differences and associations among groups.

Results: The mean age was 50 ± 14 years, and the mean BMI was 27 ± 4.6 kg/m². Among participants, 54.8% were female. Significant differences were observed among glycemic groups in liver stiffness, steatosis, BMI, and lipid profile (all $p < 0.05$). Compared to diabetics, normoglycemic individuals had significantly lower odds of intermediate fibrosis (87.4% reduction) and probable cirrhosis (87.7% reduction), while prediabetics also showed reduced odds (71.7% and 86.2%, respectively). Diabetic patients had notably higher total cholesterol, triglycerides, and LDL cholesterol compared to other groups.

Conclusions: These findings show that impaired glucose tolerance is linked to more severe liver fibrosis and steatosis, with diabetic individuals experiencing the most significant hepatic and metabolic changes. The results emphasize the importance of early metabolic screening and blood sugar management to lower the risk of liver-related complications in people with prediabetes and diabetes.

Keyword(s) : fibrosis, steatosis, liver stiffness, transient elastography, FibroScan, CAP score, diabetes mellitus, prediabetes, metabolic factors, BMI, ALT, lipid profile, HDL cholesterol, LDL cholesterol, triglycerides

1011 - Predictors of non response to antiviral therapy for hepatitis C in Almaty the largest city of

Kazakhstan

Arailym Maikenova¹, Alexander Nersesov¹, Elmira Kuantay¹, Aigul Raissova², Aliya Balabek¹
Kazakh National Medical University Named After S.d. Asfendiyarov, Gastroenterology Department, Almaty-Kazakhstan¹ Institute Of Gastroenterology, Hepatology And Metabolism, Almaty-Kazakhstan²

Background / Hypothesis: Despite the proven efficacy of direct-acting antiviral (DAA) therapies for chronic hepatitis C virus (HCV), treatment failures still occur in some patients. This study aimed to evaluate the effectiveness of these therapies in routine clinical settings and to identify factors that may influence the likelihood of achieving a sustained virological response (SVR).

Materials and Methods: A retrospective observational study was conducted at the Hepatological Center in Almaty involving 136 adult patients diagnosed with chronic hepatitis C and treated with Sofosbuvir + Daclatasvir ± Ribavirin within the state-guaranteed program (2018–2022). Cases (n=34) were defined as patients without SVR; controls (n=102) achieved SVR. Groups were matched 1:3 by age, sex, and ethnicity. Data on demographics, HCV genotype, fibrosis stage, comorbidities, laboratory parameters, treatment regimen, and adherence were collected. Univariable and multivariable logistic regression analyses were performed to identify independent predictors of treatment failure.

Results: The study population consisted predominantly of males (78.7%), with a mean age of 46 years and a mean BMI of 26.3 kg/m²; 52.2% were of Asian ethnicity. Previous interferon-based therapy was reported in 3.7% of patients and was significantly more frequent among non-responders (11.8% vs. 1.0%; $p = 0.0147$). In univariable analysis, genotype 3, advanced fibrosis, elevated ALT levels, obesity, peptic ulcer disease, HIV coinfection, and arterial hypertension were associated with an increased likelihood of treatment failure. Multivariable regression confirmed seven independent predictors of non-response: genotype 3 was associated with a more than two-fold increase in the odds of non-response compared to genotype 1 (AOR 2.33, 95% CI 1.26–3.35), and advanced fibrosis or cirrhosis (F4) also increased the risk almost two-fold (AOR 1.99, 95% CI 1.21–4.07), while arterial hypertension nearly doubled the risk of failure (AOR 1.94, 95% CI 1.03–3.36). Longer disease duration prior to treatment and elevated baseline ALT were modest but significant predictors (AOR 1.006 each, 95% CI just above 1.0). In contrast, extending therapy to 24 weeks proved protective, reducing the likelihood of failure by two-thirds

ORAL ABSTRACTS

compared with 12-week regimens (AOR 0.33, 95% CI 0.10–0.75). The most striking finding was that poor adherence to therapy dramatically increased the risk of non-response (AOR 87.1, 95% CI 23.7–313.1). Conclusions: DAA therapy remains highly effective for CHC in Kazakhstan; however, a subgroup of patients demonstrates suboptimal outcomes. Independent predictors of non-response include genotype 3, advanced fibrosis, elevated ALT, arterial hypertension, prolonged disease duration, and poor adherence, while extended treatment duration showed a protective benefit.

Keyword(s) : Hepatitis C, DAA, SVR, Non-response

1013 - Non invasive prediction of hepatic inflammation grade in chronic hepatitis B patients based on multiple parameters non enhancement MRI combined with clinical characteristics

Yuan Liu¹, Jinghui Dong¹, Hongwei Ren¹, Mengmeng Zhang¹, Changchun Liu¹, Meng Zheng¹, Yanan Zhang², Huiyi Ye³, Jianming Cai¹
Fifth Medical Centre Of Chinese PLA General Hospital, Department Of Radiology, Beijing-China¹ Third Medical Centre Of Chinese PLA General Hospital, Department Of Radiology, Beijing-China² First Medical Centre Of Chinese PLA General Hospital, Department Of Radiology, Beijing-China³

Background / **Hypothesis:**
Liver biopsy remains the gold standard for assessing hepatic inflammation in CHB (chronic hepatitis B) patients, yet its clinical utility is limited by drawbacks such as delayed reporting and potential complications. Building upon our prior research, multiple parameters MRI combined with clinical characteristics may serve as a potential non-invasive approach for evaluating hepatic inflammation.

Materials and **Methods:**
Between May 2020 and April 2024, we prospectively enrolled 100 consecutive CHB patients who underwent DWI ($b = 800 \text{ s/mm}^2$) and T2WI within 6 hours prior to liver biopsy on a GE 3.0T Signa HDxt MRI scanner. The imaging protocols were routine non-enhancement MRI protocols included RT-DWI (respiratory-triggered DWI), T2 FS (T2-weighted fat-suppressed imaging), and T1 DUAL (dual-echo T1-weighted imaging). ADC (Apparent diffusion coefficient) values derived from DWI and SII (signal intensity index) values derived from T2WI which were defined as the ratio of hepatic signal intensity adjacent to the liver biopsy site in the right liver lobe to that of the right erector spinal muscle at the same level were measured using ROI (region-of-interest) delineation by two observers. Meanwhile, clinical

characteristics of patients within 3 days before biopsy including age, age range, gender, ALT, HBV DNA exponents, HBsAg, TBIL, DBIL, ALB and PLT were documented. Using pathological hepatic inflammation grade as the gold standard, patients were classified into a case group (N=50, inflammation grade $\geq G2$) and a control group (N=50, inflammation grade $\leq G1$). Univariate and multivariable logistic regression were used to identify the significant independent risk factors and establish a predictive model. ROC (Receiver operating characteristic) analysis was performed to evaluate the diagnostic performance of radiological model, clinical model and combined model for predicting hepatic inflammation. Calibration plots and DCA (decision curve analysis) curve were generated using bootstrapping.

Results:

The radiological model was constructed by combination of ADC and SII. For the clinical model, age, ALT, and HBV DNA were identified as independent predictors of inflammation grade $\geq G2$ and thus included in its development. The combined model was established by merging the radiological and clinical predictors. AUC of radiological model in predicting liver inflammation grade $\geq G2$ was 0.904, the AUC of clinical model was 0.862, and the AUC of combined model was 0.947. Calibration plot and DCA curve of the combined model demonstrated good predictive performance. Conclusions: Multiple parameters MRI combined with clinical characteristics achieved superior accuracy in predicting hepatic inflammation grade $\geq G2$. This approach provides a non-invasive method, serving as a potential biomarker for early clinical assessment of pathological

1022 - SLC1A5 dependent glutamine transport regulates macrophage senescence and efferocytosis during liver regeneration

Hao Wang¹, Haoran Hu¹, Xiaowei Ling¹, Tao Han¹, Haoming Zhou¹, Yue Yu¹, Feng Cheng¹
The First Affiliated Hospital With Nanjing Medical University, Hepatobiliary Center, Nanjing-China¹

Background / **Hypothesis:**
Liver regeneration is an extraordinary process vital for the maintenance of homeostasis, governed by complex metabolic and immune interactions, particularly concerning the function of macrophages. Prior research underscores the significant role of these immune cells in the repair of tissue; nevertheless, the precise

ORAL ABSTRACTS

mechanisms that govern macrophage phenotypes and their functions throughout liver regeneration are not well understood. This study aims to investigate the role of SLC1A5, a neutral amino acid transporter responsible for glutamine transport, in macrophage senescence and efferocytosis during liver regeneration.

Materials and Methods: We employed myeloid-specific SLC1A5 knockout mice (SLC1A5^{fl/fl}/fLy2cre) in conjunction with a partial hepatectomy model to examine the effects of macrophage SLC1A5 deficiency on liver regeneration. Bone marrow-derived macrophages (BMDMs) were extracted and subjected to RNA sequencing and a range of functional assays to assess macrophage senescence, efferocytosis, and cytokine production levels.

Results:

The results indicate that SLC1A5 is essential for thwarting macrophage senescence and maintaining efferocytosis during liver regeneration. Macrophages lacking SLC1A5 showed elevated senescence markers and transitioned towards a pro-inflammatory phenotype, marked by increased levels of TNF- α and IL-6. Significantly, efferocytosis was compromised due to the reduced expression of Gas6, a critical ligand for macrophage efferocytosis. Treatment with L-glutamine and recombinant Gas6 effectively restored macrophage functions and enhanced liver regeneration in vivo.

Conclusions:

This investigation demonstrates that SLC1A5 is integral in modulating macrophage functions via glutamine transport during liver regeneration. The enhancement of glutamine availability may offer a new therapeutic strategy to alleviate macrophage senescence and promote liver recovery following injury.

Keyword(s) : liver regeneration, macrophage, SLC1A5, cell senescence, efferocytosis

1023 - Real world Clinical and Procedural Insights into Liver Abscesses A Multidimensional Retrospective Analysis from a Tertiary Center in North India

Ajay Patwa¹, Virendra Atam¹, Sudhir Verma¹, Kamlesh Gupta¹

King George Medical University., Gastroenterology And Hepatology Unit, Medicine, Lucknow-India¹

Background / Hypothesis: Liver abscess is a major cause of morbidity in tropical countries, with varied etiologies and outcomes. Data on large cohorts from real-world settings remain limited. Our study aimed to evaluate demographic, clinical, etiological, imaging, management, and outcome patterns in liver abscess and identify predictors of

prolonged hospitalization and mortality.

Materials and Methods: We retrospectively analyzed 1,408 confirmed liver abscess cases admitted between January 2018 and December 2023. Data on demographics, comorbidities, imaging, abscess characteristics, complications, management, and outcomes were extracted from discharge records. Hospital stay was dichotomized as ≤ 7 vs. > 7 days. Statistical analyses included univariate tests and multivariate logistic regression.

Results:

The mean age was 39.1 ± 17.5 years; 84.0% were male. Overall mortality was 5.5% (n = 77). Common etiologies were amebic (7.5%), pyogenic (7.0%), and unidentified (82.0%). Amebic abscesses had larger volumes but no mortality; pyogenic abscesses were linked to prolonged stays and higher mortality. Bilobar involvement and complications such as rupture, peritonitis, sepsis, shock, and anemia significantly worsened outcomes. Culture positivity was low (3.3%), with E. coli, Pseudomonas, and A. baumannii predominating. Ultrasound was the primary diagnostic tool (77.4%). Percutaneous catheter drainage (PCD) was used in 61.9%; discharge with PCD in situ was associated with shorter stay (p = 0.001) and low mortality (0.5%). Multivariate analysis showed younger age (OR 0.82; p = 0.001) and female gender (OR 1.19; p = 0.0025) predicted prolonged stay, while older age independently predicted mortality (OR 1.64; p < 0.0001).

Conclusions:

Liver abscess remains a heterogeneous disease with significant morbidity and mortality. Early identification of high-risk patients based on age, gender, etiology, and complications, along with safe early discharge protocols using PCD in situ, may reduce hospital stay and improve outcomes. Enhancing microbiological yield and optimizing imaging strategies are key future priorities.

1025 - Real time multidimensional system for predicting survival in patients with advanced biliary tract cancer treated with immuno chemotherapy

Jun-hao Mei¹, Xue Han¹, Kai Zhang², Jin-he Guo¹, Rong Liu³, Gao-jun Teng¹, Jian Lu¹
Zhongda Hospital, Medical School, Southeast University, Center Of Interventional Radiology & Vascular Surgery, Nanjing-China¹ Chinese Academy Of

ORAL ABSTRACTS

Medical Sciences And Peking Union Medical College,
Department Of Hepatobiliary Surgery, Beijing-China ²
The First Medical Center Of Chinese People's Liberation
Army (pla) General Hospital, Institute Of Hepatobiliary
Surgery, Beijing-China ³

Background / Hypothesis: First-line treatment for advanced biliary tract cancer (BTC) is now immunotherapy-chemotherapy. However, response varies significantly among patients, requiring ongoing monitoring and treatment adaptation. We aimed to develop an AI system that dynamically updates survival predictions for advanced BTC patients using evolving clinical data, enabling real-time prognostic stratification.

Materials and Methods: This study included patients with advanced BTC receiving immuno-chemotherapy across eight centres. Patients were divided into development, internal validation, and external validation cohorts (two retrospective, one prospective). We developed a Bayesian joint model, the Individualized Dynamic Risk Estimation Model for BTC (iDREM-BTC), that integrated baseline clinical and imaging data with serial measurements of C-reactive protein (CRP), carbohydrate antigen 19-9 (CA19-9), and total bilirubin (TBil). An enhanced model (iDREM(Pro)-BTC) also incorporated baseline immunohistochemistry and genetic data. Performance was evaluated via dynamic area under the curve (AUC) and calibration analyses.

Results: Data from 2314 patients were analysed (development cohort, n=841; internal validation cohort, n=360; external validation cohorts, n=1113). Machine learning methods identified age, tumour burden, biliary obstruction severity, ascites, CRP, CA19-9, and TBil as predictors of mortality. iDREM-BTC demonstrated robust performance in the development cohort (overall dynamic AUC 0.730 [95% CI 0.689–0.794]), internal validation cohort (0.718 [95% CI 0.668–0.778]), external validation cohort (0.755 [0.707–0.808]), external validation cohort 2 (0.705 [0.639–0.773]), and prospective external validation cohort (0.745 [0.691–0.802]). iDREM(Pro)-BTC achieved better discrimination in the development cohort (AUC 0.807 [95% CI 0.781–0.839]), and external validation confirmed these findings (0.718 [0.669–0.787]).

Conclusions: iDREM/(Pro)-BTC offer dynamic, real-time prognostic prediction for patients with advanced BTC undergoing immuno-chemotherapy. The two models suit different clinical scenarios, providing individualized prognostic stratification.

1029 - Global burden of hepatitis A virus 1990–2023 results from the Global Burden of Disease Study 2023

Changle Wu ¹, Zhifeng Zhao ¹, Kai Jiang ¹
Senior Department Of Hepato-pancreato-biliary
Surgery, The First Medical Center Of Pla General
Hospital, Beijing 100853, China, Beijing-China ¹

Background / Hypothesis: This study drew on data from the Global Burden of Disease (GBD) 2023 to examine global epidemiological patterns and long-term trends in hepatitis A virus (HAV) infection between 1990 and 2023.
Materials and Methods: Within the GBD 2023 framework, data from 204 countries and territories were synthesized from population-based surveys, clinical records, and published literature. HAV cases were defined according to ICD-10 codes B15–B15.9. Incidence and mortality were estimated using the Bayesian meta-regression tool DisMod-MR 2.1, and age-standardized rates (ASRs) were calculated.
Results:

In 2023, there were approximately 156,185,264 new cases of HAV worldwide, with an age-standardized incidence rate (ASIR) of 2,248.8 per 100,000 population. The global age-standardized mortality rate (ASMR) was 0.47 per 100,000, with 36,484 deaths. Incidence and mortality were highest in low-income regions, especially South Asia, followed by Oceania, and lowest in developed East Asia and Eastern Europe. Disability-adjusted life years (DALYs) from HAV fell from 8,747,097 in 1990 to 2,401,925 in 2023, with the lightest burden in Western Europe, Australasia, and high-income Asia-Pacific regions. Australasia saw the largest relative increase in the age-standardized DALY rate (4.9%). Across regions, there was a negative correlation between the Socio-Demographic Index (SDI) and the age-standardized DALY rate ($R = -0.58$). The age-standardized DALY rate declined sharply as SDI increased up to about 0.54, then the decline slowed but continued overall. Some exceptions were noted: San Marino, Qatar, Andorra, Estonia, and Latvia had higher-than-expected DALY rates despite high SDI, whereas Burkina Faso, Senegal, The Gambia, Timor-Leste, and Zimbabwe had lower-than-expected HAV burdens despite low SDI.

Conclusions: Between 1990 and 2023, the global burden of HAV fell sharply, though the impact varied widely across regions due to socioeconomic factors. These findings

ORAL ABSTRACTS

underscore the importance of targeted public health interventions and policies in areas where HAV remains a significant burden. Further research is needed to better understand the complex epidemiology of HAV and to inform the development of effective prevention strategies.

Keyword(s) : hepatitis A virus, disability-adjusted life years, incidence, mortality, public health

1034 - Charting immune and cancer metabolism co evolution during metastasis

Yingcheng Wu¹, Qiang Gao¹
Fudan University, Zhongshan Hospital, Shanghai-China¹

Metastasis, the leading cause of cancer death, exhibits a highly heterogeneous and suppressive cancer microenvironment. Here, we sequenced 97 matched samples by using single-cell RNA sequencing and spatial transcriptomics of colorectal cancer liver metastasis. Strikingly, the metastatic microenvironment underwent remarkable spatial reprogramming of immunosuppressive cells such as MRC1+ CCL18+ M2-like macrophages. We further developed scMetabolism, a computational pipeline for quantifying single-cell metabolism, and observed that those macrophages harbored enhanced amino acid metabolic activity. Interestingly, neoadjuvant chemotherapy could block this status and restore the antitumor immune balance in responsive patients, whereas the nonresponsive patients deteriorated into a more suppressive one. In parallel, metastatic cancer cells displayed the metabolic switch from OXPHOS to glycolysis, which is dependent on the metabolic master regulator LY6E. Our work described the metabolism co-evolution of both immune and cancer cells during metastasis and uncovered the black box of how tumors respond to neoadjuvant chemotherapy.

1035 - Targeting PAK1 on tumour associated macrophages enhances the efficacy of immunotherapy in hepatocellular carcinoma

Tongguo Miao¹, Ying Zhang², Jia Li¹, Yuemin Nan²
Tianjin First Central Hospital, Department Of Hepatology And Gastroenterology, Tianjin-China¹
Hebei Medical University Third Hospital, Department Of Traditional And Western Hepatology, Shi Jiazhuang-China²

Background

Hypothesis:

The tumour microenvironment (TME) is an important mediator of tumour immunotherapy resistance. Unfortunately, hepatocellular carcinoma (HCC) does not respond to immunotherapy due to a lack of enhancing inflammation in tumor microenvironment (TME), a contributing factor is P21 (RAC1) Activated Kinase 1 (PAK1). PAK1 is selectively highly expressed in tumour-associated macrophages (TAMs). How PAK1 impacts the TME remains under study.

Materials and Methods:

We investigated the role of the PAK1/mTORC1/TFEB pathway in HCC development by conducting metabolomic analysis, gene expression profiling and immunohistochemistry analyses in RAW264.7 cells, oncogene-induced HCC mouse models and human HCC samples, and further explored the molecular mechanism by which PAK1 promoted macrophages M2 polarization.

Results:

PAK1 is selectively expressed in different types of tumours, and was associated with adverse clinical outcome in patients with cancer. We show that targeting PAK1 is a novel and tolerable approach to significantly reverse M2 transition to inhibit tumor development in vitro experiment. This approach reshaped the tumour immune microenvironment, reduced IL-10 and TGF- β expression of macrophages, together with increasing expression and nuclear localization of TFEB. Mechanistically, PAK1 promoted M2 polarisation of macrophages by activating mTORC1/TFEB pathway.

Conclusions:

The PAK1/mTORC1/TFEB pathway plays an important role in HCC, targeting PAK1 represents a potential strategy to enhance the efficacy of immunotherapy in HCC patients.

Keyword(s) : PAK1, TFEB, macrophage polarization, tumor microenvironment, hepatocellular carcinoma

1037 - Engineered Vesicle Mediated Metabolic Regulation and Immune Targeting for the Treatment of Autoimmune Hepatitis

Mengyi Shen¹, Li Yang¹
West China Hospital, Department Of Gastroenterology And Hepatology, Chengdu-China¹

Background

Hypothesis:

ORAL ABSTRACTS

Metabolic disorder promotes CD4+ T-cell activation and associated inflammatory liver injury in autoimmune hepatitis (AIH). Strategies that target CD4+ T-cell metabolism hold great prospects for treatment. Here, we investigated the energy metabolic changes of CD4+ T cells in AIH patients and mice. Furthermore, we constructed a novel targeted delivery nanosystem, that is, a hybrid vesicle (Hy-EV) of metformin engineered mitochondria-rich extracellular vesicle (Met-EV) and dendritic cell membrane vesicle (DCMV), for the treatment of AIH.

Materials and Methods: The metabolic profiles of CD4+ T cells were characterized in human AIH and mouse hepatitis models. The liver protective effect of Hy-EV was evaluated by transaminase levels, histopathology, and inflammation. The targeting ability of Hy-EV was quantitatively detected using an IVIS imaging system and a confocal microscopy.

Results: Significant differences were found in the glycolysis and OXPHOS-related gene expression in CD4+ T cells between normal control and AIH group. Hy-EV treatment effectively rescued liver injury in AIH mice. In-depth exploration found that Hy-EV inherited Met-EV's ability to reduce CD4+ T-cell activation and cytokine release by reducing glycolysis while enhancing mitochondrial oxidative phosphorylation in such cells. In addition, DCMV component of Hy-EV displayed enhanced targeting potency for hepatic CD4+ T cells due to the overexpression of the key molecules which mediated DC-T cell contact. Lastly, multiple long-term administration of Hy-EV showed no systemic toxicity.

Conclusions: Hy-EV exploits a synthetic effect in enhancing efficacy and targeting in the treatment of AIH, which is of high value to serve as a viable strategy in clinical practice.

Keyword(s) : Autoimmune Hepatitis, Engineered Vesicle, Metabolic Regulation, Immune Targeting

1039 - Preoperative TACE with PD 1 Inhibitors and TKIs in Beyond "Up to Seven" Hepatocellular Carcinoma A Propensity Score Matched Analysis

Deyuan Zhong ¹, Yuxin Liang ¹, Xiaolun Huang ¹
Sichuan Cancer Hospital, Department Of Liver Transplantation Center And Hbp Surgery, Chengdu-
China ¹

Background / Hypothesis: Hepatocellular carcinoma (HCC) is the sixth most common malignancy globally, and patients with high tumor burden, particularly those exceeding the "up-to-seven" criteria, are at increased risk for recurrence. Despite advances in treatment strategies, effective perioperative management for these high-risk patients remains limited. This study aimed to evaluate the postoperative efficacy and safety of preoperative systemic therapy, including transarterial chemoembolization (TACE) combined with PD-1 inhibitors and tyrosine kinase inhibitors (TKIs), in HCC patients exceeding the "up-to-seven" criteria.

Materials and Methods: We retrospectively analyzed 126 HCC patients who underwent curative liver resection between January 2021 and June 2024. Of these, 73 patients received preoperative TACE with PD-1 inhibitors and TKIs (PST group), and 53 underwent direct surgery without preoperative therapy (Surgery group). Propensity score matching (PSM) was applied to control for confounding factors, resulting in 39 matched pairs. The primary endpoints were recurrence-free survival (RFS) and overall survival (OS), with secondary endpoints including intraoperative blood loss, surgical time, and complications.

Results: After matching, the PST group demonstrated significantly superior RFS and OS compared to the Surgery group ($P < 0.05$). The median RFS was 26 months in the PST group versus 13 months in the Surgery group ($P = 0.029$). There were no significant differences in postoperative complications between the two groups ($P = 0.365$). The PST group exhibited longer surgical times ($P < 0.001$) and slightly higher intraoperative blood loss, suggesting increased surgical complexity due to preoperative therapy. Treatment-related adverse events were predominantly grade 1-2, with few grade 3-4 events.

Conclusions: Preoperative TACE combined with PD-1 inhibitors and TKIs provides significant survival benefits without increasing the risk of severe postoperative complications in patients with beyond-up-to-seven HCC. This regimen may be an effective strategy for perioperative management in high-risk HCC patients, offering a promising option for improving long-term outcomes.

Keyword(s) : Neoadjuvant Therapy; Hepatocellular Carcinoma (HCC); Up-to-seven; Propensity Score Matching (PSM)

1042 - Non invasive detection of occult yet significant liver pathology in ALT normal chronic hepatitis B a multicenter study

Xinjie Li ¹, Meijie Shi ², Xiaozhong Wang ³, Feng Guo ³, Yingjie Qi ⁴, Xihong Wang ⁵, Ming Lin ², Xiaoling Liu ⁶, Pengyuan Kang ¹, Yuqi Zhang ¹, Shanshan Ji ⁵, Yizhong Hu ⁵, Jinbao Huang ⁵, Xiaoling Chi ², Tao Shen ¹
School Of Basic Medical Sciences, Peking University, Department Of Microbiology And Infectious Disease Center, Beijing-China ¹ Guangdong Provincial Hospital Of Traditional Chinese Medicine, Department Of Hepatology, Guangzhou-China ² Traditional Chinese Medicine Hospital Affiliated To Xinjiang Medical University, Department Of Liver Disease, Urumqi-China ³ Infection Hospital Area Of The First Affiliated Hospital Of University Of Science And Technology Of China (hefei Infectious Disease Hospital), Department Of Laboratory Medicine, Hefei-China ⁴ The People's Hospital Of Chizhou, Department Of Laboratory Medicine, Chizhou-China ⁵ The People's Hospital Of Chizhou, Department Of Infectious Diseases, Chizhou-China ⁶

Background / **Hypothesis:**
Individuals with chronic hepatitis B (CHB) may harbor occult yet significant liver pathology despite normal alanine aminotransferase (ALT) levels, representing a major diagnostic challenge. We aimed to identify and validate non-invasive biomarkers for detecting significant liver pathology among these population.

Materials and **Methods:**
This multicenter study screened 3,258 CHB cases from 2013-2023, enrolling 137 treatment-naïve HBeAg+ and 253 HBeAg- infection patients with normal ALT (≤ 40 U/L). All participants underwent liver biopsy (gold standard), liver function and novel biomarker measurement (including CK18-M30, CK18-M65, GP73, IL-10, and IL-2R). Significant liver pathology was defined as inflammation grade (G) and/or fibrosis stage (S) ≥ 2 . Sixteen CK18-M65-centered biomarker combinations were evaluated using eight machine learning algorithms with multicenter stratified validation.

Results:
Significant liver pathology was observed in 45.2% of HBeAg+ infection cases. CK18-M65, CK18-M30, and GP73 strongly correlated with pathology severity (G stage: 0.757, 0.688, and 0.453, respectively; $p < 0.0001$), independent of ALT levels. CK18-M65 demonstrated

optimal diagnostic performance (AUC=0.934, 95% CI: 0.896-0.973) with 85.5% sensitivity and 88% specificity, especially in those with low-normal ALT. High CK18-M65 levels conferred >40 -fold increased risk of severe liver injury (adjusted OR=40.64). The optimal biomarker combination (CK18-M65+CK18-M30+GP73) achieved AUROC of 0.942, significantly outperforming LSM (0.824), APRI (0.783), and FIB-4 (0.745; all $p < 0.01$), with enhanced clinical utility. HBeAg- infection cases showed 46% significant pathology but weaker diagnostic performance.

Conclusions:

CK18-M65-centered biomarker models provide promising non-invasive tools for detecting occult liver pathology and risk stratification of ALT-normal HBeAg+ CHB infection, potentially reducing unnecessary biopsies while identifying candidates for early intervention.

Keyword(s) : chronic hepatitis B (CHB); CK18-M65; non-invasive diagnosis; ALT-normal; liver pathology

1045 - The Denizli Model A Leading Strategy in the War on Hepatitis C

Tugba Sari ¹, Tugce Toker Ugurlu ²
Pamukkale University, Faculty Of Medicine, Department Of Infectious Diseases And Clinical Microbiology, Denizli-Türkiye ¹ Pamukkale University, Faculty Of Medicine, Department Of Psychiatry, Denizli-Türkiye ²

Background

In Türkiye, an estimated 750,000 people are infected with Hepatitis C (HCV), but diagnosis and treatment rates remain low. This is a significant issue, especially among high-risk groups like people who inject drugs (PWID) and the prison population.

Material and **Methods**
A comprehensive HCV elimination project was initiated in Denizli in 2018 to address this. The project included a retrospective study at Pamukkale University and a screening study in a Denizli prison.

Results
The retrospective study at AMATEM analyzed data from 265 patients with opioid use disorder. The results showed a remarkably high Anti-HCV positivity rate of 50.2% in this group, which is approximately 50 times higher than the general population. Longer substance use duration was found to be associated with higher HCV positivity. However, treatment initiation and follow-up rates were low. The prison screening study, conducted between 2021 and 2022, screened 187 inmates. The Anti-HCV

ORAL ABSTRACTS

prevalence among the prison population was 8.56%, which is eight times higher than the Türkiye average. The HCV SPOT rapid diagnostic test proved to be a reliable screening tool with 93.75% sensitivity and 100% specificity. The main risk factors identified were injecting drug use and a history of tattooing or piercing. Conclusions

The findings from these studies underscore the need to prioritize PWID and inmates in HCV elimination strategies. The micro-elimination approach, which focuses on these specific high-risk groups, is proposed as an effective way to achieve the WHO's 2030 goals. To reach this objective, key recommendations include enhancing systematic screening programs for high-risk populations, improving the linkage of diagnosed patients to treatment, implementing multidisciplinary approaches that coordinate care between addiction treatment and infectious diseases specialists, and leveraging rapid diagnostic tests to increase the accessibility of screening.

Keyword(s) : Hepatitis C, people who inject drugs, prison population

1046 - EVALUATING THE PROGNOSTIC VALUE OF THE MELD 3.0 SCORE IN PREDICTING MORTALITY IN CIRRHOSIS PATIENTS WITH ACUTE VARICEAL BLEEDING

Thong Vo	Duy	1
University Medical Center Hcmc, Gastroenterology, Ho Chi Minh	City-Vietnam	1

INTRODUCTION

Variceal hemorrhage is a severe complication in cirrhotic patients, occurring in up to 70% of cases of upper gastrointestinal bleeding, with a 6-week mortality rate of 15–20%. Accurate early mortality prediction is essential for optimizing treatment. The MELD 3.0 score, an improved version of the MELD score, enhances mortality prediction by incorporating gender, sodium, albumin, and a maximum creatinine threshold of 3.0 mg/dL. This study evaluates the effectiveness of MELD 3.0 in predicting 6-week mortality in cirrhotic patients with acute variceal bleeding, comparing it with MELD, Glasgow-Blatchford (GBS), and AIMS65 scores.

METHODS

A prospective study was conducted at Cho Ray Hospital from November 2023 to May 2024, enrolling cirrhotic patients with variceal bleeding. The primary outcome was 6-week mortality, and in-hospital mortality was a secondary endpoint. The predictive accuracy of MELD 3.0, MELD, GBS, and AIMS65 scores was assessed using AUCROC analysis.

RESULTS

Among 212 patients, in-hospital and 6-week mortality rates were 4.7% and 19.8%, respectively. MELD 3.0 outperformed other scores, with AUCROC values of 0.88 (in-hospital) and 0.81 (6-week mortality). A cut-off score of 20 corresponded to a >25% mortality risk, with 69.1% sensitivity and 83.5% specificity.

CONCLUSION

MELD 3.0 is a reliable tool for predicting mortality in cirrhotic patients with variceal bleeding. A cut-off score of 20 at admission can help identify high-risk patients for early intervention.

Keyword(s) : MELD 3.0 score; variceal bleeding; liver cirrhosis; 6-week mortality

1050 - Multicenter Study of Ultrasound Guided Microwave Ablation for Hepatic Cystic Echinococcosis

Ruifang Wang¹, Qian Cai², Lingqiang Zhang³, Dan Yang³, Mei Chang⁴, Shouting Tong⁵
Pla Medical College & The Seventh Medical Center Of Chinese Pla General Hospital, Department Of Interventional Ultrasound, Beijing-China¹ Clinical Medical School, Qinghai University, Department Of Interventional Ultrasound, Qinghai-China² Affiliated Hospital Of Qinghai University, Department Of Hepatopancreatobiliary Surgery, Qinghai-³ Maqin County Center For Disease Control And Prevention, Department Of Disease Control And Prevention, Qinghai-⁴ People's Hospital Of Guoluo Tibetan Autonomous Prefecture, Department Of Hepatopancreatobiliary Surgery, Qinghai-⁵

Background / Hypothesis: Hepatic cystic echinococcosis (HCE) is a endemic disease associated with significant morbidity. Microwave ablation (MWA) has recently emerged as a promising minimally invasive treatment alternative.

Materials and Methods: his retrospective multicenter study included 73 patients with 99 HCE lesions treated with ultrasound-guided MWA between 2016 and 2024. Primary endpoints were local lesion progression (LLP) and recurrence-free survival (RFS). Secondary outcomes included technical success and complication rates. Risk factors for recurrence were analyzed using Firth-penalized Cox regression. Four hierarchical risk models were developed to predict RFS.

Results:

The cohort comprised 73 patients (56.2% female, mean age 51.4±14.0 years) with mean lesion size of 7.5±2.5

ORAL ABSTRACTS

cm. Complete ablation was achieved in all cases without major complications. Over a median follow-up of 34.0 months, the LLP rate was 9.1%. The 1-, 2-, and 3-year RFS rates were 92.3%, 78.6%, and 64.2%, respectively. Three independent predictors of recurrence were identified: age >55 years, cyst diameter ≥ 11 cm, and elevated bilirubin. Four risk models were developed (Full, Extended, Basic, Mini) with C-index values ranging from 0.788 to 0.928. All models significantly stratified 3-year RFS (100% for low-risk vs 51-59% for high-risk groups, $p < 0.001$).

Conclusions:

Ultrasound-guided MWA is a safe and effective minimally invasive treatment for HCE. The proposed risk models facilitate individualized treatment planning and improved clinical decision-making.

Keyword(s) : hepatic cystic echinococcosis, microwave ablation, minimally invasive treatment, recurrence risk

1051 - Physical performance is associated with severe liver fibrosis in patients with chronic liver disease

Ching Sheng Hsu ¹, Chia-hsun Tsai ¹, Chung-yi Lin ¹, Tsung-hsing Hung ², Kuo-chih Tseng ², Chih-wei Tseng ², Ping-hung Ko ²
Taichung Tzu Chi Hospital, Center For Digestive Medicine, Taichung-Taiwan ¹ Dalin Tzu Chi Hospital, Department Of Internal Medicine, Chia-yi-Taiwan ²

Background / Hypothesis: Physical activity is a key lifestyle factor that influences the development of chronic liver disease (CLD). However, the impact of physical performance on the severity of liver fibrosis in CLD patients remains unclear. This study aimed to investigate the association between physical performance and liver fibrosis by analyzing the relationship between noninvasive fibrosis markers and various assessments of physical performance in individuals with CLD.

Materials and Methods: This retrospective study included 200 patients with various chronic liver conditions who underwent physical performance evaluations at Dalin and Taipei Tzu Chi Hospital between July 2020 and June 2023. The evaluations included handgrip strength, the Short Physical Performance Battery, the Five Times Sit-to-Stand Test, the 4-meter usual walking speed test, and the 6-minute walking test. Liver fibrosis was assessed using the Fibrosis-4 Index (FIB-4), with scores ≥ 2.67 indicating advanced fibrosis and < 1.3 indicating its absence. Clinical data, FIB-4 scores and physical performance measures were analyzed for associations.

Results:

The cohort included 100 patients with chronic hepatitis B, 16 with hepatitis C, 56 with liver cirrhosis, 20 with alcoholic liver disease, and 123 with steatotic liver disease. All participants were nutritionally stable. Among them, 23 were identified with advanced liver fibrosis. Multivariate analysis showed that older age and lower handgrip strength were significantly associated with FIB-4 scores ≥ 2.67 . On the contrary, steatotic liver disease was significantly associated with FIB-4 scores < 1.3 .

Conclusions:

Reduced handgrip strength and the presence of steatotic liver disease may serve as potential indicators for screening advanced liver fibrosis in patients with CLD.

1056 - Development of a Predictive Formula for Hepatic Steatosis in Apparently Healthy Individuals A Biopsy Proven Study in Turkish Liver Transplant Donors

Alihan Oral ¹, Eda Kaya ², Fatih Türker ³, Tolga Sahin ⁴, Erdem Kocak ⁵, Yusuf Yilmaz ⁶
School Of Medicine, Biruni University, Department Of Internal Medicine, Istanbul-Türkiye ¹ University Hospital Knappschaftskrankenhaus, Ruhr University, Department Of Medicine, Bochum-Germany ² Istanbul Haseki Training And Research Hospital, Department Of Internal Medicine, Istanbul-Türkiye ³ Istanbul Bayindir Hospital, Department Of Gastroenterology, Istanbul-Türkiye ⁴ Istanbul Liv Hospital, Department Of Gastroenterology, Istanbul-Türkiye ⁵ School Of Medicine, Recep Tayyip Erdogan University, Department Of Gastroenterology, Rize-Türkiye ⁶

Background / Hypothesis: The prevalence of metabolic-associated fatty liver disease (MAFLD) is rising globally, with an estimated prevalence of around 30%. In Türkiye, reported prevalences are approximately 50%, depending on the non-invasive diagnostic methods used. However, not all centers have access to advanced liver care. In this study, we aimed to develop a simple formula based on routine laboratory and demographic parameters to detect hepatic steatosis, using biopsy-proven data obtained from liver donors within the national liver donation program.

Materials and Methods: We analyzed prospectively

ORAL ABSTRACTS

collected data from 367 individuals who underwent liver biopsy as part of the liver donation program and were considered healthy. We divided dose patients 50/50 age- and sex-matched. Parameters associated with the presence of hepatic steatosis were first evaluated using univariate analyses, followed by binary logistic regression. Based on the results of the multivariate analysis, a formula for detecting hepatic steatosis was derived. The Youden index was applied to determine the optimal cut-off value for the detection of hepatic steatosis.

Results: The median age was 34 [19-61] and 59.7% were male. In the univariate analysis, significant differences were observed in body mass index (BMI), hemoglobin, alanine aminotransferase, bilirubin, creatinine, natrium, insulin, HOMA, T3, T4, plateletcrit (PCT), and uric acid. In binary logistic regression analysis, BMI, bilirubin, PCT, and uric acid remained statistically significant. Using the binary logistic regression analysis the following formula was created:

$$p = 1 / \{ 1 + \exp[- (-10.750 + 0.179 \cdot \text{BMI} + 12.346 \cdot \text{PCT} + 0.698 \cdot \text{Uric\_acid} + 1.791 \cdot \text{Bil})] \}$$

This model achieved an area under the curve (AUC) of 0.837 [Confidence interval: 0.775-0.898]. The optimal cut-off for predicting steatosis was $p > 0.59$, yielding a sensitivity of 83% and a specificity of 76%. In the validation cohort the AUC was 0.659 [0.578-0.740] with sensitivity of 59% and specificity of 41%.

Conclusions: In our study, we developed for the first time a formula based on simple laboratory markers, using liver biopsy as the reference standard, to predict the presence of hepatic steatosis in apparently healthy Turkish population. This formula should be validated in future cohorts. However, this formula may offer a simple approach for use in primary care as a screening tool.

Keyword(s) : MAFLD, steatosis, healthy, general population, prediction formula

1065 - Epigenetic regulation and functional mechanisms of the ZSCAN23 gene in liver cancer

Xiaoyan Chi¹, Zilin Ma²
301, 301, Beijing-China¹ Capital Medical University, Beijing Friendship Hospital, Beijing-China²

Background / Hypothesis: Liver cancer poses a major global health threat. Epigenetic alterations, alongside genetic mutations, play critical roles in its pathogenesis. The ZSCAN23 gene, encoding a zinc finger protein, is often silenced by promoter hypermethylation in cancers like breast and pancreatic cancer, but its role in liver cancer remains

unclear.

Materials and Methods: ZSCAN23 expression and methylation in liver cancer and normal tissues were analyzed using TCGA. Six liver cancer cell lines were treated with the demethylating agent 5-aza-2'-deoxycytidine (5-aza), and ZSCAN23 expression was detected by RT-PCR. Methylation-specific PCR (MSP) was performed on DNA from cell lines, 403 liver tumor tissues, and 5 normal liver tissues. Clinical data were correlated with methylation status. ZSCAN23-overexpressing cell models were constructed. Co-immunoprecipitation (Co-IP) and mass spectrometry (MS) identified ZSCAN23-interacting proteins, validated by Western blot. Drug sensitivity and colony formation assays were conducted. Pathway protein levels were measured to assess ZSCAN23 methylation as a synthetic lethal biomarker.

Results:

TCGA analysis showed promoter hypermethylation of ZSCAN23 correlated with low expression and poor patient survival ($P < 0.001$). ZSCAN23 was silenced in the SNU-449, HepG2, Huh7, HCCLM3, SNU-182, and Bel-7405 cell lines, and promoter methylation was detected in all. 5-aza treatment restored ZSCAN23 expression in these cells, confirming methylation-dependent regulation. In primary tissues, ZSCAN23 methylation frequency was 54.5% (224/403) and significantly associated with advanced tumor stage ($P < 0.0001$), smoking, and alcohol consumption ($P < 0.05$). ZSCAN23 was found to interact with Ku80, a key DNA damage repair protein. Methylation-mediated ZSCAN23 silencing suppressed non-homologous end joining (NHEJ) and promoted ATR/CHK1 pathway activation. Consequently, ZSCAN23-silenced cells showed increased sensitivity to ATR inhibitors combined with cisplatin. Western blot confirmed significantly increased DNA damage under this combination treatment.

Conclusion:

In liver cancer, the ZSCAN23 gene frequently undergoes methylation, and its expression is regulated by methylation in the promoter region. The methylation status of ZSCAN23 is closely associated with tumor stage, smoking history, and alcohol consumption in liver cancer patients. ZSCAN23 is involved in DNA damage repair, activating the non-homologous end joining pathway and inhibiting the ATR/CHK1 pathway. Methylation of ZSCAN23 serves as a potential marker for liver carcinogenesis and is also a potential marker for ATR inhibitor "synthetic lethality" therapy.

1067 - Clinical Profile and Short Term Outcomes of Patients with Acute on Chronic Liver Failure A Prospective Observational Study from a Tertiary Center in Southern India
Sreejith Ozhukil Thevarkalathil ¹, Jishnu Jayaraj ¹, Sreejith Eratte ¹
Daya Hospital, Medical Gastroenterology, Thrissur-India ¹

Background / Hypothesis:

Acute-on-chronic liver failure (ACLF) is associated with high short-term mortality, but data from South Asia remain limited, particularly regarding precipitating events and prognostic scores.

Materials and Methods:

This prospective observational study included 30 consecutive adult patients fulfilling APASL ACLF criteria, admitted between Jan–June 2025. Baseline demographic, clinical, and laboratory data were collected. Prognostic scores (MELD, CLIF-C ACLF, AARC) were calculated. Patients were followed for 28-day survival

Results:

The mean age was 47 ± 9 years; 24 (80%) were male. The underlying chronic liver disease was alcohol-related in 18 (60%), HBV in 6 (20%), and cryptogenic/NAFLD in 6 (20%). The commonest acute precipitating events were:

• Alcohol re-use	–	12	(40%)
• Sepsis	–	10	(33%)
• GI bleed	–	5	(17%)
• Drug-induced	–	3	(10%)

At baseline, median MELD was 26 (IQR 22–32), CLIF-C ACLF score 46 (IQR 40–54), and AARC: grade I – 6 (20%), grade II – 14 (47%), grade III – 10 (33%).

28-day mortality was 14/30 (47%). Independent predictors of mortality included bilirubin >15 mg/dL (p=0.01), INR >2.0 (p=0.02), grade III/IV encephalopathy (p=0.01), and sepsis (p=0.03). Prognostic discrimination was highest with CLIF-C ACLF (AUROC 0.83), followed by MELD (0.76) and AARC (0.71).

Conclusions: In this prospective cohort of ACLF patients,

alcohol and sepsis were the major precipitants. Short-term mortality was nearly 50%. CLIF-C ACLF score outperformed MELD and AARC for predicting 28-day outcome, supporting its role in early risk stratification and transplant prioritization

1069 - Gut Microbiota Derived Butyrate Alleviates the Progression of Metabolic Dysfunction Associated Steatohepatitis by Regulating Intrahepatic CD4⁺T Cell Immune Response
Xin Zhou ¹, Shiyu Zhang ², Ruihan Gao ², Shuting Liu ², Weixia Wang ¹, Bin Zhu ², Dongliang Yang ², Tianshu Zeng ¹, Baoju Wang ²
Union Hospital, Tongji Medical College, Huazhong University Of Science And Technology, Endocrinology, Wuhan-China ¹ Union Hospital, Tongji Medical College, Huazhong University Of Science And Technology, Infection, Wuhan-China ²

Background:
Metabolic dysfunction-associated steatohepatitis (MASH) is a critical stage in liver disease progression, where inflammation and fibrosis are core drivers of poor prognosis. Gut microbiota dysbiosis and abnormalities in its metabolite short-chain fatty acids (SCFAs) may affect disease progression by regulating T-cell immunity. This study focuses on the gut microbiota-SCFAs-T-cell immune axis, investigates its role and mechanisms in MASH, and provides a basis for disease prevention and treatment.

Methods:
Mendelian randomization (MR) was used to analyze the genetic association between gut microbiota and MASH, with inverse variance weighting as the main method for causal association analysis. In animal experiments, a MASH mouse model was established using a choline-deficient L-amino acid-defined high-fat diet (CDAHFD), and butyrate was supplemented via gavage combined with free drinking water. Fecal microbiota, SCFAs, serum liver function, blood lipids, inflammatory factors, liver pathological staining, and intrahepatic T-cell immune response (detected by flow cytometry [FACS]) were measured.

Results:
MR analysis showed genetically predicted higher abundance of butyrate-producing bacteria correlated with lower MASH risk, with no significant

ORAL ABSTRACTS

heterogeneity/horizontal pleiotropy and stable leave-one-out results.

Animal experiments confirmed MASH mice had reduced gut microbiota alpha diversity, lower GMHI, higher dysbiosis index, distinct beta diversity (vs control, PCoA), decreased butyrate-producing bacteria/fecal SCFAs (butyrate dropped most), plus higher visceral-to-body ratio, serum ALT/AST, intrahepatic TC/TG, and aggravated hepatic inflammation/fibrosis. Exogenous butyrate raised fecal butyrate, reduced visceral-to-body ratio, NAS score, fibrosis/steatosis, serum ALT/AST, intrahepatic TC/TG; downregulated serum IL-6/TNF- α , intrahepatic TNF- α / α -SMA/Collagen1/TIMP-1 mRNA, upregulated MMP mRNA; restored microbiota alpha diversity, improved GMHI/dysbiosis, normalized composition, and increased butyrate-producing bacteria. FACS showed that intrahepatic CD4⁺T cell proportion in MASH mice was significantly lower than in controls, restored after butyrate intervention. The MASH group had increased intrahepatic Th2 cells and decreased Treg cells; post-intervention, Th2 trended down while Treg trended up. Additionally, intrahepatic CD4⁺Perforin⁺ and CD4⁺TNF- α ⁺T cell proportions were elevated in the MASH group, which dropped significantly after butyrate treatment. No significant difference in intrahepatic T cell inhibitory phenotypes was noted among the three groups.

Conclusion:

Genetically, increased abundance of butyrate-producing bacteria is causally associated with lower MASH risk. In MASH mice, reduced butyrate-producing bacteria and butyrate correlate with hepatic injury; exogenous butyrate improves hepatic pathology and restores gut microbiota. Its protection may involve regulating intrahepatic CD4⁺T cell immune response, suggesting CD4⁺T cells mediate butyrate's role in delaying MASH progression.

1071 - Prevalence of significant fibrosis and metabolic correlates in patients with Metabolic dysfunction Associated Fatty Liver Disease A cross sectional study from a tertiary centre
Jishnu Jayarajan¹, Sreejith Ozhukil Thevarkalthil¹
Daya General Hospital, Medical Gastroenterology, Thrissur-India¹

Background

/

Hypothesis:

MAFLD is the most common chronic liver disease with an estimated prevalence of 25% worldwide. Patients with fibrosis $\geq$ F2 identified by transient elastography (TE) are considered the target population for pharmacological treatment and are most likely to benefit from antifibrotic drugs. However, FibroScan devices are expensive and not always available in resource-poor settings. Identification of metabolic correlates of advanced liver fibrosis helps in risk stratification and prioritisation of patients for further evaluation.

Materials

and

Methods:

This cross-sectional cohort study included consecutive adult patients visiting the gastroenterology department with fatty liver disease diagnosed by ultrasound scan / CAP measurement from January to June 2025(n=50). Clinical evaluation and routine lab works were performed and quantitative values of steatosis and fibrosis were measured using FibroScan. Patients with significant fibrosis defined as LSM $\geq$ 7.0 kPa ($\geq$ F2) were identified. Cross-sectional analysis assessed the prevalence and association of significant fibrosis with BMI, diabetes, hypertension and ALT.

Results:

Mean age was 45 ± 10 years, of which 30 (60%) were males and 20 (40%) were females. Mean BMI was 31 ± 4 kg/m². Metabolic features: obesity 28 (56%), diabetes 20 (40%), hypertension 18 (36%), dyslipidemia 24 (48%) and low HDL 26 (52%). Steatosis (CAP): S0 5 (10%), S1 5 (10%), S2 15 (30%), S3 25 (50%). Fibrosis by TE: F0-F1 20 (40%), F2 15 (30%), F3 8 (16%), F4 7 (14%). Overall prevalence of significant fibrosis ($\geq$ F2) was 30(60%). On statistical analysis, significant fibrosis was associated with diabetes (p=0.01), BMI $\geq$ 30 kg/m² (p=0.02) and ALT >40 U/L (p=0.03).

Conclusions:

In this cross-sectional MAFLD cohort, 60% of study population had significant fibrosis. As diabetes, obesity and raised ALT were found to be associated with advanced disease, these parameters help in risk stratification in clinics. Hence these patients can be prioritised for fibrosis assessment using TE and early administration of antifibrotic therapy.

1072 - Comparative evaluation of the level of oral microflora in patients with viral hepatitis C using

ORAL ABSTRACTS

heated tobacco product and cigarette smoking in Armenia a pilot study

Vahe Azatyan¹, Lazar Yessayan¹, Ofelia Ghevondyan¹, Melania Shmavonyan², Hasmik Ghazinyan³
Yerevan State Medical University, Therapeutic Stomatology, Yerevan-Armenia¹ Yerevan State Medical University, Infection Diseases, Yerevan-Armenia² Yerevan Scientific Medical Center, Infection Diseases, Yerevan-Armenia³

Background: Since the last decades of the 20th century up to the present time, there has been an increase in the incidence of viral hepatitis. The high frequency and diversity of the clinical picture of oral lesions in HCV are indicated. HCV contributes to the development of lesions of the oral mucosa (OM) and periodontium, but OM and periodontal diseases often precede HCV relapse. Microorganisms of periodontal pockets can cause a state of sensitization of the body and disturbances in the immunological status. Cigarette smoking (CS) also causes disturbances in the balance of oral microorganisms. In recent years a new type of products has emerged, such as Heated Tobacco Products (HTP), which are positioned as a harm reduction measure. The aim of the study was a comparative assessment of the level of oral microflora in patients with HCV using HTP and CS.

Materials and Methods: 50 patients with HCV who were treated in an infectious diseases hospital in 2025 were examined. The average age of the patients was 50.05 ± 13.29 years. Among them, there were 33 men (66%) and 17 women (34%). Bacteriological testing was performed on 50 patients in the HTP and CS groups.

Results: We have studied the features of the formation of pathological biotopes in the oral cavity in patients with HCV using HTP and CS. The comparative analysis of the frequency and intensity of inoculation of individual microorganisms between the groups is presented in Table 1. As can be seen from the table, most patients in the HTP group showed scanty growth of microorganisms. Moderate and abundant growth of pathogenic microorganisms *S. aureus* and *Str. pyogenes* are practically identical. *Veillonella* had a moderate growth in the HTP vs CS ($p < 0.001$; OR=0.01; 95% CI, 0.0–0.16). When analyzing the data of *Actinomyces* and *Candida* spp, moderate growth was revealed in HCV CS group, with a high degree of reliability compared with the HTP group ($p < 0.001$; *Actinomyces* OR=9.14; 95% CI, 3.05 to 27.43; *Candida* spp OR=8.13; 95% CI, 2.9 to 23.02).

Conclusion: Understanding patterns of interaction between different types of microorganisms will help identify new targets for the treatment of complex

polymicrobial

infections.

Keyword(s) : oral mucosae, microbiology, HCV, CS, HTP

1073 - Cognitive Impairment in Metabolic Dysfunction Associated Fatty Liver Disease (MAFLD) A Systematic Review and Meta analysis
Soe Thiha Maung¹, Roongruedee Chaiteerakij²
Faculty Of Medicine, Chulalongkorn University, Division Of Graduate Affairs, Bangkok-Thailand¹ Faculty Of Medicine, Chulalongkorn University, Integrated Innovation And Digital Technologies Affairs, Bangkok-Thailand²

Background / **Hypothesis:**
This systematic review and meta-analysis aimed to comprehensively evaluate cognitive performance in individuals with metabolic dysfunction-associated fatty Liver Disease (MAFLD) compared to healthy controls. It further sought to investigate how differences in cognitive assessment tools, including the Mini-Mental State Examination (MMSE) and Montreal Cognitive Assessment (MoCA), and key metabolic risk factors may influence the strength and direction of the association between MAFLD and cognitive impairment.

Materials and **Methods:**
We conducted a systematic search of PubMed, Scopus, Cochrane Library, and Google Scholar through May 2025 to identify studies comparing cognitive performance between individuals with MAFLD and healthy controls, assessed using either MMSE or MoCA. We performed a random-effects meta-analysis to calculate pooled standardized mean differences (SMDs) and assessed heterogeneity using I^2 statistics. Subgroup and meta-regression analyses were conducted to identify potential moderators influencing cognitive outcomes.

Results:
We included 14 studies involving 6,011 participants in the meta-analysis. The pooled SMD in cognitive scores between individuals with MAFLD and controls was -1.15 (95%CI: -2.48 to 0.19), indicating a trend toward poorer cognitive performance, though not statistically significant ($p=0.092$; $I^2=93\%$) (Figure 1). Subgroup analysis (Table 1) revealed significant effects in cross-sectional studies (SMD = -0.52 ; 95%CI: -0.75 to -0.29 ; $p < 0.001$) and cohort studies (SMD = -0.19 ; 95%CI: -0.25 to -0.13 ; $p < 0.001$). Studies using MoCA showed a significant association (SMD = -0.60 ; 95%CI: -0.89 to -0.31 ; $p < 0.001$), while MMSE did not (SMD = -1.76 ; 95%CI: -4.68 to 1.15 ; $p=0.235$). Quantitative steatosis assessment tools yielded smaller but significant effects,

ORAL ABSTRACTS

whereas ultrasound showed a larger but non-significant effect. Meta-regression (Table 2) identified higher BMI ($\beta = -0.071$; $R^2 = 81\%$), a greater prevalence of diabetes ($\beta = -0.130$; $R^2 = 92\%$), and increased liver enzymes—ALT, AST, GGT—as significant moderators. No significant associations were observed for age, hypertension, or lipid parameters. Across three studies, increasing steatosis severity was associated with progressively lower cognitive scores, suggesting a dose-response relationship. Egger's test detected publication bias; Trim and Fill analysis adjusted the effect to -0.28 ($p = 0.739$), indicating potential overestimation. Leave-one-out analysis identified one influential outlier study, which, when excluded, reduced heterogeneity and revealed a significant pooled SMD (-0.43 ; $p < 0.001$).

Conclusions:

This meta-analysis demonstrates a trend toward poorer cognitive performance in individuals with MAFLD, particularly in those with higher BMI, type 2 diabetes, and elevated liver enzymes. The findings highlight the greater sensitivity of MoCA over MMSE and underscore the importance of routine cognitive screening in at-risk populations. Well-designed longitudinal studies using standardized diagnostic and cognitive assessment methods are needed to clarify causal relationships.

Keyword(s) :

1075 - Effectiveness of Semaglutide in Non Alcoholic Steatohepatitis resolution A meta analysis and systematic review

Claudine Feliciano¹, Roger Remo Dandoy¹
Skyline Hospital And Medical Center, Internal Medicine,
Santa Maria-Philippines¹

Background / Hypothesis: NAFLD can lead to complications such as fibrosis, cirrhosis, and an elevated risk of hepatocellular carcinoma, cardiovascular disease, chronic kidney disease, and mortality. The use of glucagon-like peptide-1 (GLP-1) analogues is currently being studied as a possible treatment option in NAFLD. GLP-1 receptor agonists have pleiotropic effects on several aspects of metabolic syndrome relevant to treatment of NASH, including body weight, inflammation, and glucose and lipid metabolism.

Materials and Methods: A comprehensive literature search showed 4 randomized controlled trials ($N = 604$) comparing Semaglutide (0.4mg/day or 2.4mg/week) with placebo.

Two reviewers independently selected studies, assessed quality, and extracted and pooled outcomes including liver histology, aspartate transaminase (AST), alanine transaminase (ALT), Triglyceride, Hba1c levels and body weight. All selected studies were found to be of low risk of bias based on Cochrane risk of bias assessment tool for randomized trials

Results:

4 RCTs (604 patients) were analyzed, improvement of NASH as compared to those receiving placebo was noted (WMD = 0.23 95%CI: 0.12; 0.46) with a p-value of 0.0001; I² = 66%, fibrosis stage (WMD = 2.21 95%CI: 1.04; 4.52) with a p-value of 0.03; I² = 0%, serum ALT activity (WMD = -0.19; 95% CI: -1.73; 1.34) with a p-value of 0.36; I² = 0% (low heterogeneity) and AST activity (WMD = -0.23 95% CI: -1.90; 1.43) with a p-value of 0.33; I² = 0%, body weight (WMD = -1.05 95%CI: -1.81; -0.29) with a p-value of 0.02; I² = 83%, Hba1c (WMD = 0.39 95% CI: -0.84; 0.06) with a p-value of 0.07; I² = 59%, Triglycerides (WMD = -0.28 95%CI: -0.17; 0.17) with a p-value of 0.12;; I² = 30%.

Conclusions:

Our meta-analysis shows that while semaglutide improves liver enzyme levels and cardiovascular health in patients with NAFLD, it has a limited impact on liver fibrosis and fat content. Semaglutide is effective for weight loss and blood sugar control in patients with NAFLD and metabolic syndrome. However, larger studies are needed to fully understand its long-term effects on liver disease.

Keyword(s) :

1076 - Optimizing Risk Stratification of Esophageal Varices for Endoscopic Surveillance Diagnostic Value of APRI FIB 4 King and Bonacini Scores in Hepatitis Related Liver Disease

I Wayan Rendi Awendika¹, Didik Prasetyo², Aritantri Darmayani², Triyanta Yuli Pramana²
Sebelas Maret University, Internal Medicine, Surakarta-Indonesia¹ Moewardi Hospital, Gastroenterohepatology, Surakarta-Indonesia²

Background / Hypothesis: Chronic hepatitis B and C can lead to portal hypertension and esophageal varices, increasing the risk of upper gastrointestinal bleeding. In low-resource settings, non-invasive fibrosis scores offer a practical alternative to endoscopic screening.

ORAL ABSTRACTS

Materials and Methods: A retrospective cohort study was conducted on patients with upper gastrointestinal bleeding and chronic hepatitis B or C admitted to Moewardi Hospital, Indonesia (January–December 2024). AST, ALT, INR, and platelet levels were used to calculate APRI, FIB-4, King's, and Bonacini scores. All patients underwent EGD for EV grading (I–III). Ordinal logistic regression and ROC analysis assessed the association and diagnostic performance of each score.

Results: Among 44 UGIB patients meeting the criteria, the mean age was 56.91 ± 10.48 years, and 79.5% were male. Hepatitis B was present in 86.4%, the rest had hepatitis C. EV severity was distributed as 43.2% grade III, 40.9% grade II, and 15.9% grade I. Mean APRI, FIB-4, King, and Bonacini scores were 1.91 ± 2.63 , 5.81 ± 4.13 , 56.46 ± 81.12 , and 6.59 ± 1.66 , respectively. Ordinal regression identified FIB-4 and Bonacini as significant predictors of EV severity. FIB-4 was associated with a 29% increase in odds per unit ($p=0.01$, $OR=1.29$, $R^2=0.208$), and Bonacini with a 137% increase ($p<0.001$, $OR=2.37$, $R^2=0.379$). APRI and King scores were not significant. ROC analysis supported this, with Bonacini showing the best discrimination ($AUC=0.888$, $p=0.001$), followed by King ($AUC=0.761$, $p=0.03$), FIB-4 ($AUC=0.753$, $p=0.036$), while APRI had non-significant AUCs.

Conclusions: Bonacini index emerged as the most accurate and consistent non-invasive marker for predicting EV severity, suggesting its utility for risk stratification in hepatitis-related upper GI bleeding.

Keyword(s) : APRI, FIB-4, King Score, Bonacini Index, Esophageal Varices

1079 - Prognostic utility of the MELD score and AE model in predicting acute on chronic liver failure among patients with severe acute exacerbation of chronic hepatitis B.

Ngan Le Thanh Quynh¹, Hai Nguyen Thi Thu¹, Hoang Bui Huu²
Tam Anh General Hospital, Gastroenterology, HCM-Vietnam¹ Ucmc, Gastroenterology, HCM-Vietnam²

Background / Hypothesis: Acute-on-chronic liver failure (ACLF) remains one of the deadliest complications of chronic hepatitis B (CHB), particularly in Asia where HBV prevalence is high. Early identification of patients at risk is critical, yet existing prognostic models yield inconsistent results. Currently, predictive models for acute-on-chronic liver failure in hepatitis B virus infection remain limited in Vietnam.

Materials and Methods: We conducted a cohort study of 120 patients with severe acute exacerbation of CHB at University Medical Center, Ho Chi Minh City (2019–2024). Prognostic performance of MELD, MELD-Na, and AE models was compared using AUROC.

Results: Within 28 days, 35% of patients progressed to ACLF. MELD-Na (AUROC 0.82) and AE model (AUROC 0.84) demonstrated significantly higher predictive accuracy than MELD (AUROC 0.74). In multivariate logistic regression analysis, the factors independently associated with acute-on-chronic liver failure exacerbation included: ascites ($OR=24.65$, 95% CI = 3.77–161.29, $p<0.001$), hepatic encephalopathy ($OR=293.78$, 95% CI = 19.83–4353.16, $p<0.001$), palmar erythema ($OR=42.11$, 95% CI = 1.60–1105.74, $p=0.025$), and INR ($OR=677.89$, 95% CI = 6.91–66,468.85, $p=0.005$).

Conclusions: MELD-Na and AE models substantially outperform MELD in predicting ACLF, offering clinicians reliable tools for early risk stratification and timely intervention. This may reshape management strategies for HBV-related ACLF in high-burden regions such as Vietnam.

Keyword(s) : ACLF; CHB, MELD- Na, MELD, AE

1080 - Comparative Features of Viral and Metabolically Associated Liver Cirrhosis

Sayfullo Avezov¹, Mirhoji Khuzhamurotov¹
Institute Of Gastroenterology Of The Republic Of Tajikistan, Hepatology, Dushanbe-Tajikistan¹

Background / Hypothesis: Metabolically associated steatotic liver disease (MASLD) is becoming one of the most common liver disorders worldwide. The prevalence of MASLD is increasing in parallel with the global rise in obesity and type 2 diabetes mellitus. The most advanced stage of this disease is metabolically associated liver cirrhosis (MALC), which is associated with high morbidity, disability, and mortality rates. **Objective:** To study the clinical features of MALC in comparison with viral liver cirrhosis (VLC).

ORAL ABSTRACTS

Materials and Methods:
A total of 37 patients (14 men and 23 women) with MALC and 83 patients (49 men and 34 women) with VLC (including 54 with HBV and 29 with HCV infection) were examined. Clinical decompensation was defined by the presence of ascites, variceal bleeding, or hepatic encephalopathy (HE).

Results:

Patients with MALC were significantly older (58.43 ± 1.91 years) than those with VLC (38.70 ± 1.34 years). Elderly individuals (≥ 65 years) accounted for 35.1% of the MALC group and only 3.6% of the VLC group. Compared with VLC patients, those with MALC had a higher prevalence of obesity (32.4% vs. 4.8%), diabetes mellitus (56.7% vs. 9.6%), hypercholesterolemia (27.0% vs. 9.6%), and arterial hypertension (62.2% vs. 20.5%). Elevated ALT activity was observed in 51.4% and 75.9% of patients with MALC and VLC, respectively. Clinically significant portal hypertension (CSPH) was diagnosed in 43.2% of MALC and 59% of VLC patients. The proportion of patients with decompensated cirrhosis was higher in the MALC group (62.2% vs. 49.4% in VLC). The most frequent manifestation of decompensation was ascites, while the incidence of variceal bleeding and hepatic encephalopathy was similar between groups. Decompensation occurred in 67% of patients with obesity and in 60% of those without. Among patients with diabetes, decompensation developed in 76%, compared with 44% in non-diabetic individuals.

Conclusions:

MALC develops predominantly in older individuals with metabolic risk factors and is often accompanied by decompensation. Decompensation of MALC may occur even in the absence of CSPH. A high degree of necroinflammatory activity in the liver and the presence of diabetes mellitus—but not obesity—contribute to the progression of cirrhosis decompensation.

Keyword(s) : metabolically associated liver cirrhosis, clinically significant portal hypertension, decompensation

1085 - Radiomics on Gadoteric Acid HBP MRI to Distinguish Subclinical Hepatic Parenchymal Disease from Normal Liver

Fatih Işık¹, Serdar Sipahioğlu², Muhammed Halid Yener³, Muhammed Emre Işıktaş³, Fatih Alper³, Mehmet Alperen⁴, Tezcan⁴

Erzurum Regional Training And Research Hospital, Radiology, Erzurum-Türkiye¹ Ankara Dışkapi Yıldırım Beyazıt Resaerch Hospital, Radiology, Ankara-Türkiye² Atatürk University, Radiology, Erzurum-Türkiye³ Balıkesir University Research Hospital, Radiology, Balıkesir-Türkiye⁴

Background / Hypothesis:
Hepatobiliary-specific contrast agent gadoteric acid (Gd-EOB-DTPA) provides functional information reflecting hepatocellular uptake and biliary excretion. However, early parenchymal impairment may remain undetected on conventional biochemical tests or visual MRI assessment. We hypothesized that radiomics extracted from hepatobiliary-phase (HBP) MRI could identify subtle parenchymal alterations and distinguish subclinical hepatic disease from normal liver, enabling earlier noninvasive detection of hepatic dysfunction.

Materials and Methods:

This single-center retrospective study was approved by the Erzurum Atatürk University Ethics Committee (Approval No:B.30.2.ATA.0.01.00/692) and conducted in accordance with the Declaration of Helsinki. A total of 157 subjects who underwent Gd-EOB-DTPA-enhanced liver MRI were analyzed: 100 patients clinically diagnosed with subclinical chronic liver disease (CLD) based on laboratory scores and 57 normal controls without CLD. Exclusion criteria included large focal hepatic lesions and severe motion artifacts. Images were acquired on a 1.5T system using a 20-minute hepatobiliary phase protocol. All images were resampled to $2 \times 2 \times 2$ mm voxels and normalized using per-patient Z-scores. Automatic liver segmentation was performed using TotalSegmentator, manually corrected in 3D Slicer (Figure 1), and focal lesions with a 1.5 cm rim of surrounding tissue were excluded. PyRadiomics extracted 94 features across first-order statistics, GLCM, GLRLM, GLSZM, GLDM, and NGTDM matrices (Figure 2). The Boruta algorithm selected 10 most predictive features, primarily first-order energy-based and texture heterogeneity metrics. A logistic regression pipeline (standardization → PCA → classifier) was trained on 133 cases and tested on 24 independent cases. Model performance was evaluated by ROC-AUC, precision-recall (PR) analysis, accuracy, sensitivity, specificity, and F1-scores.

Results:

In the independent test cohort, the logistic regression model achieved ROC-AUC = 0.896 (Figure 3) and

ORAL ABSTRACTS

accuracy = 87.5%. Average precision (AP) on the PR curve was 0.93 (Figure 4). Class-based performance showed precision = 1.00, recall = 0.67, F1 = 0.80 for the normal group, and precision = 0.83, recall = 1.00, F1 = 0.91 for the subclinical group. The macro F1-score was 0.855, and weighted average F1 = 0.868. Confusion matrix analysis revealed correct classification of all 15 subclinical cases, with only 3 normal cases misclassified.

Conclusions:

Radiomics features derived from hepatobiliary-phase Gd-EOB-DTPA MRI distinguished subclinical hepatic parenchymal disease from normal liver with high accuracy and sensitivity. This machine-learning model demonstrates potential as a noninvasive imaging biomarker for detecting early hepatic dysfunction before clinical decompensation. Future multicenter validation will further define its prognostic and translational utility.

1096 - Triplet Therapy with Envafolelimab Lenvatinib and TACE Enables Curative Conversion and Pathological Response in Unresectable HCC A Single Arm Phase II study

Yuxin Liang¹, Deyuan Zhong¹, Xinpei Chen¹, Hongtao Yan¹, Xiaolun Huang¹

Sichuan Cancer Hospital & Institute, Sichuan Cancer Center, School Of Medicine, University Of Electronic Science And Technology Of China, Liver Transplantation Center And Hbp Surgery, Chengdu-China¹

Abstract

Background: Hepatocellular carcinoma (HCC) frequently presents at intermediate or advanced stages where curative resection is not feasible. Transcatheter arterial chemoembolization (TACE) is first-line for unresectable HCC but can induce angiogenesis via VEGF upregulation and often fails to cure, leading to recurrence. Combining systemic therapies with TACE may improve downstaging and conversion to surgery. Envafolelimab is a novel subcutaneous PD-L1 antibody offering convenient administration and potentially fewer infusion reactions. We conducted a single-arm, phase II trial of TACE plus Lenvatinib and envafolelimab in unresectable HCC, focusing on conversion to resectability. Methods: Fifteen patients with unresectable HCC (Barcelona Clinic Liver Cancer stage B or C) were enrolled from April 1–September 30, 2024. All received

conventional TACE (every 6 weeks as needed) combined with lenvatinib (12 mg or 8 mg daily by weight) and envafolelimab (300 mg subcutaneously every 3 weeks) until radiographic downstaging enabled surgery, or until progression, unacceptable toxicity, or death. The primary endpoint was conversion rate to curative resection. Secondary endpoints included objective response rate (ORR) and disease control rate (DCR) by mRECIST, R0 resection rate, recurrence-free survival (RFS), overall survival (OS), and safety. Results: The median age was 54 years, 86.7% were male, 80% had HBV infection, and 66.7% had multifocal tumors (median diameter 5.5 cm). ORR was 53.3% and DCR 86.7% per mRECIST. Nine patients (60%) achieved downstaging to resectable disease (conversion rate 60%), all of whom underwent R0 resections. Pathological examination showed viable tumor in most resected specimens, but 3 patients (33.3% of those resected) achieved pathological complete response. After a median follow-up of 16 months, the estimated median RFS was 15.0 months and 1-year RFS was 53%. Only one patient (6.7%) died during follow-up, yielding a 1-year OS of 100% and 18-month OS of 93.3%, median OS was not reached. Conclusion: TACE combined with envafolelimab and lenvatinib demonstrated a high conversion-to-surgery rate (60%) with favorable tumor responses and survival in unresectable HCC. All conversions led to R0 resections, and a subset achieved pathologic CR, highlighting the potential of this regimen to enable curative surgery. The safety profile was manageable and similar to known effects of TACE, VEGF inhibition, and PD-1/PD-L1 blockade. The subcutaneous delivery of envafolelimab was convenient and avoided infusion reactions. These findings support further investigation of envafolelimab plus lenvatinib and TACE as a conversion therapy strategy to improve resection rates and long-term outcomes in advanced HCC.

1098 - Disease burden of chronic hepatitis D virus (HDV) infection among people living with chronic hepatitis B virus (HBV) infection in a low endemic city

Grace Wong¹, Vincent Wong¹, Jimmy Lai¹, Terry Yip¹, Grace Lui²

The Chinese University Of Hong Kong, Medical Data Analytics Centre, Shatin-Hong Kong SAR, China¹ The Chinese University Of Hong Kong, Stanley Ho Centre For Emerging Infectious Diseases, Hong Kong Sar-Hong Kong SAR, China²

ORAL ABSTRACTS

Background / **Hypothesis:** Despite European guidelines recommending anti-hepatitis D virus (anti-HDV) screening for all hepatitis B surface antigen (HBsAg)-positive cases, screening rates in the Asia-Pacific region remain low. We aimed to evaluate the prevalence of chronic HDV infection among individuals living with chronic hepatitis B virus (HBV) infection with an additional risk factor for HDV, namely human immunodeficiency virus (HIV) co-infection or HBV-related hepatocellular carcinoma (HCC).

Materials and **Methods:** People living with chronic HBV infection, with either HIV co-infection or HBV-HCC under the care of a tertiary, academic hospital, were invited to have HDV screening by anti-HDV antibody followed by reflex HDV RNA quantitative real-time PCR (Quest Diagnostics, New Jersey, USA, limit of detection 5 IU/mL) in anti-HDV-positive individuals. Subjects with positive anti-HDV also underwent a vibration-controlled transient elastography (VCTE) examination as the non-invasive assessment for liver fibrosis.

Results: A total of 125 individuals (102 HBV-HCC, 23 HBV-HIV, mean age 65 years, 70.4% men, all HBV DNA undetectable (< 10 IU/mL) with oral nucleos(t)ide analogues) were recruited. Three (2.4%, two HBV-HCC, one HBV-HIV) subjects had positive anti-HDV, and two (1.6%, both HBV-HCC) subjects had equivocal anti-HDV; four of these five subjects also had hepatitis C virus (HCV) co-infection. All of these five subjects had undetectable HDV RNA; their median (range) liver stiffness measurement was 7.5 (6.8 – 14.8) kPa.

Conclusions: Our data showed that the implementation of anti-HDV / HDV RNA reflex testing is feasible in a low-endemic city. Even in the tertiary setting, the disease burden of HDV among individuals living with HBV and other risk factors (HCC, HCV, HIV) was low.

Funding: This work was supported by the Investigator Sponsored Research of Gilead Sciences (Reference: IN-US-980-7495).

1101 - Association of Serum ALT Levels with Histological Activity and Fibrosis in Chronic Hepatitis

Seda Zor¹, Dilek Filmaz²

Sincan Eğitim Ve Araştırma Hastanesi, Enfeksiyon Hastalıkları, Ankara-Türkiye¹ Kirikkale Yüksek İhtisas Hastanesi, Enfeksiyon Hastalıkları, Kirikkale-Türkiye²

Background / Hypothesis: This study aimed to evaluate the relationship between serum alanine aminotransferase (ALT) levels and both the histological activity index (HAI) and fibrosis stages in patients with chronic hepatitis B (CHB).

Materials and Methods: A total of 268 patients who underwent liver biopsy with a diagnosis of CHB at Yozgat City Hospital between 2017 and 2025 were retrospectively analyzed. Demographic characteristics, biochemical parameters, HBeAg status, hepatitis B virus DNA (HBV DNA) levels, and histopathological findings of the patients were evaluated. The threshold value for ALT was accepted as 50 U/L, which is the cutoff used in our hospital laboratory.

Results: Among the patients, 27.6% (n=74) had ALT levels above 50 U/L. ALT levels were significantly higher in the group with an HAI score ≥ 6 compared to those with HAI < 6 [41 U/L (10–1434) vs. 22 U/L (8–260), $p < 0.001$]. Similarly, ALT levels were higher in patients with fibrosis stage ≥ 2 [32 U/L (7–1007) vs. 26 U/L (9–1434), $p = 0.016$]. However, there was no significant difference in ALT levels between patients with advanced fibrosis (stage 5–6) and those with mild-to-moderate fibrosis (stage 0–4) [25 U/L (11–80) vs. 27.5 U/L (8–1434), $p = 0.531$].

The higher ALT levels observed in patients with HAI ≥ 6 and fibrosis stage ≥ 2 support the clinical value of ALT as an indicator of hepatic injury. On the other hand, the absence of a significant difference in ALT levels between advanced and lower fibrosis stages suggests that ALT may not consistently reflect disease severity in advanced fibrosis. This finding may indicate that, as fibrosis progresses, hepatocyte loss and increased fibrotic tissue can limit serum ALT activity. Consistent with previous literature, ALT levels may remain within the normal range in patients with advanced fibrosis or cirrhosis, indicating that ALT alone may not accurately reflect histological damage. Although elevated ALT levels were observed in some patients with HBeAg positivity and high HBV DNA levels, no absolute correlation was found between ALT and viral load. This suggests that hepatocyte injury and viral replication may not always occur in parallel during the

ORAL ABSTRACTS

natural course of CHB.

Conclusions: In patients with chronic hepatitis B, serum ALT levels were found to be associated with necroinflammatory activity and fibrosis degree. However, in advanced fibrosis stages, ALT levels do not reflect histological severity. These findings indicate that ALT should not be used as the sole marker in clinical evaluation and should be complemented with biopsy or noninvasive fibrosis assessment methods.

1102 - Natural History and Risk Factors of Metabolic Dysfunction–Associated Fatty Liver Disease in Chinese Cohorts A Scoping Review
Jing Zhang¹, Ruixi Zhan², Ying Wang², Yuemin Nan³
Beijing Youan Hospital, Capital Medical University, The Third Unit, Department Of Hepatology, Beijing-China¹
Novo Nordisk (china) Pharmaceuticals Co., Ltd, Medical Affairs, Beijing-China²
Hebei Medical University Third Hospital, Department Of Traditional And Western Medical Hepatology, Shijiazhuang-China³

Background:

Metabolic dysfunction-associated fatty liver disease (MAFLD) has rapidly become the predominant chronic liver disorder in China. However, evidence on its natural history and determinants of progression remains fragmented. We conducted a scoping review to synthesize evidence from Chinese cohorts on disease trajectories from steatosis through fibrosis, cirrhosis, and hepatocellular carcinoma (HCC), and to identify key risk factors driving progression.

Materials and Methods: Following PRISMA-ScR guidelines, we searched PubMed, EMBASE, Cochrane Library, CNKI, Wanfang, and VIP databases from January 2012 to January 2024. Eligible studies included Chinese MAFLD cohorts reporting natural history outcomes or multivariate-adjusted risk factors for progression. We mapped outcomes: Metabolic dysfunction-associated steatohepatitis (MASH), fibrosis progression, cirrhosis, HCC, liver-related events, cardiovascular events, mortality, and tabulated risk factors evaluated across studies.

Results:

41 articles (36 natural history; 21 risk factor) met the inclusion criteria, involving 247,502 participants for

disease-course analyses and 66,143 for risk modelling. For MAFLD patients, in 5 years or less, fibrosis advanced in 27.5-38.4%, and cirrhosis developed in up to 1% (0.9%). Over longer follow-up (>5 years), 0-2.1% transitioned to cirrhosis and 0-2.7% to HCC (annual incidence 0.3-2%). Hepatic decompensation (ascites, encephalopathy, variceal bleeding) occurred in 0.1-1.1% by 11 years. Within 5 years, cardiovascular mortality (2.1-7.0%) and all-cause mortality (2.2-6.8%) outpaced liver-related mortality (0.3-0.6%). Key independent predictors of progression included older age, male sex, hypertension, and overweight/obesity, especially type 2 diabetes, each reported in ≥ 3 studies across endpoints. Additional risk factors variably linked to adverse outcomes were dyslipidemia, sarcopenia, elevated transaminases, viral hepatitis coinfection, and low albumin. Heterogeneity in study populations, endpoint definitions, and reporting of demographic covariates limited comparability.

Conclusions:

MAFLD in China trends similarly to the global pattern but may exhibit notably rapid progression in specific populations or stages. Multiple risk factors contribute to disease advancement. Further large-scale prospective cohort studies are warranted to elucidate the associations between risk factors and MAFLD, and to better inform early intervention strategies for this condition.

Keyword(s) : MAFLD, MASH, fibrosis, cirrhosis, mortality, type 2 diabetes, overweight, obesity, natural history, risk factor, Scoping Review

1103 - Unusual Partners in Anemia Zieve's Syndrome and Beta Thalassemia Trait in a Single Patient A case report and literature review
Mehmet Akca¹, Ufuk Avcioglu¹, Saliha Deniz Selcuk¹, Hakan Demiroz¹, Yusuf Bunyamin Ketenci¹, Mert Emre Baykal¹
Ondokuz Mayıs University, Gastroenterology, Samsun-Türkiye¹

Introduction: Zieve syndrome (ZS) — a triad of hemolytic anemia, jaundice, and hyperlipidemia due to chronic alcohol abuse — is often underdiagnosed. Beta-thalassemia trait also causes chronic hemolysis. This report presents what we believe is the first documented case of ZS with concurrent beta-thalassemia trait, establishes the diagnosis of concurrent hemolysis, and adds to the limited literature on the complexities of treating ZS.

Case Presentation: A 36-year-old Turkish man with known beta-thalassemia trait and 3-year history of

ORAL ABSTRACTS

heavy alcohol consumption presented with a 3-4-month history of jaundice, weakness, abdominal pain, nausea, vomiting, and significant weight loss. Clinical findings included severe non-immune hemolytic anemia (Hb 6 g/dL, low haptoglobin, high reticulocytes), marked jaundice (total bilirubin 28 mg/dL, direct predominant), hypertriglyceridemia (530 mg/dL), severe hepatic steatosis, splenomegaly, and signs of pancreatitis. Diagnosis, Interventions, and Outcomes: The main diagnoses were ZS, with beta-thalassemia trait likely exacerbating the anemia, severe alcoholic steatohepatitis, and pancreatitis. Interventions included blood transfusions, alcohol withdrawal therapy, supportive care, and prednisolone administered due to a high Maddrey score (62.5). Alcohol abstinence led to significant improvement, although relapse occurred after resumption of use. The side effects of the steroids disappeared after discontinuation of the medication. Conclusion: This case underscores the importance of considering ZS in patients with chronic alcoholism who present with the characteristic triad, even in the presence of pre-existing hematologic conditions like beta-thalassemia trait, which can exacerbate anemia. Total abstinence from alcohol remains the critical component of treatment to achieve clinical improvement.

Keyword(s) : Zieve syndrome, alcoholic hepatitis, hemolytic anemia, thalassemia, case report

1110 - Effectiveness and safety of Fibrate Therapy in the treatment of adults with Primary Sclerosing Cholangitis A Systematic Review and Meta Analysis

Mark Angelo Pado¹, Celina Celeste Adraneda¹
Cardinal Santos Medical Center, Section Of Gastroenterology, San Juan City-Philippines¹

Background / Hypothesis: Primary sclerosing cholangitis is characterized by the stricturing of the bile ducts, either intrahepatic or extrahepatic bile ducts, and co-existence of inflammatory bowel disease, of which it is usually found in around 70% of patients. The global prevalence of primary sclerosing cholangitis is estimated to be 16 per 100,000 individuals, and in the Philippines, the prevalence of primary sclerosing cholangitis was around 1%. The risk for complications in the presence of primary sclerosing cholangitis could lead to liver failure, development of cholangiocarcinoma, and possible colon malignancy. This study compared the fibrate therapy and placebo in terms of serum liver biomarkers and safety of patients with primary sclerosing cholangitis

Materials and Methods:

Meta-analysis was the research design used. Specifically, the main author obtained the research design, the methodology of these investigations, interventions used, results and outcomes of these respective studies, among many others. Two research studies of de Vries and colleagues and Hatami and colleagues were included in the meta-analytical assessment. Results:

The investigation yielded statistical difference with 95% CI between placebo and fibrate therapy in terms of serum biomarkers specifically alkaline phosphatase (399.24 ± 173.57 vs. 261.85 ± 191.92 respectively, $p .050 < .05$). On the other hand, there was no statistical difference between placebo and fibrate therapy in terms of aspartate aminotransferase (66.02 ± 43.95 vs. 59.29 ± 39.86 respectively, $p .390 > .05$), alanine aminotransferase (72.09 ± 62.32 vs. 65.14 ± 42.37 respectively, $p .630 > .05$), total bilirubin (11.07 ± 10.17 vs. 10.52 ± 10.64 respectively, $p .390 > .05$), and serum albumin (22.27 ± 1.80 vs. 21.89 ± 3.23 respectively, $p .460 > .05$).

Conclusions:

Fibrate therapy could potentially improve the outcomes of primary cholangitis of patients. In this regard, the initiation of fibrate therapy could be beneficial in improving the biochemical markers of the aforementioned disease, better prognosis, and may also alleviate pruritus in patients.

Keyword(s) : Fibrate Therapy, Liver Disease, Primary Sclerosing Cholangitis

1116 - Racial Disparities in Hepatocellular Carcinoma A TCGA Based Gene Expression Study of Caucasian and Asian Populations

Muhammad Rezki Rasyak¹, Sri Jayanti², Cyrollah Disoma³, Bens Pardamean⁴, Caecilia Sukowati²
Bina Nusantara University, Bioinformatics And Data Science Research Center, Kabupaten Bogor-Indonesia¹
National Research And Innovation Agency (brin), Eijkman Research Center For Molecular Biology, Jakarta-Indonesia²
University Of Trieste, Doctoral School Of Molecular Biomedicine, Department Of Life Sciences, Trieste-Italy³
Computer Science Department, Binus Graduate Program - Master Of Computer Science, Computer Science Department, Binus Graduate Program, Jakarta-Indonesia⁴

Background / Hypothesis: Hepatocellular carcinoma (HCC) continues to be one of the leading causes of cancer death globally and has notable racial differences in incidence. As a result of hepatitis B or C virus (HBV/HCV) infection, Asian populations have a higher incidence of HCC, while

ORAL ABSTRACTS

Caucasian populations are more likely to be affected by non-viral etiologies such as metabolic dysfunction-associated steatotic liver disease (MASLD) and alcohol-related liver injury. These differences may produce different tumor biology and treatment outcomes.

Materials and Methods: Transcriptomic and clinical data from Asian (n = 157) and Caucasian (n = 184) patients were obtained from The Cancer Genome Atlas Liver Hepatocellular Carcinoma (TCGA-LIHC) cohort. Gene expression analysis was carried out in PyDESeq2 with size factor normalization and dispersion estimation. Different expressed genes (DEG) were defined by $FDR < 0.05$ and $|\log_2FC| \geq 1.0$. Gene annotation was done using Sanbomics, data visualization was done using seaborn and functional enrichment was done with GSEA using GSEApv. Enrichment was focused on Gene Ontology (GO) and KEGG pathways. Prognostic significance was assessed with GEPIA and the human protein atlas.

Results:

In both cohorts, 387 genes were upregulated and 250 downregulated compared to non-tumour tissues. Altered expression of GPC3, PLVAP, FCN3, and OIT3 suggests their potential as universal HCC markers. A total of 16 genes were upregulated in Asians but downregulated in Caucasians, while 25 showed the opposite pattern. The upregulated genes in Asian population AKR1B10, UBE2C, S100P were linked to viral infection and immune modulation, while MDK, LCN2, NQO1, CYP2C19 up-regulated in Caucasian were linked to proliferation and metabolism and xenobiotic exposure. GO and KEGG analyses revealed distinct biological programs: Asians showed enhanced ubiquitin ligase activity and reduced inflammatory signalling consistent with immune evasion in HBV/HCV-related HCC, whereas Caucasians showed enrichment of cytokine signalling, complement activation, and xenobiotic metabolism linked to alcohol and environmental carcinogen exposure. Elevated AKR1B10 in Asians and MDK in Caucasians were both associated with poorer five-year survival.

Conclusions:

This study identifies population-specific molecular pathways underlying HCC in Asian and Caucasian groups. While shared genes such as GPC3 and PLVAP may serve as common therapeutic targets, distinct immune and metabolic signatures reflect differing etiologies. Integrating these molecular and demographic differences will be essential for advancing precision oncology and developing equitable,

population-tailored prevention and treatment strategies for HCC.

1117 - ADH1B rs6850217 as a Novel Genetic Determinant of Hepatocellular Carcinoma Risk in Chronic Hepatitis B

Yun-chieh Su¹, Mei-hung Pan², Chih-jen Huang², Yi-chung Hsieh³, Wen-juei Jeng³, Chien-jen Chen², Hwai-i Yang²

National Yang Ming Chiao Tung University, School Of Medicine, College Of Medicine, Taipei-Taiwan¹
Academia Sinica, Genomics Research Center, Taipei-Taiwan²
Chang Gung Memorial Hospital, Linkou Branch, Department Of Gastroenterology And Hepatology, Taipei-Taiwan³

Background / Hypothesis:

While viral and host immune determinants of hepatocellular carcinoma (HCC) in chronic hepatitis B (CHB) are well established, the influence of alcohol-metabolizing gene polymorphisms remains unclear. We investigated whether variants in alcohol dehydrogenase 1B (ADH1B) and aldehyde dehydrogenase 2 (ALDH2) affect HCC risk and interact with alcohol consumption among hepatitis B virus (HBV) carriers.

Materials and Methods:

A total of 3,631 participants from the Risk Evaluation of Viral Load Elevation and Associated Liver Disease/Cancer-HBV (REVEAL-HBV) cohort were analyzed. Incident HCC was the primary endpoint. Associations between genotypes, alcohol intake, and HCC risk were assessed using multivariable Cox proportional hazards models and adjusted hazard ratios (HRs) were estimated. Gene-environment interactions were examined on an additive scale by calculating the relative excess risk due to interaction (RERI), attributable proportion (AP), and synergy index (SI).

Results:

During a median follow-up of 26.7 years, 416 participants developed HCC. The ADH1B rs6850217 variant was independently associated with an increased risk of HCC (adjusted HR = 1.60; 95% CI: 1.08–2.37; $p = 0.020$). The ALDH2 rs146752252 variant showed a crude association with HCC (HR = 2.06; 95% CI: 1.25–3.40; $p = 0.005$), but this association was attenuated after multivariable adjustment (adjusted HR = 1.38; 95% CI:

ORAL ABSTRACTS

0.81–2.36; $p = 0.242$). Alcohol consumption was also significantly associated with an increased risk of HCC (crude HR = 1.96; 95% CI: 1.54–2.49; $p < 0.001$). A significant synergistic interaction was observed between ADH1B rs6850217 and alcohol consumption (RERI = 1.635, AP = 0.408, SI = 2.19), whereas the ALDH2 rs146752252–alcohol interaction was comparatively weaker (RERI = 0.913, AP = 0.263, SI = 1.585).

Conclusions:

ADH1B rs6850217 is a novel, independent genetic determinant of HCC risk in chronic HBV carriers. Its synergistic interaction with alcohol highlights the importance of integrating genetic and lifestyle factors in HCC risk assessment and personalized prevention strategies.

Keyword(s) : Chronic hepatitis B; Hepatocellular carcinoma; Alcohol metabolism; ADH1B polymorphism; Gene–environment interaction

1118 - Targeting Premalignant Liver Lesions with Dietary Bioactive Compounds From Multi Targeted Mechanisms to Precision Prevention

Rui Zhao¹, Ruijuan Yan¹, Junzhe Jiao², Ran Nan², Ning Wang², Shuguang Yan¹, Zhanjie Chang², Haibo Zhang¹, Jingtao Li²
Shaanxi University Of Chinese Medicine, College Of Traditional Chinese Medicine, Xianyang-China¹
Affiliated Hospital To Shaanxi University Of Chinese Medicine, Department Of Liver Diseases, Xianyang-China²

Background / **Hypothesis:** Hepatocellular Carcinoma (HCC) is a leading cause of cancer-related mortality globally, with over 800,000 new cases and 700,000 deaths annually (WHO data). It develops through preneoplastic stages including liver cirrhosis and dysplastic nodules, and its malignant transformation is driven by risk factors such as HBV/HCV infection, aflatoxins, alcohol intake, and MAFLD, via mechanisms like mutations, epigenetic changes, and pathway dysregulation. Advanced HCC has a poor prognosis, creating an urgent need for chemopreventive strategies. Dietary bioactive compounds, with low toxicity and multi-targeted properties, are hypothesized to address this need—they may regulate hepatocyte homeostasis, exert chemopreventive effects, and intercept HCC progression from preneoplastic lesions, though their clinical translation is constrained by bioavailability limitations and interindividual variability. **Materials** and **Methods:**

This review synthesized peer-reviewed studies retrieved from databases including PubMed, Web of Science, and Scopus. The search used keywords such as “liver cancer precancerous lesions” and “dietary active ingredients”. Included studies met three criteria: focused on dietary bioactive compounds, reported specific mechanisms of action and efficacy, and provided full-text access. **Results:**

Dietary bioactive compounds regulate hepatocyte homeostasis through multiple interconnected pathways, primarily by activating the Nrf2 pathway to enhance antioxidant defenses and suppressing NF- κ B-mediated inflammatory responses. These compounds further exert their chemopreventive effects by inducing apoptosis via caspase pathway activation and modulating key oncogenic signaling networks such as Wnt/ β -catenin and PI3K/AKT. Synergistic combinatorial strategies significantly enhance their efficacy; for instance, curcumin-resveratrol co-treatment inhibits Hepa1-6 cell proliferation and induces apoptosis in a dose- and time-dependent manner, mechanistically involving mitochondrial pathway activation, downregulation of XIAP/survivin, and ROS accumulation. Similarly, the combination of Grifola frondosa polysaccharide (DFP) and vitamin C triggers G2/M phase arrest and 65% apoptosis in SMMC-7721 cells through mitochondrial membrane destabilization, excessive ROS generation (3.2-fold increase), and inhibition of the PI3K/AKT/NF- κ B axis, demonstrating multifaceted anticancer activity.

Conclusions:

Dietary bioactive compounds show significant promise in intercepting the progression from preneoplastic lesions to HCC, with multi-targeted chemopreventive effects. Synergistic combinatorial strategies and advanced delivery systems (e.g., nanodelivery) address their bioavailability limitations, while genomics/metabolomics-guided interventions enable precision prevention. Current research gaps include limited large-scale clinical trials and unclear compound–host interactions. Future research should focus on exploring crosstalk with the tumor microenvironment, conducting phase II/III clinical trials, and promoting the clinical translation of delivery technologies and personalized strategies to reduce the global burden of HCC.

1121 - The first application and feasibility assessment of 5G enabled remote robot assisted hepatobiliary and pancreatic surgery in patients

ORAL ABSTRACTS

with malignant tumors

Xingru Wang¹, Xianghong Guo², Guodong Zhao³
Southwest Hospital, Army Medical University, Institute Of Hepatobiliary Surgery Of The Army, Chongqing-China¹ Qujing Second People's Hospital Of Yunnan Province, Department Of Surgery, Qujing-China² Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Department Of General Surgery, Shanghai-China³

Background / Hypothesis: Remote surgery is gradually demonstrating its potential due to the application of the new generation of network and satellite communication technologies. Previously reported remote robot-assisted laparoscopic surgery has confirmed the technical feasibility of remote surgery at a physical distance of 4,670.2 km (5,031.2 km network communication distance), with a median network delay of 73 ms during the operation, no interruption or packet loss, and no abnormalities in the patient's 30-day follow-up. However, the feasibility assessment of remote robot-assisted complex hepatobiliary surgery for resectable malignant tumors is still lacking, and relevant research is urgently needed to fill this gap.

Materials and Methods: This study was the first to apply remote robotic surgery to four patients with liver, gallbladder and pancreatic tumors. The surgery was conducted using the MP2000 robotic platform independently developed in China (Shenzhen Edge Medical Company). The main surgeon operated from a location 900 kilometers away from the surgical site (1035 kilometers in terms of network communication distance), with 5G network as the primary communication method and dedicated fiber optic network as a backup. Network latency and fluctuations were monitored throughout the procedure, and experienced local surgeons were on standby at the surgical site to handle any emergencies.

Results: All the remote surgeries in this study were successfully completed. The average communication delay during the operation was only 21ms, and the end-to-end total delay was less than 100ms. There was no network interruption or packet loss throughout the process. The average operation time in the surgical cavity was 240 minutes, and the average intraoperative blood loss was 100mL. All patients achieved R0 resection. During the postoperative hospital follow-up

period, no complications such as pancreatic fistula, bile leakage, delayed gastric emptying, or postoperative hemorrhage occurred in the patients. Their physiological conditions remained stable, and intestinal function recovered within 24 hours after the operation, achieving rapid recovery. As of the time of this report, the short-term recovery effect of the patients was good, and no obvious abnormalities were observed.

Conclusions: This study confirms for the first time the technical feasibility of remote robotic surgery in treating resectable malignant tumors. Short-term follow-up shows favorable outcomes and safety, filling a gap in research on complex remote robotic procedures for cancer.

Keyword(s): 5G, remote robot-assisted, hepatobiliary and pancreatic surgery

1123 - From Cirrhosis to Cancer End to End Deep Learning Surveillance on Non Contrast CT

Shifan Liu¹, Shenghong Ju¹
Zhongda Hospital Southeast University, Department Of Radiology, Nanjing-China¹

Background / Hypothesis: Patients with liver cirrhosis are at high risk of developing hepatocellular carcinoma (HCC). However, the sensitivity of current surveillance strategies for early detection remains limited, often leading to delayed diagnosis and poor outcomes. To develop and validate an end-to-end deep learning model based on noncontrast-enhanced abdominal CT scans to predict the occurrence of HCC 3–12 months in advance among patients with liver cirrhosis.

Materials and Methods: This prospective study included 703 patients with liver cirrhosis from a single tertiary center between June 2018 and January 2020 (median age, 48.5 years; 86.2% male). Patients were divided into a training cohort (n = 568) and an external validation cohort (n = 135). For patients who later developed HCC, noncontrast CT scans obtained 3–12 months before diagnosis were analyzed; for those without HCC, CT images from the final follow-up were used. An end-to-end deep learning model (LCPC) based on a fine-tuned ResNet-50 architecture was trained with five-fold cross-validation and evaluated in an independent external validation cohort.

Results: The LCPC model achieved an area under the receiver operating characteristic curve (AUC) of 0.818 (95% CI, 0.795–0.892) in five-fold cross-validation, 0.829 (95% CI, 0.735–0.914) in the internal validation cohort, and 0.758 (95% CI, 0.646–0.861) in the external

ORAL ABSTRACTS

validation cohort. The model demonstrated good generalizability and discrimination for early HCC prediction using only noncontrast-enhanced CT images. Conclusions: The LCPC model enables prospective and individualized risk assessment of HCC in patients with liver cirrhosis using noncontrast abdominal CT scans. This approach may facilitate earlier clinical decision-making and expedite preparation for liver transplantation or donor registration in high-risk patients.

Keyword(s) : Liver Cirrhosis; Hepatocellular Carcinoma; Deep Learning; AI

1125 - Development of an Explainable Hybrid Artificial Intelligence System for Early Detection of Chronic Liver Diseases

Nazli Tokatli ¹, Yakuphan Bilmez ², Hatice Oğur ¹, Furkan Karan ², Halis Altun ², Necati Örmeci ³
Istanbul Health And Technology University, Department Of Computer Engineering, Istanbul-Türkiye ¹ Istanbul Health And Technology University, Department Of Software Engineering, Istanbul-Türkiye ² Istanbul Health And Technology University, Department Of Internal Medicine, Istanbul-Türkiye ³

Background / Hypothesis: Chronic liver diseases such as metabolic-associated fatty liver disease, cirrhosis and hepatocellular carcinoma are major causes of global morbidity and mortality. Traditional scoring systems, including the fibrosis-4 (FIB-4) index and the model for end-stage liver disease (MELD), guide management decisions but primarily quantify disease severity rather than enabling early detection. MELD is calculated to determine how soon a patient needs a liver transplant; higher scores indicate more advanced disease. FIB-4 relies on age and specific enzyme tests, and its performance varies across populations, leading to false positives and missed cases. This situation highlights the need for tools capable of analysing complex clinical data to identify high-risk individuals at an early stage. We hypothesised that combining conventional scoring algorithms with modern machine-learning models and explainability techniques could enhance early diagnosis and personalised risk stratification.

Materials and Methods: A web-based clinical decision-support system was developed with separate modules for metabolic-associated fatty liver disease, cirrhosis and hepatocellular carcinoma. The system integrated established clinical scores and trained supervised algorithms (CatBoost, extreme gradient boosting and support vector machines) on publicly

available datasets. Data preprocessing included missing-value imputation via k-nearest neighbours, removal of outliers using z-scores and standardisation. Datasets were partitioned into 80 % training and 20 % test sets. Model transparency was achieved through Shapley additive explanation analysis, feature-importance tables, receiver-operating-characteristic curves and confusion matrices. To mitigate class imbalance in the hepatocellular carcinoma module, a balanced training set was used.

Results: The CatBoost model achieved the highest performance, attaining 92 % accuracy and a 0.95 area-under-the-curve value in predicting hepatocellular carcinoma. The extreme gradient boosting model used for cirrhosis classification reached 93 % accuracy on the test data. Explainability methods revealed cases in which FIB-4 suggested low risk yet the model predicted a high probability of cirrhosis because of factors such as elevated international normalised ratio and low albumin. In the metabolic-associated fatty liver disease module, the support-vector machine achieved comparable performance, and the system generated individual risk profiles and feature contributions.

Conclusions: Integrating traditional clinical scores with modern machine-learning algorithms and explanation methods improved early detection and risk stratification of chronic liver diseases. The system provides transparent predictions that highlight contributing factors, thereby alerting clinicians to high-risk patients who might otherwise be overlooked. These findings suggest that explainable artificial intelligence can augment existing screening strategies and support digital health solutions adaptable to resource-limited settings.

1126 - Development of a Dual Module Artificial Intelligence System for Non Invasive Staging of Liver Fibrosis Using Blood Tests and Ultrasound Images

Nazli Tokatli ¹, Yakuphan Bilmez ², Helin Özalkan ², Sümeyye Ağır ¹, Halis Altun ², Necati Örmeci ³
Istanbul Health And Technology University, Department Of Computer Engineering, Istanbul-Türkiye ¹ Istanbul Health And Technology University, Department Of Software Engineering, Istanbul-Türkiye ² Istanbul Health

ORAL ABSTRACTS

And Technology University, Department Of Internal Medicine, Istanbul-Türkiye ³

Background / Hypothesis: Liver fibrosis staging guides therapy and predicts progression to complications such as cirrhosis. The current standard, percutaneous liver biopsy, is invasive and can cause pain, bleeding, infection and accidental injury. Moreover, sampling error and patient reluctance limit its utility. Existing non-invasive serum-based scores often lack accuracy in intermediate fibrosis stages. Evidence that combining different non-invasive modalities improves diagnostic accuracy suggests that integrating biochemical data with imaging could provide complementary information. We hypothesised that a dual-module artificial intelligence system that simultaneously analyses blood test data and ultrasound images can non-invasively predict fibrosis stage with high accuracy, offering a practical alternative to biopsy.

Materials and Methods: A web-based platform with two separate machine-learning modules was developed. The biochemical module used a random forest algorithm trained on 30691 records of liver biochemistry (aspartate aminotransferase, alanine aminotransferase, albumin and related markers) to estimate fibrosis stage. The imaging module employed a convolutional neural network based on ResNet-50 and transfer learning to classify 6323 B-mode ultrasound images. Each dataset was partitioned into 80 % training and 20 % test sets. Outputs from the two modules were fused and passed to a large language model that generated an interpretable report for clinicians.

Results: The imaging module achieved a test accuracy of 96.26 % in classifying ultrasound images across fibrosis stages. The random forest module analysing blood tests also demonstrated strong predictive performance. When predictions from both modules were combined, the system provided consistent stage estimates from F0 through F4 and produced detailed reports explaining the contributions of key laboratory and imaging features. The multi-modal integration improved robustness compared with using biochemical or imaging data alone.

Conclusions: Developing a dual-module artificial intelligence system that combines serum laboratory values and ultrasound images enables promising reliable non-invasive staging of liver fibrosis. By reducing reliance on biopsy and integrating complementary data sources, this approach may enhance diagnostic confidence, improve patient comfort and streamline clinical workflows. Such multi-modal decision-support systems illustrate the potential of explainable artificial intelligence in hepatology and could be adapted for other chronic liver diseases where early, non-invasive assessment is essential.

Keyword(s) : Liver Fibrosis, Non-Invasive Staging, Artificial Intelligence, Machine Learning, Multimodal Imaging

1127 - Development of a Multi Modal Artificial Intelligence Assistant for Early Diagnosis of Hepatocellular Carcinoma Using Imaging and Laboratory Data

Nazli Tokatli ¹, Yakuphan Bilmez ², Beyzanur Bayir ², Zeynep Tekin ², Halis Altun ², Necati Örmeci ³
Istanbul Health And Technology University, Department Of Computer Engineering, Istanbul-Türkiye ¹ Istanbul Health And Technology University, Department Of Software Engineering, Istanbul-Türkiye ² Istanbul Health And Technology University, Department Of Internal Medicine, Istanbul-Türkiye ³

Background / Hypothesis: Hepatocellular carcinoma (HCC) is a leading cause of cancer-related death and is often detected at advanced stages. Early detection substantially improves eligibility for curative therapies and five-year survival rates. Standard surveillance with ultrasonography and alpha-fetoprotein (AFP) testing has limited sensitivity; in cirrhosis patients these methods detect early-stage HCC in only 45 % of cases, although adding AFP modestly increases sensitivity. Recent research highlights that integrating imaging, clinical and laboratory data can enhance HCC risk prediction and early detection. We hypothesised that a multi-modal artificial intelligence system combining magnetic resonance imaging (MRI) with laboratory results and computing personalised risk scores could improve early diagnosis and clinical decision-making.

Materials and Methods: A web-based multi-module assistant was developed. A U-Net convolutional neural network segmented the liver and tumours from three-dimensional MRI volumes. Liver fibrosis stages were predicted using a VGG16 network trained via transfer

ORAL ABSTRACTS

learning on 2843 medical images. Laboratory data—including serum AFP, the ratio of aspartate to alanine aminotransferase and bilirubin levels—were preprocessed and merged with imaging features. All data were integrated into a virtual liver model that computed personalised risk scores based on tumour-to-liver volume ratios and nodule counts. Outputs were summarised by a large language model to generate interpretable clinical reports. Model performance was evaluated on separate test sets.

Results: The segmentation module achieved a 92 % dice similarity score in separating liver and tumour regions. The fibrosis-staging module reached 93.13 % accuracy. Combining imaging and laboratory features within the virtual liver model yielded consistent risk estimates across tumour stages and fibrosis grades. The system produced detailed reports explaining the contribution of each feature, facilitating clinician interpretation. By integrating MRI with laboratory biomarkers, the assistant addresses the low sensitivity of ultrasound and AFP surveillance offers a data-driven alternative for early detection.

Conclusions: A multi-modal artificial intelligence assistant that combines MRI segmentation, fibrosis staging and laboratory data can provide accurate non-invasive assessment and personalised risk stratification for early detection of hepatocellular carcinoma. This approach overcomes limitations of current surveillance methods, has potential to increase early diagnosis rates and could be incorporated into clinical workflows to improve patient outcomes and reduce mortality.

1130 - Effects of COVID 19 Vaccines on HBV Replication in Patients with Chronic Hepatitis B A Comparative Analysis of mRNA and Inactivated Vaccines

Mehmet Raşit Ayte¹, Bora Aktaş¹, Fırat Korlaelçi², Seçkin Özgül¹, Metin Uzman¹, Sanli Arabaci¹, Haluk Cihad Albayrak¹, Kerem Izmirlioğlu¹, Evrim Kahramanoğlu¹, Aksoy¹
Sağlık Bilimleri Üniversitesi Atatürk Sanatoryum Eğitim Araştırma Hastanesi, Gastroenteroloji, Ankara-Türkiye¹

Sağlık Bilimleri Üniversitesi Mehmet Akif İnan Eğitim Araştırma Hastanesi, Gastroenteroloji, Şanlıurfa-Türkiye²

Background and Aim: Chronic hepatitis B virus (HBV) infection remains a global health burden, affecting more than 250 million individuals and predisposing to cirrhosis and hepatocellular carcinoma. HBV DNA levels are the most reliable biomarker of viral replication and disease activity. With the global implementation of COVID-19 vaccination programs, questions have arisen regarding their impact on HBV replication, particularly with mRNA-based vaccines (BNT162b2) compared to inactivated vaccines (CoronaVac). This study aimed to evaluate the effects of COVID-19 vaccines on HBV DNA dynamics and to assess the modifying role of antiviral therapy (tenofovir, entecavir). **Methods:** In this retrospective cohort, medical records of 2,183 HBsAg-positive patients followed between January 2021 and December 2023 were screened. A total of 167 vaccinated patients met inclusion criteria, comprising 118 treated with antivirals and 49 untreated. An additional 80 unvaccinated HBsAg-positive patients served as controls. Patients were stratified according to vaccine type (mRNA vs. inactivated) and antiviral therapy status (tenofovir or entecavir). HBV DNA levels were recorded 3–6 months before vaccination and subsequently at 3-month intervals post-vaccination. Viral breakthrough was defined as $>1 \log_{10}$ IU/mL increase in HBV DNA, while smaller but significant increases were categorized as "HBV DNA rise. **Results:** Among antiviral-treated patients, HBV DNA rise was observed in 58.2% of BNT162b2 recipients and 12.8% of CoronaVac recipients, with no increase in the unvaccinated controls. In the untreated cohort, HBV DNA rise occurred in 84.6% of BNT162b2 recipients, 20% of CoronaVac recipients, and 17.5% of unvaccinated controls. Viral breakthrough was significantly more frequent in BNT162b2 recipients compared with both CoronaVac and control groups ($p<0.001$). In antiviral-treated subgroups, breakthrough rates were 22.8% for BNT162b2 and 2.6% for CoronaVac. Despite these increases, no hepatic flare or liver failure occurred, and HBV DNA levels in most patients returned to baseline within 12 months. **Conclusion:** COVID-19 vaccination, particularly with mRNA-based vaccines, appears to transiently increase HBV replication in patients with chronic infection, while inactivated vaccines show minimal effect. Antiviral therapy with tenofovir or entecavir reduces but does not completely eliminate this risk. These findings suggest the importance of close HBV DNA monitoring after vaccination, especially in untreated patients, and

ORAL ABSTRACTS

emphasize the need for prospective studies to clarify immunological mechanisms and long-term clinical significance.

Keyword(s) : Chronic Hepatitis B, HBV replication, COVID-19 vaccines, mRNA vaccine, Inactivated vaccine, Antiviral therapy

1132 - POTENTIAL HERB DRUG INTERACTIONS IN CHRONIC HEPATITIS B TREATMENT A CASE SERIES

Zeynep Tekin Taş¹, Elif Nur Özbay Haliloğlu¹
Sincan Research And Training Hospital, Department Of Infectious Disease And Clinical Microbiology, Ankara-Türkiye¹

Background / **Hypothesis:**
The use of herbal supplements is increasingly widespread among patients with chronic diseases, including chronic hepatitis B (CHB). Although antiviral therapies such as tenofovir disoproxil fumarate (TDF), tenofovir alafenamide (TAF), and entecavir have high efficacy and safety, data on their pharmacokinetic and pharmacodynamic interactions with herbal products remain limited. Herb-drug interactions can alter antiviral drug metabolism, potentially leading to therapeutic failure or hepatotoxicity. This case series hypothesizes that concurrent use of herbal preparations with standard CHB therapy may influence liver enzyme levels or viral suppression by interfering with antiviral drug bioavailability.

Materials and **Methods:**
Four male patients (aged 35–60 years) with CHB receiving long-term antiviral therapy were evaluated between 2015 and 2024. All had previously achieved virological suppression and normal liver function tests (LFTs). Each patient presented with unexpected HBV DNA positivity or elevated transaminase levels during routine follow-up. Detailed histories were obtained to identify concurrent use of herbal products. After recognition of supplement use, patients were instructed to discontinue the herbal product while continuing antiviral treatment. Laboratory parameters, including HBV DNA and LFTs, were monitored at one- to six-month intervals.

Results:
Case 1: A 48-year-old on TDF developed detectable HBV DNA (1276 IU/mL) while using okra seed extract for osteoarthritis. HBV DNA became undetectable three months after discontinuation.
Case 2: A 35-year-old on TDF showed persistent low-level viremia (665 IU/mL) despite adherence; he had used cornflower extract tablets for four months. HBV DNA normalized within four months of cessation.
Case 3: A 42-year-old on TDF presented with HBV DNA

525 IU/mL after one month of artichoke capsule use; viral suppression was restored within three months.
Case 4: A 60-year-old on entecavir showed elevated LFTs (ALT 245 U/L) and detectable HBV DNA while taking garlic powder. After stopping garlic, both LFTs and HBV DNA normalized within six months. In all cases, normalization occurred without changes in antiviral therapy, suggesting reversible herb-drug interactions rather than resistance.
Conclusions:

This case series indicates that herbal supplement use may transiently impair virological control or elevate liver enzymes in CHB patients receiving standard antiviral therapy. The observed reversibility following supplement discontinuation supports a pharmacokinetic or pharmacodynamic interaction mechanism. Clinicians should routinely inquire about herbal product consumption in CHB follow-up, especially when unexplained viral breakthrough or hepatotoxicity occurs. Further controlled studies are needed to elucidate specific metabolic pathways and to guide safe co-administration practices.

Keyword(s) :

1133 - A Novel HFE Mutation C.1006+1G>A Disrupts Iron Homeostasis and Drives Hereditary Hemochromatosis Pathogenesis

Xueyan Lin¹, Huping Huang¹, Zhengchao Zhang²
Fuzhou University Affiliated Provincial Hospital, Department Of Gastroenterology And Hepatology, Fuzhou-China¹ Fuzhou University Affiliated Provincial Hospital, Department Of Emergency Surgery, Fuzhou-China²

Background / **Hypothesis:**

Hereditary hemochromatosis (HH) is predominantly linked to pathogenic mutations in the homeostatic iron regulator (HFE) gene (NM_000410.3), yet non-classical variants remain understudied. We investigated a rare splice-site mutation (c.1006+1 G>A) in HFE, which retains intron 5 and introduces a premature stop codon, truncating the HFE protein's intracellular domain to elucidate its role in HH pathogenesis.

Materials and **Methods:**
Clinical data and liver MRI from a patient with iron overload were analyzed. Iron deposition was confirmed via histochemical staining of liver tissue. Sanger sequencing validated the c.1006+1 G>A mutation. Structural modeling (PyMOL) visualized the truncated HFE protein. Immunofluorescence and confocal microscopy quantified HFE expression in hepatocytes

ORAL ABSTRACTS

and gastric mucosal cells versus controls, supported by semi-quantitative analysis (Image Pro Plus 6.0).

Results:

Magnetic resonance imaging (MRI) of the liver and histopathological sections from the patient revealed typical iron deposition. Genetic testing confirmed the c.1006+1 G > A mutation in the HFE gene. The mutation retained intron 5 and introduced a stop codon, resulting in the truncation of the intracellular domain (R336-E348) of the HFE protein. Immunofluorescence and confocal microscopy revealed significantly reduced expression of HFE protein in hepatocytes and gastric mucosal epithelial cells compared to the control group ($p < 0.001$).

Conclusions:

The c.1006+1 G>A mutation disrupts HFE splicing, leading to a truncated protein with impaired iron regulatory function, directly contributing to HH. This study identifies a novel molecular mechanism underlying HH and underscores the diagnostic and therapeutic potential of targeting this mutation.

Keyword(s) : Hereditary hemochromatosis; homeostatic iron regulator; IVS5 mutation; liver; iron overload.

1139 - Sequential Application of the Fibrosis 4 Index and Serum Gamma Glutamyl Transferase for Enhanced Detection of Advanced Fibrosis in Type 2 Diabetes Mellitus Patients with Metabolic Dysfunction Associated Steatotic Liver Disease

Shamsul Mohd Zain¹, Wei Yoon Poh², Fatiha Hana Shabaruddin², Amirah Azzeri³, Rosmawati Mohamed⁴
Universiti Malaya, Department Of Pharmacology, Kuala Lumpur-Malaysia¹ Universiti Malaya, Department Of Clinical Pharmacy And Pharmacy Practice, Kuala Lumpur-² Universiti Sains Islam Malaysia, Department Of Research Development And Innovation, Nilai-³ Universiti Kebangsaan Malaysia, Department Of Medicine, Bangi-⁴

Background / Hypothesis:

The Fibrosis-4 index (FIB-4) reliably stratifies advanced fibrosis in patients with metabolic dysfunction-associated steatotic liver disease (MASLD). However, the limitation of FIB-4 is its considerable proportion of indeterminate results, notably in patients with type 2 diabetes mellitus (T2DM). Additionally, tools like vibration-controlled transient elastography (VCTE) are

often unavailable in resource-limited settings. This study aimed to compare the performance of FIB-4 in MASLD patients with and without T2DM and to identify potential biomarkers associated with advanced fibrosis.

Materials and Methods:

A cross-sectional study was conducted on patients who underwent VCTE for steatotic liver disease at Universiti Malaya Medical Centre. Clinical data, including T2DM status, FIB-4 index, and liver stiffness measurements by VCTE, were collected.

Results:

A total of 253 MASLD patients were analyzed, with 55% having T2DM. Among T2DM patients, 46.8% had indeterminate or high-risk FIB-4 ≥ 1.3 , compared to 25.4% of patients without T2DM. A greater proportion of T2DM patients had indeterminate FIB-4 (1.3–3.25) results (38.8% vs. 21.9% in non-T2DM). In T2DM patients with an indeterminate FIB-4, gamma-glutamyl transferase (GGT) levels above the upper limit of normal indicated a 10.5-fold increased risk of advanced fibrosis (odds ratio 10.5, 95% CI 2.94–37.55, $P < 0.001$). The proposed sequential use of FIB-4 followed by the GGT test in FIB-4 indeterminate cases improved stratification performance (sensitivity from 58.2% to 71.4%, specificity from 63.9% to 80.8%), while reducing referrals from 46.8% to 25.9%. FIB-4 ≥ 3.25 also appeared to predict advanced fibrosis effectively.

Conclusions:

A sequential FIB-4 followed by GGT approach improves fibrosis stratification and may reduce unnecessary tertiary-care referrals.

Keyword(s) : fatty liver, fibrosis, FIB-4, MAFLD, MASLD, NAFLD

1140 - EEF1E1 sustains EGFR signaling to drive immune evasion and tumor progression in hepatocellular carcinoma

Liying Ren¹, Dongbo Chen¹, Hongsong Chen¹
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China¹

Background / Hypothesis: Despite the advent of immune checkpoint inhibitors, clinical benefit in hepatocellular carcinoma (HCC) remains limited. Robust, clinically actionable biomarkers are urgently needed to identify patients most likely to benefit from

ORAL ABSTRACTS

immunotherapy and to guide rational combination strategies.

Materials and Methods: We evaluated EEF1E1 expression and prognosis in HCC using an immunohistochemistry tissue microarray (n = 141). Pro-tumor effects were tested by gain/loss-of-function assays in vitro and in vivo, including an orthotopic tumor model. The impact on the tumor immune microenvironment was profiled by single-cell RNA sequencing and multiparameter flow cytometry. EEF1E1-EGFR interaction was examined by co-immunoprecipitation and related signaling assays.

Results: EEF1E1 was highly expressed in HCC tissues and served as an independent adverse prognostic factor. Functionally, EEF1E1 enhanced invasion and migration and promoted epithelial-mesenchymal transition in vitro and in vivo. EEF1E1 reshaped the tumor immune microenvironment toward immunosuppression, characterized by increased infiltration of PD-1+ CD8 T cells. Mechanistically, EEF1E1 interacted with EGFR, activated EGFR-STAT signaling, and facilitated EGFR accumulation by impeding endosomal-lysosomal degradation. Consistent with this, tumors with high EEF1E1 expression showed superior efficacy from combined PD-1 and EGFR inhibition compared with either monotherapy.

Conclusions: EEF1E1 drives aggressive biology and immune dysfunction in HCC by sustaining EGFR signaling and may serve as a prognostic and predictive biomarker to guide combined PD-1 and EGFR blockade.

Keyword(s) : hepatocellular carcinoma; immunotherapy; EEF1E1; EGFR

1141 - Sequential met inhibition from crizotinib to capmatinib in a patient with advanced met amplified intrahepatic cholangiocarcinoma a case report
Xianglong Chen¹, Weixuan Xu¹, Xia Lin¹, Xiong Chen¹
Mengchao Hepatobiliary Hospital Of Fujian Medical University, Department Of Oncology, Fuzhou-China¹

Background: Intrahepatic cholangiocarcinoma (iCCA) is the second most common primary liver malignancy. It carries a poor prognosis, with limited options after first-line therapy failure. MET amplification is a rare (2%-4%) but targetable driver in iCCA cases.
Case Presentation: We present the case of a 49-year-old male with metastatic iCCA complicated by cirrhosis and thrombocytopenia. After progressing on an adjusted first-line regimen (nanoparticle albumin-bound paclitaxel, S-1, radiotherapy, and simvastatin), next-

generation sequencing (NGS) of tissue confirmed a high-level MET amplification (copy number 13). The patient was initiated on crizotinib, achieving a rapid partial remission (PR) that lasted 4.1 months. Upon progression, liquid biopsy NGS confirmed persistent MET amplification (copy number 4), which guided a switch to capmatinib, a more selective MET inhibitor. This sequential strategy brought the patient a sustained progression-free survival (PFS) of 10 months on capmatinib and an overall survival (OS) of 24 months from the advanced diagnosis.
Conclusion: This case demonstrates that dynamic molecular monitoring via NGS can effectively guide sequential MET-TKI therapy. Switching to a more potent MET inhibitor, rather than abandoning the target, may be a promising strategy for MET-amplified iCCA that progresses on a first-generation TKI while maintaining MET dependency.

Keyword(s) : cholangiocarcinoma, MET amplification, sequential targeted therapy, crizotinib, capmatinib.

1144 - The GREM1-BMP7 axis orchestrates apoptosis driven fibrotic remodeling in biliary atresia

Akshit Vats¹, Yashwant Kumar¹, Sadhna Lal², Shailesh Solanki³, Amit Arora⁴, Suvradeep Mitra⁵, Alka Bhatia⁶
Pgimer, Immunopathology, Chandigarh-India¹ Pgimer, Pediatric Gastroenterology, Chandigarh-India² Pgimer, Pediatric Surgery, Chandigarh-India³ Pgimer, Medical Microbiology, Chandigarh-India⁴ Pgimer, Histopathology, Chandigarh-India⁵ Pgimer, Experiment Medicine & Biotechnology, Chandigarh-India⁶

Background / Hypothesis: Biliary Atresia (BA) is a life-threatening fibro-inflammatory cholangiopathy of infancy that progresses to cirrhosis despite timely Kasai portoenterostomy. The mechanistic interplay between apoptosis, necroptosis, and fibrogenesis remains poorly defined, impeding biomarker discovery and therapeutic targeting.

Materials and Methods: Peripheral blood and extrahepatic biliary tissue from BA patients, and controls were analyzed using targeted RT² Profiler PCR arrays. Data underwent PCA, hierarchical clustering, and Weighted Gene Co-Expression Network Analysis. Feature selection employed multi-model machine learning (LASSO, Elastic Net, Random Forest, XGBoost, SVM) with cross-validation. Gene Ontology, Reactome, and Ingenuity Pathway Analysis, were used for functional annotation. Correlations with clinical parameters and histopathology were evaluated. Relative mRNA expression of key molecules were quantified by

ORAL ABSTRACTS

qRT-PCR among healthy controls, biliary atresia, and non-BA neonatal cholestasis groups.

Results:

A molecular signature of FASLG, GREM1, SNAI1, MMP8, IL10, and BCL2A1 showed strong and reproducible discriminatory power between BA and controls, with consistently high AUC = 1.0 values across different ML models. WGCNA revealed a dominant turquoise module integrating apoptosis, necroptosis, and fibrotic regulators ($r = 0.82$, $p < 0.001$). Network analysis identified TNF, CASP8, TGFB1, and GREM1 as topological hubs bridging apoptotic and fibrotic pathways. IPA demonstrated co-activation of TNF/FAS signaling, TGF- β /SMAD2/3, and RIPK1-RIPK3-MLKL necroptosis, delineating a feed-forward inflammatory-fibrogenic loop. Upregulation of GREM1 and SNAI1 ($p < 0.001$) was functionally linked to suppression of BMP7-mediated antifibrotic signaling and epithelial-mesenchymal transition activation. Expression of GREM1 correlated strongly with serum γ -GT ($r = 0.73$) and histological fibrosis grade, establishing direct clinical association. GREM1 expression was significantly upregulated in BA compared to HC and NC ($p < 0.001$), with a diagnostic cut-off value of 5.373.

Conclusions:

The study establishes a unified apoptosis-necroptosis-fibrosis axis as the molecular driver of progressive liver injury in BA. The identified multi-gene panel holds promise as a minimally invasive biomarker set for disease diagnosis and progression monitoring where GREM1 emerges as a promising diagnostic and therapeutic target.

1147 - Global regional and national burdens of cirrhosis in adolescents and young adults from 1990 to 2021

Zeyi Zhang¹, Yuefei Pan¹, Ziyang Zhang¹, Jingxi Wu², Mengqi Yuan¹, Kaidi Zhu¹, Jiaqi Xiong¹, Dong Ji³, Zhe Xu¹, Lei Huang¹, Lei Shi¹, Fu-sheng Wang¹
The Fifth Medical Center Of Chinese PLA General Hospital, Senior Department Of Infectious Diseases, Beijing-China¹, Medical School Of Chinese PLA, Beijing-China² The Fifth Medical Center Of Chinese PLA General Hospital, Senior Department Of Liver Diseases, Beijing-China³

Background

Cirrhosis is a leading cause of morbidity and mortality

Hypothesis:

worldwide, yet epidemiological data specific to adolescents and young adults (AYAs, aged 15–39 years) remain limited. This study aimed to evaluate global, regional, and national trends in the burden of cirrhosis among AYAs from 1990 to 2021 and to characterize etiologic contributions.

Materials

and

Methods:

Data on incidence, prevalence, mortality, and disability-adjusted life years (DALYs) of cirrhosis among individuals aged 15–39 years were obtained from the Global Burden of Disease (GBD) 2021 database. Temporal trends were assessed using estimated annual percentage change (EAPC) at global, regional, and national levels. Subgroup analyses were conducted by sex, age group, etiology, and Socio-demographic Index (SDI)

Results:

Globally, incident cases increased from 20,240,719 in 1990 to 32,087,179 in 2021 (EAPC = 0.55 [0.51 - 0.59]). The burden attributable to hepatitis B virus (EAPC = -1.51 [-1.65 to -1.37]) and hepatitis C virus (EAPC = -0.07 [-0.14 to 0.00]) decreased, whereas alcohol-related cirrhosis (EAPC = 0.13 [0.03 - 0.23]), non-alcoholic fatty liver disease (EAPC = 0.79 [0.74 - 0.84]), and other causes (EAPC = 0.18 [0.06 - 0.31]) showed rising trends. Males exhibited a higher burden than females, and incidence peaked at ages 20–24.

Conclusions:

Cirrhosis poses an increasing health burden. Given the changing etiology, early adulthood represents a period of peak vulnerability, and substantial geographic and sex disparities exist. Public health strategies should prioritize viral hepatitis prevention, alcohol control, and metabolic risk management, with targeted interventions for high-risk populations, particularly in low-SDI regions.

Keyword(s) : Cirrhosis, Adolescents, Young adults, Burdens.

1149 - Dead box helicase1 promote cancer stemness of hepatocellular carcinoma by enhancing FSCN1 mRNA translation

Yao Yang¹, Hongsong Chen²

The First People's Hospital Of Yunnan Province, Department Of Gastroenterology, Kunming-China¹ Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China²

Background

/ Hypothesis: Hepatocellular carcinoma (HCC) is a highly heterogeneous tumor with a high recurrence rate and mortality. Liver cancer stem cells are a major source of tumor heterogeneity and a critical factor in tumor

ORAL ABSTRACTS

recurrence, metastasis, and drug resistance. An in-depth exploration of the stem cell-like characteristics of HCC is essential for unraveling HCC heterogeneity, elucidating its pathogenesis, reducing recurrence, and overcoming therapeutic resistance. We aim to explore the intratumor heterogeneity through single-cell transcriptomic profiling and identify the key driver of cancer stemness in HCC.

Materials and Methods: Single-cell RNA sequencing (scRNA-seq) and bulk RNA sequencing of HCC were integrated to reveal key cell subpopulations and therapeutic targets that determine the stemness and tumorigenesis of HCC. Furthermore, in vitro and in vivo studies were performed to elucidate the underlying mechanism.

Results:

scRNA-seq was conducted on 10,548 cells from twelve primary HCC samples. After cluster analysis, CytoTRACE analysis and Scissor analysis of heterogeneous malignant cells revealed that cells with high stemness were enriched in the Scissor+ cell subpopulation, which was associated with poor prognosis. Next, integrated analysis with bulk RNA-sequencing profiles indicated that DEAD-box helicase 1 (DDX1) was a key driver of cancer stemness and tumorigenesis in HCC. Furthermore, DDX1 was found to be highly expressed in HCC tissues and liver cancer stem-cell-like cells. In vitro and in vivo assays showed, for the first time, that the stem cell-like properties of HCC cells were inhibited by DDX1 depletion, as evidenced by the decreased size and number of formed spheres, the downregulated expression of C-MYC, OCT4, and NANOG proteins, as well as the reduced proportion of CD133+ cells. In addition, depletion of DDX1 expression also restrained proliferation, migration, and invasion, yet facilitated apoptosis of HCC cells. Overexpression of DDX1 exhibited the opposite effects on the stemness and tumorigenesis of HCC. Mechanistically, high-throughput RNA sequencing, IP-MS, and RIP analyses revealed that DDX1 directly binds to FSCN1 mRNA and facilitates its translation without altering mRNA levels, thereby enhancing FSCN1 protein expression. Furthermore, DDX1 interacts with eIF4E and eIF4G1 to promote FSCN1 translation, which in turn activates the MAPK/ERK1/2 pathway, ultimately enhancing liver stemness and tumorigenesis.

Conclusions:

Our study unraveled the intratumor heterogeneity of HCC malignant cells and highlighted the functional significance of DDX1 in regulating HCC stemness and

tumorigenesis. These findings could facilitate the development of novel prognostic strategies and therapies for HCC.

Keyword(s) : Hepatocellular carcinoma, Tumor heterogeneity, Cancer stemness, DDX1, FSCN1

1153 - A Pilot Program of Community Volunteers to Improve Adherence to Hepatitis B Medications in Kiribati

David Hilmers¹, Thomas Russell², Caroline Lee³, Alice Lee⁴

Baylor College Of Medicine, Internal Medicine, Houston-United States¹ Hepatitis B Free, Internal Medicine, Sydney-Australia² Hepatitis B Free, Infectious Disease, Sydney-Australia³ Hepatitis B Free, Gastroenterology, Sydney-Australia⁴

Background / Hypothesis: Chronic hepatitis B (CHB) is a significant global health concern affecting approximately 254 million people worldwide with sequelae of cirrhosis, liver failure, and hepatocellular carcinoma. While effective antiviral therapies exist, adherence remains a significant challenge due to barriers such as long-term treatment, medication fatigue, stigma, cost, transportation, and health literacy. Antiviral adherence is crucial for achieving and maintaining viral suppression and improving long-term outcomes and quality of life. Studies demonstrate poor adherence can lead to treatment failure, viral resistance, and increased risk of liver-related complications including hepatocellular carcinoma. Suboptimal adherence to antiviral therapy for CHB has been problematic in Kiribati, particularly amongst high-risk groups of pregnant women and people with cirrhosis.

Materials and Methods: A community volunteer intervention was initiated in Kiritimati, a remote island in Kiribati, to address adherence to antiviral therapy for CHB. Community volunteers were assigned to HBsAg-positive patients newly commencing antiviral therapy who were pregnant or had cirrhosis. During home visits (weekly for pregnant women and monthly for cirrhotic patients), volunteers provided education and encouraged medication adherence and clinic follow-up. Adherence in the intervention group was compared to HBsAg-positive patients on treatment on other remote islands in Kiribati without the intervention.

Results: Adherence was measured by medication bottle

ORAL ABSTRACTS

counts. Outcomes were assessed by two measures: overall group adherence (total bottles taken by the group divided by total months since treatment start) and the proportion of individuals in the group with adherence >80%. When compared to patients on treatment in other outer islands, group adherence was 77.4% with volunteer intervention (n=51) versus 52.5% without (n=205, $p<0.001$). Overall adherence amongst pregnant women in the intervention group was 89.7%. Individual adherence >80% was met in 58.8% of the intervention group and 34.1% in those without the intervention ($p=0.0012$).

Conclusions: Although these findings are preliminary and the control and intervention groups were not matched, this pilot program suggests community volunteers are a potential strategy to improve adherence to CHB in a high-prevalence setting in the Pacific region. Improved adherence can reduce vertical transmission, decrease hospitalizations and complications including HCC and deaths. CHB patients commonly have co-morbidities such as diabetes, hypertension, and heart disease requiring long-term medication adherence that could also be addressed during volunteer visits. Fostering a supportive healthcare environment with volunteers in the local community reduces stigma, promotes education, and encourages open communication that can empower patients to adhere to treatment.

1156 - Contrast enhanced Ultrasound Features of Combined hepatocellular carcinoma and cholangiocarcinoma (cHCC CC) A Case Series Report

Qiao Wei¹, Lili Wu²
Sun Yat-sen University, The Third Affiliated Hospital Of Sun Yat-sen University, Guang Zhou-China¹

Background / Hypothesis: Combined hepatocellular carcinoma and cholangiocarcinoma (cHCC-CC) a rare histologic variant of primary liver malignancy, accounting for approximately 4–14.2% of cases. Due to its concurrent composition of both hepatocellular carcinoma and cholangiocarcinoma elements, definitive preoperative diagnosis remains challenging. Non-specific clinical and imaging findings lead to a high misdiagnosis rate. The final diagnosis mainly depends on pathological examination. This article aims to explore the ultrasound and contrast-enhance ultrasound (CEUS) features of cHCC-CC to improve its early diagnosis.

Materials and Methods: A retrospective analysis of ultrasound imaging data and clinical manifestations of 10 patients pathologically confirmed with cHCC-CC from 2017 to 2024 was conducted.

Results:

The patients ranged from 38 and 71 years old, 9 male and 1 female. The lesions were solitary, with a maximum diameters of 2.3-8.6cm. Serum Alpha-fetoprotein (AFP) was elevated in the majority of patients (60%), whereas carbohydrate antigen 19-9 (CA19-9) was elevated in 20%, concurrent elevation of both markers was observed in only one case (10%). The conventional ultrasound showed irregular hypoechoic mass with blurred boundary (80%), frequently exhibited irregular margins (60%), and intratumoral hypervascularity was observed in half of the cases. The arterial phase of the CEUS was peripheral Homogeneous hyperenhancement/heterogeneous hyperenhancement, and the portal phase and delayed phase were both hypoenhancement. Three of the lesions had unenhanced zones. The most common enhancement patterns (70%) were high peripheral Homogeneous enhancement in arterial phase, hypoenhancement in portal phase and delayed phase. The arterial phase may be Homogeneous hyperenhancement (70%) or Inhomogeneous hypoenhancement (30%). Most of the lesions showed hypoenhancement in portal phase (90%) and delayed phase (100%). There were irregularly unenhanced zones in some lesions (30%).

Conclusions: The present ultrasonographic study revealed that the majority of combined hepatocellular – cholangiocarcinoma (cHCC-CC) lesions present as irregular, hypoechoic intrahepatic masses with conspicuous intratumoral vascularity. The arterial phase of the CEUS was peripheral Homogeneous hyperenhancement/heterogeneous hyperenhancement, and the portal phase and delayed phase were both hypoenhancement. There were irregularly unenhanced zones in some lesions. Combining these ultrasound characteristics with their laboratory test results (increased AFP and CA19-9) can assist in the correct diagnosis of cHCC-CC.

Keyword(s) : Combined hepatocellular carcinoma and cholangiocarcinoma, US, CEUS, cHCC-CC, contrast-enhance ultrasound

1157 - Predictive Model for Targeted Combination Immunotherapy Efficacy in Unresectable

ORAL ABSTRACTS

Hepatocellular Carcinoma Patients Based on Multimodal MRI Radiomics (MC hccAI 007) A Multicenter Study

Jialin Chen¹, Xiong Chen¹
Mengchao Hepatobiliary Hospital Of Fujian Medical University, Oncology, Fuzhou-China¹

Background / **Hypothesis:**
Targeted combination immunotherapy has improved outcomes in unresectable hepatocellular carcinoma (HCC), yet the majority of patients fail to respond. Existing clinical staging and biomarker systems offer limited predictive power. Radiomics enables noninvasive quantification of tumor heterogeneity and may enhance therapeutic response prediction.
Materials and **Methods:**
In this multi-center study, 142 patients with unresectable HCC underwent pre-treatment contrast-enhanced MRI. Radiomic features from arterial and portal venous phases were extracted and optimized through multistage selection and LASSO-Cox regression. 117 machine-learning algorithms were compared, and the best-performing model was validated via 10-fold cross-validation. Proteomic profiling of 15 resected samples identified biological correlates of imaging phenotypes. Model interpretability was assessed using SHAP and Grad-CAM analyses.

Results:
Fifteen prognostic features were retained. The Random Survival Forest (RSF) model achieved the best performance (C-index=0.79, 95%CI: 0.757–0.953). RSF score, ALBI score, and performance status were independent predictors of overall survival ($P<0.05$). Stratification based on RSF-derived risk (cutpoint=14.49) revealed significantly improved survival in the low-risk group (HR=0.19, $P<0.0001$). Proteomics identified 24 differential proteins enriched in NK-cell cytotoxicity and FcγR-mediated phagocytosis pathways.

Conclusions:
The multimodal MRI radiomics model provides an interpretable and biologically grounded tool for predicting immunotherapy efficacy in unresectable HCC, enabling personalized risk stratification and treatment optimization.

1158 - Donor Isolated Hyperbilirubinemia and Post Liver Transplant Survival A Propensity Matched Analysis

Kamran Bagheri Lankarani¹, Mohammad Jamalnia²

Seyed Ali Malek-hosseini³, Saman Nikeghbalian³, Siavash Gholami³, Alireza Shamsaeefar³, Hamed Nikoupour³, Kourosh Kazemi³
Shiraz University Of Medical Sciences, Health Policy Research Center, Institute Of Health, Shiraz-Iran¹ Shiraz University Of Medical Sciences, Gastroenterohepatology Research Center, Shiraz-Iran² Shiraz University Of Medical Sciences, Shiraz Transplant Research Center, Shiraz-Iran³

Background / **Hypothesis:**
Donor hyperbilirubinemia is commonly viewed as a sign of hepatic dysfunction and often leads to organ discard, despite limited evidence on its true prognostic meaning. However, mild to moderate bilirubin elevation without accompanying liver enzyme abnormalities—termed isolated hyperbilirubinemia—may represent benign conditions rather than intrinsic hepatic injury. Understanding the impact of such donor characteristics on transplant outcomes is essential to improve organ utilization. This study aimed to evaluate the post-transplant survival of recipients who received grafts from donors with isolated hyperbilirubinemia compared with those from donors with normal bilirubin levels.

Materials and **Methods:**
We conducted a retrospective cohort study including adult liver transplant recipients (≥ 18 years) between January 2020 and March 2022. Donors were categorized according to pre-procurement serum bilirubin levels. Isolated hyperbilirubinemia was defined as total bilirubin between 1.2–5.0 mg/dL, with normal alanine aminotransferase, aspartate aminotransferase, and alkaline phosphatase levels, and no evidence of systemic illness. Recipients were propensity score-matched (1:1) for age, sex, and year of transplant, yielding 36 matched pairs. Post-transplant survival was analyzed using Cox proportional hazards models adjusted for potential confounders and validated through stepwise selection procedures. All analyses were conducted using Python 3.11 with appropriate statistical libraries.

Results:
A total of 72 liver transplant recipients (mean age: 53 years; 52.8% male) were included. The median follow-up duration was 5.7 months (interquartile range: 0.3–28.2 months), during which 47 deaths occurred. Remarkably, recipients of grafts from donors with isolated hyperbilirubinemia demonstrated substantially better survival compared to those receiving grafts from donors with normal bilirubin levels. After full adjustment, donor

ORAL ABSTRACTS

isolated hyperbilirubinemia was associated with an 81% reduction in mortality risk (adjusted hazard ratio: 0.19; 95% confidence interval: 0.08–0.45; $p < 0.001$). The observed benefit remained consistent across sensitivity analyses and was independent of donor and recipient clinical profiles.

Conclusions:

Isolated donor hyperbilirubinemia does not appear to indicate poor graft quality. Rather, such donors may safely expand the liver donor pool without compromising—and possibly improving—recipient survival. Recognizing this benign biochemical pattern could prevent unnecessary organ discard and optimize organ utilization. Larger, multicenter studies with longer follow-up are needed to confirm these findings and clarify the mechanisms underlying the observed benefit.

Keyword(s) : Liver transplantation; donor hyperbilirubinemia; graft survival; post-transplant outcomes; donor selection

1159 - Gut Microbiota Derived CoQ8 Improves Hepatic Lipid Metabolism via GPR120

Lujie Liu¹, Yanfeng Xiao¹
The Second Affiliated Hospital Of Xi'an Jiaotong University, Pediatrics, Xi'an-China¹

Background / **Hypothesis:**
Dysbiosis of the gut microbiota has been implicated in modulating host metabolic processes through microbial metabolites; however, the precise underlying mechanisms remain inadequately defined. Our prior investigation revealed a marked reduction in serum levels of coenzyme Q8 (CoQ8) among obese pediatric subjects. We posited that this diminution results from the depletion of specific gut bacterial taxa and contributes to metabolic dysregulation via the gut-liver axis.

Materials and **Methods:**

Serum CoQ8 was analyzed by LC-MS/MS in 80 obese and 40 lean children, correlating levels with metabolic parameters. To trace its gut origin, fecal metagenomic sequencing identified CoQ8-associated bacteria in a subgroup, and their production capacity was confirmed by in vitro culture. Fecal microbiota transplantation from obese or healthy donors into germ-free mice tested effects on serum CoQ8 and liver metabolism. Mechanism studies included SPR binding, STAT3 knockdown, ChIP, and hepatocyte assays. In HFD-fed

mice, treatment with engineered CoQ8-producing bacteria or CoQ8, plus a GPR120 antagonist, evaluated therapeutic efficacy.

Results:

Serum CoQ8 was significantly lower in obese children and inversely correlated with adverse lipid profiles and insulin resistance. Metagenomic analysis revealed a decreased abundance of putative CoQ8-producing bacteria, such as *Prevotella* and *Bacteroides*. In vitro culture confirmed their efficient CoQ8 biosynthesis. Crucially, FMT demonstrated that microbiota from obese donors was sufficient to reduce serum CoQ8 and exacerbate hepatic steatosis in recipient mice, a phenotype rescued by CoQ8 supplementation. Mechanistically, CoQ8 bound to GPR120 with high affinity ($KD=3.2 \mu M$), activating STAT3 signaling. Phosphorylated STAT3 directly bound to the promoter of carnitine palmitoyltransferase 1 (CPT1), upregulating fatty acid oxidation. In HFD-fed mice, supplementation with the engineered CoQ8-producing bacterium replicated the benefits of direct CoQ8 administration, significantly reducing hepatic triglyceride accumulation in a GPR120-dependent manner.

Conclusion:

Our findings define a gut-liver axis wherein obesity-associated depletion of specific gut bacteria reduces circulating CoQ8. This microbial metabolite activates the hepatic GPR120-STAT3-CPT1 pathway to promote fatty acid oxidation and improve lipid homeostasis. Restoring CoQ8-producing bacteria or supplementing with CoQ8 represents a promising therapeutic strategy for obesity-related metabolic disorders.

1162 - Study on the Mechanism of Samhd1 Mediated NEMO Polyubiquitination in Liver Ischemia Reperfusion Injury

Xianzhang Luo¹, Zuotian Huang¹, Dewei Li¹
Chongqing University Cancer Hospital, Department Of Hepatobiliary Pancreatic Tumor Center, Chongqing-China¹

Background / **Hypothesis:**
Hepatic ischemia reperfusion injury (IRI) is one of the major pathological processes in liver transplantation and various liver surgeries. To date, there is still a lack of effective diagnosis and treatment strategies for hepatic IRI, and one of the root causes is that its mechanism has not been fully elucidated. This study aims to explore the molecular mechanism by which Samhd1 participates in

ORAL ABSTRACTS

the regulation of hepatic IRI, providing a research foundation and theoretical basis for the prevention and treatment of hepatic IRI.

Materials and Methods: This study established a classic 70% liver ischemia-reperfusion injury (IRI) model in mice. The expression and localization of key molecules were detected using methods such as immunoprecipitation, immunofluorescence, quantitative real-time polymerase chain reaction (qRT-PCR), and enzyme-linked immunosorbent assay (ELISA). The pathological damage and liver function of mice in each group were examined through hematoxylin and eosin (HE) staining, terminal deoxynucleotidyl transferase dUTP nick end labeling (TUNEL) assay, and microplate method.

Results:

We have discovered that Samhd1 is a key molecule exacerbating hepatic ischemia - reperfusion injury (IRI). Down - regulation of Samhd1 can significantly alleviate hepatic IRI, while over - expression of Samhd1 yields the opposite effect. Mechanistically, Samhd1 can mediate the polyubiquitination modification of NEMO, induce the activation of the IKK inflammatory complex, and enhance its stability, ultimately leading to the phosphorylation and combined translocation of multiple subunits of the IKK family. Inhibition of IKK can reverse hepatic IRI caused by Samhd1 enrichment.

Conclusions:

In conclusion, this study has revealed the potential functions and roles of Samhd1 in liver ischemia-reperfusion injury (IRI). Targeting Samhd1 may be a potential strategy for treating liver IRI.

1163 - One-Pot Assay Based on CRISPR Cas13a Technology for HEV RNA Point-of-Care Testing

Zihao Fan¹, Ling Xu¹, Feng Ren¹
Beijing Youan Hospital, Capital Medical University,
Beijing Institute Of Hepatology, Beijing-China¹

Background / Hypothesis: Hepatitis E virus (HEV) poses a serious threat to both public health and animal food safety, thereby highlighting the demands for rapid, sensitive, and easy-to-use detection. This study aimed to develop a One-Pot assay using CRISPR/Cas13a for detecting HEV RNA, suitable for point-of-care testing (POCT) in resource-limited settings.

Materials and Methods: We established, optimized, and evaluated the methods for HEV RNA detection using CRISPR/Cas13a combined with reverse transcription polymerase chain reaction (RT-PCR) and reverse transcription recombinase-aided amplification (RT-RAA). Additionally, a large cohort of 154 HEV-infected patients and 74 HEV-infected animal specimens were utilized for application validation.

Results:

The RT-PCR/RT-RAA+CRISPR/Cas13a assays for HEV RNA detection (genotypes: HEV-1, HEV-3, and HEV-4) were established, optimized, and validated, achieving a limit of detection (LoD) of 1copy/μL and 100% specificity. In the HEV-infected application validation (ddPCR assay as the gold standard), the positivity rates of patients detected by RT-qPCR, RT-PCR-CRISPR and RT-RAA-CRISPR assays were 70.8%, 98.6%, and 79.2%, respectively, and among animals were 75.8%, 95.2%, and 87.1%, respectively, which were superior to those of RT-qPCR. Furthermore, sample rapid lysis, reagent lyophilization, and the One-Pot device were integrated to construct a One-Pot assay with an LoD of 102copies/μL. The 5-minute rapid lysis of processed specimens (serum and feces) significantly reduces the assay time to 35min, making it easy to perform, minimizing contamination, and meeting the requirements for screening.

Conclusions:

We developed a One-Pot assay for HEV RNA detection using CRISPR/Cas13a, which effectively achieves a "sample in, result out" POCT system, maximizes the potential for POCT implementation, and shows promise as a valuable tool for detecting and monitoring HEV infection.

1164 - Study on the Mechanism of TRIM55 Mediating K63 Polyubiquitination of Bcl10 Protein to Aggravate Liver Ischemia Reperfusion Injury

Zhenghua Luo¹, Zuotian Huang¹, Dewei Li¹
Chongqing University Cancer Hospital, Department Of
Hepatobiliary Pancreatic Tumor Center, Chongqing-
China¹

Background / Hypothesis: Hepatic ischemia-reperfusion injury (IRI) has long been a major concern for liver transplant and various liver surgery patients, severely affecting prognosis. This study aims to clarify the molecular mechanism by which the

ORAL ABSTRACTS

E3 ubiquitin ligase trimeric domain protein TRIM55 regulates liver IRI, providing a research foundation and theoretical basis for the prevention and treatment of liver IRI.

Materials and **Methods:**
We established a 70% liver ischemia-reperfusion injury (IRI) model in classic mice. We detected the expression and localization of key molecules using methods such as IHC, WB, immunofluorescence, qRT-PCR, and ELISA. We also examined the pathological damage and liver function of mice in each group using HE staining, TUNEL assay, and microplate method.

Results:

We have discovered that TRIM55 is an important signal transduction protein that exacerbates liver IRI. Downregulation of TRIM55 can significantly alleviate liver IRI, while overexpression of TRIM55 has the opposite effect. Mechanistically, TRIM55 can mediate the polyubiquitination modification of Bcl10 at the K63 site, inducing the classical and non-classical IKK inflammatory signaling pathways, thereby exacerbating liver IRI. Specific inhibition of IKK can reverse liver IRI caused by TRIM55 enrichment.

Conclusions:

In conclusion, this study has revealed the potential functions and roles of TRIM55 in liver ischemia-reperfusion injury (IRI). Targeting TRIM family proteins may be a potential strategy for treating liver IRI.

1167 - SERPINE2 mitigates hepatic ischemia-reperfusion injury via a SUMO-ubiquitin rheostat
Penghong Song¹

Zhejiang University School Of Medicine First Affiliated Hospital, Surgery, Hangzhou-China¹

Background / **Hypothesis:**

Hepatic ischemia-reperfusion injury (HIRI) is a prototypical tissue stress-induced injury. Serpin family E member 2 (SERPINE2) has been implicated in tissue remodeling, but its role in HIRI remains undefined. This study aimed to elucidate the biological function of SERPINE2 during HIRI and to evaluate its potential as a therapeutic target.

Materials and **Methods:**
Donor liver biopsies from 50 transplants were profiled for SERPINE2 and correlated with recipients'

postoperative day-3 (POD3) biochemistry. A murine partial-liver HIRI model was used in wild-type, hepatocyte-specific Serpine2 knockout (Serpine2-HKO), and AAV8-mediated hepatocyte SERPINE2- or TRIM28-overexpressing mice. SERPINE2 expression was significantly reduced after reperfusion in both human liver graft biopsies and murine livers, with donor hepatic SERPINE2 inversely correlated with recipients' POD3 ALT/AST.

Results:

Relative to controls, Serpine2-HKO mice exhibited aggravated liver injury, inflammatory infiltration, hepatocellular apoptosis, and early fibrotic remodeling after HIRI, whereas hepatocyte-targeted SERPINE2 overexpression mitigated these phenotypes. Mechanistically, SERPINE2 enhanced the expression of TRIM28, which directly interacted with NRF2, promoting its SUMOylation while constraining its ubiquitination, thereby stabilizing NRF2 and sustaining its antioxidant transcriptional program. Reconstitution of TRIM28 in Serpine2-HKO mice partially reversed biochemical and histologic injury and restored NRF2 downstream signaling.

Conclusions:In conclusion, SERPINE2 confers protection in HIRI by modulating TRIM28 to promotes NRF2 SUMOylation and attenuates its ubiquitin-mediated degradation, thereby maintaining NRF2 proteostasis and antioxidant capacity. These findings provide new insights into potential therapeutic strategies for mitigating HIRI.

Keyword(s) : Hepatic ischemia-reperfusion injury ; SERPINE2 ; SUMOylation

1168 - Peginterferon alpha 2b and nucleos(t)ide analogs combination therapy for chronic hepatitis B patients with high HBsAg level at the end of treatment (52 weeks) from ongoing CREATED Excellent Study

Wenhua Zhang¹, Haitao Tang¹, Qinghua Lu², Haifang Cao², Tingxia Chao¹, Fengmei Wang¹, Wenling Jia¹, Chunhui Liang¹, Feng Ren³, Hongfei Zhang⁴
Gansu Wuwei Tumour Hospital, Hepatobiliary Center, Wuwei-China¹ The 4th People's Hospital Of Qinghai Province, Department Of Hepatology, Xining-China² Beijing Youan Hospital, Capital Medical University, Beijing Institute Of Hepatology, Beijing-China³ Jumei Doctor Group Medical (shenzhen) Co., Ltd, Shenzhen, China., Jumei Doctor Group Medical (shenzhen) Co., Ltd, Shenzhen, China., Beijing-China⁴

ORAL ABSTRACTS

Background / **Hypothesis:**
Background and **Aims:**
Chronic hepatitis B (CHB) patients with HBV DNA < LLOQ, HBeAg negative and HBsAg <1500 IU/mL after prior nucleos(t)ide analogs (NAs) treatment were the preferred population for clinical cure (PPCC). Peginterferon alpha (PegIFN α)-based therapy enables clinical cure in this population. The purpose of this study aims to observe the efficacy of NAs combined with PegIFN α -2b in treating CHB patients with HBsAg >1500 IU/mL (Non-preferred population for clinical cure, NPPCC).

Methods:

The CREATED EXCELLENT study (ChiCTR2400081073) is a multi-center, prospective, non-randomized, open-label, positive-controlled study. CHB patients with NAs treated for ≥ 3 months and HBsAg >1500 IU/mL were enrolled and divided into two groups. The NAs monotherapy group continued to receive their original NAs (ETV/TDF/TAF/TMF) treatment, while the PegIFN α -2b+NAs group received PegIFN α -2b (180 μ g/week) subcutaneously in addition to NAs. The total treatment period was 52 weeks, and all participants were followed up for 24 weeks after the end of treatment (EOT).

Results:

A total of 682 patients (NAs monotherapy group, n=330; PegIFN α -2b+NAs group, n=352) were included. At baseline, there were 170 patients with HBsAg between 1500 IU/mL and 3000 IU/mL (NAs group: 21.81%, PegIFN α -2b+NAs group: 27.84%), 133 patients with HBsAg between 3000 IU/mL and 6000 IU/mL (NAs group: 18.23%, PegIFN α -2b+NAs group: 20.68%), 90 patients with HBsAg between 6000 IU/mL and 9000 IU/mL (NAs group: 12.11%, PegIFN α -2b+NAs group: 14.24%); and 289 patients with HBsAg greater than 9000 IU/mL (NAs group: 47.91%, PegIFN α -2b+NAs group: 37.23%). The baseline average HBsAg level in the NAs group was 18767.23 $\pm$ 5623.33 IU/mL and in the PegIFN α -2b+NAs group was 17346.91 IU/mL (P > 0.05). After 52 weeks of treatment, the average HBsAg level of the NAs group was 16963.92 $\pm$ 5127.89 IU/mL and the PegIFN α -2b+NAs group was 3589.40 $\pm$ 1223.47 IU/mL (P<0.001). The stratification ratio of patients with HBsAg<1500 IU/mL, 1500<HBsAg<3000 IU/mL, 3000<HBsAg<6000 IU/mL, 6000<HBsAg<9000 IU/mL and more than 9000 IU/mL were 46.51%, 14.11%, 25.66%, 4.73% and 9.32%, respectively, in the PegIFN α -2b+NAs group; there rates were 20.00%, 30.15%, 26.72%, 3.32%, and 20.22% in the NAs group, respectively. At week 52 of EOT, 2 participants in NAs

group had HBsAg loss, compared with 9 participants in PegIFN α -2b+NAs group.

Conclusions: Compared with NAs monotherapy, PegIFN α -2b combined with NAs therapy for the treatment of NPPCC (HBsAg>1500 IU/mL) rapidly reduced HBsAg levels, and increased the number of PPCC (HBsAg<1500 IU/mL), thereby providing a new treatment strategy for CHB patients with high-level HBsAg to achieve clinical cure.

Keyword(s) : Chronic hepatitis B (CHB), Nucleos(t)ide analogs (NAs), Peginterferon alpha (PegIFN α), Clinical cure

1170 - Nurse led lifestyle modification intervention to improve self efficacy illness perception self management behaviours and liver steatosis among adults with metabolic dysfunction associated steatotic liver disease A pilot randomised controlled trial

Angel Cho Kan Ma ¹, Ka Ming Chow ²
Hospital Authority, Gi And Hepatology, Hong Kong-Hong Kong SAR, China ¹ The Chinese University Of Hong Kong, Faculty Of Medicine, Hong Kong-Hong Kong SAR, China ²

Background / **Hypothesis:**
Metabolic dysfunction associated steatotic liver disease (MASLD) is a growing global and local health burden linked to progressive liver injury, cardiovascular complications, and increasing healthcare costs. Despite clinical guidelines underscoring lifestyle modification as the cornerstone therapy, many patients struggle to adhere to recommended changes due to low self-efficacy, poor illness perception, inconsistent information, and limited structured support. Evidence-based, theory-informed, and patient-centred programme development is urgently needed, particularly in regions where structured interventions are lacking. This study hypothesised that a nurse-led lifestyle modification intervention, developed through systematic evidence appraisal and qualitative exploration, would improve self-efficacy, illness perception, self-management behaviours, and liver steatosis among adults with the disease.

Materials and **Methods:**
A three-phase study was undertaken. Evidence from a systematic review and a qualitative study informed the design of a nurse-led lifestyle modification intervention grounded in Bandura's self-efficacy theory. A single-

ORAL ABSTRACTS

centre, assessor-blinded pilot randomised controlled trial (RCT) was then conducted. Sixty-four adults with imaging-confirmed disease were randomised 1:1 to either the intervention group or a usual-care group. The three-month intervention included lifestyle counselling, behavioural strategies, structured education, goal setting, and psychological support delivered through face-to-face and telephone sessions. Outcomes were measured at baseline and week twelve. The primary outcome was self-efficacy, and the secondary outcomes were illness perception and self-management behaviours. The clinical outcome was steatosis grade. Feasibility and acceptability indicators included recruitment, retention, fidelity, attendance, and participant satisfaction. Repeated-measures analysis of variance was used to assess time-by-group effects.

Results:

In Phase III pilot RCT, 64 participants were recruited and demonstrated significant time-by-group interaction effects across self-efficacy, illness perceptions, self-management behaviours, and steatosis grade (all $p < .001$). High feasibility of the RCT was reflected by a recruitment rate of 76.4%, a retention rate of 98.4%, and session attendance exceeding 81%. Intervention acceptability was high, as evidenced by strong participant satisfaction ratings.

Conclusions:

The study demonstrated that a nurse-led lifestyle modification intervention is effective significantly improved self-efficacy, illness perceptions, self-management behaviours, and steatosis grade among MASLD patients, with high feasibility and acceptability. Developed from systematic evidence and stakeholder input, this intervention addresses critical gaps in MASLD management. These findings support the implementation of a full-scale RCT and underline the potential of nurse-led behavioural interventions in managing MASLD in Hong Kong and beyond.

1172 - EMMPRIN Loss Promotes Fatty Acid Transport Protein FATP2 Lactylation in MAFLD via the MCTs lactate Axis

Linying Lai¹, Feng Zhu², Wenzhuo Yang¹, Xinyan Zhu²
Tongji Hospital, School Of Medicine, Tongji University,

Department Of Gastroenterology And Hepatology, Shanghai-China¹ Shanghai East Hospital, School Of Medicine, Tongji University, Department Of Gastroenterology, Shanghai-China²

Background / Hypothesis: Although metabolic-associated fatty liver disease (MAFLD) is a growing global health concern, its molecular mechanisms remain unclear. This study explores EMMPRIN-mediated metabolic reprogramming in hepatic steatosis.

Materials and Methods: The expression of hepatic EMMPRIN was examined in MAFLD murine models and steatotic cells models. Genetic manipulation of EMMPRIN, including both ablation and overexpression, was conducted in murine models to evaluate its impact on lipid accumulation and inflammation. Multi-omics techniques, including transcriptomics, 4D-FastDIA lacylproteomics, and co-immunoprecipitation, were employed to identify EMMPRIN's interaction partners and lactylation targets. Lipidomics was utilized to quantify changes in fatty acid profiles.

Results: EMMPRIN expression was found to be elevated in MAFLD, contributing to the development of steatohepatitis phenotypes. Its genetic ablation resulted in decreased lipid accumulation and inflammation, whereas its overexpression intensified the disease. Mechanistically, EMMPRIN was shown to interact with monocarboxylate transporters (MCT1/4), influencing lactate shuttling and intracellular lactate concentrations. The knockout of EMMPRIN resulted in the lactylation at lysine 174 (K174) of fatty acid transport protein 2 (FATP2), a modification mediated by CREBBP, thereby influencing subsequent lipid metabolic processes and preferentially directing activated fatty acids. Lipidomic analyses substantiated the role of FATP2 lactylation in determining hepatic fatty acid profiles.

Conclusions: The study findings demonstrated that EMMPRIN drove MAFLD progression through regulation of lactate shuttling and protein lactylation. The EMMPRIN-MCTs-FATP2 axis was identified as offering new therapeutic targets for fatty liver disease.

Keyword(s) : MAFLD; EMMPRIN; Lactylation; FATP2; Lipid metabolism; Fatty acid metabolism.

1173 - Unfolding Clinical Research Landscape on Bacterial Infections in Cirrhosis Trends Hotspots and Insights

ORAL ABSTRACTS

Zhengyu Zhang ¹, Juntao Tan ², Ying Li ³, Yuan Yuan ⁴, Xiaoxin Wu ⁵

The First Affiliated Hospital, Zhejiang University School Of Medicine, Medical Records Department, Hangzhou-China ¹ Chongqing Medical University, College Of Medical Informatics, Chongqing-China ² The First Affiliated Hospital, Zhejiang University School Of Medicine, Department Of Medical Administration, Hangzhou-China ³ Women And Children's Hospital Of Chongqing Medical University, Medical Records Department, Chongqing-China ⁴ The First Affiliated Hospital, Zhejiang University School Of Medicine, State Key Laboratory For Diagnosis And Treatment Of Infectious Diseases, Hangzhou-China ⁵

Background / Hypothesis: Bacterial infection is the most common complication in cirrhosis patients. This study evaluated the research hotspots and trends of bacterial infections in cirrhosis through bibliometric analysis, and provides guidance for future research on bacterial infection in cirrhosis.

Materials and Methods: We extracted publications on bacterial infections associated with cirrhosis from the Web of Science Core Collection, covering the period from January 2000 to May 2025. CiteSpace and VOSviewer were used for bibliometric analysis.

Results: Publications on bacterial infections in cirrhosis reflect an upward trend, with 69 countries/territories contributing to research, of which United States ranks first with 324 publications. The Journal of Hepatology is the prime publication on liver cirrhosis associated with bacterial infections, Fernandez Javier being the most-cited author. Cirrhosis with bacterial infection is the most popular research topic regarding mortality, infection, ascites and sepsis. The research hotspots of the future are systemic inflammation, acute-on-chronic liver failure and chronic liver failure.

Conclusions: The hotspots and trends of related research are discussed, and the research results are presented objectively through knowledge maps. The research directions in this field are analyzed to provide a reference for subsequent clinical research.

Keyword(s) : Cirrhosis, Bacterial infections, Bibliometric, Data visualization

1174 - A Ten Year Comparative Analysis of Open vs. Laparoscopic Anatomical Hepatectomy for Right Sided Complex Hepatocellular Carcinoma A Large Sample Nationwide Multicenter Real World Study

Qingyun Xie ¹, Yinghao Lyu ¹, Ying Yang ¹, Guimin Hou ², Hailing Liu ³, Xi Chen ⁴, Junnan Liang ⁵, Fengwei Gao ¹, Tian Lan ¹, Hong Wu ¹
West China Hospital, Sichuan University, Liver Transplant Center, Chengdu-China ¹ Sichuan Cancer Hospital, Department Of Hepato-biliary-pancreatic Surgery, Chengdu-China ² Second Affiliated Hospital Of Chongqing Medical University, Department Of Hepatobiliary Surgery, Chongqing-China ³, Zhongnan Hospital Of Wuhan University, Department Of Hepatobiliary And Pancreatic Surgery, Wuhan-China ⁴ Tongji Hospital, Tongji Medical College, Huazhong University Of Science & Technology, Division Of Hepato-pancreato-biliary Surgery, Wuhan-China ⁵

Background / Hypothesis: The optimal surgical approach for complex right-sided hepatocellular carcinoma (HCC), particularly regarding long-term oncologic outcomes between laparoscopic anatomical hepatectomy (LAH) and open anatomical hepatectomy (OAH), remains undefined. This large-scale, multicenter real-world study aimed to compare the perioperative outcomes and long-term survival of LAH versus OAH for right-sided HCC across different tumor stages and anatomical locations.

Materials and Methods: In this nationwide retrospective cohort study, 1,914 patients who underwent curative-intent right-sided AH (Lap-group: 766; Open-group: 1,148) between March 2015 and May 2020 across five high-volume Chinese centers were analyzed. Patients were stratified by Barcelona Clinic Liver Cancer (BCLC) stage 0–A (n=1,342), B (n=309), and C (n=263). Baseline characteristics were balanced using inverse probability of treatment weighting (IPTW) and propensity score matching (PSM). Primary endpoints included overall survival (OS) and disease-free survival (DFS).

Results: Following IPTW adjustment, the Open-group demonstrated significantly longer median DFS in BCLC stage 0–A (47.0 vs. 45.0 months; HR=1.14, 95% CI: 1.01–1.30, P=0.02) and stage B (36.0 vs. 28.0 months; HR=1.45, 95% CI: 1.01–1.31, P<0.01). Conversely, in the stage C cohort, Lap-group achieved superior median OS (39.0 vs. 33.0 months; HR=0.56, 95% CI: 0.36–0.86,

ORAL ABSTRACTS

P<0.01). Subgroup analyses indicated that the DFS advantage of Open-group was confined to CNLC Ib/Ia stages and resections involving the right anterior section. Lap-group was associated with a lower bile leak rate in stage 0–A (3.73% vs. 7.44%, P=0.016) and a higher frequency of repeat resection after recurrence. Microvascular invasion (MVI) grade emerged as the strongest independent prognostic factor for both OS and DFS across all cohorts.

Conclusions:

The selection between LAH and OAH for right-sided HCC should be individualized based on tumor stage and location. OAH provides superior DFS in specific early–intermediate subgroups, whereas LAH confers favorable survival in selected advanced-stage cases, potentially owing to enhanced feasibility of salvage therapy.

Keyword(s) : Right-sided HCC, Laparoscopic anatomical hepatectomy, Inverse probability of treatment weighting, Real-World study

1176 - METTL16 drives MAFLD progression by regulating lipid synthesis and immune responses

Guixin Li¹, Jinghui Guo¹
Shanghai Sixth People's Hospital Affiliated To Shanghai Jiao Tong University School Of Medicine, Department Of Gastroenterology, Shanghai-China¹

Background / **Hypothesis:** Methyltransferase-like 16 (METTL16) is a newly identified m6A RNA methyltransferase involved in RNA methylation and gene expression regulation. Although its oncogenic roles have been described in hepatocellular carcinoma, the contribution of METTL16 to metabolic dysfunction-associated fatty liver disease (MAFLD) remains unclear. This study aimed to elucidate the expression pattern, functional significance, and molecular mechanism of METTL16 in MAFLD. **Materials** and **Methods:** Methylation-related gene expression profiles were analyzed in liver tissues from 206 MAFLD patients and 10 healthy controls. Palmitic acid-induced cell models and diet-induced MAFLD mouse models were used to evaluate the biological functions of METTL16. Gene silencing was achieved using siRNA or AAV-mediated shRNA delivery. Hepatic steatosis, insulin resistance, and fibrosis were assessed by histological staining, biochemical assays, and immunoblotting. Bioinformatic analyses were conducted to examine immune cell infiltration, signaling pathways activation, and to predict potential transcriptional regulators and small-molecule inhibitors of METTL16. **Results:**

METTL16 expression was markedly upregulated in MAFLD livers and showed a strong correlation with lipid metabolism-related pathways. Knockdown of METTL16 significantly alleviated hepatic steatosis, insulin resistance, and fibrosis in high-fat diet-fed mice. Mechanistically, cell death-inducing DFF45 like effector family members A (CIDEA) was identified as a downstream mediator of METTL16-driven steatosis. Elevated hepatic METTL16 expression was associated with enhanced infiltration of innate immune cells, activation of immune-related pathways, and increased expression of pro-fibrotic genes. Database analyses further indicated that METTL16 might regulate immune-related gene expression at both transcriptional and post-transcriptional levels. Moreover, ERG1 and MYC were identified as potential upstream transcriptional regulators of METTL16, and eleven small molecules were predicted to bind to and inhibit METTL16 activity. **Conclusions:**

METTL16 promotes hepatic steatosis and immune-mediated fibrogenesis in MAFLD, providing novel mechanistic insights into m6A-dependent metabolic regulation. Targeting the METTL16-CIDEA axis or pharmacologically inhibiting METTL16 activity may represent a promising therapeutic strategy for MAFLD.

1179 - Association of Urinary Spot Sodium Potassium Ratio with Acute Kidney Injury in Decompensated Cirrhosis

Manish Kumar¹, Nargis Bano¹
Abvims & Dr Rml Hospital, Medicine, New Delhi-India¹

Background

Acute Kidney Injury (AKI) is a frequent and severe complication in patients with decompensated cirrhosis, contributing significantly to morbidity and mortality. Early recognition of renal dysfunction is crucial for timely intervention. The urinary sodium-to-potassium (Na/K) ratio is a simple, non-invasive, and readily available bedside marker reflecting renal sodium handling and circulatory function. This study aimed to evaluate the association between urinary spot Na/K ratio and AKI in patients with decompensated cirrhosis.

Materials and **Methods:** This cross-sectional observational study was conducted at the Department of General

ORAL ABSTRACTS

Medicine, Atal Bihari Vajpayee Institute of Medical Sciences and Dr. Ram Manohar Lohia Hospital, New Delhi, from February 2024 to June 2025. A total of 122 adult patients with decompensated cirrhosis were enrolled. Clinical, biochemical, and urinary parameters were assessed, and the urinary Na/K ratio was calculated. AKI was defined using ICA-AKI/KDIGO criteria. Receiver Operating Characteristic (ROC) curve analysis was performed to determine the diagnostic performance of urinary Na/K ratio in predicting AKI.

Results:

Of 122 patients, 61 (50%) developed AKI. The mean urinary Na/K ratio was significantly lower in patients with AKI compared to those without. A cut-off value of ≤ 0.945 predicted AKI with 45.9% sensitivity and 95.1% specificity (AUC = 0.770). The ratio showed a strong correlation with serum creatinine rise ($\Phi = 1.000$). Lower Na/K ratios were also associated with severe ascites, higher bilirubin, hyponatremia, and advanced hepatic encephalopathy.

Conclusions: The urinary spot sodium-to-potassium ratio is a reliable, rapid, and non-invasive biomarker for early identification of AKI in decompensated cirrhosis. Incorporating this marker into routine evaluation may help clinicians identify high-risk patients earlier, allowing timely intervention and improved clinical outcomes.

1185 - Perioperative Management Ethical Concerns and Outcomes of Pediatric Domino Liver Transplants from Maple Syrup Urine Disease Donors

Vipul Gautam¹, Vikram Kumar¹, Dibya Jyoti Das², Subhash Gupta³

Max Centre For Liver And Biliary Sciences, Pediatric Hepatology, New Delhi-India¹ Max Centre For Liver And Biliary Sciences, Intensive Care Unit, New Delhi-India² Max Centre For Liver And Biliary Sciences, Liver Transplant Surgery, New Delhi-India³

Background / Hypothesis: Domino liver transplantation (DLT) expands the donor pool by using structurally normal livers from patients with metabolic disorders like Maple Syrup Urine Disease (MSUD). This study presents our pediatric DLT experience, focusing on ethical issues, family perspectives, perioperative care, and outcomes.

Materials and Methods: This retrospective study included all children who underwent DLT between January 2019 and September 2025, building on our earlier work (Kumar et al., 2023) with a larger cohort and extended follow-up. Each child with MSUD donated to a recipient with end-stage liver disease or another metabolic disorder. Families received detailed counselling on the procedure, ethical considerations, and social implications before giving informed consent. All liver transplants (LT) were approved by the Transplant Board and Ethics Committee.

Results: Eighteen MSUD patients underwent living donor LT, and their explanted livers (domino allografts) were transplanted into 20 recipients. Two older children with MSUD underwent split LT, benefiting four recipients. Half of the DLT recipients' families initially feared the potential for new genetic conditions but consented after thorough counselling. All three surgeries in the DLT were performed simultaneously through coordinated teamwork, with three synchronized surgical teams carrying out liver extractions in parallel; the MSUD donor hepatectomy was straightforward. The MSUD children followed a branched-chain amino acid restricted diet pre-transplant and an unrestricted normal diet post-transplant, with normalized amino acid levels and no symptoms. The post-LT ICU and hospital stay durations were 12 (8–16) days and 34 (22–51) days, respectively. Patient survival among DLT recipients was 65% at a mean follow-up of 25 (15–31) months. No long-term vascular, biliary, graft-related complications, or MSUD occurrence were seen in DLT recipients, and there was no mortality in the MSUD donor cohort (Table attached).

Conclusions: MSUD livers are safe for transplant and should be offered with proper counselling. A multidisciplinary approach supports long-term success and helps address organ shortages.

1189 - VISTA deficiency exacerbates the development of acute on chronic liver failure by promoting Tc1 Differentiation

Yao Zhang¹, Xueyun Zhang¹, Yidi Jia¹, Richeng Mao¹, Yuxian Huang¹, Jiming Zhang¹

ORAL ABSTRACTS

Huashan Hospital, Fudan University, Infectious Diseases, Shanghai-China¹

Background / Hypothesis: Acute-on-chronic liver failure (ACLF) has a high early mortality, and there is abundant evidence that persistent inflammatory response and immune activation are the core pathogenesis of ACLF. However, the mechanism of immune disorder has not been fully clarified. Previous studies have shown that deficiency of V-type immunoglobulin domain-containing suppressor of T-cell activation (VISTA) exacerbates the progression of inflammatory diseases. Moreover, the immune response mediated by CD8⁺T cells can directly cause liver damage and is closely related to the dysregulation of inflammatory response in ACLF patients. Our study was designed to investigate the role of VISTA expression on CD8⁺T cells in the pathogenesis of ACLF.

Materials and Methods: We assessed the expression and function of VISTA on CD8⁺ T cells in blood samples from healthy controls, patients with stable cirrhosis, and ACLF patients. Transcriptome sequencing was performed to determine the relevant pathways, which was then verified by WB. Inhibitors of relevant signaling pathways were added to the CD8⁺ T cells to explore the key signal mechanism.

Results: In ACLF patients, the expression of VISTA was significantly reduced in the CD8⁺ T cells compared with healthy subjects and stable cirrhosis patients, especially in the effector memory and terminally differentiated effector memory cells with high CD45RA expression subsets. The expression of VISTA on CD8⁺ T cells was associated with disease severity and prognosis. VISTA downregulation contributed to the activation and proliferation of CD8⁺ T cells, and enhanced the differentiation of type 1 cytotoxic T cells (Tc1), as well as heightened inflammatory cytokine secretion. This effect was mediated through the activation of the extracellular signal-regulated kinase 1 and 2 (ERK1/2) signaling pathway.

Conclusions: Our study reveals that VISTA downregulation drives ACLF progression by amplifying Tc1-mediated inflammation. This insight not only advances the mechanistic understanding of ACLF pathogenesis but also nominates VISTA as a potential candidate for therapeutic intervention.

1190 - Macrophage Nrf1 Foxo1 KLF6 Axis Drives Mitochondrial Dysfunction and Inflammatory Progression in Liver Fibrosis

Qiong Wu¹, Yao Yao¹, Mingwei Sheng², Fengmei Wang²

Nankai University, Medical School, Tianjin-China¹
Tianjin First Central Hospital, Gastroenterology And Hepatology Department, Tianjin-China²

Background / Hypothesis: Liver fibrosis is a progressive condition driven by chronic injury, ultimately leading to cirrhosis. Immune dysregulation, particularly macrophage polarization, plays a crucial role in fibrosis progression. Pro-inflammatory M1 macrophages worsen inflammation and fibrosis, with polarization influenced by metabolic shifts between glycolysis and oxidative phosphorylation. Nuclear factor erythroid 2-related factor 1 (Nrf1), a key redox-sensitive factor essential for mitochondrial homeostasis, has been extensively studied in hepatocytes but remains largely unexplored in macrophages in the context of liver fibrosis. This study aims to elucidate the immunoregulatory role of macrophage Nrf1 in liver fibrosis, potentially identifying novel therapeutic targets to mitigate or reverse fibrosis progression.

Materials and Methods: Myeloid-specific Nrf1-knockout (Nrf1 M-KO) mice and Foxo1 knockout (Foxo1M-KO) mice were developed to investigate the role and underlying mechanisms of macrophage Nrf1-Foxo1 axis across three murine models of liver fibrosis induced by a high-fat diet, carbon tetrachloride injection or bile duct ligation. Bone marrow-derived macrophages (BMDMs) were isolated from conditional mice, then stimulated with lipopolysaccharide (LPS, 100 ng/mL, 6 hours). CRISPR/Cas9 and siRNA approaches were used to assess downstream targets.

Results: Nrf1 expression was significantly reduced in macrophages from fibrotic liver tissues, as confirmed by qRT-PCR and immunofluorescence staining in both human and murine models. Nrf1M-KO mice exhibited exacerbated liver fibrosis, characterized by elevated serum ALT/AST levels, increased collagen deposition, and upregulated fibrotic markers (TGF- β , Col1a1, TIMP1). Loss of Nrf1 promoted M1 macrophage polarization, enhanced inflammatory responses (elevated TNF- α , IL-1 β , iNOS), and impaired

ORAL ABSTRACTS

mitochondrial function (reduced ATP production and increased mitochondrial ROS). In contrast, Foxo1M-KO mice exhibited attenuated fibrosis, reduced inflammation, and improved mitochondrial integrity. Mechanistically, Nrf1 directly interacted with Foxo1 to regulate the transcription of KLF6, a key mediator of mitochondrial function and macrophage polarization. These findings underscore the pivotal role of the Nrf1-Foxo1-KLF6 axis in macrophage-driven inflammation and fibrosis, highlighting potential therapeutic targets for liver fibrosis.

Conclusions:

Our study highlights the functional properties of macrophage Nrf1-Foxo1 axis in controlling mitochondrial reprogramming and liver fibrosis progression.

1195 - MMP 9 Suppresses the Anti HBsAg B Cell Response During Chronic HBV Infection

Jia Liu ¹, Dongliang Yang ¹, Xin Zheng Zheng ¹, Dilhumare Ablidik Ablidik ¹, Yuhang Chen Chen ¹
Union Hospital, Tongji Medical College, Huazhong University Of Science And Technology, Infectious Diseases, Wuhan-China ¹

Background / Hypothesis: Chronic Hepatitis B (CHB) infection poses a significant threat to global health, and current treatment regimens are insufficient for achieving a cure for the disease. Virus-specific T-cell and B-cell responses are crucial in the clearance of Hepatitis B Virus (HBV) infection. Our previous research indicated that Matrix Metalloproteinase (MMP)-9, together with MMP-2, are involved in the regulation of intrahepatic anti-HBV effector T cell responses in acute self-limiting HBV infection. However, it remains unclear if MMP-9 also plays a role in regulating anti-HBV immune responses and mediating HBV clearance in the scenario of chronic HBV infection.

Materials and Methods: We addressed this question by employing MMP-9 gene knockout (KO) and RNA interference techniques in chronic HBV replication mouse models.

Results: Our results showed that the absence of MMP-9 in FVB mice led to significantly accelerated clearance of

Hepatitis B surface antigen (HBsAg) in peripheral blood and increased production of Hepatitis B surface antibody (HBsAb) in pAAV-HBV1.2 or BPS plasmids hydrodynamic injection (HDI) mouse models. Adoptive transfer of spleen immune cells from MMP-9 KO mice to wild-type mice could also accelerate serum HBsAg clearance and enhance HBsAb production in the pAAV-HBV1.2 HDI mouse model, suggesting that the anti-HBV effect of MMP-9 KO is mainly mediated by immune cells. RNA-seq analysis showed that MMP-9 KO significantly induced enrichment of genes related to the B-cell receptor signaling pathway in the splenocytes of mice post pAAV-HBV1.2 HDI compared to wild-type mice. MMP-9 KO mice also showed significantly enhanced B cell activation, as well as increased numbers of germinal B cells and follicular helper CD4+ T cells infiltration in the liver post pAAV-HBV1.2 HDI compared to wild-type mice. Importantly, in vivo knockdown of MMP-9 expression by RNAi also resulted in significantly accelerated serum HBsAg clearance in wild-type FVB and C57BL/6 mice post pAAV-HBV1.2 HDI.

Conclusions: MMP-9 may play a role in negatively regulating anti-HBV B cell responses during chronic HBV infection. Targeting MMP-9 could serve as a novel strategy for the treatment of chronic HBV infection.

1196 - Prevalence and severity of chronic atrophic gastritis in cirrhotic patients versus dyspeptic controls

Aizirek Abdikayrova ¹, Haldun Selçuk ², Ahmet Sedat Boyacıoğlu ²

Başkent University Ankara Hospital, Internal Medicine, Ankara-Türkiye ¹ Başkent University Ankara Hospital, Gastroenterology, Ankara-Türkiye ²

Background / Hypothesis: Chronic atrophic gastritis represents a crucial step in the Correa cascade leading to gastric malignancy. In patients with cirrhosis, premalignant gastric lesions are reported in nearly one-third of cases, independent of portal hypertension severity. Cirrhosis is thought to increase the risk of chronic atrophic gastritis by promoting gastric mucosal injury and inflammation. This study aimed to compare the frequency of chronic atrophic gastritis in individuals with cirrhosis versus a dyspeptic control population.

Materials and Methods:

ORAL ABSTRACTS

A total of 115 patients with cirrhosis (mean age: 54.6 ± 13.4 years) and 510 patients with dyspeptic symptoms (mean age: 55.8 ± 14.6 years) were included. Demographics, comorbidities, endoscopic findings, and histopathological biopsy results were assessed. The presence and severity of chronic atrophic gastritis as well as *Helicobacter pylori* status were recorded. Gender distribution was comparable between group

Results:

The prevalence of chronic atrophic gastritis was significantly higher in cirrhotic patients (51.3%) compared with controls (31.7%, $p < 0.001$). The severity of atrophy was also significantly greater in the cirrhosis group. *Helicobacter pylori* positivity was lower in patients with cirrhosis (17.3%) compared with controls (26.7%, $p < 0.05$).

Conclusions:

Patients with cirrhosis exhibit a significantly higher frequency and greater severity of chronic atrophic gastritis compared with individuals presenting with dyspepsia. These findings reinforce the association between cirrhosis, premalignant gastric mucosal changes, and increased gastric cancer risk. The presence of more severe and frequent chronic atrophic gastritis highlights its role as a potential key factor in gastric carcinogenesis in cirrhosis. Routine endoscopic surveillance with targeted biopsy sampling should therefore be considered an essential preventive strategy in this high-risk patient population.

Keyword(s) : premalignant gastric lesions, chronic atrophic gastritis, cirrhosis

1197 - Enhancement of Liver Regeneration in Mice through DDX3X CD36 Pathway Mediated Promotion of Hepatic Lipid Accumulation

Ling Xu¹, Zhenzhen Pan¹, Zihao Fan¹, Feng Ren¹
Beijing Youan Hospital, Capital Medical University,
Beijing Institute Of Hepatology, Beijing-China¹

Background / Hypothesis:

The liver possesses a unique regenerative capacity, which is indispensable for the recovery process following liver resection and the management of various liver diseases. Accumulation of lipids in hepatocytes has been recognized as a pivotal factor during liver regeneration, yet the intricate mechanisms underlying this process remain elusive. This study endeavors to elucidate the mechanism through which DDX3X mediates lipid accumulation during liver regeneration.

Materials and Methods:

We collected serum samples from patients at various time points post-hepatectomy. A liver regeneration model in C57BL/6 mice was established by performing a two-thirds partial hepatectomy (PH). Hepatocyte-specific DDX3X knockout (DDX3X Δ hep) mice were generated using CRISPR/Cas9/Cre-LoxP technology to investigate the pivotal role of DDX3X in liver regeneration. High-throughput RNA sequencing was conducted to dissect the downstream signaling pathways in DDX3X Δ hep mice during liver regeneration. Oil Red O staining was utilized to visualize liver lipid accumulation. qPCR and Western blotting were employed to assess the expression levels of target genes and proteins, respectively.

Results:

Patients undergoing PH exhibited a progressive decrease in serum DDX3X levels. In the mouse liver regeneration model, hepatic DDX3X expression initially surged (0-12 hours) and subsequently declined (24-96 hours). Following two-thirds PH, DDX3X Δ hep mice demonstrated a significantly augmented regenerative capacity compared to controls, accompanied by a marked increase in liver lipid levels. RNA sequencing revealed enhanced fatty acid uptake in DDX3X Δ hep mice during liver regeneration. Notably, knockdown of the key fatty acid receptor CD36 significantly reduced hepatocyte lipid accumulation and impeded liver regeneration in DDX3X Δ hep mice.

Conclusions:

During liver regeneration, hepatocyte DDX3X deficiency promotes hepatocyte proliferation by augmenting liver lipid accumulation through CD36 regulation. Our findings offer novel insights into the mechanisms underlying liver regeneration and identify potential targets for accelerating post-surgical recovery in patients.

King Faisal Specialists Hospital And Research Centre, Liver And Small Bowel Health Centre, Riyadh-Saudi Arabia¹ King Faisal Specialists Hospital And Research Centre, Organ Transplant Centre Of Excellence, Riyadh-Saudi Arabia² King Faisal Specialists Hospital And

ORAL ABSTRACTS

Research Centre, Intensive Care Unit, Riyadh-Saudi Arabia ³

Background / Hypothesis: Acute-on-chronic liver failure (ACLF) is a life-threatening syndrome in patients with chronic liver disease (CLD), marked by multi-organ failure and high mortality. Living donor liver transplantation (LDLT) is critical in donor-scarce regions. This study compares baseline characteristics, perioperative complications, and long-term survival in recipients with versus without ACLF, focusing on etiology, ACLF grading, and graft factors

Materials and Methods: Data were derived from a prospective local registry with 591 adult LDLT recipients (2018–2023). ACLF was defined using EASL-CLIF (multi-organ failure, grades 1–3) and APASL (jaundice/coagulopathy with complications) criteria, assessed at initial liver transplant evaluation and within 24 hours of LDLT

Results: Patients with ACLF (n=101, 17.1%) had higher MELD-Na (27 vs. 20, $p<0.001$), bilirubin (6.84 vs. 1.75 mg/dL, $p<0.001$), creatinine (108 vs. 70.5 $\mu\text{mol/L}$, $p<0.001$), metabolic/genetic etiologies (9.9% vs. 2.8%, $p=0.001$), chronic kidney disease (23.7% vs. 8.1%, $p<0.001$), and lower Hepatocellular carcinoma (HCC) prevalence (11.8% vs. 29.6%, $p<0.001$). Graft-to-recipient weight ratio (GRWR) was lower in ACLF (0.59 vs. 0.66, $p=0.10$). Patients with ACLF had higher rates of infection (27.7% vs. 10.4%, $p<0.001$), bleeding (14.9% vs. 6.3%, $p=0.004$), and biliary complications (15.8% vs. 7.8%, $p=0.010$). They had longer intensive care unit (5 vs. 3 days, $p<0.001$) and hospital stays (33.66 vs. 20.7 days, $p=0.036$). At 5-year follow-up, overall survival was lower in ACLF (log-rank $p=0.001$), and worse in higher ACLF grades (EASL-CLIF grade 3: 55% vs. 86% for no ACLF, $p=0.002$). Graft survival was lower in ACLF (75% vs. 85%, $p=0.02$). In multivariable analysis, chronic kidney disease independently predicted mortality (HR 2.09, 95% CI 1.11–3.95, $p=0.023$).

Conclusions: LDLT in ACLF incurs significant perioperative morbidity and reduced long-term survival compared to non-ACLF, with outcomes declining sharply with ACLF severity. Chronic kidney disease is a key independent predictor of mortality. Timely LDLT remains a life-saving option in donor-scarce settings.

Keyword(s):

1204 - Sequential therapy with anti PD 1 antibody and pegylated interferon alpha promoted HBsAg reduction and enhanced T cell response in patients with chronic hepatitis B

Taiyu He¹, Min Chen¹, Maoying Liu¹, Li Zhang¹, Peng Hu¹, Dachuan Cai¹, Dazhi Zhang¹, Mingli Peng¹, Yinghua Lan¹, Hong Ren¹
Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Institute For Viral Hepatitis, The Second Affiliated Hospital, Chongqing Medical University, Chongqing-China ¹

Background: This study aimed to investigate the safety, efficacy and immunological mechanisms of sequential therapy with anti-PD-1 antibody ($\alpha\text{PD-1}$) and pegylated interferon-alpha (Peg-IFN α) in patients with chronic hepatitis B (CHB).

Methods: In this non-randomized, prospective, open-label, ongoing study, hepatitis B e antigen (HBeAg)-negative virally suppressed patients with hepatitis B surface antigen (HBsAg) levels between 100 and 600 IU/mL were assigned to one of the following regimens: nucleos(t)ide analogue (NA) monotherapy for 48 weeks (NA group); NA plus Peg-IFN α for 48 weeks (NA+Peg-IFN α group); NA plus $\alpha\text{PD-1}$ for 24 weeks followed by NA alone for 24 weeks (NA+ $\alpha\text{PD-1}$ group); or NA plus $\alpha\text{PD-1}$ for 24 weeks followed by NA plus Peg-IFN α for 24 weeks (NA+ $\alpha\text{PD-1}$ /Peg-IFN α group). $\alpha\text{PD-1}$ (sintilimab, 100mg) was administered intravenously every 3 weeks.

Results: A total of 62, 26, 25, and 10 patients in the NA, NA+Peg-IFN α , NA+ $\alpha\text{PD-1}$, and NA+ $\alpha\text{PD-1}$ /Peg-IFN α groups, respectively, completed the 48-week follow-up. The incidences of overall adverse events (AEs) (100.0% vs. 100.0%) and severe AEs (SAEs) (30.8% vs. 30.0%) were comparable between the NA+Peg-IFN α and NA+ $\alpha\text{PD-1}$ /Peg-IFN α groups. In contrast, the NA+ $\alpha\text{PD-1}$ group exhibited numerically lower rates of AEs (88.0%) and SAEs (16.0%), though these differences were not statistically significant ($P>0.05$). Baseline HBsAg levels were comparable across all groups ($P=0.906$). At week 24, the mean changes in HBsAg from baseline were -0.03, -1.35, -1.01 and -0.66 log₁₀ IU/mL in the NA, NA+Peg-IFN α , NA+ $\alpha\text{PD-1}$ and NA+ $\alpha\text{PD-1}$ /Peg-IFN α groups, respectively. By week 48, the greatest mean HBsAg reduction was observed in the NA+ $\alpha\text{PD-1}$ /Peg-IFN α group (-3.08 log₁₀ IU/mL), followed by the NA+Peg-IFN α (-1.68 log₁₀ IU/mL), NA+ $\alpha\text{PD-1}$ (-0.96 log₁₀ IU/mL) and NA (-0.09 log₁₀ IU/mL) groups. Furthermore, at week 48, NA+ $\alpha\text{PD-1}$ /Peg-IFN α group also achieved the highest HBsAg loss rates (50.0%), significantly exceeding those in the NA (0%), NA+Peg-

ORAL ABSTRACTS

IFN α (23.1%), and NA+ α PD-1 (16.0%) groups ($P < 0.001$). During α PD-1 treatment, T cell activation and enhanced HBV-specific T cell responses were observed ($P < 0.05$). After sequential Peg-IFN α therapy, HBV-specific IFN- γ spot counts decreased, whereas CD38 expression on T cells continued to elevate ($P < 0.05$), and the Th2 cell frequencies showed an increasing trend. Conclusions: In a 48-week treatment course, sequential therapy with α PD-1 and Peg-IFN α showed an acceptable safety profile, and appeared to induce stronger HBsAg reductions and higher HBsAg loss rates than either agent alone in NA-treated CHB patients. These findings provide new insights into achieving CHB functional cure.

1209 - Therapeutic Effects of Qinggan Huatan Huoxue Prescription on Metabolic Dysfunction Associated Steatohepatitis via Modulation of the CYP4a32-PPAR γ -CD36 Signaling Axis

Feixiang Xiong¹, Fengna Yan², Yuyong Jiang¹, Xiaomin Ji¹, Tong Wu¹, Yang Zhou¹, Xuejie Zhang¹, Dandan Chen¹, Yixin Hou¹
Beijing Ditan Hospital, Capital Medical University, Center Of Integrative Medicine, Beijing-China¹ Beijing Institute Of Infectious Diseases, Beijing Institute Of Infectious Diseases, Beijing-China²

Background / Hypothesis:
Therapeutic Effects of Qinggan Huatan Huoxue Prescription on Metabolic Dysfunction-Associated Steatohepatitis via Modulation of the CYP4a32-PPAR γ -CD36 Signaling Axis

Materials and Methods:
Twenty-five male mice fed a high-fat diet were randomly assigned to five groups: normal control, model, positive control, low-dose QHHP, and high-dose QHHP. Mice received QHHP, atorvastatin, or saline for four consecutive weeks. Liver lipid accumulation and inflammatory infiltration were evaluated by hematoxylin-eosin (HE) staining, lipid content was quantified by Oil Red O staining, and liver fibrosis was assessed using Masson's trichrome staining. Molecular docking and molecular dynamics simulations were performed to evaluate the binding affinity and stability of QHHP active compounds with the CYP4a32-PPAR α -CD36 signaling axis. The expression of CYP4a32, PPAR α , and CD36 was assessed by immunohistochemistry, immunofluorescence, qPCR, and Western blotting.

Results:

QHHP treatment improved hepatic lipid accumulation and inflammation in mice, accompanied by improved liver function and serum lipid profiles in both mice and human subjects. In vitro, Nile Red immunofluorescence in Huh7 and AML12 cells confirmed the therapeutic effect of QHHP on MASH. RNA-seq analysis of mouse livers revealed enrichment in the PPAR γ signaling pathway, and PCR and Western blot assays demonstrated increased hepatic expression of Cyp4a32 and CD36 and decreased expression of PPAR γ . Mass spectrometry identified 10 active compounds in QHHP, and network pharmacology, molecular docking, and molecular dynamics simulations suggested interactions between these compounds and the targets Cyp4a32, PPAR γ , and CD36. Further in vitro experiments validated that QHHP exerts its therapeutic effects on MASH through modulation of the Cyp4a32-PPAR γ -CD36 axis.

Conclusions:

QHHP ameliorates hepatic lipid metabolism and inflammatory responses in MASH through modulation of the CYP4a32-PPAR γ -CD36 signaling axis. These findings provide mechanistic evidence supporting the multitarget therapeutic potential of TCM prescriptions in the management of MASH.

1215 - Oxysterol Binding Protein Related Protein 2 Drives Sterol Accumulation and Neutrophil Dysfunction in Sepsis Associated with Alcoholic Cirrhosis

Gaurav Tripathi¹, Jaswinder Singh Maras¹, Rakhi Maiwall², Shiv Kumar Sarin²
Institute Of Liver And Biliary Sciences, Molecular And Cellular Medicine, Delhi-India¹ Institute Of Liver And Biliary Sciences, Department Of Hepatology, Delhi-India²

Background / Hypothesis: Patients with alcoholic cirrhosis often develop sepsis with high mortality. Neutrophil dysfunction, marked by impaired pathogen clearance, excessive inflammation, and metabolic dysregulation, is common, yet its underlying mechanisms remain poorly understood.

Materials and Methods: Untargeted proteomic and metabolomic profiling were performed on neutrophils from healthy controls, non-septic alcoholic cirrhosis, and septic/septic shock patients. A total of 185 patients were randomized (70:30) into training (n=150) and test (n=35) cohorts. Proteins and metabolites were quantified using LC-MS/MS and UHPLC-HRMS, and

ORAL ABSTRACTS

pathway enrichment, fold change, t-tests, and AUC analyses, along with neutrophil functionality analysis.

Results: Multi-omics analysis revealed significant alterations in neutrophil function and metabolism in cirrhotic sepsis. A total of 9,115 proteins and 1,414 metabolites were identified, with 6,488 proteins ($FC > 1.5$, $p < 0.05$) and 729 metabolites ($FC > 1.5$, $p < 0.05$) significantly dysregulated compared to non-septic cirrhosis. Pathway enrichment analysis highlighted dysregulation in lipid metabolism, sterol homeostasis, and mitochondrial function. Key findings include the upregulation of OSBPL2 ($FC > 3892$, $AUC = 0.93$) and LDLR ($FC > 4.47$, $AUC = 0.92$), which promote increased uptake of fats, contributing to sterol accumulation. Elevated levels of cholesterol ($FC > 6$), 25-hydroxycholesterol ($FC > 500$), and cortisone ($FC > 25$) confirmed this metabolic shift.

Sterol overload induced lipid droplet formation, reprogramming neutrophils into lipid-laden cells. The increased lipid uptake caused by OSBPL2 and LDLR led to membrane instability, increased cell lifespan, and disrupted neutrophil functions. This metabolic shift triggered mitochondrial and ER stress. Mitochondrial dysfunction, marked by increased expression of THEM4 ($FC > 5$) and HIF1A ($FC > 7$), indicated impaired oxidative phosphorylation and elevated ROS production. ER stress markers, including HSPA1A ($FC > 3$) and AMFR ($FC > 189$), reflected disrupted protein folding.

These structural disruptions resulted in defective neutrophil degranulation, with altered exocytosis proteins such as KLC1 ($FC > 59$) and ITGB2 ($FC > 11$), indicating secretory exhaustion. Neutrophils also showed impaired phagocytosis and compromised antimicrobial response, despite elevated pro-inflammatory cytokines like IL6 ($FC > 29$) and ICAM1 ($FC > 6$). Furthermore, neutrophils in sepsis exhibited impaired chemotaxis and migration, as indicated by reduced CXCR2 ($FC > 2.5$) and ITGB2 ($FC > 11$), reflecting a diminished ability to respond to inflammation.

Conclusions- This study shows metabolic and functional reprogramming of neutrophils in cirrhotic sepsis, driven by sterol accumulation and organelle stress. Lipid buildup and mitochondrial dysfunction impair neutrophil functions, including degranulation, phagocytosis, and antimicrobial responses. Enhanced NETosis and dysfunctional chemotaxis worsen immune dysregulation. Biomarkers like OSBPL2 and LDLR offer potential targets for diagnostic and therapeutic

interventions, improving patient

Keyword(s) : Sepsis, Alcoholic Cirrhosis, Neutrophils, Proteomics, Metabolomics, Lipid Metabolism, Cholesterol, Biomarkers, Mitochondrial Stress, Immune Dysfunction.

1226 - Metabolic dysfunction associated steatotic liver disease by fibrosis stage in China and Japan a 20 year model

Carolyn Wallace¹, Ivane Gamkrelidze¹, Homie Razavi¹
Cda Foundation, N/a, Lafayette-United States¹

Background / **Hypothesis:**

As metabolic dysfunction-associated steatotic liver disease (MASLD) continues to grow worldwide, China and Japan are similarly impacted. MASLD is linked to increased prevalence of cirrhosis, hepatocellular carcinoma, and a myriad of other life-threatening complications. Documenting the current and projected number of individuals with MASLD by fibrosis stage in the Chinese and Japanese adult populations provides an understanding how MASLD may evolve over time, which is vital to counteracting the burden of the disease.

Materials and **Methods:**

A Markov model was used to estimate the current and projected number of individuals with MASLD by fibrosis stage in the adult populations of China and Japan. The model incorporated prevalence, natural history, and mortality. Published estimates were used to build and validate the model projections, including the prevalence of MASLD, obesity, diabetes, and liver transplantations specific to each country.

Results:

The model projected total cases in China increasing from 400,903,100 to 429,100,700 (7%) in the next ten years, to 412,929,300 cases in 2045. F2-F3 cases, however, increased from 17,412,900 to 30,051,600 (73%) from 2025 to 2045. Further, F4 cases more than doubled from 1,572,300 to 3,484,300, and advanced liver disease cases, which includes decompensated cirrhosis, hepatocellular carcinoma, and liver transplantation, simultaneously increased by 128% from 209,200 to 477,900.

Japanese total cases declined by 15% in the twenty-year period from 26,669,100 in 2025 to 22,612,300 in 2045. This can be attributed to the country's slowing of obesity rates which directly influences MASLD incidence, as well as the falling population numbers. Yet, as seen in

ORAL ABSTRACTS

China, the danger of higher fibrosis stages burgeoning persisted. In ten years, F2-F3 cases increased from 1,993,100 to 2,071,900 (4%). In twenty years, F4 cases increased from 245,100 to 287,000 (17%), and advanced liver disease cases increased from 35,300 to 42,700 (21%).

Conclusions:

The use of modeling provides insights into the current and future disease burden of MASLD in China and Japan and establishes a framework for public health discussion to facilitate best policies and practices for optimal management of MASLD. The effects of later stages of MASLD rising appear to be perspicacious, posing morbid long-term outcomes. Effective therapies halting the progression of fibrosis will markedly benefit the rising disease burden of later stages of MASLD in China and Japan.

Keyword(s) : metabolic dysfunction-associated steatotic liver disease, disease burden, fibrosis stage, Markov model, China, Japan

1229 - PD 1 is required for the early expansion of HBV specific CD8+ T cells and does not suppress their effector function during the acute phase of HBV infection

Xiaoqing Zeng ¹, Wen Pan ¹, Ziwei Li ¹, Zhaoli Liu ², Hongming Huang ¹, Xuecheng Yang ¹, Kathrin Sutter ³, Mengji Lu ³, Ulf Dittmer ³, Gennadiy Zelinskyy ³, Xin Zheng ¹, Dongliang Yang ¹, Patrick T.f. Kennedy ⁴, Yanqin Du ¹, Jia Liu ¹

Huazhong University Of Science And Technology, Department Of Infectious Diseases, Union Hospital, Tongji Medical College, Wuhan-China ¹ National Center For Cardiovascular Diseases, Center China Subcenter, Zhengzhou-China ² University Of Duisburg-essen, Institute For Virology, University Hospital Of Essen, Essen-Germany ³ Queen Mary University Of London, Barts Liver Centre, Blizard Institute, Barts And The London School Of Medicine And Dentistry, London-United Kingdom ⁴

Background / **Hypothesis:**
Programmed cell Death Protein 1(PD-1) is one of the key inhibitory receptors that regulates CD8 T cell exhaustion during chronic viral infection. However, the role of PD-1 in modulating effector T cell differentiation and function during acute hepatitis B virus (HBV) infection is remains poorly defined.

Materials and **Methods:**
We analyzed PD-1⁺ and PD-1⁻ CD8⁺ T cell dynamics in

acute self-resolving (AR) and chronic (CH) HBV mouse models using flow cytometry and RNA sequencing. Wild-type (WT) or PD-1 knockout (KO) HBV core antigen-specific TCR transgenic (C93-TCRtg) CD8⁺ T cells were adoptively transferred into naïve mice prior to HBV challenge.

Results:

Acute HBV infection induced sustained PD-1 upregulation on intrahepatic/splenic CD8⁺ T cells, predominantly exhibiting an effector phenotype. PD-1⁺ cells displayed enhanced proliferation, cytotoxicity, and effector cytokine production compared to PD-1⁻ counterparts. Transfer of PD-1 KO C93-TCRtg CD8⁺ T cells resulted in significantly impaired early expansion in both spleen and liver during acute infection, alongside reduced granzyme B expression but unaffected IFN- γ , TNF- α , or IL-2 production. Transcriptomics revealed PD-1 deficiency promoted apoptosis gene signatures. In chronic HBV infection, PD-1 KO cells failed to expand long-term and exhibited exacerbated exhaustion (loss of IFN- γ production).

Conclusions:

PD-1 is essential for the early expansion and survival of HBV-specific CD8⁺ T cells during acute infection and does not suppress their effector cytokine function. Its absence impairs proliferation and promotes exhaustion of HBV-specific CD8⁺ T cell in chronic settings.

Keyword(s) : PD-1, hepatitis B virus, CD8 T cell exhaustion.

1232 - Preoperative Viral Hepatitis Screening Evaluation of the Consultation Chain

Asli Haykir Solay ¹, Pelin Beyza Ünal ¹, Gülnur Kul ¹, Sema Cihan ², Emin Ediz Tütüncü ¹
Etlik City Hospital, Infectious Diseases And Clinical Microbiology, Ankara-Türkiye ¹ Etlik City Hospital, Orthopedics And Traumatology, Ankara-Türkiye ²

Background / Hypothesis: Chronic hepatitis B virus (HBV) and hepatitis C virus (HCV) infections are often asymptomatic, and delayed diagnosis may adversely impact clinical outcomes. Preoperative screening with HBsAg and anti-HCV in surgical patients offers an opportunity to assess occupational risk for healthcare workers and identify undiagnosed cases requiring follow-up. However, referral of patients with positive results to infectious diseases specialists is inconsistent. This study evaluates referral practices for patients screened positive in the orthopedics clinic and examines surgical team awareness on the issue.

ORAL ABSTRACTS

Materials and Methods: This cross-sectional descriptive study was conducted by reviewing the hospital information system records of patients who presented to the orthopedics outpatient clinic between July 1, 2024, and October 1, 2025, and underwent HBsAg and anti-HCV testing as part of the preoperative assessment. For patients with positive results, referral to infectious diseases or gastroenterology clinics, receipt of antiviral therapy, and history of prior chronic hepatitis follow-up were recorded. Additionally, a structured 14-item anonymous questionnaire was administered to 81 orthopedic physicians to evaluate the perceived purpose of preoperative screening, referral practices, and clinical attitudes. Data were analyzed using descriptive statistical methods.

Results: A total of 20,690 patients were screened; HBsAg positivity was detected in 161 (0.78%) and anti-HCV positivity in 38 (0.18%) patients. Among HBsAg-positive individuals, 17 were already under follow-up and 7 were receiving antiviral therapy, while 144 patients (89.4%) were identified as newly positive. Of these, 34% were referred to infectious diseases or gastroenterology clinics. Among anti-HCV-positive patients, 32 were newly diagnosed, and 37.5% of them were referred for specialist follow-up (Table 1).

Of the 81 surveyed physicians, 68% reported having received three doses of the HBV vaccine, and 70.4% stated that their anti-HBs level was ≥ 10 IU/L. Preoperative screening was reported to be routinely ordered in 91.3% of cases. Referral frequency varied; 33.3% of physicians reported always referring positive patients, whereas 27.2% reported frequently doing so. The proportion of physicians who reported feeling uneasy about operating on HBsAg-positive patients was 39.5%, compared to 74.1% for anti-HCV-positive patients. Surgical postponement due to hepatitis positivity was low (7.4%) (Table 2).

Conclusions: Although new hepatitis diagnoses are infrequent in preoperative screening, low referral rates suggest a missed opportunity for linkage to care. Despite high vaccination coverage, disparities exist in physician attitudes and referral behaviors, especially toward HCV. These findings underscore the need for better education on hepatitis management and standardized referral protocols to improve care continuity.

Keyword(s) : Preoperative screening, Hepatitis B virus, Hepatitis C virus, HBsAg, anti-HCV, referral practices, surgical awareness

1233 - Predictors of response to ursodeoxycholic acid treatment and non invasive identification of autoimmune hepatitis tendencies in primary biliary cholangitis

Li Zhang¹, Hongmei Wu¹, Li Liu¹, Xiaofeng Shi¹, Dachuan Cai¹, Peng Hu¹, Yu Lei¹
The Second Affiliated Hospital Of Chongqing Medical University, Infectious Diseases Department, Chongqing-China¹

Background / Hypothesis: Up to 40% of primary biliary cholangitis (PBC) patients may have a poor response to ursodeoxycholic acid (UDCA) treatment, and those with concurrent autoimmune hepatitis (AIH) tendencies require combined treatment with glucocorticoid/immunosuppressive drugs. Therefore, early diagnosis, assessment of concurrent AIH tendencies, and standardized treatment of PBC patients are particularly important for their prognosis.

Materials and Methods: A total of 154 PBC patients who underwent liver biopsy and received at least one year of UDCA monotherapy were included. The subjects were divided into the UDCA well-response group and the poor-response group based on treatment response. Univariate and multivariate logistic regression were used to evaluate the predictive value of clinical and pathological indicators for treatment response. Kaplan-Meier univariate analysis and Cox proportional hazards regression model were constructed to screen the independent predictors of patient survival prognosis. The included PBC patients were further divided into two groups based on the presence or absence of AIH tendency. Univariate and multivariate logistic regression were used to evaluate the predictive diagnostic value of hematological indicators for PBC with AIH tendency.

Results: Compared with the UDCA well-response group, the baseline ALP, GGT, AST, TBIL, IgG, GLB and APRI in the poor-response group were significantly higher. In terms of liver pathological manifestations, the proportion of patients with III-IV stage fibrosis, moderate to severe interface hepatitis, hepatocyte bile stasis, bile duct absence, and pseudolobule formation in the poor-response group was significantly higher than that in the well-response group. The results of logistic univariate regression and multivariate regression model analysis showed that baseline ALP, AMA-M2, GLB, and bile duct absence were independent risk factors affecting the response to UDCA. The multivariate COX regression model showed that UDCA treatment poor response, higher APRI, hepatocyte bile stasis, and III-IV stage fibrosis were independent risk factors for the poor prognosis of PBC patients. Univariate logistic regression analysis and multivariate logistic regression analysis

ORAL ABSTRACTS

showed that serum globulin, AST, total bilirubin, and IgG were important predictors of the AIH tendency in PBC patients.

Conclusions: PBC patients with severe hepatocyte cholestasis or bile duct absence had a lower response rate to UDCA treatment. The degree of liver fibrosis is a key factor affecting the prognosis of UDCA treatment. PBC patients with poor UDCA treatment response are more likely to have AIH tendencies. This study also identified non-invasive hematological indicators for predicting the AIH tendency of PBC patients, this will be helpful in guiding the proper treatment of these patients.

Keyword(s) : Primary biliary cholangitis, liver tissue pathology, ursodeoxycholic acid, AIH tendency, prognosis

1237 - Novel Trends in Liver Transplantation for MASLD and ALD Emerging Epidemiology Allocation & Post Transplant Challenges

¹ ekram Hasanin
University Of Tripoli, Faculty Of Medicine, Tripoli-Libya ¹

Background / Hypothesis:
The prevalence of metabolic dysfunction-associated steatotic liver disease (MASLD), formerly known as nonalcoholic fatty liver disease (NAFLD), has increased worldwide. By 2019, 38% of adults in North America or Australia had MASLD, and 5% had metabolic dysfunction-associated steatohepatitis (MASH), formerly known as nonalcoholic steatohepatitis (NASH). People with MASLD or MASH are at increased risk of adverse liver-related health outcomes, and MASH is projected to soon become the leading indication for liver transplant (LT) in the US. The new nomenclature of MASLD was adopted to replace NAFLD in 2023. While their definitions differ, approximately 99% of patients with NAFLD would be classified as having MASLD. The aim of the study to review and summarize recent trends and emerging challenges in liver transplants for MASLD (metabolic dysfunction-associated steatotic liver disease) and ALD (alcohol-related liver disease).

Materials and Methods:
A focused narrative synthesis of registry data, epidemiologic modeling, and cohort studies (2013–2025) evaluating LT indication trends, donor/recipient characteristics, and post-LT outcomes in MASLD and ALD.

Results:

The proportion of liver transplant candidates with ALD increased from ~23% in 2013 to nearly 50% in 2022, while MASLD rose from 19% to 27%. MASLD recipients frequently present with obesity, diabetes, and cardiovascular comorbidities, contributing to higher peri- and post-transplant metabolic risk. De novo or recurrent steatosis in grafts is increasingly reported, though long-term graft survival appears preserved. Allocation disparities and differing pre-transplant requirements (sobriety for ALD vs metabolic optimization for MASLD) highlight policy gaps. Advances include machine-perfused and marginal graft use, metabolic risk-stratified recipient selection, and early post-LT weight and glycemic interventions.

Conclusions:

MASLD and ALD now dominate liver transplant indications. Novel strategies in candidate selection, allocation policy, and metabolic management are critical to improving outcomes. Future research should focus on recurrence of graft steatosis, cardiovascular mortality, and metabolic precision medicine in post-LT care.

Keyword(s) : MASLD/MASH, ALD, rising LT indications, machine-perfused marginal grafts, metabolic comorbidities

1238 - Awareness of Primary Biliary Cholangitis Among Turkish Physicians An Online Survey

Hasan Eruzun¹, Henning Grønbaek²
Samsun Training And Research Hospital, Gastroenterology, Samsun-Türkiye ¹ Aarhus University Hospital, Gastroenterology And Hepatology, Aarhus-Denmark ²

Background / Hypothesis:

Primary biliary cholangitis (PBC) is a chronic, rare, autoimmune liver disease characterized by non-suppurative cholangitis of the small bile ducts. This study aimed to assess the awareness of physicians in Türkiye, who are likely to encounter PBC patients.

Materials and Methods:

An online survey consisting of 28 questions related to the disease was sent to physicians via email and mobile phone groups. In addition to collecting participants' general demographic data, the survey included

ORAL ABSTRACTS

questions on their medical specialty, years of practice, and knowledge about the epidemiology, pathology, diagnosis, treatment, and follow-up of PBC.

Results:

Of the 615 physicians who were sent the survey, 270 answered the questions fully. Of the participants, 48% were women, and 28.8% had been practicing medicine for over ten years. Regarding specialties, 56% were internal medicine specialists or residents, 11.4% were gastroenterology specialists or residents, 9% were general practitioners, 8% were general surgery specialists or residents, 9% were family medicine specialists or residents, and 6% were other subspecialists. The rate of correct answers was lowest among general practitioners (64.5%) and highest among gastroenterologists (90%). There was a significant difference in correct response rates between specialists (77%) and non-specialists (71%) ($p=0.003$). The awareness of the need for response evaluation in first year of UDCA treatment was lowest among the family medicine and general practitioner group (36%).

Conclusions:

PBC is a relatively rare disease with low awareness not only in the general population but also among physicians. Delayed diagnosis and lack of treatment response evaluation are associated with poor outcomes. The results clearly indicate the need to raise awareness of PBC among physicians.

Keyword(s) :

1239 - Study on the Value of Antithrombin III Activity Combined with COSSH ACLF Score in Predicting the Prognosis of HBV ACLF Patients in the Intensive Care Unit

Xueshi Zhou¹, Chaoyue Fan¹, Hejuan Du¹
Wuxi Fifth People's Hospital, Infection Department Icu,
Wuxi-China¹

Background

/

Hypothesis:

To explore the predictive value of antithrombin III (AT-III) activity combined with the Chinese Society of Hepatology-ACLF (COSSH-ACLF) score for the mortality risk of patients with hepatitis B virus-related acute-on-chronic liver failure (HBV-ACLF) admitted to the intensive care unit (ICU).

Materials

and

Methods:

A total of 196 patients with severe HBV-ACLF admitted to the ICU of the Fifth People's Hospital of Wuxi from

January 1, 2020 to January 1, 2025 were retrospectively included. The baseline AT-III activity levels at admission were recorded. The area under the receiver operating characteristic curve (AUROC) was used to compare the efficacy of the European Chronic Liver Failure Consortium-ACLF (CLIF-C ACLF) score, COSSH-ACLF score, COSSH-ACLF II score, and Model for End-Stage Liver Disease (MELD) score in predicting the 28-day and 90-day mortality rates of HBV-ACLF patients.

Results:

Multivariate Cox regression analysis showed that AT-III activity (HR = 0.961, 95% CI 0.937–0.986, $P = 0.002$), INR (HR = 1.468, 95% CI 1.130–1.909, $P = 0.004$), and the presence or absence of sepsis (HR = 0.391, 95% CI 0.240–0.636, $P < 0.001$) were independent predictors of 90-day survival outcomes in HBV-ACLF patients. The AUROC of AT-III activity for predicting 28-day mortality was 0.745 (95% CI 0.677–0.804, $P < 0.001$), with an optimal cut-off value of 20%; for predicting 90-day mortality, it was 0.725 (95% CI 0.657–0.787, $P < 0.001$), with the same cut-off value of 20%. The AUROC of COSSH-ACLF score for predicting 28-day and 90-day mortality was 0.760 (95% CI 0.694–0.819, $P < 0.001$) and 0.738 (95% CI 0.671–0.798, $P < 0.001$), respectively, with a corresponding cut-off value of 90.6 for both. When AT-III activity and COSSH-ACLF score were combined, the AUROC for predicting 28-day and 90-day mortality increased to 0.780 and 0.757, respectively. Further analysis revealed that the AUROC of AT-III activity on the 7th day of admission for predicting 28-day and 90-day mortality was 0.799 and 0.773, respectively; the corresponding AUROC of COSSH-ACLF score was 0.898 and 0.872, respectively; and the AUROC of the combined prediction was 0.928 and 0.897, respectively.

Conclusions:

The activity of AT-III is closely related to the prognosis of HBV-ACLF patients. Either alone or in combination with the COSSH-ACLF score, it can effectively predict the 28-day and 90-day mortality risk of HBV-ACLF patients treated in the ICU. The predictive efficacy is further enhanced when the 7th-day indicators are dynamically monitored.

Keyword(s) : Antithrombin III Activity ; COSSH-ACLF Score ; Prognosis of HBV-ACLF ; Intensive Care Unit

1243 - Liver Transplantation Outcomes in Primary Sclerosing Cholangitis Patients With and Without Ulcerative Colitis A Comparative Analysis

Seyed Mohammad Amin Dashti¹, Mohammadamin Aslani¹, Ali Najafi², Payam Jannatdoust³, Parsa Alehossein³, Foroogh Alborzi⁴, Mohssen Nassiri Toosi¹, Mohammad¹, Taher⁴
School Of Medicine, Tehran University Of Medical

ORAL ABSTRACTS

Sciences, Liver Transplantation Research Center, Tehran-Iran ¹ Imam Hossein Center For Education, Research And Treatment, Shahroud University Of Medical Sciences, Gastroenterology, Shahroud-Iran ² Tehran University Of Medical Sciences, School Of Medicine, Tehran-Iran ³ School Of Medicine, Tehran University Of Medical Sciences, Gastroenterology And Hepatology, Tehran-Iran ⁴

Background / **Hypothesis**
Primary sclerosing cholangitis (PSC) is a rare immune-mediated cholestatic disease characterized by progressive inflammatory fibrosis, strictures, and eventual cirrhosis. Up to 60–80% of PSC patients have inflammatory bowel disease (IBD), mainly ulcerative colitis (UC). PSC is a major indication for liver transplantation (LT), but post-transplant outcomes are influenced by rejection, recurrent PSC, malignant risk, and IBD-related immune activation. Recurrence occurs in nearly 20% of patients, with active IBD, male sex, and intact colon as risk factors. The effect of UC on graft and patient survival remains uncertain. This study evaluated the impact of UC on survival and post-transplant complications in PSC patients undergoing LT.

Materials and **Methods**
We performed a retrospective cohort study (January 2002–March 2023) at Imam Khomeini Hospital Complex (IKHC), Tehran. PSC was confirmed by explant pathology and UC by colonoscopy and histopathology. Patients younger than 18 years, re-transplants, those with hepatocellular carcinoma or cholangiocarcinoma, incomplete records, or loss to follow-up were excluded. In total, 167 PSC patients undergoing LT were included. Follow-up every three months included cholangiography and laboratory tests. Primary outcomes were overall survival and rejection-free survival; secondary outcomes were biliary stricture, hepatic artery thrombosis (HAT), and renal failure (RF). Statistical analysis included Chi-square, Fisher's exact test, Wilcoxon rank-sum test, Kaplan–Meier curves, Cox regression, and time-dependent covariates.

Results
Among 167 patients, 116 had UC. Baseline characteristics were similar except for higher INR in UC patients ($p=0.003$) and differences in ABO blood type. UC severity was mild in 61%, moderate in 22%, and severe in 17%. Overall survival was 75%. UC patients had higher rejection incidence (42% vs. 25%, $p=0.039$). Overall survival showed a borderline advantage in UC ($p=0.061$), while rejection-free survival showed a borderline decrease ($p=0.086$). Severe UC was

associated with increased HAT (HR 5.38, $p=0.028$). Tacrolimus use correlated with fewer biliary strictures ($p=0.015$). Higher BMI and MELD were associated with reduced renal-failure-free survival. Baseline creatinine predicted overall survival ($p=0.013$), and elevated CEA correlated with shorter rejection-free survival ($p<0.001$). Post-transplant renal failure strongly predicted mortality (HR 3.12, $p<0.001$). In multivariable analysis, UC showed a borderline survival advantage ($p=0.083$).

Conclusions

PSC patients with UC experienced higher rejection rates, increased HAT in severe UC, and worse outcomes in those with renal dysfunction. Pre-transplant creatinine, BMI, MELD, INR, and CEA were significant predictors. These findings underscore the importance of IBD control, renal protection, surgical optimization, and cancer surveillance in PSC patients undergoing LT.

Keyword(s) : Primary Sclerosing Cholangitis, Ulcerative Colitis, Liver Transplantation, Post-transplant Complications, Acute Rejection

1245 - Combined Application of Serum Alpha Fetoprotein and PIVKA II Levels for Prognostic Stratification in Patients With Hepatocellular Carcinoma

Chien-wei Su ¹, Chun-ting Ho ¹, Chia-jung Ho ¹, Shin-yu Tsai ¹, Yi-hsiang Huang ², Ming-chih Hou ¹, Jaw-ching Wu ³

Taipei Veterans General Hospital, Division Of General Medicine, Department Of Medicine, Taipei-Taiwan ¹ Taipei Veterans General Hospital, Department Of Medical Research, Taipei-Taiwan ² National Yang Ming Chiao Tung University, Institute Of Clinical Medicine, School Of Medicine, Taipei-Taiwan ³

Background / **Hypothesis:**
Protein induced by vitamin K absence or antagonists-II (PIVKA-II) and alpha-fetoprotein (AFP) are widely used biomarkers for the diagnosis and surveillance of hepatocellular carcinoma (HCC). However, their combined prognostic utility has not been fully clarified. This study aimed to evaluate the prognostic performance of combining serum AFP and PIVKA-II to determine the survival of HCC patients.
Materials and **Methods:**
The retrospective study enrolled 598 treatment-naïve HCC patients diagnosed from 2020 to 2023. Patients were categorized based on their serum PIVKA-II (cut-off value 1500 mAU/mL) and AFP (cut-off value 20 ng/mL) levels at diagnosis and stratified into three groups: high AFP and high PIVKA-II, low AFP and low PIVKA-II, and others. Cox proportional hazards models were used to

ORAL ABSTRACTS

identify independent predictors of overall survival (OS). Kaplan–Meier (KM) analyses were performed to compare survival across groups. Results:

Significant differences in tumor characteristics, including tumor stage, size, multiplicity, vascular invasion, and extrahepatic spread, as well as liver functional reserve were observed across the three groups. After a median follow-up of 16.0 months (interquartile range 5.0-22.0), 141 patients had died, with a 3-year OS rate of 63.0%. The 3-year OS rates for the three groups (high AFP & high PIVKA-II, either AFP/PIVKA-II elevated, and low AFP & low PIVKA-II) were 36.5%, 69.3%, and 85.0%, respectively. A multivariate analysis revealed co-existence of elevated serum AFP and PIVKA-II levels, lower serum albumin level, higher serum creatinine level, higher serum alkaline phosphatase levels, larger prothrombin time international normalized ratio (PT INR), presence of vascular invasion, and non-curative treatment as independent risk factors for poor OS. KM analysis confirmed clear prognostic separation between the three biomarker groups ($p < 0.05$) (Figure). Conclusions:

AFP and PIVKA-II are independent predictors of OS in HCC patients, and their combined assessment offers superior prognostic stratification. Integration of both biomarkers can effectively classify patients into distinct risk categories and may guide clinical decision-making and individualized treatment planning.

1250 - Identifying MASLD Patients with MASH or Significant Fibrosis The Role of Lower ALT Thresholds

Jie Liu¹, Hang Yang¹, Jia Li¹
Tianjin Second People's Hospital, Hepatology, Tianjin-
China¹

Background / Hypothesis: Although ALT is a marker for detecting MASH and significant fibrosis in patients with Metabolic Dysfunction-Associated Steatotic Liver Disease (MASLD), some individuals with normal ALT levels still exhibit these histological changes, leading to underdiagnosis. Liver biopsy is often recommended for MASLD patients with elevated ALT, yet its routine use remains limited. This study aimed to determine the prevalence of MASH and significant fibrosis in MASLD patients with normal ALT and to identify predictive factors.

Materials and Methods: In this cross-sectional study, 404 MASLD patients without concurrent viral hepatitis

who underwent liver biopsy at Tianjin Second People's Hospital between October 2012 and July 2024 were included. Liver histology served as the gold standard for assessing inflammation and fibrosis. Patients were categorized using both conventional and lower ALT thresholds. Univariate and multivariate analyses were performed to identify factors associated with MASH and fibrosis in patients with normal ALT.

Results: Among the 404 patients with MASLD, 284 (70.3%) had MASH and 271 (67.1%) had significant fibrosis. Of those with conventionally normal ALT levels ($n=130$), the prevalence of MASH and significant fibrosis was 49.23% and 50.00%, respectively. Using a lower ALT threshold (30 U/L for men, 19 U/L for women), patients above the cutoff had significantly higher rates of significant fibrosis (56.18% vs. 36.59%, $P=0.002$, Table 1), along with elevated ferritin, CAP, and APRI levels ($P < 0.05$). The incidence of MASH also showed a decreasing trend in the lower ALT group (53.93% vs. 39.02%, $P = 0.082$). There was no significant difference in the prevalence of MASH or significant fibrosis between patients aged <50 and ≥ 50 years ($P > 0.05$). Female patients in the higher ALT subgroup had significantly higher rates of both MASH and significant fibrosis. Multivariate analysis confirmed that the lower ALT threshold was an independent predictor of MASH (OR=10.089, $P < 0.001$) and significant fibrosis (OR = 5.718, $P = 0.006$, Table 2).

Conclusions: Current conventional ALT ULNs result in the missed diagnosis of a substantial number of MASLD patients with histologically significant disease. Implementing lower ALT upper limites (30 U/L for men, 19 U/L for women) significantly improves risk stratification and could prevent missed diagnoses of MASH and significant fibrosis.

1252 - Clinical Trajectories of Acute Decompensation in Cirrhosis The First Prospective PREDICT Based Study from India

Dr Kapil Kumar Kumar¹, Dr Ujjwal Sonika Sonika¹, Dr Ajay Kumar Kumar¹, Dr Ashok Dalal Dalal¹, Dr Siddharth Srivastava Srivastava¹, Dr Sanjeev Sachdeva Sachdeva¹
Govind Ballabh Pant Institute Of Postgraduate Medical Education And Research, Gastroenterology, New Delhi-
India¹

Background / Hypothesis: Acute decompensation (AD) of cirrhosis is a heterogeneous clinical state with variable short-term

ORAL ABSTRACTS

outcomes. The PREDICT study identified three phenotypes—Stable Decompensated Cirrhosis (SDC), Unstable Decompensated Cirrhosis (UDC), and pre-Acute-on-Chronic Liver Failure (pre-ACLF)—driven largely by systemic inflammation. This study aimed to evaluate the clinical trajectories of AD based on the PREDICT framework in an Indian cohort and to identify inflammatory and biochemical predictors of progression to ACLF and 6-month mortality.

Materials and Methods: This prospective observational study included 105 consecutive adults with cirrhosis admitted with AD to a tertiary-care center over 12 months. AD was defined by new or worsening ascites, hepatic encephalopathy (HE), gastrointestinal bleeding, or bacterial infection. Patients with ACLF at presentation, immunosuppression, pregnancy, or post-transplant status were excluded. All participants were followed for 90 days to classify outcomes as SDC, UDC, or pre-ACLF, and for 6-month survival. Demographic, clinical, and laboratory parameters—including Hs-CRP, TNF- α , IL-6, and urinary NGAL—were recorded at baseline. Group comparisons were performed using appropriate statistical tests, and variables with $p < 0.1$ on univariate analysis were entered into multivariate logistic regression for prediction of ACLF and mortality. Prognostic accuracy of Hs-CRP was assessed using ROC analysis.

Results:

Of 105 patients (mean age 46.6 ± 10.9 years; 82.9% male), 57 (54.3%) were classified as SDC, 24 (22.9%) as UDC, and 24 (22.9%) as pre-ACLF at 90 days. Pre-ACLF patients had significantly higher prevalence of HE (54%), bacterial infections (46%), SBP (50%), sepsis (38%), renal dysfunction (creatinine 1.47 ± 0.33 mg/dL), and markedly elevated inflammatory markers (Hs-CRP 38.1 ± 14.6 mg/L; TNF- α 157 ± 50 pg/mL; IL-6 126 ± 45 pg/mL; all $p < 0.001$). Thirty-one patients (29.5%) died by 6 months. Non-survivors showed significantly higher baseline inflammation, organ dysfunction, and severity scores (MELD-Na 22.4 ± 5.8 vs 16.6 ± 5.6 , $p < 0.001$). On multivariate analysis, Hs-CRP independently predicted both ACLF (OR 1.057; $p = 0.04$) and 6-month mortality (OR 1.111; $p = 0.03$). Hs-CRP demonstrated excellent prognostic accuracy (AUC 0.92), with an optimal cut-off of 10.8 mg/L (90% sensitivity, 95% specificity).

Conclusions:

In this first Indian prospective validation of the PREDICT

classification, inflammatory phenotype strongly determined clinical trajectory and survival in AD. Pre-ACLF was characterized by severe systemic inflammation and high early mortality. Hs-CRP emerged as a simple, robust, and independent predictor of ACLF and 6-month mortality. Routine CRP assessment may greatly improve early risk stratification in acutely decompensated cirrhosis.

Keyword(s) : Acute decompensation, Acute-on-chronic liver failure, PREDICT classification, Systemic inflammation, Hs-CRP, Prognosis, Mortality

1257 - Si Ni San a traditional Chinese herbal formula ameliorates cholestatic liver injury by targeting the calcium sensing receptor (CaSR) MAPK pathway
Yu Huang¹, Yunfan Liu², Xi Wang¹
Hebei University Of Chinese Medicine, Institute Of Traditional Chinese Medicine, Shijiazhuang-China¹
Hebei University Of Chinese Medicine, College Of Pharmacy, Shijiazhuang-China²

Background / Hypothesis: Cholestatic liver injury (CLI) is a common hepatic disorder characterized by bile acid accumulation, leading to hepatocyte damage and inflammation. Si-Ni-San (SNS), a traditional Chinese medicine formula, has shown potential in CLI treatment, yet its molecular mechanisms remain unclear. This study aimed to explore the protective effects and mechanisms of SNS in CLI.

Materials and Methods: The primary active components of SNS were identified using high-performance liquid chromatography (HPLC). A network pharmacology approach was used to predict the protective mechanisms of SNS against CLI. In vivo and in vitro experiments were performed to verify the network pharmacology findings. Molecular docking was used to explore the interactions between the active compounds of SNS and the calcium-sensing receptor (CaSR).

Results:

HPLC identified 4 main active components of SNS, and the network pharmacology predicted that SNS exerts its therapeutic effects on CLI by modulating the calcium and MAPK signaling pathways. The result of animal experiments revealed that SNS significantly alleviated hepatocellular injury, reduced inflammatory infiltration, restored bile acid homeostasis. Additionally, SNS inhibited CaSR expression and lowered Ca^{2+} concentrations, leading to the downregulation of p-p38

ORAL ABSTRACTS

MAPK and p-JNK in both in vivo and in vitro models. Molecular docking further revealed strong binding affinities between SNS active ingredients and CaSR, supporting its role in regulating the CaSR/MAPK pathway in CLI treatment.

Conclusions:

SNS alleviated CLI by regulating bile acid homeostasis, reducing inflammatory infiltration, and lowering Ca^{2+} concentrations, likely through inhibition of the CaSR/MAPK pathway.

1263 - The Paradox of Size A Non Linear Relationship Between Liver Size and Fibrosis Stage in Acute Autoimmune Hepatitis

Yusuf Bünyamin Ketenci ¹, Hakan Demiröz ¹, Mehmet Akca ¹, Ufuk Avcioğlu ¹, Ibrahim Gören ¹, Müge Ustaoglu Dede ¹, Talat Ayyildiz ¹, Ahmet Bektaş ¹
Ondokuz Mayıs University, Gastroenterology, Samsun-Türkiye ¹

Background/Hypothesis: No conventional radiological characteristic for fibrosis is defined for autoimmune hepatitis (AIH). In acute hepatitis, hepatomegaly is often attributed to inflammation. Conversely, advanced fibrosis is associated with splenomegaly. This study aimed to investigate the correlation between liver size and histological fibrosis stage in patients presenting with acute AIH.

Material and Methods In this single-center retrospective study (2015-2025), 63 patients with acute AIH (IAIHG criteria) were included. Other liver disease etiologies were excluded. CT or MRI measured liver size. Data included labs and liver biopsy results (Modified Ishak staging). The relationship between liver size and fibrosis stage was analyzed using the Kruskal-Wallis test and ordinal logistic regression. Patients were categorized as non-fibrotic (Stage 0-2) and advanced fibrosis (Stage 3-4) and compared using non-invasive scores (APRI, FIB-4) and portal hypertension indicators. Results: Of 63 patients (77.8% female, with a mean age of 42.98), 30.1% (n = 19) had advanced fibrosis (Stage 3-4) at diagnosis. A significant relationship was found between liver size and the stage of fibrosis ($p < 0.05$). Median liver size exhibited a non-linear pattern, increasing from Stage 0 (150 mm) to Stage 3 (180.5 mm) and then decreasing at Stage 4 (148.5 mm). In multivariate logistic regression (adjusting for age, sex, and diabetes), liver size was the only independent variable associated with fibrosis stage ($p = 0.013$). When

comparing non-fibrotic (S0-2) vs. advanced fibrosis (S3-4) groups, standard non-invasive scores (APRI, FIB-4) and portal hypertension indicators (e.g., spleen size) showed no significant difference (all $p > 0.05$). However, liver size was significantly larger in the advanced fibrosis group (median 180 mm vs 157 mm, $p < 0.05$). Conclusion: Standard non-invasive scores (APRI, FIB-4) and portal hypertension signs fail to predict advanced fibrosis in acute AIH, likely due to the inflammatory nature of the disease. Our study demonstrates a novel, non-linear relationship: liver size increases with fibrosis up to Stage 3, then decreases at Stage 4 (cirrhosis) due to fibrotic retraction. This suggests hepatomegaly may be a radiological indicator of progressive fibrosis (especially Stage 3), not just inflammation. Liver size is a simple, accessible, non-invasive marker that may aid in estimating fibrosis when a biopsy is not feasible.

1265 - Risk factors for advanced liver fibrosis in psoriasis patients with metabolic dysfunction associated steatotic liver disease (MASLD)

Chen-te Huang ¹, Che-chia Hsu ², Tsen-fang Tsai ², Chun-jen Liu ³

National Taiwan University Biomedical Park Hospital, Internal Medicine, Hsinchu County-Taiwan ¹ National Taiwan University Hospital, Dermatology, Taipei City-Taiwan ² National Taiwan University Hospital, Internal Medicine, Taipei City-Taiwan ³

Background:

Psoriasis is a risk factor for steatotic liver disease (SLD), and the prevalence of SLD among psoriasis patients is high. Most previous studies have been retrospective. We aim to identify clinical risk factors for predicting advanced liver fibrosis in patients with psoriasis and metabolic dysfunction-associated steatotic liver disease (MASLD) in a prospective Asian cohort.

Materials and Methods:

Adult psoriasis patients at National Taiwan University Hospital (NTUH) were screened for SLD using FibroScan®. Patients with controlled attenuation parameter (CAP) ≥ 248 dB/m were prospectively recruited. Advanced fibrosis was defined as liver stiffness measurement (LSM) >8 kPa. Patients with excessive alcohol consumption were excluded. A questionnaire was administered to collect past medical history, alcohol consumption, smoking, and exercise habits. Laboratory tests for metabolic dysfunction were performed. Psoriasis-related history was collected from the electronic medical record system at NTUH. Clinical

ORAL ABSTRACTS

risk factors for advanced fibrosis were investigated and the performance of established non-invasive scores for predicting advanced fibrosis (FIB-4, APRI, and SAFE) was also examined.

Results:

From April to October 2025, a cohort of 109 patients was prospectively recruited, all of whom met the criteria for MASLD. The prevalence of advanced fibrosis was 28%. The cohort had a high burden of metabolic risk factors, including obesity (71%), prediabetes or diabetes (79%), and dyslipidemia (78%). Twelve patients (11%) had chronic hepatitis B virus (HBV) infection. Univariable analysis identified body mass index (BMI) (odds ratio [OR]: 1.15 per unit [kg/m²] increase, 95% confidence interval [CI]: 1.04-1.28), waist circumference (OR: 1.06 per cm increase, 95% CI: 1.02-1.10), high waist-to-height ratio (WHtR ≥ 0.6) (OR: 5.67, 95% CI: 2.17-14.82), and high insulin resistance (homeostatic model assessment for insulin resistance [HOMA-IR] > 2.9) (OR: 2.67, 95% CI: 1.12-6.38) as significant risk factors for advanced fibrosis. Psoriasis severity and disease duration were not associated with advanced fibrosis. Multivariable analysis identified WHtR ≥ 0.6 (OR: 5.50, 95% CI: 1.95-15.54), chronic HBV infection (OR: 5.58, 95% CI: 1.29-24.20), and cumulative methotrexate dose > 1500 mg (OR: 3.41, 95% CI: 1.22-9.55) as independent risk factors for advanced fibrosis. FIB-4 performed poorly (area under the receiver operating characteristic curve [AUROC]: 0.594), while the SAFE score (cutoff < 0) was effective for ruling out advanced fibrosis (negative predictive value [NPV]: 90%).

Conclusions:

In this cohort of patients with concurrent psoriasis and MASLD, an elevated waist-to-height ratio (≥ 0.6), chronic HBV infection, and a cumulative methotrexate dose > 1500 mg were independent risk factors for advanced fibrosis.

Keyword(s) : MASLD, Advanced fibrosis, Psoriasis, Waist-to-height ratio, HBV, Methotrexate

1266 - The quality and reliability of short videos about liver cirrhosis on Bilibili and TikTok Cross sectional study

Liwei Zeng¹, Yu Huang¹, Huanwei Zheng²
Hebei University Of Chinese Medicine, Graduate School, Shijiazhuang-China¹ The Fifth Hospital Of Shijiazhuang City, The Fifth Hospital Of Shijiazhuang City, Shijiazhuang-China²

Background / Hypothesis: Cirrhosis is a major global public health burden, with a high prevalence in China.

Short video platforms such as TikTok and Bilibili have become key channels for disseminating cirrhosis-related health information, but concerns remain regarding the quality and reliability of such content. Materials and Methods: A cross-sectional study was conducted. Using "cirrhosis" as the keyword, 157 eligible videos (74 from TikTok, 83 from Bilibili) were selected. Video quality and reliability were assessed using the Global Quality Score (GQS), modified DISCERN (mDISCERN), and JAMA scoring tools. Demographic characteristics, content categories, and user engagement metrics were analyzed with nonparametric tests and correlation analysis. Results: The median GQS, mDISCERN, and JAMA scores were 3 (IQR 3-4), 2 (IQR 2-2), and 3 (IQR 3-3), respectively. TikTok videos had higher user engagement (median likes: 1987 vs. 51) but shorter duration (57s vs. 328s) and lower GQS (3 vs. 4) than Bilibili. Videos by hepatologists and other specialists showed significantly higher quality scores than those by TCM practitioners and non-professionals. No significant correlation was found between user engagement and video quality. Conclusions: Cirrhosis-related short videos on TikTok and Bilibili have suboptimal scientific quality. Bilibili provides more in-depth content, while TikTok has higher popularity. Professional background of uploaders is a key determinant of content quality. Platforms should strengthen qualification review and content supervision to improve health information equity.

1272 - Comparing two intervention strategies to improve hepatitis B virus deoxyribonucleic acid testing rate among hepatitis B surface antigen positive hospitalized patients

Qinzhi Deng¹, Sheng Luo², Jieqiong Chen², Nan Ye², Qi Zhao³

Ningbo No.2 Hospital, Ward 1, hepatology, Ningbo-China¹ Wenzhou Medical University, Graduate School Of Wenzhou Medical University, Ningbo-China² Ningbo Haichu Third Hospital, Internal Medicine Ward, Ningbo-China³

Background / Hypothesis: Hepatitis B surface antigen (HBsAg) screening is fundamental for chronic hepatitis B management, while hepatitis B virus deoxyribonucleic acid (HBV-DNA) testing is crucial for determining the viral replication status and initiating antiviral therapy. However, the HBV-DNA testing rate among inpatients is generally low. This study aimed to analyze the HBsAg positivity

ORAL ABSTRACTS

rate and HBV-DNA testing among inpatients at Ningbo Second Hospital and to evaluate the effectiveness of two intervention measures—publishing departmental rankings on the hospital intranet and conducting on-site educational sessions in departments—in improving the HBV-DNA testing rate.

Materials and Methods:1. Retrospectively collect data from inpatients between August 2024 and November 2025 and calculate the monthly HBsAg positivity rate and HBV-DNA testing rate.2. Starting from November 2024, departmental HBV-DNA testing rate rankings were published monthly on the hospital intranet. Changes in the testing rate over the subsequent 5 months (December 2024 to April 2025) were evaluated.3. Starting from May 2025, on-site educational sessions emphasizing the clinical significance of HBV-DNA testing were conducted in the 10 departments with the lowest testing rates. Changes in the testing rate over the following 6 months (May to October 2025) were evaluated. A t-test was used to compare testing rates before and after the interventions, with a P-value < 0.05 considered statistically significant.

Results:1. During the baseline period (August–November 2024), a total of 40,255 inpatients were included. The HBsAg positivity rate was 7.8%(3,139/40,255), and the mean HBV-DNA testing rate was 28.4%.2. During the period of intranet ranking publication (December 2024–April 2025), a total of 48,176 inpatients were included. The HBsAg positivity rate was 7.3% (3,506/48,176), and the mean HBV-DNA testing rate was 28.4%, showing no significant change compared to the baseline (P = 0.94).3. During the period of on-site educational sessions (May–October 2025), a total of 61,512 inpatients were included. The HBsAg positivity rate was 7.4% (4,531/61,512), and the HBV-DNA testing rate increased to 32.6%, showing a significant improvement compared to the previous period (P < 0.05).

Conclusions: Publishing testing rate rankings on the intranet alone did not effectively improve the HBV-DNA testing rate. However, targeted on-site educational sessions in departments significantly increased the HBV-DNA testing rate. Proactive, face-to-face medical education holds important practical value in enhancing HBV-DNA testing among inpatients.

Background / Hypothesis:The combination of sofosbuvir/velpatasvir/voxilaprevir (SOF/VEL/VOX) is recommended as a salvage therapy for treatment-experienced chronic hepatitis C (CHC) patients. However, it is used in our country for treatment-naïve and treatment-experienced patients. This study aims to present real-world data from Türkiye on CHC patients treated with SOF/VEL/VOX. The present study was conducted by the Viral Hepatitis Study Group of the Turkish Society of Clinical Microbiology and Infectious Diseases (KLİMİK).

ORAL ABSTRACTS

Materials and Methods: It was a multicenter, retrospective, observational study. The data were collected from patients receiving SOF/VEL/VOX therapy at 12 medical centers in Türkiye between 1 June 2022 and 31 December 2024. The patients had received the treatment for 8 to 12 weeks.

Results: Of the 139 patients enrolled, 63.3% (n = 88) were male, with a mean age of 54.4 years. Most patients were non-cirrhotic (94.2%, n = 131) and treatment-naïve (92%, n = 128); 49.6% (n = 69) were infected with genotype 1b. Early virologic response (EVR) could be assessed in 126 patients, with an EVR rate of 82.5% (n = 104). End-of-treatment data were available for 113 patients, all achieving an end-of-treatment response. Among the 80 patients for whom week-12 post-treatment data were available, 97.5% sustained virologic response at week 12 (SVR12). Significant improvements were observed in AST, ALT, and platelet levels, along with reductions in APRI and FIB-4 scores (p = 0.001). No serious adverse events leading to treatment discontinuation were reported. Mild adverse events included pruritus (2.1%, n = 3), fatigue (2.1%, n = 3), and nausea (1.4%, n = 2).

Conclusions: The SOF/VEL/VOX combination is a highly effective and well-tolerated treatment option in treatment-naïve CHC patients, achieving an SVR12 rate of 97.5%.

Keyword(s) : sofosbuvir/velpatasvir/voxilaprevir, hepatitis C treatment, real-world data, Türkiye

1278 - Small lesion oriented early hepatocellular carcinoma segmentation via a hybrid attention deformable U-Net

Mucong Yu¹, Jing Liang²
The Third Central Clinical College Of Tianjin Medical University, Tianjin Medical University, Tianjin-China¹,
Tianjin Medical University And Tianjin Third Central Hospital, Tianjin-China²

Background : / **Hypothesis:**
Early detection of hepatocellular carcinoma (HCC) on contrast enhanced CT is hindered by tiny, low contrast lesions, motion/phase artifacts, and cross scanner variability. We hypothesized that coupling 2.5D hybrid attention with a boundary aware deformable decoder would enhance small lesion recall and boundary fidelity without prohibitive computation.

Materials and Methods:
We developed a Hybrid Attention Deformable U-Net comprising a 2.5D encoder that interleaves depthwise separable convolutions with windowed self-attention (shifted tilings) and cross scale gated fusion, and a decoder with modulated deformable convolutions plus an auxiliary contour head trained on signed-distance targets. A composite objective (Focal-Tversky, boundary-IoU, Soft-Dice) with online hard example mining and motion/phase-aware augmentation (synthetic respiratory blur, slice misregistration) was used. The Liver Tumor Segmentation (LiTS) dataset (n=131) was standardized with liver ROI extraction; five-fold, patient disjoint cross validation was performed. Inference used sliding window with overlap and test time augmentation.

Results:

Across folds, the method achieved Dice $78.6 \pm 1.5\%$, HD95 11.2 ± 2.1 mm, and thin band boundary IoU $61.0 \pm 1.5\%$, with lesion wise sensitivity $75.9 \pm 2.3\%$ and small lesion (<10 mm) sensitivity $56.3 \pm 3.0\%$. It consistently outperformed five strong 2D/3D and hybrid baselines under an identical pipeline. Under motion/phase perturbations, Dice decreased by only 1.4 points (vs. 2.9 – 4.5 for comparators), indicating improved robustness; the model uses 12.9M parameters with ≈ 2.3 s/volume single GPU inference.

Conclusions:

The approach improved early HCC segmentation on contrast enhanced CT, particularly for sub-centimeter and subcapsular lesions, while maintaining practical efficiency. Multi-center, multi-phase validation and semi- or weakly supervised learning with domain adaptation will be pursued.

Background / Hypothesis:Accumulating clinical evidence has shown that adjuvant PD-1 inhibitor therapy confers prognostic benefits in hepatocellular carcinoma (HCC) patients at high risk of recurrence after curative hepatectomy. However, the necessity of combining with molecular targeted agents remains controversial. This study aims to evaluate the efficacy of tislelizumab (a PD-1 inhibitor) plus lenvatinib (a molecular targeted drug) versus tislelizumab monotherapy in this patient cohort.

Materials and Methods:This is a prospective multicenter cohort study. HCC patients who underwent curative resection and had at least one high-risk factor for recurrence were screened and recruited from 13 centers in China between January 16, 2019, and December 26, 2024. All enrolled patients were assigned to receive adjuvant tislelizumab (200 mg) monotherapy or tislelizumab plus lenvatinib. The primary endpoint was recurrence-free survival (RFS), with secondary endpoints including overall survival (OS) and safety.

Results:A total of 167 patients were enrolled, with 91 (54.5%) receiving adjuvant tislelizumab plus lenvatinib and 76 (45.5%) receiving adjuvant tislelizumab monotherapy. During follow-up, the median RFS was 26.4 months (95% CI: 18.6–34.1) in the tislelizumab monotherapy group versus 22.4 months (95% CI: 17.0–27.8) in the tislelizumab plus lenvatinib group, with no statistically significant difference observed (HR: 0.81; 95% CI: 0.53–1.24), and this trend persisted after propensity score matching. Median OS was not reached in either cohort, and there was no significant difference between the adjuvant tislelizumab monotherapy and tislelizumab plus lenvatinib groups, both prior to (HR: 0.95; 95% CI: 0.43–2.07) and following propensity score matching. The rate of grade 3 or 4 adverse events was significantly higher with tislelizumab plus lenvatinib, particularly for hand-foot syndrome, rash, and hypertension.

Conclusions:The addition of lenvatinib did not significantly improve the prognosis of patients receiving adjuvant PD-1 inhibitor therapy. Further large-scale randomized controlled trials are required to evaluate the potential of adjuvant combination therapy.

1281 - Short Term Gains Long Term Challenges A Pilot Randomized Controlled Trial for Time Restricted Feeding Versus Caloric Restriction in MASLD

Katelyn Chiu ¹, Sophia Lin ¹, Mastura Salim ², Lei Pheng Yeo ², Jazleen Leo ², Melissa Tay ³, Siew Min Ang ³, Yuh Ling Amy Tay ², Eunice Xiang Xuan Tan ¹, Mark Dhinesh Muthiah ¹, Seng Gee Lim ¹, Bee Choo Tai ⁴, Su Lin Lim ³, Dan Yock Young ¹, Jonathan Wei Jie Lee ¹ National University Hospital, Division Of Gastroenterology & Hepatology, Singapore-Singapore ¹ Yong Loo Lin School Of Medicine, National University Of Singapore, Department Of Medicine, Singapore-Singapore ² National University Hospital, Department Of Dietetics, Singapore-Singapore ³ National University Of Singapore, Saw Swee Hock School Of Public Health, Singapore-Singapore ⁴

Background:

Weight loss remains the cornerstone therapy for Metabolic dysfunction associated steatotic liver disease (MASLD), for which caloric restriction (CR) is an established strategy. Recently, time restricted feeding

ORAL ABSTRACTS

(TRF) which aligns food intake with circadian rhythms have shown promise in improving metabolic outcomes. However, comparative data on adherence and weight loss between conventional CR and TRF in MASLD remain limited.

Methods:

We conducted a single-centre pilot randomized controlled trial comparing TRF with conventional CR in adults with significant MASLD fibrosis ($\geq 7\text{kPa}$). Forty participants were randomized 1:1 to either daily CR (control) or TRF with an 8-hour feeding window (8:00–16:00) while maintaining equivalent caloric restriction. Dietary adherence was tracked through digital food logs and structured nutritional reviews. Compliance was defined as $\geq 70\%$ adherence to the prescribed caloric intake (and TRF window for the intervention group). Participants were followed up to 12 months with serial anthropometric and clinical chemistry measurements.

Results:

Forty participants (mean age 48.2 ± 12.2 years; 67.5% male, 72.5% Chinese) were enrolled. Baseline metabolic and anthropometric parameters were similar between the two arms (BMI 31.2 vs 30.7 kg/m², $p = 0.77$; waist circumference 104.6 vs 102.3 cm, $p = 0.59$, CAP 315.7 vs 311.2 dB/m, $p = 0.68$, HbA1c 6.2% vs 6.1% , $p = 0.77$). Comorbidities were balanced (diabetes 30%, hypertension 50%, dyslipidaemia 67.5%).

TRF participants achieved greater weight loss than control from Month 1 through Month 6 ($p < 0.01$), with a mean percentage loss at 6 months of $-7.7 \pm 5.0\%$ versus $-2.0 \pm 4.9\%$ ($p = 0.01$). The difference attenuated at 12 months ($-3.8 \pm 4.4\%$ vs $-1.6 \pm 5.3\%$, $p = 0.19$), reflecting partial weight gain after the intervention period. Early caloric adherence was comparable between the groups but declined in the TRF arm after 3 months. In the multivariable analysis, TRF independently predicted greater weight loss ($p < 0.01$). Higher caloric adherence correlated with incremental weight reduction (-5% adherence for each 10% weight increase, $p < 0.01$) though the relationship differed by the intervention arm (interaction $p < 0.01$).

Conclusion:

TRF led to significantly short-term weight loss compared with standard caloric restriction, and was feasible among adults with significant MASLD. However, adherence waned over time, enforcing that sustained behaviour support is essential to maintain long-term benefits.

1283 - Diagnostic Performance of Non Invasive Serum Biomarkers for Fibrosis in Hepatocellular Carcinoma Patients With Metabolic Dysfunction-Associated Steatotic Liver Disease

Chun-ting Ho¹, Chia-jung Ho², Shin-yu Tsai², Chien-an Liu³, Yi-hsiang Huang⁴, Ming-chih Hou⁵, Jaw-ching Wu⁶, Chien-wei Su²

Taipei Veterans General Hospital/national Yang Ming Chiao Tung University, Division Of General Medicine/ph.d. Program Of Interdisciplinary Medicine, Taipei-Taiwan¹ Taipei Veterans General Hospital, Division Of General Medicine, Taipei-Taiwan² Taipei Veterans General Hospital, Department Of Radiology, Taipei-Taiwan³ Taipei Veterans General Hospital, Department Of Medical Research, Taipei-Taiwan⁴ Taipei Veterans General Hospital, Division Of Gastroenterology And Hepatology, Taipei-Taiwan⁵ National Yang Ming Chiao Tung University, Institute Of Clinical Medicine, Taipei-Taiwan⁶

Background

Non-invasive serum biomarkers (NISB), such as the Fibrosis-4 (FIB-4) and aspartate aminotransferase-to-platelet ratio index (APRI), are widely used to estimate liver fibrosis and cirrhosis. However, recent studies indicate that their diagnostic performance may be altered in patients with hepatocellular carcinoma (HCC), particularly those with metabolic dysfunction-associated steatotic liver disease (MASLD). This study aimed to evaluate the correlation between various NISBs and histological fibrosis severity and to compare their accuracy in predicting advanced fibrosis in HCC patients with concurrent MASLD.

Materials

A total of 469 HCC patients who underwent curative resection at Taipei Veterans General Hospital and had available pathology slides and complete clinical datasets were included in the study. Spearman correlation coefficients were used to assess associations between ISHAK fibrosis scores and five NISBs: FIB-4, APRI, non-alcoholic fatty liver disease fibrosis score (NFS), BMI-AST/ALT ratio-diabetes mellitus (BARD) score, and AST/ALT ratio (AAR). Diagnostic performance for predicting advanced fibrosis (ISHAK ≥ 4) was evaluated using receiver operating characteristic (ROC) analyses and compared across biomarkers. Subgroup analyses were conducted for viral versus non-viral etiologies. Optimal single cutoffs were determined using Youden's

Methods:

ORAL ABSTRACTS

index; rule-out and rule-in thresholds corresponded to values with sensitivity >90% and specificity >80%, respectively.

Results:

Among the cohort, 252 patients (53.7%) had advanced fibrosis. Compared with those without advanced fibrosis, these patients exhibited more aggressive tumor features, including larger tumor size, more multifocal disease, and higher prevalence of vascular invasion and extrahepatic spread, while liver functional reserve remained comparable. Among the NISBs, FIB-4 and APRI demonstrated the strongest correlation with ISHAK fibrosis stage. FIB-4 showed marginally superior discriminatory ability for advanced fibrosis (AUROC 0.735; 95% CI 0.690–0.779; $p < 0.001$), similar to APRI (AUROC 0.731; 95% CI 0.686–0.776; $p < 0.001$). The optimal single cutoff of FIB-4 was 2.39, with rule-out and rule-in thresholds of 1.31 and 2.45, respectively. Subgroup analyses showed consistent performance of NISBs and similar cutoff values across viral and non-viral etiologies.

Conclusions:

In HCC patients with concurrent MASLD, NISBs such as FIB-4 and APRI demonstrated modest correlation with histological fibrosis and comparable diagnostic accuracy across different etiologies. The FIB-4 rule-out threshold of 1.3 aligned with current guideline recommendations, while the rule-in threshold identified in this cohort was slightly lower than those reported in earlier development studies.

Science, Kyoto Prefectural University Of Medicine, Molecular Gastroenterology And Hepatology, Kyoto-Japan⁶ Department Of Internal Medicine Ii, Hamamatsu University School Of Medicine, Hepatology Division, Shizuoka-Japan⁷ Okayama University, Department Of Gastroenterology And Hepatology, Okayama-Japan⁸

Background

The prevalence of metabolic dysfunction–associated steatotic liver disease (MASLD) is rapidly increasing worldwide, yet choice of pharmacologic therapy is limited. Pemafibrate is a novel selective PPAR α modulator (SPPARM α) with greater activity and selectivity than conventional PPAR α agonists. Previous studies have shown improvements in alanine aminotransferase (ALT) without increasing serum creatinine. We aimed to evaluate the efficacy and safety of pemafibrate in patients with MASLD.

Materials

This multicenter, open-label, randomized controlled trial enrolled MASLD patients aged 20–80 years who met inclusion criteria. Participants were randomly assigned to receive pemafibrate 0.4 mg/day (PEM-H), pemafibrate 0.2 mg/day (PEM-L), or fenofibrate (FENO) for 48 weeks. The primary endpoint was the change in ALT after 24 weeks. Secondary endpoints included changes in fibrosis markers and, in selected centers, liver stiffness assessed by magnetic resonance elastography (MRE) at week 48.

Results:

Among 360 enrolled patients, 356 were analyzed. Mean ALT changes at week 24 were -24.0 ± 23.0 U/L (PEM-H), -14.8 ± 27.6 U/L (PEM-L), and -4.2 ± 35.9 U/L (FENO), showing significantly greater reductions with pemafibrate compared with fenofibrate. Percent changes in Mac-2 binding protein glycosylation isomer (M2BPGi) at week 48 were $-21.0 \pm 23.0\%$ (PEM-H), $-17.8 \pm 25.6\%$ (PEM-L), and $-3.2 \pm 27.3\%$ (FENO), respectively ($p < 0.05$ vs FENO). Liver stiffness by MRE decreased by $-9.2 \pm 14.0\%$ (PEM-H), $-8.4 \pm 9.9\%$ (PEM-L), and $-3.6 \pm 21.4\%$ (FENO), respectively ($p < 0.05$ vs. FENO). Percent changes in eGFR was $-3.7 \pm 10.0\%$ (PEM-H), $-0.8 \pm 10.3\%$ (PEM-L), and $-10.1 \pm 10.2\%$ (FENO), indicating less renal function decline with pemafibrate. Treatment-related adverse events occurred in 8 patients (PEM-H), 8 patients (PEM-L), and 18 patients (FENO), respectively; 15 cases involved myalgia or rhabdomyolysis. Liver or biliary disorders occurred only in the FENO group ($n = 5$).

Conclusions:

ORAL ABSTRACTS

Pemafibrate 0.4 mg/day and 0.2 mg/day significantly reduced ALT and improved both fibrosis markers and liver stiffness compared with fenofibrate, with superior renal safety and tolerability. These findings demonstrate that pemafibrate exerts antifibrotic effects and represents an effective and well-tolerated therapeutic option for MASLD.

1286 - Clinical characteristics of diabetic patients with limited improvement in elevated ALT following tirzepatide initiation

Akio Moriya¹, Shoko Tobe², Yasunari Yoshida³, Teruya Nagahara¹, Yoshiaki Iwasaki⁴
Mitoyo General Hospital, Department Of Gastroenterology, Kanonji-Japan¹ Mitoyo General Hospital, Department Of Internal Medicine, Kanonji-Japan² Mitoyo General Hospital, Department Of Metabolism, Kanonji-Japan³ Okayama University, Health Service Center, Okayama-Japan⁴

Background / **Hypothesis:**
Tirzepatide acts on both GIP and GLP-1 receptors and improves glucose metabolism, and is therefore expected to reduce elevated ALT levels in diabetic patients with steatotic liver disease. However, some patients do not show such improvement. This study aimed to identify the clinical characteristics of diabetic patients in whom ALT reduction was not achieved after tirzepatide administration.

Materials and Methods:
Among 100 diabetic patients treated with tirzepatide for at least 12 weeks at our institution, 51 patients with baseline ALT >30 U/L were analyzed. Cases were defined as "effective" if ALT decreased to <30 U/L or showed a ≥30% reduction from baseline, and "ineffective" otherwise. Clinical factors associated with ineffectiveness were retrospectively examined.

Results:

Of the 51 patients (35 men and 16 women; median age 52 years), 21 were classified as effective and 30 as ineffective. Univariate logistic regression analysis revealed significant associations between ineffectiveness and lower platelet count (odds ratio [OR] 1.117 per 10,000/ μ L decrease; $P=0.0379$), lower serum albumin (OR 21.41 per 1 g/dL decrease; $P=0.0464$), and prior use of GLP-1 receptor agonists (OR 4.400; $P=0.0285$). Switching from GLP-1RA/insulin combination therapy was not significant ($P=0.7176$). Multivariate analysis identified serum albumin and prior GLP-1RA use as independent predictors. ROC analysis of

albumin levels ($n=27$, excluding 24 cases with missing data) yielded a cutoff of 4.3 g/dL (AUC=0.750). Patients with albumin ≥ 4.3 g/dL and no prior GLP-1RA monotherapy ($n=7$) had an odds of ineffectiveness of 0.167, compared to 4.0 in other cases ($n=20$), with an OR of 24.0 ($P=0.0019$).

Conclusions:

ALT reduction with tirzepatide therapy may be less likely in patients previously treated with GLP-1 receptor agonists or those with baseline serum albumin levels below 4.3 g/dL.

Keyword(s) : GIP, GLP-1 receptor agonists, albumin

1289 - Computed tomography based hepatosplenic volumetry can predict all cause and liver related mortality in patients with cirrhosis

Baishen Wang¹, Chengwu Hong¹, Chao Sun², Shuo Yang³, Yuhan Dong¹, Rui Huang⁴
Peking University Health Science Center, Peking University People's Hospital, School Of Basic Medical Sciences, Beijing-China¹ Peking University People's Hospital, Department Of Radiology, The Informatics Division, Beijing-China² Peking University People's Hospital, Department Of Radiology, Beijing-China³ Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China⁴

Backgrounds: Although traditional noninvasive prognostic models for cirrhosis are widely used, their predictive performance remains limited. Previous studies have identified computed tomography (CT)-based hepatosplenic volumetry as a predictor of portal hypertension, decompensation of cirrhosis, and liver fibrosis staging. This study aimed to evaluate the prognostic value of CT-based hepatosplenic volumetry in predicting mortality among cirrhotic patients. **Materials and Methods:** This retrospective study included adult patients diagnosed with cirrhosis at our hospital from 2008 to 2022. All patients underwent portal-venous or equilibrium-phase CT imaging. Total liver volume (TLV), spleen volume (SV), and liver to spleen volume ratio (LSVR) were obtained. The primary endpoint was all-cause mortality, and secondary endpoint was liver-related mortality, which was subcategorized into infectious, portal hypertensive, oncologic, and other hepatic causes. Univariable and multivariable logistic regression analyses were performed to identify predictors of mortality, and Kaplan-Meier survival curves were constructed to compare survivals between patients stratified by the median LSVR value.

Results: 525 cirrhotic patients were enrolled, with a

ORAL ABSTRACTS

mean follow-up of 4.74 ± 2.22 years. The primary etiologies of cirrhosis were viral (50.3%) and alcoholic (32.0%). 361 (68.8%) patients had decompensated cirrhosis. 182 (34.67%) patients died during the follow-up period (Table 1). The univariate analysis identified age, MELD score, LSVR, and TLV/SV as predictors of all-cause mortality. The multivariate analysis pinpointed age (OR =1.041; 95% CI: 1.022-1.060; P=0.000), MELD (OR =1.058; 95% CI: 1.022-1.095; P=0.001), LSVR (OR =3.091; 95% CI: 1.265-7.555; P=3.091) and TLV/SV (OR =0.863; 95% CI:0.770-0.969; P=0.012) as independent predictors for all-cause mortality (Table 2). Age, MELD score, LSVR, and TLV/SV were associated with liver-related death in the univariate analysis. The multivariable analysis indicated that age (OR =1.025; 95% CI: 1.008-1.043; P=0.004), MELD score (OR =1.053; 95% CI: 1.018-1.090; P=0.003) and LSVR (OR =2.377; 95% CI: 1.012-5.581; P=0.047) were independent predictors for liver-related mortality (Table 3). Kaplan-Meier survival curves demonstrated significant differences in both overall survival (Figure 1) and liver-related survival (Figure 2) between high and low LSVR groups (Log-rank test, P<0.05). Subgroup analyses revealed that LSVR (OR =4.815; 95% CI, 1.140-20.332; P=0.032) were independent predictors for infection-related mortality. LSVR (OR =5.461; 95% CI, 1.809-16.488; P=0.003) and TLV/SV (OR =0.739; 95% CI, 0.571-0.956; P=0.020) were independent predictors of oncology-related mortality. Conclusions: LSVR can independently predict both all-cause and liver-related mortality in cirrhotic patients, supporting its potential role as a complementary prognostic tool for risk stratification and clinical decision-making in the health care of cirrhosis.

Keyword(s) : liver to spleen volume ratio (LSVR), total liver volume (TLV), spleen volume (SV), computed tomography, cirrhosis, all-cause mortality, liver-related mortality

1305 - Fenofibrate and ursodeoxycholic acid in treatment naïve primary biliary cholangitis a pilot randomized trial with integrated multi omics analysis

Yansheng Liu¹, Yulong Shang¹, Ying Han¹
Xijing Hospital, Hepatology, Xi'an-China¹

Background / Hypothesis: Primary biliary cholangitis (PBC), a chronic autoimmune liver disease, involves the destruction of interlobular bile ducts, resulting in cholestasis and liver fibrosis. Currently, ursodeoxycholic acid (UDCA) is the sole first-line therapy for PBC, and refractory patients can be treated with a supplementary fenofibrate therapy.

However, it remains unclear whether fenofibrate monotherapy can directly improve the biochemical indicators of patients with PBC. This study conducted a preliminary investigation of the efficacy and safety of fenofibrate monotherapy in treatment-naïve patients with PBC and analyzed the metabolic changes and potential mechanisms associated with different treatments.

Materials and Methods: Thirty treatment-naïve PBC patients were enrolled in a 6-month, randomized, parallel-controlled, open-label pilot trial and randomly assigned in a 1:1 ratio to two groups: (1) UDCA (13–15 mg/kg/d) and (2) fenofibrate (once daily, 200 mg) monotherapy. The primary endpoint was the normalization rate of alkaline phosphatase (ALP). The secondary endpoints were changes in pruritus severity, liver stiffness, and prognostic scores. Adverse events during the treatment period were also recorded. Plasma samples collected from patients at baseline, 1, and 6 months post-treatment and from 16 healthy controls underwent multi-omics analysis, including the Olink Reveal assay, bile acid quantification, and untargeted metabolomics.

Results:

After 6 months of treatment, 86.7% patients in the fenofibrate group achieved a normal ALP level compared to only 28.6% patients in the UDCA group (P < 0.001). The two groups showed no significant differences in pruritus severity, liver stiffness, or prognostic scores. Adverse events were detected in 73.3% and 80% of patients in the fenofibrate and UDCA groups, respectively, with no occurrence of severe adverse events. Fenofibrate treatment significantly increased the plasma FGF21 level. Moreover, UDCA treatment increased the levels of 7 bile acid (BA) components, whereas fenofibrate exhibited a minimal effect on BA. Additionally, fenofibrate and UDCA altered the levels of 71 and 62 lipid components, respectively.

Conclusions:

Fenofibrate substantially increased the ALP normalization rate in PBC patients, with an incidence of adverse events similar to that following UDCA treatment. Furthermore, fenofibrate more profoundly influenced metabolism-related indicators, while UDCA more significantly affected BAs. Thus, fenofibrate monotherapy appears to be a promising option for treating PBC patients.

ORAL ABSTRACTS

Keyword(s) : primary biliary cholangitis, fenofibrate, Olink, untargeted metabolomics

1308 - KDM5A Driven Epigenetic Reprogramming of IL1B⁺ CD14⁺ Monocytes Mediates Resistance to Anti-PD 1 Therapy in Advanced Hepatocellular Carcinoma by Suppressing T Cell Mediated Antitumor Immunity

Wenying Qiao ¹, Xuefeng Huang ¹, Xiaoxue Yuan ¹, Ziyi Li ¹, Gongming Zhang ², Qi Wang ¹, Lei Li ¹, Lina Sun ¹, Han Shi ¹, Yang Wang ¹, Guangming Li ², Xiaoyan Ding ¹, Jinglong Chen ¹, Xi Wang ¹, Ronghua Jin ¹
Beijing Ditan Hospital, Capital Medical University, Beijing Ditan Hospital, Capital Medical University, Beijing-China ¹ Beijing Youan Hospital, Capital Medical University, Beijing Youan Hospital, Capital Medical University, Beijing-²

Background / Hypothesis: Hepatocellular carcinoma (HCC) is a leading cause of cancer-related mortality globally, with anti-PD-1 immunotherapy emerging as a promising therapeutic strategy. However, the clinical efficacy of immune checkpoint blockade remains limited, primarily due to complex and poorly understood immune evasion mechanisms. In particular, circulating immune signatures involving monocytes may represent critical but underexplored determinants of therapeutic responses. This study aims to characterize circulating immune signatures in HCC patients treated with anti-PD-1 immunotherapy, elucidate the role and mechanisms of IL-1β⁺ CD14⁺ monocytes in tumor immune evasion, and identify novel targets to improve HCC immunotherapy outcomes.

Materials and Methods: Peripheral blood from 10 HCC patients undergoing anti-PD-1 treatment was analyzed via single-cell RNA sequencing (scRNA-seq). Paired tumor tissue samples from 4 patients receiving targeted immunotherapy were examined using multiplex immunofluorescence staining and spatial transcriptomics. To explore mechanisms, we integrated ATAC-seq analysis, in vitro monocyte-T cell co-culture experiments, and murine tumor models, combining single-cell and spatial omics with functional validation to comprehensively assess systemic immune responses to therapy.

Results: Responders exhibited a higher abundance of CD8⁺ T cells and fewer CD14⁺ monocytes compared to

non-responders. The accumulation of IL-1β⁺ CD14⁺ monocytes suppressed CD8⁺ T cell function and contributed to resistance. Spatial transcriptomics revealed increased infiltration of IL-1β⁺ CD14⁺ macrophages in non-responders, which interacted with T cells to inhibit antitumor activity—a pattern confirmed by multiplex immunofluorescence. Mechanistically, in non-responders, CD14⁺ monocytes showed synergistic upregulation of the immunosuppressive SOCS3 and pro-inflammatory IL-1β, leading to M1 macrophage reduction and CD8⁺ T cell dysfunction. These gene expression patterns were epigenetically regulated by KDM5A. In murine HCC models, combined IL-1β blockade and anti-PD-1 therapy decreased immunosuppressive factors, enhanced T cell infiltration, and significantly suppressed tumor progression and improved therapeutic efficacy.

Conclusions: IL-1β⁺ monocytes play a key role in suppressing CD8⁺ T cell-mediated antitumor immunity. Targeting these monocytes enhances T cell responses and synergizes with anti-PD-1 therapy, offering a promising strategy to improve HCC immunotherapy outcomes.

1310 - Creb1 regulated slc39a1 attenuates alcoholic liver disease by orchestrating autophagy and mitophagy

Xianwei Liu ¹, Yijin Wang ¹
Southern University Of Science And Technology, Pharmacology, Shenzhen-China ¹

Background / Hypothesis:

Alcoholic liver disease (ALD) remains a leading cause of liver-related morbidity globally, yet its molecular mechanisms are incompletely defined. Zinc transporter SLC39A1, implicated in ion homeostasis, is hypothesized to play a critical role in ALD pathogenesis. This study aims to decipher a hitherto unrecognized SLC39A1-dependent pathway that confers protection against ALD.

Materials and Methods:

We established hepatocyte-specific Slc39a1 knockout (CKO) mice and employed Lieber-DeCarli ethanol feeding in vivo and ethanol-stimulated primary

ORAL ABSTRACTS

hepatocytes in vitro. Liver injury, steatosis, cell autophagy and mitophagy were assessed. Transcriptional regulation of SLC39A1 by CREB1 was evaluated via ChIP and luciferase assays. Mechanistic insights into SLC39A1-DRP1 interaction and mitophagy were explored through genetic and pharmacological interventions.

Results:

Analysis of the GEO database and human ALD samples revealed a significant upregulation of SLC39A1, which negatively correlated with severity of liver injury—evidenced by reduced liver damage, steatosis (HE), inflammation (TGF- β), and fibrosis (Masson), suggesting a protective role in patients. Consistent with human data, SLC39A1 was also significantly elevated in the livers of ethanol-fed mice and associated with improved survival. Slc39a1 CKO mice developed exacerbated ethanol-induced liver injury and steatosis compared to wild-type littermates. Mechanistically, SLC39A1 deficiency enhanced autophagy, as evidenced by increased LC3IIB and Atg5 expression and elevated autophagic flux—effects reversible upon autophagy inhibitor chloroquine (CQ). Importantly, CQ treatment in Slc39a1 CKO mice attenuated liver injury, reduced steatosis, and improved survival, underscoring the pathogenic role of excessive autophagy in this context. Further investigation identified CREB1 as a direct transcriptional regulator of SLC39A1 via ChIP-seq data and validated by chromatin immunoprecipitation, showing enhanced promoter binding upon ethanol challenge. Furthermore, SLC39A1 physically interacted with DRP1, promoting mitochondrial fission and Fundc1-mediated mitophagy. Either genetic or pharmacological inhibition of DRP1 suppressed SLC39A1-driven mitophagy, indicated by abolished Fundc1 induction. Conversely, DRP1 overexpression rescued impaired mitophagy and attenuated apoptosis in SLC39A1-silenced hepatocytes.

Conclusions: Our findings unveil a cytoprotective axis in which CREB1-driven SLC39A1 curbs alcohol-induced liver injury through dual regulation of autophagy and DRP1-dependent mitophagy. This mechanistic insight not only delineates a novel signaling pathway in ALD pathogenesis but also nominates SLC39A1 as a compelling therapeutic target for clinical intervention in alcoholic liver disease.

1311 - Liver Centric Therapeutic Profiling of 2 β Hydroxybetulinic Acid 3 β Caprylate (HBAC) A Phyto Derived Modulator of Hepatic Redox Balance Gluconeogenesis and Lipotoxic Stress in Experimental Diabetes

Danish Ahmed¹
Sam Higginbottom University Of Agriculture, Technology And Sciences, Department Of Pharmaceutical Sciences, Prayagraj-India¹

Background / Hypothesis: Natural triterpenoids are promising antidiabetic agents with hepatoprotective potential. We evaluated HBAC (2 β -hydroxybetulinic acid 3 β -caprylate), isolated from Euryale ferox seeds, for antidiabetic, anti-oxidant and hepatic metabolic effects in streptozotocin (STZ)-induced diabetic rats.

Materials and Methods: HBAC was purified by column chromatography and characterized by NMR/IR/MS (designated HBAC). Male Wistar rats received STZ (60 mg/kg i.p.) to induce diabetes. HBAC was administered orally at 20, 40 and 60 mg/kg once daily for 45 days. Assessments included fasting plasma glucose, plasma insulin, glycosylated hemoglobin (A1c), HOMA-IR, hepatic gluconeogenic enzymes (G6Pase, F-1,6-BPase, G6PD, hexokinase), lipid profile (TC, LDL, HDL, TG), antioxidant markers (SOD, CAT, GPx, GSH, MDA) and histopathology of pancreas, liver and kidney. (n=5/group).

Results: HBAC produced dose- and time-dependent reductions in fasting glucose and A1c, with the 60 mg/kg dose restoring glucose and A1c toward normal and significantly increasing plasma insulin versus diabetic controls. HOMA-IR was significantly improved, indicating reduced insulin resistance. HBAC restored disturbed hepatic gluconeogenic enzyme activities and increased hexokinase and G6PD activities (p<0.01). Lipid abnormalities ($\uparrow$ TC, $\uparrow$ LDL, $\uparrow$ TG, $\downarrow$ HDL) were ameliorated, and antioxidant status (SOD, CAT, GPx, GSH) was significantly restored while MDA decreased (p<0.01). Histology showed partial regeneration of pancreatic islets and reversal of STZ-induced liver/kidney damage in HBAC-treated groups. Effects were comparable to/ exceeded those of conventional reference drug at the highest HBAC dose.

ORAL ABSTRACTS

Conclusions: HBAC (2 β -hydroxybetulinic acid 3 β -caprylate) exhibits potent antidiabetic activity in STZ rats by improving glycemic control, reducing insulin resistance, normalizing hepatic gluconeogenesis and restoring antioxidant defenses, with supportive histopathology. These data suggest HBAC is a promising candidate for further preclinical development as an antidiabetic agent with hepatic protective properties.

1312 - Multiparametric magnetic resonance imaging to risk stratify patients with chronic liver disease **Descriptive results from the ELEGANCE study**

Yi-chun Wang¹, Edward Jackson¹, Pik Eu Jason Chang², Guan Huei Lee³, Marianne Anastasia De Roza⁴, Ngiam Chuan Tan⁵, Yu Jun Wong⁶, Wei Lyn Yang⁷, Han Chong Toh⁸, Pierce Kah Hoe Chow⁹
Perspectum Ltd, Translational Science, Oxford-United Kingdom¹ Singapore General Hospital, Gastroenterology & Hepatology, -Singapore² National University Hospital, Gastroenterology & Hepatology, Department Of Medicine, -Singapore³ Sengkang General Hospital, Gastroenterology & Hepatology, -Singapore⁴ Singhealth, Polyclinic, -Singapore⁵ Medical Academic Clinical Programme, Duke-nus Medical School, Gastroenterology & Hepatology, Changi General Hospital, -Singapore⁶ Tan Tock Seng Hospital, Gastroenterology & Hepatology, -Singapore⁷ National Cancer Centre Singapore, Medical Oncology, -Singapore⁸ Hepato-pancreato-biliary And Transplant Surgery, Division Of Surgery And Surgical Oncology, Singapore General Hospital And National Cancer Centre Sing, Surgery Academic Clinical Program, Singhealth Duke-nus Academic Medical Center, -Singapore⁹

Background / **Hypothesis:**
The ELEGANCE study is a prospective, multi-centre, cohort study enrolling 2000 participants with chronic liver disease, at risk of developing hepatocellular carcinoma (HCC) in Singapore. Participants undergo standard-of-care 6-monthly ultrasound imaging and alpha-fetoprotein (AFP) testing for HCC surveillance, and provide clinical biochemistry and bio-samples for metabolomic, microbiome and miRNA profiling. A sub-cohort undergoes advanced phenotyping using non-contrast, multiparametric MRI (mpMRI) with preliminary results presented herein.

Materials and **Methods:**
mpMRI were acquired on clinical scanners and

processed with LiverMultiScan and Hepatica softwares (Perspectum, UK). LiverMultiScan provides fibro-inflammation (from iron corrected T1, cT1), liver fat content (LFC, from proton density fat fraction [PDFF]) and liver iron content (from T2* mapping). Hepatica returns whole liver volume and volume for each Couinaud segment. Spleen volume is also calculated. Descriptive statistics report mpMRI measurements across different aetiologies. A logistic regression model was developed to evaluate the utility of mpMRI for identifying cirrhosis.

Results:

At the time of analysis, N=732; 124 with metabolic dysfunction associated liver disease (MASLD), 328 chronic hepatitis B (HBV), 7 chronic hepatitis C (HCV), and 273 clinically diagnosed cirrhosis of varying aetiologies.

In MASLD (mean age 59 years, 40% female, mean BMI 26), mean liver cT1 was 770ms, LFC 14%, liver iron 0.97mg/g and volume 1.4L. The prevalence of lean-MASLD (defined as LFC $\geq$ 5% and BMI<23) was 17%, the prevalence of MASH (defined as cT1 $\geq$ 800ms) was 31% and fibrotic-MASH (cT1 $\geq$ 875ms) was 6%. In HBV (mean age 61 years, 44% female, mean BMI 24) mean liver cT1 was 717 ms, LFC 6%, liver iron 0.91 mg/g and volume 1.1L. 41% of the HBV patients had co-morbid MASLD as defined by LFC $\geq$ 5%. In the cirrhotic group (mean age 65 years, 40% female, mean BMI 26), mean liver cT1 was 773ms, LFC 6%, liver iron 0.9mg/g and volume 1.3L. A logistic regression model to classify cirrhosis using all the mpMRI variables distinguished those with or without cirrhosis with an area under the receiver operator curve (AUC) of 0.88 in the MASLD sub-group and 0.80 for the entire cohort (Figure 1).

Conclusions:

mpMRI enabled the identification of participants along the continuum of liver disease from simple steatosis to MASH and cirrhosis and aided in the identification of co-morbid MASLD and viral hepatitis. Accurately phenotyping patients with chronic liver disease for disease severity may aid in identifying those at highest risk of developing subsequent liver related events including cancer.

Of Hepatology, Wenzhou-China⁵

Background / Hypothesis: Chronic hepatitis B (CHB) and metabolic dysfunction-associated steatotic liver disease (MASLD) are constituting a growing global health burden. Notably, their co-occurrence is linked to dramatically worsened clinical outcomes, including rapid fibrosis progression and a heightened incidence of hepatocellular carcinoma (HCC), pointing to a vicious synergy between viral infection and metabolic dysregulation. However, the core mechanisms underlying this convergence, particularly how MASLD reshapes the CHB liver to drive oncogenesis, are poorly defined. Our study seeks to decipher these key mechanistic drivers, focusing on dysregulated inter-organelle communication and metabolic reprogramming.

Materials and Methods: Liver biopsies from patients with simple MASLD (n=7), CHB (n=10), CHB complicated by MASLD (n=12), and controls (n=5) were subjected to spatial transcriptome sequencing. A mouse model of CHB concomitant with MASLD was established via rAAV8-1.3 HBV hydrodynamic injection followed by high-fat, high-cholesterol diet (HFHC) or high-fat methionine-restriction choline-deficient diet (HFMRCd) feeding. Proteins mediating lipid droplet-mitochondria tethering were profiled by LC-MS/MS. VDAC1-ACSL3 interaction and USP9X-mediated deubiquitination were confirmed by IP-MS and site-directed mutagenesis. An orthotopic HCC model using RIL-175 cells expressing wild-type or K365A-mutant ACSL3 were established to assess the tumorigenesis capacity.

Results: Spatial transcriptomics identified pronounced mitochondrial dysfunction and a distinct immune landscape, marked by significant enrichment of tumor-associated macrophages in livers of patients with CHB complicated by MASLD, even during the immune-

tolerant phase. Mechanistically, hepatocytes in this disease context exhibited upregulated expression and oligomerization of the mitochondrial outer membrane protein VDAC1. VDAC1 directly interacted with acyl-CoA synthetase long-chain family member 3 (ACSL3), whose protein stability was enhanced through K365-dependent deubiquitination by USP9X. The formation of the VDAC1-ACSL3 complex facilitated aberrant lipid droplet-mitochondria contact, leading to exacerbated oxidative stress, severe mitochondrial impairment, and metabolic reprogramming characterized by excessive lactate production, thereby fueling a procarcinogenic niche. Crucially, the ACSL3 K365A mutation disrupted USP9X-dependent deubiquitination and led to increased ACSL3 degradation, reduced ACSL3-VDAC1 interaction, normalized mitochondrial function, attenuated lactate generation and potently suppressed tumor formation in an orthotopic model. Furthermore, VDAC1 oligomerization triggered mitochondrial DNA release, activating the cGAS-STING pathway and subsequent interferon-stimulated gene responses, which contributed to the suppression of HBV replication.

Conclusions: Our findings identify the VDAC1-ACSL3-mediated lipid droplet-mitochondria tethering as a novel pathogenic mechanism that drives metabolic stress and microenvironment reprogramming in CHB complicated by MASLD. This axis represents a promising therapeutic target to mitigate hepatocarcinogenesis in this high-risk patient population.

1328 - CRISPR Prime Targeting of Interleukin 1 Receptor Type 1 (IL1r1) in Stellate Cells Identifies a Pathogenic Inflammation to Fibrosis Axis in the Liver
Hiba Al Lawati¹, Daniel F Wallace¹, V. Nathan Subramaniam¹

Centre For Genomics And Personalised Health, Health, Brisbane-Australia¹

Background / Hypothesis: Liver fibrosis, a central driver of chronic liver disease, arises from maladaptive activation of hepatic stellate cells (HSCs) and excessive extracellular matrix deposition. Although transforming growth factor beta (TGF β) is a well-established fibrogenic signal, the interplay between inflammatory cues and TGF β -driven fibrogenesis is incompletely understood. We developed a novel mouse model of fibrosis and analysed livers using a NanoString nCounter Fibrosis Panel. Potential

ORAL ABSTRACTS

genetic targets, including interleukin-1 receptor type 1 (IL1r1), were identified and their role in fibrosis and modulating TGF β response examined.

Materials and Methods:

We generated a novel CRISPR HSC model with heterozygous and homozygous knockout of IL1r1. Successful IL1r1 disruption was confirmed by immunofluorescence, flow cytometry, and functional loss of Interleukin-1 beta (IL1 β) responsiveness. Fibrotic activation was probed in two-dimensional monocultures and physiologically relevant three-dimensional co-cultures, quantifying alpha-smooth muscle actin (α -SMA) and collagen type I. Pharmacologic modulation with the antioxidant N-acetylcysteine (NAC) assessed the contribution of redox-sensitive pathways.

Results:

IL1r1 deficiency markedly attenuated TGF β -induced myofibroblastic transformation, with homozygous knockouts exhibiting the largest reductions in α -SMA and collagen I expression ($p < 0.01$). NAC further suppressed fibrotic marker induction across genotypes, implicating oxidative stress as an amplifier of TGF β signalling downstream or in parallel to IL1r1. Collectively, these data establish the major role of IL1r1 linking inflammatory and profibrotic signalling.

Conclusions:

This study introduces a novel CRISPR-engineered HSC model and identifies IL1r1 as a critical modulator of fibrosis. These findings reveal an inflammation fibrosis axis and highlight IL1r1 as a potential therapeutic target for liver disease.

1331 - Evaluation of Hepatitis B Serology Vaccination Rate and Reactivation in Hepatitis C Patients Treated with Direct Acting Antivirals

Emrullah Atas¹, Ilknur Şenel²
Oltu State Hospital, Infectious Diseases And Clinical Microbiology, Erzurum-Türkiye¹ Giresun University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Giresun-Türkiye²

Background / Hypothesis: In patients infected with HCV treated with DEAs, HBV reactivation may occur during or after treatment. Therefore, HBV serology should be

checked before treatment, treatment should be given to patients requiring HBV treatment, and patients at risk of reactivation should be monitored. HBV vaccination is also recommended for patients susceptible to HBV. Our study aimed to retrospectively screen patients diagnosed with HCV and treated with DAAs to determine hepatitis B screening rates and serology in these patients, as well as to determine hepatitis B vaccination rates and hepatitis B reactivation rates based on the screening results.

Materials and Methods: 170 patients were retrospectively reviewed. The patients' demographic characteristics, laboratory findings, treatments received, treatment responses, HCV genotype, HBV serology, HBV reactivation rates and HBV vaccination rates were investigated. Groups at risk for HBV reactivation were compared. Statistical analysis of the data obtained from the patients was performed using IBM SPSS Statistics for Windows version 26.0. Statistical data were evaluated using the Kolmogorov Smirnov, Student t, Mann Whitney U and Chi-square tests. A significance level of $p < 0.05$ was accepted.

Results: When the demographic characteristics of the included patients were analysed, 94 (55.3%) were male and 76 (44.7%) were female. The mean age was found to be 63 ± 14.3 years. When the serology of 170 patients were analysed, HBsAg positive; 3 patients (1.8%) and HBsAg negative; 167 patients (88.2%) were found. In HBsAg negative patients, HBsAg negative/anti HBs negative; 114 patients (68.2%), HBsAg negative/anti HBs positive; 53 patients (31.8%). HBsAg-negative patients were divided into subgroups according to their serological characteristics for vaccination and reactivation evaluation. HBsAg negative/anti-HBs negative/anti HBc IgG negative 75 patients (44.9%), HBsAg negative/anti-HBs negative/anti HBc IgG positive 15 patients (9%), HBsAg negative/anti-HBs negative/anti HBc IgG unknown 24 patients (14%), HBsAg negative/anti-HBs positive/anti HBc IgG negative 11 patients (6.6%), HBsAg negative/anti-HBs positive/anti HBc IgG positive 42 patients (25.1%). In terms of reactivation, HBV reactivation was not detected in 3 HBsAg positive patients, while HBV reactivation was detected in 1 (1.75%) of 57 anti-HBc positive patients. In our study, HBV vaccination was initiated in a total of 23 patients diagnosed with CHC. It was observed that 20.2% (23/114) of HBsAg negative/anti-HBs negative patients and 20% (15/75) of HBsAg negative/anti-HBs negative/anti-

ORAL ABSTRACTS

HBc IgG negative patients were vaccinated.

Conclusions: HBV reactivation may be observed during HCV treatment with DEA drugs. Therefore, HBV serology should be checked before treatment, treatment should be given to patients who require it, patients at risk of reactivation should be identified and closely monitored, and patients who are susceptible to HBV should be vaccinated. In our study, no reactivation was observed in HBsAg-positive patients, while reactivation was observed in one anti-HBc IgG-positive patient. Therefore, when screening patients who will receive DEA for HBV, anti-HBc IgG should be checked along with HBsAg.

Yong Loo Lin School Of Medicine, National University Of Singapore, Department Of Medicine, Singapore-Singapore ²
National University Hospital, Department Of Dietetics, Singapore-Singapore ³
National University Of Singapore, Saw Swee Hock School Of Public Health, Singapore-Singapore ⁴

Background:

Metabolic dysfunction-associated steatotic liver disease (MASLD) is among the most prevalent chronic liver diseases globally, driven by metabolic syndrome, obesity, and insulin resistance. Progressive MASLD can advance to steatohepatitis, fibrosis, and cirrhosis, contributing to significant liver-related morbidity. Lifestyle modification remains the mainstay of therapy, with weight loss through caloric restriction shown to improve hepatic steatosis and fibrosis. However, adherence to continuous calorie restriction is difficult. Time-restricted feeding (TRF), a form of intermittent fasting that restricts daily caloric intake to a fixed window is a potentially sustainable approach. This study compared the effects of TRF versus standard medical therapy on hepatic and metabolic outcomes in advanced MASLD.

Methods

In this prospective, randomised, single-centre trial, adults with advanced MASLD were assigned 1:1 to standard medical therapy (control) or TRF (8-hour feeding window). This abstract presents interim results from data collected over the first 8 weeks from 40 participants. We analysed the change in controlled attenuation parameter (CAP, dB/m) and liver stiffness (kPa) by transient elastography, changes in liver enzymes (ALT, AST, ALP, GGT, bilirubin) and metabolic indices (HbA1c, LDL, triglyceride levels). Between-group comparisons were made using Welch's t-test or Mann-Whitney U test ($p < 0.05$).

Results:

Of the 40 enrolled participants, complete paired data were available for 17 control and 17 TRF participants for primary elastography analysis. Steatosis (CAP): Both groups showed minimal changes from baseline to week 8. Mean Δ CAP was 0.65 ± 33.4 dB/m in controls versus 3.35 ± 45.9 dB/m in TRF ($p = 0.85$), indicating no statistically significant difference in hepatic fat regression. Fibrosis (kPa): A significant improvement was seen in the TRF group (-3.12 ± 3.48 kPa) compared with controls (-0.02 ± 2.39 kPa), with a between-group difference of 3.10 kPa (95% CI 1.01–5.19, $p = 0.005$). This represents a statistically significant fibrosis regression between the TRF and the control arm. Liver Enzymes: Both groups showed reductions in ALT, AST, and GGT, but differences were not significant (all $p \geq 0.46$). Metabolic Indices: Mean changes in HbA1c, LDL, and triglycerides were small and comparable (all $p > 0.27$).

Conclusions:

TRF led to significant improvement in liver fibrosis compared with standard caloric restriction, despite minimal differences in steatosis, liver enzymes, or metabolic indices. These interim findings support TRF as a promising dietary strategy with potential antifibrotic effects. Ongoing recruitment and longitudinal follow-up will determine whether these effects are sustained and reproducible in a larger cohort.

1335 - A 7 item discharge risk index predicts 12 month decompensation in HDV cirrhosis derivation and external validation

[Adela Turcanu](#) ¹, Ecaterina Cebanu ¹, Veronica Cumpata ²

ORAL ABSTRACTS

Nicolae Testemitanu State University Of Medicine And Pharmacy, Gastroenterology, Chisinau-Moldova ¹
Nicolae Testemitanu State University Of Medicine And Pharmacy, Family Medicine, Chişinău-Moldova ²

Background / **Hypothesis:**
HDV cirrhosis progresses rapidly, and is a frequent reason for hospitalization involving complex medical needs and carries a high risk of death in hospital. Therefore, a practical, discharge-time tool is needed to stratify risk of early decompensation in these patients. Aim of the study: to derive and externally validate a 7-item Decompensation Risk Index (bedside score) for HDV cirrhosis.

Materials and **Methods:**
Two real-world cohorts with HDV cirrhosis patients were analyzed: Derivation cohort (DC) - 104 patients and Validation cohort (VC) - 101 independent HDV cases. Exclusion criteria were: other associated liver diseases (autoimmune hepatitis, cholestatic liver diseases, hereditary liver diseases, HCV), HIV, malignancies. Twelve-month decompensation was defined as any of ascites, hepatic encephalopathy, or variceal hemorrhage. The Index assigns points for: MELD-Na ≥ 15 (+2), Child-Pugh ≥ 7 (+2), albumin < 30 g/L (+2), sodium < 130 mmol/L (+2), platelets $< 50 \times 10^9$ /L (+2), any baseline complication (+1), male sex (+1). Predefined categories: < 5 points = low risk, 5–7 = medium, ≥ 8 = high. Discrimination was assessed by AUC-ROC; calibration by calibration-in-the-large/slope and Brier score; validation category event rates and pragmatic thresholds were reported.

Results:

DC - 104 HDV-cirrhosis patients, median age 56 years; 51.5% male, AUC 0.907, PPV 64%; NPV 100%. In VC - median age 55.7 ± 8.8 years; 48 % male; AUC = 0.933, indicate excellent discrimination of patients with/without decompensation. Pragmatic thresholds: ≥ 1 point: Sensitivity 100%, Specificity 86.9%; ≥ 3 points: Sensitivity 53.8%, Specificity 98.4%. The results support the integration of the score into the discharge form for triage of follow-up frequency (1–3 months for high risk, 3 months for medium, 6 months for low).

Conclusions:

A discharge-ready, 7-item Index shows robust discrimination and acceptable calibration for predicting 12-month decompensation in HDV cirrhosis, with actionable thresholds to tier surveillance intensity. Prospective implementation and impact evaluation are

warranted.

Keyword(s) : decompensation, liver cirrhosis, HDV
1336 - Can poor sleep signal fatty liver disease Evidence from a rural population in North India
Tushar Prabhakar ¹, Satya Vir Singh ¹, Gahan Jois ¹
Amrita School Of Medicine, Community Medicine, New Delhi-India ¹

Background / **Hypothesis:**
Metabolic-dysfunction associated fatty liver disease (MAFLD) is a major emerging liver disorder, including in lean populations. While metabolic risk factors are well-studied, rural populations remain underrepresented in such research, despite their high burden of unrecognized MAFLD. Poor sleep may influence hepatic steatosis via insulin resistance, inflammation, and circadian rhythm disruption. The study hypothesized that poor sleep quality and short duration are independently associated with high MAFLD risk, and that sleep parameters could serve as non-invasive, scalable risk markers.

Materials and **Methods:**
This community-based cross-sectional study recruited 550 adults (≥ 18 years) residing in catchment area of a primary health centre in North India. Sleep quality and duration were assessed using the Pittsburgh Sleep Quality Index (PSQI); a global score > 5 indicated poor sleep. Sleep duration was categorized as < 6 h (short), 6–8 h (normal), > 8 h (long). MAFLD risk was evaluated using a validated non-laboratory 15-point Self-Assessment Score (≥ 8 = high risk). Descriptive statistics, chi-square, and multivariable logistic regression were used. Additional analyses included ROC curve for predictive validity of PSQI, test for trend across sleep duration categories, and interaction analysis with BMI and sex.

Results:

Among 550 participants (mean age: 42.6 ± 13.5 years; 56.4% female), 38.2% had poor sleep quality and 31.6% had high MAFLD risk. High MAFLD risk was observed in 47.9% of poor sleepers vs 22.1% of good sleepers ($p < 0.001$). MAFLD risk was also elevated in short sleepers (44.6%) vs normal (28.5%) and long sleepers (23.8%) ($p = 0.002$; p -trend < 0.01). On multivariable regression, poor sleep quality (AOR=2.31; 95% CI: 1.58–3.38) and short sleep (AOR=1.76; 95% CI: 1.15–2.69) were independently associated with high MAFLD risk. ROC analysis yielded an AUC of 0.71 (95% CI: 0.65–0.77)

ORAL ABSTRACTS

for PSQI in predicting high MAFLD risk. Significant interaction was noted between poor sleep and elevated BMI (p-interaction=0.03), indicating amplified risk in overweight individuals.

Conclusions:

Poor sleep quality and short sleep duration are strong, independent predictors of MAFLD risk, with moderate discriminatory ability on ROC analysis. These findings suggest that sleep assessment could serve as a low-cost, non-invasive surrogate marker for hepatic risk stratification in primary care. Integrating sleep-focused screening into MAFLD preventive strategies may improve early detection and intervention, especially in resource-constrained settings.

Keyword(s) : metabolic-dysfunction associated fatty liver; MAFLD; Sleep quality; Sleep duration; Rural population; community-based

1337 - Analysis of Factors Associated with Liver Fibrosis in Type 2 Diabetes Patients and the Predictive Value of CHI3L1 for Liver Fibrosis

Lixia Sun ¹, Aili Fan ², Jiawen Feng ², Qing Ye ¹
Tianjin University Central Hospital, Gastroenterology And Hepatology, Tianjin-China ¹ Third Affiliated Clinical College Of Nankai University, Gastroenterology And Hepatology, Tianjin-China ²

Background / Hypothesis:

Type 2 diabetes mellitus (T2DM) is the most common chronic metabolic disease globally, with its comorbidity with metabolic dysfunction-associated steatotic liver disease (MASLD) becoming increasingly prevalent. The prevalence of MASLD is significantly increased in patients with Type 2 diabetes mellitus (T2DM), elevating the risk of cirrhosis and hepatocellular carcinoma. Therefore, early diagnostic assessment of liver fibrosis in T2DM patients is critically important. Our study investigated the factors associated with liver fibrosis in T2DM patients with comorbid MASLD and evaluated the predictive value of chitinase-3-like protein 1 (CHI3L1) for liver fibrosis in these patients.

Materials and Methods:

This is a retrospective study that enrolled T2DM patients who received care at Tianjin Third Central Hospital between January 2023 and August 2024 as research subjects. Liver fibrosis was assessed in both the total T2DM population and in T2DM patients with comorbid MASLD using liver stiffness measurement (LSM) and non-invasive assessment indicators including APRI, FIB-4, and CHI3L1. The LSM value ≥ 8 kPa was established as the threshold for significant liver fibrosis

(SLF). Correlation analysis was applied to evaluate the relationships between LSM, CHI3L1, and other indicators. Univariate and multivariate logistic regression analyses were conducted to identify risk factors associated with liver fibrosis, and receiver operating characteristic (ROC) curve analysis was used to assess the predictive value of CHI3L1. Results:

This study included 236 patients with T2DM, of whom 176 had comorbid MASLD (prevalence rate: 74.6%) and 89 had significant liver fibrosis (prevalence rate: 37.7%). Among T2DM-MASLD patients, 74 had significant liver fibrosis, with a prevalence rate of 42%. In the T2DM-MASLD population, patients with significant liver fibrosis demonstrated significantly higher levels of BMI, TSH, AST, GGT, LDH, CHI3L1, APRI, LSM, and CAP compared to the non-significant fibrosis subgroup, with all differences being statistically significant ($P < 0.05$). Conversely, the significant fibrosis subgroup exhibited significantly lower levels of PLT, LDL-C, and PWR compared to the non-significant fibrosis subgroup ($P < 0.05$). CHI3L1 showed positive correlation with LSM ($r = 0.48$, $P < 0.001$). Multivariate logistic regression analysis identified CHI3L1, APRI, and CAP as potential independent risk factors for significant liver fibrosis in T2DM-MASLD patients. The area under the ROC curve (AUC) for CHI3L1 in predicting significant liver fibrosis was 0.717 (95% CI: 0.638-0.796, $P < 0.05$), with an optimal cutoff value of 96.6 ng/mL. Conclusions:

The prevalence of MASLD among T2DM patients was 74.6%, while the prevalence of significant liver fibrosis was 37.7%.

Keyword(s) : Type 2 diabetes mellitus ; fibrosis ; chitinase 3-like protein

1338 - Validation of the 2025 Global Expert Panel Consensus Definition of ACLF in Real World Hospitalized Patients With Cirrhosis

Jingjing Chen ¹, Wenling Wang ¹, Yu Wu ¹, Yanrong Yang ¹, Xiao Che ¹, Rui Zhao ¹, Manman Xu ¹, Yu Chen ¹
Beijing You'an Hospital Affiliated To Capital Medical University, Fourth Department Of Liver Disease; Beijing Key Laboratory Of Liver Regeneration And Artificial Liver Transformation Research, Beijing-China ¹

Background / Hypothesis:

The Defining Organ Failures in Patients With Cirrhosis: Consensus Statements (hereafter referred to as the Global Expert Consensus, GEC) proposed a new diagnostic framework for acute-on-chronic liver failure (ACLF) and introduced updated criteria for the definition of organ failures. However, this definition has not

ORAL ABSTRACTS

undergone systematic evaluation in independent clinical cohorts, and its evidence base remains limited. This study aimed to assess the clinical applicability and short-term prognostic discrimination of the GEC definition of ACLF.

Materials and Methods: We retrospectively included patients with cirrhosis and acute hepatic deterioration (defined as TB $\geq$ 5 mg/dL and INR $\geq$ 1.5) admitted to Beijing You'an Hospital between 2020 and 2025. ACLF was classified according to both the GEC and EASL-CLIF definitions, while organ failures were assessed using GEC criteria. The primary outcomes were 28-day and 90-day transplant-free survival (TFS).

Results:

A total of 410 patients were consecutively enrolled. The proportions of patients fulfilling the GEC and EASL-CLIF definitions of ACLF were 44.9% (184/410) and 46.3% (190/410), respectively. Compared with non-ACLF patients, those identified by the GEC criteria had a higher incidence of infection (89.7% vs. 77.4%, $P = 0.001$) and significantly lower TFS at both 28 and 90 days (56.0% vs. 91.6% and 40.8% vs. 87.2%, respectively; all $P < 0.001$). When compared with EASL-CLIF, the GEC definition demonstrated higher AUCs for predicting 28-day and 90-day TFS (28-day: 0.744 vs. 0.685, $P = 0.056$; 90-day: 0.760 vs. 0.682, $P = 0.015$), indicating overall superior risk stratification and short-term prognostic discrimination. In addition, the GEC showed better concordance (C-index: 0.705 vs. 0.641, $P = 0.003$). Sensitivity analyses showed a stepwise decline in TFS as the number of organ failures increased from 0 to ≥ 4 (all $P < 0.001$).

Conclusions: The GEC definition of ACLF shows robust short-term prognostic performance in hospitalized patients with cirrhosis and acute deterioration. Moreover, GEC-based organ failure stratification further refines assessment of disease severity. To our knowledge, this study represents the first clinical validation of the GEC definition in hospitalized cirrhotic patients, supporting its value as a more effective tool for short-term prognostic evaluation.

1341 - Screening of new active molecules derived from ursodiol in the treatment of primary biliary cholangitis and ursodeoxycholic acid

Engin Altinkaya¹, Mehmet Yildiz¹, Mustafa Tosun¹, Koray Sayin², Hilmi Ataseven¹
Sivas Cumhuriyet University, Department Of Gastroenterology, Faculty Of Medicine, Sivas-Türkiye¹
Sivas Cumhuriyet University, Department Of Chemistry, Faculty Of Science, Sivas-Türkiye²

Background / Hypothesis: Primary biliary cholangitis (PBC) is a chronic autoimmune cholestatic liver disease that primarily affects the biliary system, leading to progressive hepatocellular damage and fibrosis. Despite ursodeoxycholic acid (UDCA) being the first-line and standard therapy that improves biochemical parameters and delays histological progression, approximately 20–40% of patients show suboptimal or no response to treatment. Moreover, UDCA does not sufficiently alleviate clinical symptoms in some cases. Therefore, the discovery and design of novel ursodiol-derived compounds with enhanced therapeutic efficacy and improved pharmacokinetic profiles represent a promising research direction for optimizing PBC management.

Materials and Methods: In this study, a series of ursodiol derivatives were virtually screened using in silico computational approaches to identify potential candidates with improved binding affinity and pharmacological properties. Molecular docking analyses were performed to evaluate interactions with key PBC-related molecular targets, followed by ADME profiling to assess drug-likeness and pharmacokinetic behavior. Additionally, MM-GBSA calculations were conducted to estimate binding free energies and refine compound selection. The results of this comprehensive in silico screening will be presented, providing insights into the structural determinants that may guide the development of next-generation UDCA-based therapeutics for PBC treatment. Total 118 organic compounds were taken into consideration. The whole compounds were downloaded from PUBCHEM. Maestro (Version 13.7.125) was used all calculations.

Results: All results were compared with that of ursodiol. Three different protein structures were used in this study which PDB ID's are 1OSH, 3DCT and 4QE6. In molecular docking analyses, four different organic compounds were found as potential due the having better results than that of ursodiol. Their PUBCHEM ID's are 10133, 11281160, 11731984, and 16217615. Their ADME, MM-GBSA and CYP2C9 p450 cytochrome analyses were

ORAL ABSTRACTS

completed.

Conclusions: In conclusion, all of these compounds were found to be good candidates to replace ursodiol and may be utilized to optimize the management of PBC. However, further and more comprehensive studies are required in this direction.

Keyword(s) : Primary biliary cholangitis, Ursodiol derivatives, In silico screening, Molecular docking, UDCA alternatives

1344 - A single VRON 0200 prime dose induced sustained and or continued HBsAg declines up to one year post dosing and rapid HBsAg declines with addition of antiviral agents in chronically HBV infected patients

Sl Currie¹, Ej Gane², Th Lim³, A Luber¹, M Bonhomme⁴, Gl Wong⁵

Virion Therapeutics, Clinical Research, Philadelphia-United States¹ Auckland City Hospital, University Of Auckland, New Zealand Liver Transplant Unit, Auckland-New Zealand² Middlemore Hospital, Clinical Studies, Auckland-New Zealand³ Ppd, Part Of Thermo Fisher Scientific, Laboratory Services, Vaccine Sciences Department, Richmond-United States⁴ The Chinese University Of Hong Kong, Medical Data Analytics Centre, Department Of Medicine And Therapeutics, And Institute Of Digestive Disease, Hong Kong-Hong Kong SAR, China⁵

Background / Hypothesis: Current and investigational HBV Functional Cure treatments have been limited by their inability to restore anti-HBV immunity, leading to off treatment viral rebound. VRON-0200 is an immune-modulator containing a checkpoint modifier, with HBV core and pol (but not S) antigens, designed to enhance, broaden, and prolong T cell responses. Here, we report safety, immunogenicity, and HBsAg data from chronically-HBV infected patients(pts) that received VRON-0200 alone, and in combination with investigational antivirals, when added to ongoing NUC therapy.

Materials and Methods: CHB pts, NUC-suppressed with HBsAg <500IU/mL(Cohorts 1(C1) and 2(C2)), or <1,000IU/mL(Cohort 3(C3)), were randomized to receive i.m. VRON-0200 low(C1) or high(C2) dose prime on D1, w/wo VRON-0200 boost on D91; C3 receive VRON-0200 prime, followed by 6 mthly doses of elebsiran plus tobevibart starting on D28, alone, or with a VRON-0200 boost on D196. Safety, virologic, and immunologic assessments were performed. HBsAg (ELISA; LLOD:0.05IU/mL), T cell frequencies (IFN γ ELISpot), core,

pol,S antigen)), and neutralizing antibody responses(NAbs) were measured.

Results: As of November 17,2025, 35 pts were included: 28(80%)male, 30(86%)Asian, median age:46 yrs, and median BL HBsAg,179 IU/mL(range:10–1169). In 11,959 pt safety days, 38 TRAEs were reported: 4-GR2,34-GR1, with no tx-related SAEs or D/Cs. In C1/2, 23 of 27 had reached EOS(D360): of those,19/23(83%) had sustained and/or continued HBsAg declines(9/19>50% declines), 4 pts had >1log10 IU/mL; a boost dose did not enhance responses, and declines were independent of BL HBsAg levels. In C3, within 7 days of the first antiviral dose, rapid and profound HBsAg declines were observed(100% <2 IU/mL; 1 LLOD) and were independent of BL HBsAg levels. Additional antiviral doses improved declines with 3 of 6 pts at D140 achieving HBsAg loss. IFN γ ELISpot responses were not associated with HBsAg declines; immunogenic responses to VRON-0200 were observed in all pts, regardless of pre-existing NAb status. Additional data to be reported.

Conclusions: VRON-0200 alone, or in combination, had no observed safety concerns, and was well tolerated. Despite not targeting HBsAg, a single VRON-0200 dose was able to induce broad anti-HBV immunity in the majority of pts, that was sustained and/or continued to decline up to one-year post dosing. When combined with antivirals, rapid and profound HBsAg declines were observed in all patients. This novel approach where anti-HBV immunity is "sparked" (i.e. primed) with VRON-0200, and then "fanned" (i.e. boosted) by HBV removal, could position VRON-0200 to be a foundational backbone agent for future HBV Functional Cure regimens.

Keyword(s) : HBV, Functional Cure, VRON-0200, HBsAg, Checkpoint Modifer, Therapeutic Vaccine

1346 - A Ductless Dilemma Pembrolizumab Induced versus Paraneoplastic Vanishing Bile Duct Syndrome

Gabriel Daniel Alcantara¹, Juliet Gopez-cervantes¹
St. Luke's Medical Center - Global City, Gastroenterology, Bonifacio Global City-Philippines¹

Background / Hypothesis: To present a case of a 72-year-old male, known Urothelial Carcinoma Stage IV, Prostate Adenocarcinoma who developed progressive jaundice seven weeks after receiving his eighth cycle of Pembrolizumab

Materials and Methods:

ORAL ABSTRACTS

Patient was admitted for a two day history of beginning icteresia progressing to jaundice. Initial diagnostics showed conjugated hyperbilirubinemia; with SGPT and Alkaline Phosphatase both 13x and 6.7x the upper limit of normal, respectively. Workup for obstruction with Abdominal Ultrasound, Whole Abdominal CT-Scan, MRCP and ERCP were negative, showing only signs of patchy hepatic steatosis with no mass lesions. Hepatitis, infectious and autoimmune workup were also negative, and was managed initially as a case of immune-related adverse event from Pembrolizumab. Oral prednisone was initiated; however, due to increasing bilirubin and liver enzymes, shifted to pulse dose steroid therapy for 3 days and again maintained on oral prednisone, azathioprine and ursodiol afterwards. Serial monitoring showed a gradual but fluctuating decline in liver parameters. Liver biopsy was eventually pursued, revealing a cholestatic pattern of injury with associated 70% bile duct loss suggestive of Vanishing Bile Duct Syndrome (VBDS). Medications were continued with gradual decrease in liver enzymes and bilirubin levels; however, after a few days, values plateaued. Paraneoplastic syndrome was then considered, and the patient underwent Transurethral Resection of Bladder Tumor and Prostate. Steroids and Immunosuppressant were maintained post procedure and liver parameters eventually reached their lowest values after 2 weeks. Patient was discharged with close follow up recommended afterwards

Results:

With the clinical picture, diagnostics and histopathology obtained, Vanishing Bile Duct Syndrome secondary to Pembrolizumab versus a paraneoplastic process were considered. Paraneoplastic VBDS is an extremely rare phenomenon mostly associated with hematological malignancies, particularly Hodgkin's lymphoma rather than solid tumors. With this, a diagnosis of Pembrolizumab induced VBDS was still heavily favored. Management included prompt discontinuation of Pembrolizumab and the initiation of targeted supportive therapy, including ursodiol, systemic corticosteroids, and immunosuppressant

Conclusions:

Pembrolizumab-induced VBDS is a rare adverse event documented primarily through isolated case reports with no exact incidence rates available. Diagnosis relies heavily on histopathology findings of ductopenia defined as a loss of more than 50% of bile ducts with evaluation of at least ten portal tracts. Currently, no

standardized treatment regimen exists, however prompt discontinuation of the offending drug and supportive care with ursodiol, steroids and immunosuppressants have been suggested. Prognosis is variable, ranging from gradual recovery to progressive liver failure and in severe cases, mortality.

1349 - Enhanced detection of hepatocellular carcinoma using combined biomarker panels including alpha fetoprotein alpha fetoprotein L3 des gamma carboxyprothrombin and the galad score

Van Trung Huynh ¹, Cong Khanh Pham ²
Tam Anh Hospital, Center For Gastrointestinal Endoscopy And Laparoscopic Surgery, Ho Chi Minh City-Vietnam ¹ Center For Gastrointestinal Endoscopy And Laparoscopic Surgery, Center For Gastrointestinal Endoscopy And Laparoscopic Surgery, Center For Gastrointestinal Endoscopy And Laparoscopic Surgery-Vietnam ²

Background / Hypothesis:Hepatocellular carcinoma (HCC) remains a major global health burden, with early detection being crucial for improving outcomes. However, conventional diagnostic methods, including imaging and alpha-fetoprotein (AFP), have limited sensitivity and specificity. Emerging biomarkers such as AFP-L3 and des-gamma-carboxy prothrombin (DCP/PIVKA-II), along with composite models like the GALAD score, have shown potential in enhancing HCC detection. Evidence on the diagnostic performance of GALAD in diverse populations, particularly in Southeast Asia, remains scarce. This study evaluated the diagnostic accuracy of AFP, AFP-L3, DCP, and GALAD, individually and in combination, for detecting HCC. Materials and Methods:A cross-sectional study was conducted at Tam Anh General Hospital, Ho Chi Minh City, Vietnam, from March to October 2025. A total of 83 patients with histologically confirmed HCC and 83 patients with chronic hepatitis or cirrhosis were enrolled. Serum AFP, AFP-L3, and DCP were quantified, and GALAD scores were calculated. Diagnostic performance was assessed using sensitivity, specificity, and area under the receiver operating characteristic curve (AUC). Biomarkers were compared individually and in combination, with subgroup analyses stratified by BCLC stage.

Results:AFP >8.5 ng/mL and AFP-L3 >3.85% yielded moderate sensitivity (72.3% and 77.1%) and high specificity (91.6% and 86.7%). DCP >33.5 mAU/mL and GALAD >2.19 demonstrated superior diagnostic accuracy, with sensitivities of 91.6% and 85.5%, specificities of 92.8% and 95.2%, and identical AUCs of

ORAL ABSTRACTS

0.957. Both DCP and GALAD significantly outperformed AFP and AFP-L3 ($p < 0.05$), with no significant difference between them ($p > 0.05$). Combined biomarker panels further improved performance, with the AFP–AFP-L3–DCP panel achieving the highest sensitivity (95.2%). In advanced HCC (BCLC $\geq B$), GALAD (AUC 0.939) outperformed AFP and AFP-L3 and was comparable to DCP. None of the biomarkers reliably differentiated very early (BCLC 0) from early-stage HCC (BCLC A). Conclusions: DCP and GALAD exhibit superior diagnostic accuracy compared with AFP and AFP-L3, particularly in advanced HCC. Combining multiple biomarkers further enhances detection, although none effectively distinguish very early from early-stage disease. These findings support the clinical utility of DCP and GALAD and underscore the need for improved strategies to identify very early-stage HCC.

Keyword(s) : AFP, AFP-L3, DCP, GALAD, HCC

1350 - Metabolic Syndrome is Independently Associated with 1 Year Readmission of Patients with Alcohol Associated Cirrhosis

Jiarui Zheng¹, Yuxuan Song¹, Bo Feng¹, Yandi Xie¹
Peking University People's Hospital, Peking University
Hepatology Institute, Beijing-China¹

Background / Hypothesis:
To explore the relationship between metabolic syndrome and the 1-year readmission rate in patients with alcohol-associated cirrhosis, and to uncover potential factors that influence this relationship.

Materials and Methods:
This retrospective analysis encompassed 379 patients with alcohol-associated cirrhosis who were hospitalized from January 2012 to December 2023. Patients were categorized in two groups according to whether they had metabolic syndrome (MetS) or not, and comparisons were made regarding their baseline characteristics, liver function indicators and complications. Multivariate regression analysis was conducted to determine the independent factors influencing the 1-year readmission rate. In addition, stratified analysis was conducted to investigate how various factors might influence the relationship between MetS and the 1-year readmission rate.

Results:

Of the 379 patients with alcohol-associated cirrhosis, 40 (10.6%) patients had MetS, who exhibited a reduced occurrence of ascites (40.0% vs. 62.5%, $P = 0.006$) but a

higher rate of 1-year readmission (65.0% vs. 44.5%, $P = 0.014$) compared to those without MetS. In total, 177 patients (46.7%) were readmitted within 1 year. The incidence of MetS (65.0% vs. 44.5%, $P = 0.014$), hepatic encephalopathy (19.2% vs. 10.9%, $P = 0.023$) and variceal bleeding (13.6% vs. 5.0%, $P = 0.003$) was also considerably higher in individuals who were readmitted within 1 year compared to those not readmitted. Multivariate analysis indicated that MetS, hepatic encephalopathy, variceal bleeding and ALT levels were independent predictors of 1-year readmission. Stratified analysis showed no significant interaction between MetS and 1-year readmission rate across different subgroups stratified by age, BMI, hypertension, diabetes, hyperlipidemia, ALT levels, ALP levels and TBIL levels.

Conclusions:

Metabolic syndrome is one of the independent predictive factors for 1-year readmission in individuals with alcohol-associated cirrhosis, which influences the risk of readmission in conjunction with factors such as hepatic encephalopathy and variceal bleeding.

Keyword(s) : metabolic syndrome; alcohol associated cirrhosis; alanine aminotransferase; readmission; MELD score

1352 - Evaluation of Liver Fibrosis Using FIB 4 and ARFI in Non Diabetic NAFLD Patients

Van Trung Huynh¹, Cong Khanh Pham¹, Dang Toan Vo¹, Xuan Phat Luu¹, Hoang Long Doan¹, Tuan Phong Vo¹

Tam Anh Hospital, Center For Gastrointestinal Endoscopy And Laparoscopic Surgery, Ho Chi Minh City-Vietnam¹

Background / Hypothesis: Background and Aims: Non-alcoholic fatty liver disease (NAFLD) is a growing cause of liver fibrosis, even in non-diabetic populations. Non-invasive methods such as the Fibrosis-4 (FIB-4) index and Acoustic Radiation Force Impulse (ARFI) elastography are increasingly utilized, yet data in non-diabetic patients remain limited. This study aimed to evaluate the diagnostic performance of FIB-4 and ARFI in detecting liver fibrosis among non-diabetic NAFLD patients.

Materials and Methods: We conducted a cross-sectional study involving 107 non-diabetic patients diagnosed with NAFLD at Tam Anh General Hospital, Ho Chi Minh City, between January 2023 and October 2024. The FIB-4 index was calculated using a standardized formula. Liver stiffness was measured by ARFI-based shear wave

ORAL ABSTRACTS

velocity (SWV). Correlation analyses, ROC curves, and multivariate logistic regression were applied to determine associations with significant ($F \geq 2$) and advanced fibrosis ($F \geq 3$). Results: The mean FIB-4 score was 1.46 ± 1.82 and mean SWV was 1.29 ± 0.44 m/s. The prevalence of fibrosis stage $F \geq 2$ and $F \geq 3$ was 15.0% and 11.3%, respectively. FIB-4 showed high diagnostic performance, with AUROC of 0.903 for $F \geq 2$ and 0.949 for $F \geq 3$. Independent predictors of $F \geq 2$ included age, platelet count, AST, and GGT, while age, AST, and total cholesterol were associated with $F \geq 3$. Among prediabetic patients (47.7%), 50% had $F \geq 2$ fibrosis and 41.7% had $F \geq 3$. Conclusions: FIB-4 and ARFI are effective non-invasive tools to assess liver fibrosis in non-diabetic NAFLD patients. Their application may facilitate early identification and management of at-risk individuals.

Keyword(s) : NAFLD, liver fibrosis, FIB-4, ARFI, non-diabetic, liver stiffness

1353 - 30% of Inactive HBsAg Carriers Achieved Clinical Cure at 48 Weeks with Pegylated Interferon Alpha 2b Therapy A Multicenter Real World Study (STARHB Project in China) 3 years Data Update

Background and Aims: This study aimed to investigate the efficacy and safety of achieving functional cure (HBsAg loss) using Pegylated Interferon alpha-2b (PEG IFN α -2b) treatment in inactive HBsAg carriers (IHC). Method: The STARHB Project (The STUDY ON TREATMENT FOR INACTIVE CARRIERS OF HEPATITIS B) is a multicenter real-world study in China focused on the functional cure of IHC, aiming to onboard approximately 25,000 patients (ChiCTR2200061541). Based on patient preferences, participants were assigned to a control group (without antiviral treatment) or treatment groups (NAs group and PEG IFN α -2b $\pm$ NAs group). The basic treatment duration was 48 weeks, extendable to 96 weeks as needed. Results: As of Oct. 2025, 24,758 individuals were screened, and 20,788 eligible IHC patients were included in the mITT population baseline analysis. This cohort was 63.9% male with a mean age of 43 years; 5.6% were under 30 years old, and 39.4% had fatty liver. The mean HBsAg level was 265 IU/ml, with 49.3% below 100 IU/ml. The mean HBV DNA level was 265 IU/ml, with 62.1% having undetectable HBV DNA at baseline. The mean ALT was 21 U/L. Liver biopsies were performed on 231 patients at baseline, with 35.9% showing significant liver necroinflammation and/or fibrosis ($\geq G2$ and/or $\geq S2$). At present, 3.58 patients have completed the 48-week follow-up. In the control group (n=43), 24 achieved virological response (VR), with 4 achieved HBsAg loss. In the NAs group, the VR rate at 48 weeks was 92% (93/101), with 5 achieved HBsAg loss. Among those treated with PEG IFN α -2b $\pm$ NAs, the VR rate at 48 weeks was 90.17% (2578/2860), with an HBsAg loss rate of 30% (852/2860). ROC analysis indicated that baseline HBsAg levels, 12-week and 24-week HBsAg levels, and 12-week AST levels could predict HBsAg loss at 48 weeks. Conclusion: PEG IFN α -2b therapy can effectively achieve functional cure in IHC patients, with a 48-week HBsAg loss rate of 30%. Lower baseline, 12-week, and 24-week HBsAg levels, along with higher 12-week AST levels, are predictors of functional cure at 48 weeks. Thus, the IHC population is a favorable group for pursuing clinical cure for hepatitis B.

Keyword(s) : PEG IFN α -2b;inactive HBsAg carriers;HBsAg loss;antiviral therapy

1356 - Severe Hepatic Steatosis Impairs PEG IFN Response in HBsAg Clearance Favorable Chronic

ORAL ABSTRACTS

Hepatitis B A Retrospective Cohort Study

Shan Ren ¹, Pengxuan Wu ¹, Jianxia Dong ¹, Dacheng Sheng ¹, Lilin Wang ¹, Xinyue Meng ¹, Jing Zhao ¹, Sujun Zheng ¹, Xinyue Chen ¹
Beijing Youan Hospital, Capital Medical University, The First Unit, Department Of Hepatology, Beijing-China ¹

Background/Objectives: The impact of hepatic steatosis (HS) severity on pegylated interferon-alpha (PEG-IFN α) efficacy in chronic hepatitis B (CHB) patients ideally suited for HBsAg clearance remains undefined. We aimed to investigate this relationship in a well-defined, favorable-population. **Methods:** This multicenter, retrospective cohort study enrolled 499 HBeAg-negative CHB patients with HBsAg <1500 IU/mL who completed 48 weeks of PEG-IFN α -based therapy. Patients were stratified by controlled attenuation parameter (CAP) values into no-HS (CHB, n=250), mild (n=90), moderate (n=41), and severe HS (n=118) groups. The primary endpoint was HBsAg clearance at week 48. **Results:** The overall HBsAg clearance rate was 39.1% (195/499). While no significant difference existed between the composite CHB+HS and CHB groups (37.0% vs. 41.2%, $P>0.05$), clearance rates demonstrated a severity-dependent gradient. Notably, patients with severe HS had significantly reduced clearance (24.6%) compared to the CHB group (41.2%, $P<0.01$) and to mild or moderate HS subgroups (45.6% and 53.7%, respectively; $P<0.01$). After adjustment for confounders using inverse probability of treatment weighting (IPTW), severe HS remained an independent negative predictor of HBsAg clearance (adjusted HR=0.577, 95% CI: 0.345–0.964; $p=0.04$). **Conclusion:** Severe hepatic steatosis is independently associated with a significantly attenuated response to PEG-IFN α in HBsAg-low CHB patients, highlighting the critical need for incorporating steatosis severity assessment into clinical decision-making.

1361 - L Taurine for Fatigue in Decompensated Cirrhosis A Randomized Controlled Trial

Swarup Sasidharan ¹, Cyriac Abby Philips ², Ajit Tharakan ¹, Rizwan Ahamed ¹, Tharun Tom Oommen ¹, John Menachery ², Rosh Varghese ¹, Philip Augustine ¹
Rajagiri Hospital, Gastroenterology, Trivandrum-India ¹
Rajagiri Hospital, Hepatology, Kochi-India ²

Background / Hypothesis: Chronic liver disease (CLD), including cirrhosis, affects over 1.5 billion people worldwide. Cirrhosis can manifest with diverse symptoms. Fatigue, despite its substantial impact on

quality of life, often goes under-recognized and inadequately managed. No universally effective treatment exists. This study explored whether taurine supplementation improved fatigue in patients with decompensated cirrhosis.

Materials and Methods: We conducted a randomized controlled trial from July 1st 2023 to December 31st, 2024, at an urban tertiary care center in South India. Individuals with decompensated cirrhosis presenting to the outpatient unit and reporting fatigue were screened and enrolled after obtaining informed consent. Fatigue was objectively quantified using the Fatigue Assessment Scale (FAS) score. Participants were block randomized to the study group (standard care plus 1000 mg L-aurine for 12 weeks), while the control group received standard care alone for the same duration. The primary outcome was change in FAS score at 12 weeks. Secondary outcomes included assessment of adverse drug events and changes to quality of life.

Results: A total of 382 patients were screened for enrolment. After applying exclusion criteria, 162 were excluded. Finally, 220 participants (110 in each group) underwent randomization and were enrolled. Eighteen patients were excluded from the final analysis (8 in the study group and 10 in the control group) due to reasonable causes. Both groups were comparable at the baseline with regards to demographics and disease severity, except for a statistically significant difference in FAS scores. Taurine use was associated with a greater median reduction in fatigue scores that did not reach statistical significance. Additionally, there was no significant improvement in quality of life compared to standard of care. Subgroup analysis revealed that among non-anemic patients (Hemoglobin ≥ 12 g/dL), L-aurine use showed statistically significant, greater reduction in fatigue scores, with a mean Δ FAS of -11.9 ± 4.04 compared to -4.57 ± 9.23 in the control group ($p = 0.01$). No serious adverse events were notable between groups.

Conclusions: L-Taurine did not produce a statistically significant improvement in fatigue. Baseline imbalances in fatigue scores appeared to be influenced by anemia, highlighting the importance of controlling for this confounder in future research. Nonetheless, the addition of L-aurine could effectively reduce fatigue in non-anemic individuals which requires further validation in a larger well-defined multi-center cohort (Clinical Trials Registry India number CTRI/2023/06/054455)

1362 - Cell Microcapsule Loaded Potent Nanoenzymes Alleviate Drug Induced Liver Injury via Dual Strategies

Xiaoyu Huang¹, Qiong Wu¹, Mingwei Sheng², Fengmei Wang²

Nankai University, School Of Medicine, Tianjin-China¹

Nankai University, The First Central Hospital, Tianjin-China²

Background / Hypothesis: Drug-induced liver injury (DILI) primarily results from the metabolic activation of drugs such as acetaminophen or anti-tuberculosis agents, leading to the accumulation of toxic intermediates that impair mitochondrial function. These toxins disrupt oxidative phosphorylation, reduce ATP production, and promote excessive reactive oxygen species (ROS) formation. Furthermore, Kupffer cell activation and disrupted redox homeostasis, particularly through suppression of antioxidant pathways like Nrf2, exacerbate DILI, providing a mechanistic basis for designing multi-target therapeutic strategies. This study aims to investigate whether cell-encapsulated nano-antioxidants can alleviate hepatic DILI and elucidate its specific mechanisms.

Materials and Methods: A liver-targeted oral delivery system with high safety was designed for DILI treatment. CeO₂ nanoparticles and silibin were encapsulated within cellular vesicles to generate highly biocompatible anti-inflammatory nanoparticles. These nanoparticles resist gastric acid degradation, are absorbed via intestinal M cells, and undergo translocation for targeted delivery to the liver. To validate the safety and targeting efficacy of the material, an APAP-induced liver DILI mouse model was employed. Oral administration occurred one day prior to model establishment and concurrently with APAP injection. Mice were euthanized 24 hours later. Liver tissue was collected for histopathological examination, measurement of common inflammatory cytokine levels, and molecular analyses including Western blotting.

Results: Yeast cell microcapsules loaded with nanoenzymes demonstrated excellent ROS scavenging capacity, stability in the intestinal environment, and biocompatibility with cells and mice. Furthermore, yeast cell microcapsules effectively targeted macrophages in the liver. In the drug-induced mouse model, nanoenzyme-loaded yeast cell microcapsules effectively alleviated weight loss, hepatic fibrosis, and hepatocyte necrosis while reducing inflammatory cytokines.

Additionally, yeast cell microcapsules remodeled the gut microbiota, increasing SCFA levels by suppressing harmful bacteria and enhancing beneficial bacteria.

Conclusions: This natural product-targeted oral delivery system offers a novel therapeutic approach for drug-induced liver injury through anti-inflammatory, antioxidant, and gut microbiota-modulating effects. Furthermore, detailed experimental findings elucidate the precise mechanism by which nano-antioxidant agents alleviate drug-induced liver injury. Overall, this study provides a comprehensive account of the effects of nano-antioxidant agents on drug-induced liver injury, laying the groundwork for future research into treating this condition with nano-therapeutic materials.

1375 - Multidimensional analysis of diagnosis and treatment status of chronic hepatitis B

Ying Tan¹, Bo Li¹, Aiqi Lu¹, Lihua Lin¹, Xiaoyuan Chen¹, Jianping Li¹, Yujuan Guan¹
Guangzhou Eighth People's Hospital, Guangzhou Medical University, Center For Liver Disease, Guangzhou-China¹

Background / Hypothesis: The aim was to analyze key indicators for the diagnosis and treatment of chronic hepatitis B (CHB), including virus detection rate, standardized treatment rate, and loss to follow-up rate, in order to provide a basis for optimizing diagnosis and treatment plans, improve the diagnosis and treatment level of CHB, and improve patient prognosis.
Materials and Methods: Patients with CHB admitted to Guangzhou Eighth People's Hospital Affiliated to Guangzhou Medical University from January 2024 to January 2025 were enrolled. The data were collected and organized using Excel. Statistical analysis was conducted using SPSS 26.0 software, with a focus on evaluating core indicators such as virus detection rate, standardized treatment rate, and loss to follow-up rate.
Results:

The positive rate of hepatitis B surface antigen (HBsAg) in nonspecific patients was 28.95%, the antiviral treatment rate in specialized patients was 90.78%, and the standardized antiviral drug conversion treatment rate in low-level viremia (LLV) patients was 61.45%. The standardized antiviral drug conversion treatment rates for high-risk patients with combined kidney/bone injuries were 72.75% and 74.40%, respectively. The overall dropout rate was 10.47%, with a dropout rate

ORAL ABSTRACTS

of 13. 80% for LLV patients.

Conclusions:

The antiviral treatment coverage rates in CHB patients were over 90%, but in certain groups (such as LLV patients and those with kidney or bone injuries), the standardized treatment rates were still low and loss to follow-up rates were high, suggesting the need to improve HBV screening, treatment for special populations, and patient adherence.

1378 - Leucine rich alpha 2 glycoprotein 1 turnover imbalance impairs regenerative signaling in Alcohol associated Hepatitis

Nupur Sharma¹, Vipul Sharma Bhat¹, Sadam H Bhat¹, Sushmita Pandey¹, Sanju Yadav¹, Mothe Shravya², Babu Mathew¹, Vasundhra Bindal¹, Gaurav Tripathi¹, Manisha Yadav¹, Rimsha Saif¹, Neha Sharma¹, Ranjan Nanda², Chhagan Bihar³, Archana Rastogi³, Shvetank Sharma¹, Viniyendra Pamecha⁴, Shiv Kumar Sarin⁵, Jaswinder Singh¹, Maras¹

Institute Of Liver And Biliary Sciences, Molecular And Cellular Medicine, New Delhi-India¹, International Centre For Genetic Engineering And Biotechnology, Translational Health Group, New Delhi-India² Institute Of Liver And Biliary Sciences, Department Of Pathology, New Delhi-India³ Institute Of Liver And Biliary Sciences, Department Of Hepato-pancreato-biliary Surgery, New Delhi-India⁴ Institute Of Liver And Biliary Sciences, Department Of Hepatology, New Delhi-India⁵

Background / Hypothesis: Severe alcohol-associated hepatitis (SAH) is characterized by intense hepatic inflammation, impaired regeneration, and rapid clinical deterioration. We hypothesized that disrupted protein turnover reflects the failure of regenerative mechanisms in SAH and may identify biomarkers predictive of liver injury and recovery potential.

Materials and Methods: SAH patients, healthy controls, and liver donors received 70% D₂O, and plasma samples were collected at baseline, Days 1, 3, 5, and 7. LC-MS/MS analysis quantified turnover of pathology- and regeneration-related proteins, which correlated with disease severity. Key regeneration markers were validated in the ALD model and abstinent rats, and further confirmed in platelets of SAH patients, controls, and post-hepatectomy donors.

Results:

SAH plasma showed significantly higher protein turnover (0.38/day) compared to controls (0.23/day,

p<0.05). Turnover of 37 proteins was elevated, primarily involving inflammatory, complement, platelet activation, and ECM remodeling pathways, while 14 proteins involved in HDL assembly and BCR regulation were reduced (FC>1.5, p<0.05). ECM and fibrosis-related turnover cluster correlated with histological severity ($r^2=0.98$, p<0.05). Liver donors exhibited increased turnover of 50 proteins linked to platelet degranulation, complement activation, and HDL remodeling. Notably, LRG1 turnover and LRG1-mediated regenerative potential were significantly reduced in SAH patients (35%) compared to liver donors (100%, p<0.05). Alcohol abstinence in a preclinical ALD model restored hepatic LRG1 expression, its receptors (IL6r, IL4r, TGF β 2r, EGFr), and downstream survival/proliferation signaling (FC>1.5, p<0.05). Platelet degranulation, a source of LRG1, was impaired in SAH, contributing to compromised LRG1-mediated signaling and regeneration. Western blot analysis demonstrated higher plasma LRG1 in donor regeneration compared with SAH, and functional blockade of LRG1 delayed wound healing, validating its pro-regenerative role.

Conclusions: Leucine-rich alpha-2-glycoprotein 1 turnover, particularly from plasma or platelets, supports liver regeneration and may serve as a novel indicator of liver repair and regenerative capacity in alcohol-associated liver disease.

1380 - The SAFE DILI Model for the Dynamic Prediction of Liver Transplantation or Death in Idiosyncratic Drug Induced Liver Injury

Mengmeng Zhang¹, You Deng¹, Hao Niu², Cailun Zou³, Liwei Liu⁴, Liang Wang⁵, Fernando Bessone⁶, Ismael Álvarez-álvarez², Raúl J. Andrade², Xinyan Zhao¹ Beijing Friendship Hospital, capital Medical University, Liver Research Center, Beijing-China¹ Instituto De Investigación Biomédica De Málaga (ibima) – Plataforma Bionand; Hospital Universitario Virgen De La Victoria; Universidad De Málaga, Unidad De Gestión Clínica De Enfermedades Digestivas; Servicio De Farmacología Clínica, Málaga-Spain² The Fifth Medical Center Of PLA General Hospital, Senior Department Of Hepatology, Beijing-China³ Beijing You'an Hospital, Capital Medical University, Fourth Department Of Liver Disease (difficult & Complicated Liver Diseases And Artificial Liver Center), Beijing-China⁴ The Second Hospital & Clinical Medical School, Lanzhou University, Infectious Diseases Department, Gansu Province-China⁵ Hospital Centenario De Rosario, Department Of Gastroenterology, Santa Fe-Argentina⁶

ORAL ABSTRACTS

Background

&

Aims

decision

making.

Idiosyncratic drug induced liver injury (DILI) exhibits a highly variable clinical course, ranging from spontaneous recovery to liver transplantation (LTx) or death. Although existing models assist in risk stratification, they rarely provide individualized, time dynamic predictions. This study aimed to develop and externally validate a simple, clinically applicable model to dynamically estimate the risk of LTx or death in patients with DILI.

Methods

We included 2,170 adjudicated DILI cases from two Chinese cohorts (derivation cohort, n=938; validation cohort, n=741) and two independent international cohorts, the Spanish DILI Registry (n=344) and the Latin American DILI Network (n=147). The primary outcome was LTx or death. A Cox regression model incorporating baseline laboratory variables was developed and internally evaluated using Harrell's c index, time dependent area under the curve (AUC), calibration, and decision curve analysis. External performance was assessed across validation and confirmation cohorts.

Results

During follow up, LTx or death occurred in 38 patients in the derivation cohort and in 55, 12, and 9 patients in the validation and confirmation cohorts, respectively. The SAFE DILI model included total bilirubin, albumin, and international normalized ratio. The c index in the derivation cohort was 0.85; time dependent AUCs were 0.94, 0.90, 0.86, and 0.82 at 30, 90, 180, and 270 days, respectively. Both calibration and decision curve analyses demonstrated consistent agreement and clinical utility. High risk patients (SAFE DILI >1.05) had significantly lower transplant free survival at 30, 90, and 180 days compared with low risk patients in both the derivation and validation cohorts. SAFE DILI showed higher discriminatory ability than established prognostic tools such as nR-based Hy's law, the Spanish DILI prognostic algorithm and MELD, across all validation cohorts.

Conclusion

SAFE DILI offers a clinically practical and time dynamic approach for predicting transplant free survival in patients with DILI. Its robust validation in diverse, multicenter, international cohorts underscores its value in facilitating early risk stratification and personalized

1384 - Hepatitis A and E Guidelines created by the Japan Agency for Medical Research and Development (AMED) HAV and HEV Study Group
Tatsuo Kanda¹, Reina Sasaki-tanaka², Hiroaki Okamoto³

Uonuma Institute Of Community Medicine, Niigata University Medical And Dental Hospital, Division Of Gastroenterology And Hepatology, Minami-uonuma-Japan¹ Graduate School Of Medical And Dental Sciences, Niigata University, Division Of Gastroenterology And Hepatology, Niigata-Japan² Jichi Medical University School Of Medicine, Division Of Virology, Department Of Infection And Immunity, Shimotsuke-shi-Japan³

Background / Hypothesis: There have been no clinical practice guidelines for hepatitis A virus (HAV) and hepatitis E virus (HEV) infection in Japan. Materials and Methods: Therefore, in 2024, the Japan Agency for Medical Research and Development (AMED) HAV and HEV Study Group created and published "Recent advances in hepatitis A virus research and clinical practice guidelines for hepatitis A virus infection in Japan" and "Recent advances in hepatitis E virus research and the Japanese clinical practice guidelines for hepatitis E virus infection." Results: We will introduce these guidelines, which seem useful for the research and clinical practice for hepatitis A and E. Conclusions: These guidelines for HAV and HEV infection could shed light on their research and clinical practice in Japan as well as in Asian-Pacific countries.

1385 - Direct chemical reprogramming of urine derived stem cells from acute on chronic liver failure patients into hepatocyte like organoids to attenuate liver injury

Pengfei Yu¹, Jiateng Zhang¹, Jiaqi Li¹, Huaibin Zou¹, Zhongping Duan¹, Yu Chen¹
Beijing You An Hospital, Capital Medical University, Hepatology, Beijing-China¹

Background / Hypothesis: Acute-on-chronic liver failure (ACLF) has extremely high short-term mortality, while access to liver transplantation remains limited, creating an urgent need

ORAL ABSTRACTS

for safe, expandable autologous cells for bioartificial liver (BAL) support and cell therapy. Urine-derived stem cells (USCs) are easily and non-invasively obtained and show strong proliferative and immunomodulatory capacity. ACLF is characterized by TRF1/telomerase decline, PGC1- α downregulation and telomere-mitochondrial dysfunction with enhanced cellular senescence and apoptosis. We hypothesized that direct chemical reprogramming of ACLF-patient USCs (LF-USCs) into hepatocyte-like organoids (3D CiHep organoids) could restore the TRF1-PGC1 α -mitochondrial axis and thereby ameliorate liver injury in ACLF.

Materials and **Methods:** LF-USCs were isolated from urine of ACLF patients, expanded to $\leq P6$, and characterized for surface markers and tri-lineage mesenchymal differentiation. A three-stage small-molecule/cytokine protocol—definitive endoderm, hepatic progenitor cells, and hepatic differentiation/maturation—was used to generate chemically induced hepatocyte-like cells and 3D CiHep organoids, whose metabolic, detoxification, and secretory functions were evaluated. Concanavalin A (ConA)-induced acute liver injury and Fah-KO (M-NSG) liver failure mouse models were employed to assess intraperitoneal transplantation of N-USC- and LF-USC-derived 3D CiHep organoids, and telomere-mitochondrial parameters, senescence, injury, and apoptosis markers were quantified.

Results:

LF-USCs displayed typical “rice-grain” morphology, expressed CD73/CD90/CD105, and retained tri-lineage mesenchymal differentiation. LF-USC-derived 3D CiHep organoids were dominated by a mature hepatocyte phenotype, incorporated biliary epithelial elements, exhibited correct hepatocyte polarity with organized bile canaliculi networks, and showed near-adult liver function in albumin synthesis, ammonia/urea metabolism, CYP450-mediated drug metabolism, and bile acid/bilirubin handling. In both ConA and Fah-KO (M-NSG) models, LF-USC-derived 3D CiHep organoids substantially reversed ACLF-associated abnormalities, restoring TRF1, telomerase activity, PGC1- α , mtTFA, mtDNA content, and ETC I-V, while reducing SOD2, β -galactosidase, KIM-1, CYP2E1, and cleaved-caspase3/caspase3. Functionally, 3D CiHep organoids significantly lowered serum ALT/AST and pro-inflammatory cytokine levels, reduced hepatocellular necrosis and TUNEL-positive cells, and improved short-term survival compared with vehicle controls.

Conclusions:

Direct chemical reprogramming of LF-USCs into hepatocyte-like organoids yields an expandable

autologous liver cell source and restores the TRF1-PGC1 α -mitochondrial axis, improving telomere integrity and mitochondrial function while limiting senescence and apoptosis. These benefits translate into meaningful hepatoprotection in preclinical ACLF/liver failure models, supporting 3D CiHep organoids as a promising individualized BAL and cell-based.

1387 - The transcription factor PRDM5 is a novel pro fibrotic factor in liver fibrosis

Chaiyaboot Ariyachet ¹, Nuchanart Suntornnont ¹
Faculty Of Medicine, Chulalongkorn University,
Biochemistry, Bangkok-Thailand ¹

Background / Hypothesis: Hepatic stellate cells (HSCs) are the key cellular drivers of liver fibrosis, promoting the excessive production of the extracellular matrix (ECM). PRDM5, a PR-domain transcription factor, is crucial for ECM homeostasis, and its deficiency is known to reduce collagen production in fibroblasts. However, the role of PRDM5 in HSCs and liver fibrosis remains unknown. We hypothesized that PRDM5 plays a pro-fibrotic role by activating HSCs and driving the progression of liver fibrosis.

Materials and Methods: The role of PRDM5 was investigated using both loss-of-function (shRNA-mediated knockdown) and gain-of-function (overexpression) approaches in primary human HSCs. HSC activation phenotypes, including proliferation, migration, contraction, and collagen production, were examined. RNA sequencing was performed on PRDM5-knockdown cells to identify regulated pathways. The direct DNA binding of PRDM5 to target genes was demonstrated using a chromatin profiling assay (CUT&RUN) in HSCs. In vivo, PRDM5-knockout mice were generated and subjected to fibrosis induction using the CDAHFD (a model mimicking human MASLD for 8 weeks) and CCl₄ models (4 weeks). Fibrosis was assessed by Sirius red and Masson trichrome stainings, and liver function was examined by measuring blood serum aminotransferase, albumin, and total bilirubin levels. Finally, PRDM5 expression was investigated in human liver tissues with a spectrum of fibrotic levels from normal to cirrhosis, and its correlation with ECM gene expression was determined. PRDM5 expression was also investigated in human samples from other fibrotic diseases.

Results:

Knockdown of PRDM5 in human HSCs was found to suppress proliferation, migration, contraction, and

ORAL ABSTRACTS

collagen production, while PRDM5 overexpression yielded the opposite results. Transcriptomic analysis indicated that the depletion of PRDM5 markedly influenced ECM-related pathways, resulting in the downregulation of several ECM genes. Mechanistically, the CUT&RUN assay confirmed the presence of PRDM5 at the promoter of ECM genes. In vivo, PRDM5-knockout mice showed resistance to fibrosis in both the CDAHFD and CCl₄ models, accompanied by improved liver function. Clinically, PRDM5 was observed to be upregulated in human fibrotic liver tissues and demonstrated a strong positive correlation with ECM gene expression. Similar upregulation patterns were also observed in other fibrotic organs, including lung, heart, and skin.

Conclusions:

We show PRDM5 activates HSCs and drives ECM gene transcription through direct promoter binding, leading to enhanced fibrosis across diet- and chemical-induced liver injury models. This is the first study to show the critical role of PRDM5 in fibrotic diseases and suggest its potential as a novel therapeutic target.

Keyword(s) : PRDM5, Liver fibrosis, Hepatic stellate cells, Extracellular matrix, Transcriptional regulation

1389 - Variability of Presentation of Cholelithiasis in Relation to Etiology and Stages of Cirrhosis of Liver in a Tertiary Care Hospital in Dhaka City

M Golam Azam Azam Mg¹, Nabila Ferdous Ferdous N¹, Shireen Ahmed Ahmed S¹, Abdullah Al Mamoon Mamoon Aa¹, Tareq M Bhuiyan Bhuiyan Tm¹, A H M Rowshon Rowshon Ahm¹
Birdem, Gastroenterology And Hepatology, Dhaka-Bangladesh¹

Background: In patients with cirrhosis of liver, cholelithiasis has been recognized to have a higher incidence associated with high morbidities. The treatment of the cholelithiasis in cirrhotic patients has become a challenging issue. To manage these groups of people more effectively, we need better understanding between the relation of cholelithiasis and cirrhosis of the liver.

Aim and objective: The aim of this study is to see the demographic and clinical profile of cholelithiasis among cirrhosis of liver disease.

Materials and methods: This cross-sectional study was carried out at the Department of Gastroenterology and Hepatology of BIRDEM, Dhaka, Bangladesh. A total of 261 patients were enrolled. Among them, 131 were patients with cirrhosis of liver and the remaining 130 served as controls. Purposive type sampling was used to select study. Relevant history, physical examination,

laboratory investigations were recorded. Data were analyzed using the software SPSS 25. Result: In this study, cholelithiasis was significantly high in cirrhotic patient (34.4%) than in control (7.7%) ($p < 0.001$). Also found more often in male cirrhotic patients (68.9%) than in female (31.1%) ($p = 0.001$). A significant association was found between family history of cholelithiasis and the presence of gallstones in cirrhotic patients ($p = 0.003$). The stages of liver disease, as assessed by the Child- Pugh classification, cholelithiasis was found more often in decompensated liver disease (80%) than in compensated (20%) but this is not statistically significant. Cirrhosis with cholelithiasis significantly associated with HBV related etiology ($p = 0.001$) where non B non C etiology is significantly associated with cirrhosis without cholelithiasis group ($p = 0.038$). CBC, liver enzymes, and serum bilirubin did not show significant differences. Among patients with cholelithiasis, 31.1% were symptomatic, while 68.9% were asymptomatic. No significant association was observed between the presentation of cholelithiasis (symptomatic vs. asymptomatic) and common etiology of liver cirrhosis ($p = 0.614$) and also there were no significant associations with liver disease severity ($p = 0.156$).

Conclusion: Cholelithiasis is not uncommon among patients with cirrhosis of liver, among them a considerable portion have asymptomatic cholelithiasis. Presence of cholelithiasis in cirrhosis is significantly associated with male gender, having family history of gallstones and HBV related etiology. But there were no significant association between the presentation of cholelithiasis (symptomatic vs. asymptomatic) with common etiology of liver cirrhosis and stages of liver disease. These results emphasize the need for targeted screening and management strategies for this large group of patients.

Department Of Hepatobiliary, Pancreatic And Spleen
Surgery, Hengzhou-China ⁷

Background / Hypothesis: Conversion therapy can render initially unresectable hepatocellular carcinoma (HCC) amenable to potentially curative resection. No consensus guidelines exist about what criteria should guide when such surgery should be performed and how risk of postoperative recurrence should be assessed. The present study explored potential criteria for these purposes.

Materials and Methods: This multicenter retrospective study included 464 patients with initially unresectable HCC who underwent conversion therapy followed by hepatectomy at 24 medical centers in Guangxi, China. Recurrence-free and overall survival were determined using Cox regression and restricted cubic spline models for patients stratified according to radiological response rate and tumor size after conversion therapy, based on version 1.1 criteria for Response Evaluation Criteria in Solid Tumors (RECIST) or on modified RECIST criteria.

Results: Of the 2,219 patients screened for enrollment, 464 (403 men) aged 52.0 ± 10.5 years were analyzed, among whom conversion therapy led to complete response in 2 (0.4%) based on RECIST 1.1 or 78 (16.8%) based on mRECIST. Regardless of the choice of RECIST criteria, radiological response $\geq 40\%$ was associated with significantly longer recurrence-free and overall survival. Maximization of the log-rank statistic identified cut-off rates of 34.0% based on RECIST 1.1 and 42.0% based on mRECIST for optimal stratification of patients according to survival risk. Tumor downstaging after conversion therapy, which occurred in 142 patients (30.6%) based on RECIST 1.1 and 206 (44.4%) based on mRECIST, was associated with significantly longer recurrence-free and overall survival. Pathological complete response, which occurred in 122 patients (26.3%), was also associated with significantly longer recurrence-free survival (hazard ratio 0.45, 95% confidence interval 0.26–0.78) and overall survival (hazard ratio 0.28, 95% confidence interval 0.12–0.69).

Conclusions: Radiological response rate and tumor size following conversion therapy may be useful prognostic determinants for HCC recurrence. Predicting recurrence

risk following hepatectomy should also take into account whether pathological complete response was achieved.

Keyword(s) : hepatocellular carcinoma, conversion therapy, hepatectomy, radiographic response, tumor size

1396 - Exploring the efficacy of Systemic Inflammatory Markers in predicting outcomes post Transarterial Chemoembolization (c TACE & deb TACE)

Rajat Prabhakar Pande¹, Aswin Krishna¹, Vivek Ashokan¹, Joeimon JI¹, Premkumar K¹, Premkumar K¹
Madras Medical College & Rajiv Gandhi Government General Hospital, Hepatology, Chennai-India ¹

Background / Hypothesis: Tumour inflammation is the driving force behind tumour progression in hepatocellular carcinoma. Various prognostic markers can predict connection between inflammatory response and tumour microenvironment. Systemic inflammatory markers like lymphocyte monocyte ratio, systemic inflammatory index, neutrophil lymphocyte ratio can offer insight into the inflammatory milieu, which may predict the response to locoregional therapy.

Materials and Methods: This is a retrospective, single centre study done from January 2023 to March 2025 encompassing 43 patients with intermediate stage Hepatocellular carcinoma, undergoing transarterial chemoembolization (cTACE & debTACE) for tumour downstaging. Patients were evaluated for biochemical and inflammatory panel, serum AFP levels, imaging prior to undergoing transarterial chemoembolization. Post TACE follow up imaging was done at one month and three months to identify response using modified response evaluation criteria in solid tumours (mRESIST) criteria. Patients having severe liver or renal dysfunction, active infection were excluded from the study.

Results:

Total 43 patients fulfilling the inclusion criteria were included in the study and evaluated for response after TACE and median survival at 3 and 6 months. The median age of the participants was 55.84 ± 9.87 years consisting of 25.5% females and 74.4% males. The most common etiology was Chronic Hepatitis B, followed by Metabolic dysfunction associated steatotic liver disease & chronic Hepatitis C amongst others. 27.9% patients

ORAL ABSTRACTS

underwent drug eluting bead TACE and 72.09% patients underwent conventional TACE. Higher SII (p= 0.041)and lower LMR (p= 0.024) were associated with a poor tumour response. The ROC analysis for the Lymphocyte-to-Monocyte Ratio demonstrated a discriminative ability to predict treatment outcome in patients with HCC with a cut-off value of ≥ 2.2 [AUC- 0.892,(95% CI0.619 -0.976)]having better prognosis. AFP levels also correlated with the outcome to TACE (p=0.033) There was no significant difference in the outcome with debTACE as compared to cTACE.

Conclusions:

Peripheral inflammatory markers can unveil the dynamics between the tumour biology, the tumour stromal microenvironment and the immune response, serving as valuable prognostic indicators, predicting recurrence, disease progression and response. This study helps identify systemic inflammatory markers that can be incorporated prior to TACE, paving way for an enhanced therapeutic precision.

Keyword(s) : Hepatocellular Carcinoma, Systemic Inflammatory Markers, TACE

1399 - Trajectory Based Multidimensional Risk Scoring in a Single Center Retrospective Cohort Exploratory Development for Predicting Poor HBsAg Seroclearance Response in Chronic Hepatitis B

Functional Cure
Ying Liu ¹, Liting Yan ¹, Naijuan Yao ¹, Shuqiang Wang ¹,
Lin Tuo ¹
Sichuan Provincial People's Hospital, Department Of Infectious Diseases, Chengdu-China ¹

Background / Hypothesis:Chronic hepatitis B functional cure is associated with multiple markers—with HBsAg levels being particularly critical—yet methods for comprehensive dynamic multi-marker assessment to predict poor cure outcomes remain lacking. This single-center retrospective longitudinal study thus characterizes trajectories of multiple indicators—including HBsAg, ALT, AST, and Plate—in CHB patients on functional cure regimens (starting with pegylated interferon) and explores their links to cure outcomes.

Materials and Methods:A retrospective study included chronic hepatitis B (CHB) patients pursuing functional cure at Sichuan Provincial People's Hospital (2022–2025). Dynamic data of indicators (e.g., HBsAg, ALT) were collected. CHB Trajectory Clustering, multidimensional dynamic risk scoring, and treatment

failure probability model were used for grouping and analysis. Binary logistic regression explored associations between risk factors and treatment failure.

Results:A total of 166 chronic hepatitis B (CHB) patients were included in the analysis. Patients were classified into four trajectory types based on indicators including hepatitis B surface antigen (HBsAg): rapid high-clearance (22.8%, n=38), delayed high-clearance (26.5%, n=44), fluctuating (34.3%, n=57), and slow low-clearance (16.3%, n=27). Treatment failure rates were calculated for each trajectory type: 8.3% in the rapid high-clearance type, 15.6% in the delayed high-clearance type, 32.7% in the fluctuating type, and 68.2% in the slow low-clearance type. A comprehensive risk scoring system was further established, integrating five key dimensions: baseline HBsAg score, HBsAg reduction score, transaminase stability score, early response score, and trajectory type score. Additionally, a time-weighted risk prediction model for calculating treatment failure probability was developed, with the formula: $P_{failure} = \min(0.95, P_{baseline}(t) + \sum_{i=1}^n W_i \times I_i)$ (where $P_{baseline}(t)$ represents the time-dependent baseline failure probability, W_i denotes the weight of the i-th adverse risk signal, and I_i is the indicator variable for the presence of the i-th risk signal)

Conclusions:This study established an integrated system combining trajectory clustering and dynamic risk scoring, identifying four CHB treatment response trajectory types and quantifying their failure risks, with slow low-clearance patients having the highest failure risk. Five factors (including baseline HBsAg, early HBsAg reduction, ALT stability) correlated with treatment failure, with trajectory type as the strongest independent predictor (HR=8.48), highlighting the value of dynamic HBsAg monitoring in clinical decision-making.

Keyword(s) : Chronic Hepatitis B; Trajectory Clustering; Dynamic Risk Scoring; Treatment Outcome Prediction

1401 - Effects of the secondary metabolites of Terminalia arjuna on non alcoholic fatty liver disease in experimental mice model

Mst. Rejina Afrin ¹, Md. Shahinul Islam Shahin ¹, Kashmiri Pandit ¹, Sadikun Nahar Nodi ¹, Shohidul Kabir Emon ¹, Khandaker Tamanna ¹, Meratul Jannat ¹, Chowdhury Faiz Hossain ¹
East West University, Department Of Pharmacy, Dhaka-Bangladesh ¹

Background

Hypothesis:

ORAL ABSTRACTS

Fatty liver diseases, including non-alcoholic fatty liver disease (NAFLD) and NASH, are significant global health issues that can lead to severe conditions. Terminalia arjuna, a medicinal plant, is being studied for its potential liver-protective properties. The aim is to isolate its compounds and study their effectiveness in treating NAFLD.

Materials and Methods:

To create the NAFLD mouse model, Swiss albino male mice were injected with 200µg streptozotocin (STZ) and given a high-fat diet (HFD) for three months starting at one month of age. The NAFLD-induced mice were treated with four isolated secondary metabolites of T. arjuna using an oral dose of 50 mg/kg of body weight daily for one month starting from three months of age, while still being fed the HFD. After four months of age, all mice were sacrificed for further analysis. The histological changes and the percentage of fibrosis were quantified using hematoxylin & eosin (H&E) and Masson trichrome (MT) staining in the liver tissues, respectively. The dried powdered bark of T. arjuna was extracted using ethyl acetate. This extract was separated through chromatography and fractions rich in triterpene acid derivatives were purified by HPLC. The structures of the purified metabolites were elucidated using high-resolution ¹H- and ¹³C-NMR experiments.

Results:

The isolated secondary metabolites were arjunic acid, arjunoglucoside-1, arjungenin, and arjunolic acid. It was found that the body weight of NAFLD mice treated with the vehicle was significantly reduced, whereas the liver index and blood glucose levels were markedly elevated when compared to the normal mice. The blood glucose level and liver index were improved in all treatment groups. The NAFLD group showed significantly increased levels of glucose, creatinine, total cholesterol, triglycerides, and hepatic enzymes ALT, AST, and ALP in serum in comparison to the normal group. These parameters were significantly reduced in mice treated with arjunic acid, arjunoglucoside-1, arjungenin, and arjunolic acid compared to the untreated NAFLD mice. The NAFLD activity score (NAS) and percentage of fibrosis were significantly increased in the NAFLD group but significantly reduced in most treatment groups.

Conclusions:

The study findings indicate that all four secondary metabolites have hepatoprotective effects against NAFLD. Arjunic acid and arjungenin are particularly

effective. Further research is needed to elucidate the molecular mechanisms behind this effect.

Keyword(s) : arjunolic acid; arjunic acid, arjungenin, arjunoglucoside-1; fibrosis; non-alcoholic fatty liver disease; Terminalia arjuna

1408 - Predicting Recompensation and Exploring the Prognostic Benefit of its Durability in patients with HBV related decompensated cirrhosis

Yuwei Wang¹, Yaxin Li¹, Ying Han¹, Huiguo Ding¹
Beijing You'an Hospital, Capital Medical University, Department Of Gastroenterology And Hepatology, Beijing-China¹

Background / Hypothesis: Although a subset of patients with HBV-related decompensated cirrhosis can achieve recompensation following nucleos(t)ide analogue (NAs) therapy, the impact of recompensation durability on liver-related clinical outcomes remains insufficiently elucidated. Furthermore, the determinants of recompensation, particularly the prognostic value of virological response indicators and baseline decompensation complications, require further investigation.

Materials and Methods:

This retrospective-prospective cohort study enrolled patients with HBV-related decompensated cirrhosis receiving NAs therapy. Based on whether recompensation was achieved within the initial 2 years, patients were stratified into a recompensation group and a non-recompensation group. Those in the recompensation group were further divided into a long-term recompensation group and a non-long-term recompensation group based on maintaining recompensation for over 2 years. All patients were subsequently followed until the occurrence of clinical outcomes—including hepatocellular carcinoma (HCC), acute-on-chronic liver failure (ACLF), or liver-related death—or until the end of the study period in December 2024. We compared the cumulative incidence of clinical outcomes among these groups. Furthermore, we investigated the determinants of recompensation and developed a predictive model.

Results:

A total of 813 patients were enrolled with a median follow-up of 6 years. By year 2, 25.5% achieved recompensation. The recompensation rate was inversely correlated with the number of baseline complications (33.3% vs. 23.5% vs. 14.7% for patients with one, two, and three complications, respectively). Among patients

ORAL ABSTRACTS

with a single complication, the recompensation rate was highest in those with ascites (40.6%), followed by bleeding (23.8%) and hepatic encephalopathy (15.7%). Among those who achieved recompensation, 85.1% maintained long-term recompensation. The long-term recompensation group had lower cumulative incidence of HCC than the non-long-term group (5-year: 8.7% vs. 36.8%; 10-year: 18.3% vs. 43.9%) and also exhibited a reduced incidence of liver-related death. Virological response within 6 months (OR = 2.390, 95% CI: 1.671–3.458, $p < 0.001$) was an independent predictor for 2-year recompensation, and a prediction model incorporating this factor demonstrated good performance.

Conclusions:

Virological response within 6 months is a strong predictor of 2-year recompensation. Recompensation rates were lower in patients with more baseline complications or with hepatic encephalopathy as a single complication. Over 80% of patients maintained long-term recompensation and exhibited lower 5- and 10-year cumulative incidence of HCC and liver-related death than the non-long-term recompensation group, underscoring the necessity for continued clinical monitoring and risk assessment even after initial recompensation.

1410 - Characterization of Serum Cytokine Profile and Its Early Warning Value in Elderly Patients with Hepatitis E

Changyi Ji ¹, Mengmeng Gu ², Luyu Wang ¹, Jian Wu ², Zhao Qian ³

Bengbu Medical University, School Of Laboratory Medicine, Bengbu City, Anhui Province, China-China ¹

Suzhou Municipal Hospital, Laboratory Department, Suzhou City, Jiangsu Province, China-China ²

The Affiliated Suzhou Hospital Of Nanjing Medical University, Department Of Clinical Laboratory, Suzhou City, Jiangsu Province, China-China ³

Background / Hypothesis:Hepatitis E virus (HEV) is one of the public health problems threatening human health. The mortality rate of elderly people infected with HEV can reach 25% to 75%. With the intensification of global population aging, it is of great significance to study the HEV infection mechanism of this special population. This study aims to analyze the serum cytokine levels of elderly patients with hepatitis E and

explore the value of serum cytokine levels in predicting the severity and prognosis of elderly patients with hepatitis E.

Materials and Methods:This case-control study collected 35 elderly patients with acute hepatitis E (AHE), 40 elderly patients with acute liver failure related to hepatitis E virus (HEV-ALF), and 43 healthy elderly patients. First, the levels of 12 cytokines in the three groups of subjects were analyzed using immunofluorescence technology. Secondly, the serum cytokine levels of patients in the healthy elderly group and the HEV-infected group (AHE elderly group and HEV-ALF elderly group) were compared. The serum cytokine levels of patients in the AHE elderly group and the HEV-ALF elderly group were compared. According to the prognosis, 40 HEV-ALF patients were divided into the survival group (n=33) and the death group (n=6). Finally, univariate Logistic regression analysis, receiver operating characteristic (ROC) curve, and decision curve analysis (DCA) were used to evaluate the predictive and decision-making power of serum IL-4 level for prognosis.

Results:IL-8 was significantly highly expressed in the elderly HEV infection group. However, there was no statistically significant difference in the expression of the two cytokines, IL-5 and IL-12P70, between the healthy elderly group and the HEV infection group. The expression of serum cytokines is also correlated with the severity of hepatitis E progression. The AUC of serum TNF- α level for predicting severe hepatitis E was 0.747, with a sensitivity of 58.97% and a specificity of 82.86%. The AUC of serum IL-4 level for predicting death within 30 days in elderly patients with HEV ALF was 0.793, with a sensitivity of 100.00% and a specificity of 57.58%. DCA found that the serum IL-4 level has a good decision-making power for death within 30 days in elderly patients with HEV-ALF.

Conclusions:The level of serum TNF- α has a good predictive efficacy for the severe illness of elderly patients with AHE. The higher the level of serum IL-4, the worse the prognosis of patients with HEV-ALF.

Keyword(s) : Elderly patients with hepatitis E infection; Cytokine; Liver failure; Severe exacerbation; Prognosis

ORAL ABSTRACTS

1414 - Multi omics integration analysis identifies Molecular Signatures of Liver Stress in preclinical model of Acute Hypoxia

Sanju Yadav¹, Rupinder Kalra², Manisha Yadav¹, Neha Sharma¹, Gaurav Tripathi¹, Nupur Sharma¹, Jaswinder Singh Maras¹, Nasir Salam³
Institute Of Liver And Biliary Sciences, Molecular And Cellular Medicine, New Delhi-India¹ Banasthali Vidyapith,, Molecular And Cellular Medicine, Rajasthan-India² Jamia Millia Islmia, Department Of Biosciences, New Delhi-India³

Background / Hypothesis: Hypobaric hypoxia, as encountered at high altitudes, imposes systemic stress with significant yet understudied effects on the liver, a central hub for metabolic regulation. Short-term hypoxia may initiate harmful molecular changes, disrupting hepatic homeostasis. This study aimed to characterize temporal liver-specific proteomic and metabolic perturbations under acute hypoxic exposure.

Materials and Methods: Male Sprague-Dawley rats (n = 6 per group) were exposed to simulated 25,000 ft altitude for 1, 3, or 7 days using a hypobaric chamber. Liver tissues were harvested and subjected to untargeted high-resolution proteomics and metabolomics. Integrated analysis identified time-dependent molecular alterations linked to hepatic injury and stress adaptation.

Results: A total of 313 metabolites were upregulated by hypoxia ($p < 0.05$, $FC > 1.5$) associated with redox and mitochondrial pathways (glutathione, cysteine/methionine, thiamine metabolism, TCA cycle) reflecting stress response. key nitrogen and amino acid metabolism pathways such as ammonia recycling, histidine, beta-alanine were significantly suppressed, indicating impaired detoxification and antioxidant capacity in liver due to hypoxia. Proteomic profiling revealed 444 upregulated proteins related to stress signaling, lipid handling ($p < 0.05$, $FC > 1.5$). 586 proteins were downregulated associated with pathways involved in protein and amino acid metabolism, lipid metabolism, membrane trafficking, neurotransmitter transport, fatty acid oxidation, biological oxidations, proteasome degradation, and calcium signaling. The downregulation of these pathways indicates impaired hepatic biosynthesis, energy metabolism, detoxification, and protein turnover. Integration analysis showed that

significant increase in energy metabolism (TCA cycle) directly correlates to increase in Inflammatory (tryptophan catabolism, nucleotide metabolism and GPCR signaling) cascade ($R^2 > 0.7$, $p < 0.05$). Together, these alterations reflect compromised liver function and molecular disruptions contributing to metabolic stress, redox imbalance, and potential progression toward hypoxia-induced liver injury.

Conclusions: Short-term hypobaric hypoxia induces early hepatic molecular injury, marked by compromised nitrogen metabolism, proteostasis, and antioxidant defense, despite concurrent activation of redox and mitochondrial pathways. These findings underscore the liver's vulnerability to acute altitude exposure and highlight potential molecular targets for mitigating hypoxia-induced hepatic stress.

1416 - PPAR α Activation Restores GSDME Pyroptosis to Reverse Anti-PD 1 Resistance in HCC

Peng Chen¹, Zheyu Dong¹, Yongyin Li¹, Yuchuan Jiang²

Southern Medical University, Nanfang Hospital, Department Of Infectious Diseases, Guangzhou-China¹
The Second Affiliated Hospital Of Nanchang University, Department Of Gastroenterology, Nanfang-China²

Background / Hypothesis: Resistance to anti-Programmed cell death protein 1 (anti-PD-1) remains a major clinical obstacle in hepatocellular carcinoma (HCC). The fibroinflammatory liver microenvironment (FILM), characterized by excessive extracellular matrix deposition and immunosuppressive inflammatory cell infiltration, has been implicated in anti-PD-1 resistance; however, the underlying mechanisms remain poorly understood.

Materials and Methods:

Clinical HCC cohorts, FILM-induced syngeneic mouse models, and lipidomic, transcriptomic, and single-cell analyses were used to evaluate how FILM regulates tumor-cell pyroptosis and immunotherapy efficacy. Mechanistic assays including co-culture systems, ChIP-qPCR, rescue experiments, and ROS/caspase activity measurements were performed to delineate the FILM-PPAR α -PDK4-ROS-caspase-3-GSDME signaling axis. The therapeutic effects of PPAR α agonists were

ORAL ABSTRACTS

assessed in multiple mouse models and a retrospective patient cohort.

Results:

FILM selectively suppressed GSDME cleavage—rather than total GSDME abundance—resulting in diminished tumor-cell pyroptosis, impaired dendritic-cell activation, reduced cytotoxic T-cell infiltration, and anti-PD-1 resistance. Mechanistically, FILM-derived cancer-associated fibroblasts recruited and polarized NOS2⁺ macrophages, whose nitric-oxide production induced S-nitrosylation-dependent inhibition of the transcription factor SP1, thereby reducing PPAR α transcription. Reduced PPAR α activity led to decreased transcription of PDK4, suppressed mitochondrial ROS generation, attenuated caspase-3 activation, and ultimately blocked GSDME-mediated pyroptosis. Pharmacological PPAR α activation (GW7647 or fenofibrate) restored the PDK4-ROS-caspase-3-GSDME cascade, enhanced immunogenic tumor-cell death, reprogrammed the FILM-immunosuppressive niche, and synergized with anti-PD-1 therapy in multiple HCC models. Retrospective clinical analyses showed improved tumor shrinkage and progression-free survival in patients receiving fenofibrate plus anti-PD-1, particularly in tumors with preserved PPAR α expression.

Conclusions:

This study identifies PPAR α activation as a promising strategy to overcome FILM-induced anti-PD-1 resistance in HCC by restoring GSDME-mediated pyroptosis. Combining PPAR α agonists with immune checkpoint inhibitors represents a potential therapeutic approach for HCC patients, particularly those with FILM.

Keyword(s) : anti-PD-1 resistance, PPARA, Pyroptosis, GSDME

1417 - The Clarity Trial Prospective evaluation of pemafibrate therapy in MASLD

Takefumi Kimura ¹, Shun-ichi Wakabayashi ¹, Takanobu Iwadare ¹, Tomoo Yamazaki ¹, Naoki Tanaka ²
Shinshu University, Gastroenterology, Matsumoto-Japan ¹ Shinshu University, Global Medical Research Promotion, Matsumoto-Japan ²

Background

The Clarity trial was designed to prospectively evaluate the metabolic and hepatic effects of pemafibrate in metabolic dysfunction-associated steatotic liver disease (MASLD). Although pemafibrate exerts potent triglyceride-lowering effects, prospective studies integrating paired biochemical and histological

endpoints remain limited. We hypothesized that pemafibrate-based therapy would improve clinical, biochemical, and particularly histological markers in MASLD with hypertriglyceridemia.

Materials and Methods
Clarity (UMIN000052895) is a single-center prospective study enrolling adults with biopsy-proven MASLD and hypertriglyceridemia who required longitudinal histological assessment. Pemafibrate 0.2 mg/day and nutritional counseling were initiated after baseline evaluation. The primary endpoint was paired histological change at week 52, including fibrosis stage, steatosis, lobular inflammation, ballooning, and NAFLD activity score (NAS). Secondary endpoints included biochemical, metabolic, and elastography-based changes. This interim analysis included 14 patients completing ≥ 52 weeks of follow-up with paired biopsies (median age 60 years, IQR 45–71; 7 men and 7 women). Median (IQR) differences were assessed using the Wilcoxon signed-rank test.

Results

The primary histological endpoint demonstrated significant improvement. Fibrosis stage decreased from 3 (2–3) to 2 (1–3) ($p = 0.015$), with 7 of 14 patients showing fibrosis regression. Lobular inflammation improved from 2 (1–2) to 1 (1–1) ($p = 0.005$). Steatosis grade remained stable at 1 (1–2) at both time points ($p = 0.41$), while hepatocellular ballooning showed a modest reduction. NAS decreased from 4 (4–5) to 3 (2–4) ($p = 0.0076$). Regarding secondary endpoints, body weight decreased from 75.1 (70.0–89.4) to 71.3 (67.4–87.2) kg ($p = 0.0067$), and triglycerides from 143 (125–198) to 96 (82–119) mg/dL ($p = 0.013$). Liver enzymes decreased significantly: AST from 55.0 to 30.5 U/L ($p = 0.0067$), ALT from 77.5 to 27.5 U/L ($p = 0.0085$), GGT from 80.0 to 30.5 U/L ($p = 0.0166$), and ALP from 271.5 to 172.0 U/L ($p = 0.0107$). Liver stiffness improved from 12.7 (8.8–20.3) to 7.5 (6.1–10.5) kPa ($p = 0.0088$), while controlled attenuation parameter remained unchanged. No pemafibrate-related adverse events occurred.

Conclusions

This interim analysis of the Clarity trial shows significant improvement in the primary histological endpoint—particularly fibrosis and lobular inflammation—together with favorable biochemical and metabolic changes in MASLD with hypertriglyceridemia. These findings suggest potential hepatic benefit of pemafibrate, although confirmation in the full cohort is required before therapeutic implications can be established.

Keyword(s) : MASLD, pemafibrate, paired biopsy, prospective study, hypertriglyceridemia, fibrosis regression

1418 - Efficacy of Sulfasalazine in Patients with Primary Biliary Cholangitis and Incomplete Response to Ursodeoxycholic Acid

Li Wei¹, Yu Zhang¹, Jing Xu¹, Huan He¹, Taiyu He¹, Duo Li¹, Hong Ren¹, Peng Hu¹, Yinghua Lan¹, Mingli Peng¹

The Second Affiliated Hospital, Chongqing Medical University, Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Institute For Viral Hepatitis, Chongqing-China¹

Background / Hypothesis: Approximately 40% of primary biliary cholangitis (PBC) patients exhibit incomplete response to ursodeoxycholic acid (UDCA), leading to increased disease progression risk and limited second-line therapeutic options. Our preliminary animal studies suggested sulfasalazine (SASP), which is a classic drug for inflammatory bowel disease, alleviates cholestatic liver injury via activation of peroxisome proliferator-activated receptor α (PPAR α). This study aimed to evaluate the efficacy of SASP combined with UDCA in UDCA-nonresponsive (UDCA-NR) patients and to further investigate its underlying mechanisms of action.

Materials and Methods: This single-center, prospective, single-arm exploratory study enrolled 8 UDCA-NR patients. UDCA-NR was defined as a serum ALP level $>1.67 \times \text{ULN}$ after stable UDCA therapy (≥ 12 months). All patients maintained UDCA at 13–15 mg/kg/day and received SASP at 1.5 g/day for 48 weeks. The primary endpoint was the composite biochemical response rate at week 48, defined as meeting all the following criteria: (1) serum ALP $<1.67 \times \text{ULN}$ (specifically <225 U/L for females and <208 U/L for males); (2) a $\geq 15\%$ decrease in ALP from baseline; and (3) serum total bilirubin $\leq \text{ULN}$ ($28 \mu\text{mol/L}$). Metagenomic sequencing, fecal bile acid profiling, and flow cytometry were used to investigate the specific mechanisms underlying the therapeutic effects of SASP.

Results: Following 48 weeks of SASP combined therapy, composite biochemical response rate was 62.5% (5/8), with ALP normalization rate of 25% (2/8). Serum ALP, γ -GGT, ALT and AST decreased significantly compared

with baseline; no serious adverse events were reported. Metagenomic sequencing showed SASP increased relative abundance of the genera *Blautia* and *Bifidobacterium*, while decreasing that of *Alistipes putredinis*, *Parasutterella*, and *Klebsiella*. Fecal bile acid profiling revealed that, although total bile acid levels showed no significant change pre- versus post-intervention, SASP elevated UDCA, GUDCA, and TUDCA, and reduced the toxic secondary bile acids DCA and LCA. Flow cytometry indicated SASP ameliorated peripheral Th17 (T helper 17 cell)/Treg (regulatory T cell) immune imbalance and increased double-negative (IgD⁻CD27⁻) B cells. Subgroup analysis identified high baseline relative abundance of *Escherichia coli*, *Ruminococcus gnavus*, *Streptococcus* spp. was associated with non-response to SASP, while high baseline *Blautia obeum* associated with treatment response and more substantial Th17/Treg balance improvement.

Conclusions: This study demonstrates that SASP effectively elicits a biochemical response with a favorable safety profile in UDCA-NR PBC patients. Its mechanism of action involves modulation of the "gut microbiota-bile acid-immune" axis. These findings indicate that SASP may serve as an effective second-line treatment option for UDCA-NR PBC patients, which warrants further investigation.

Keyword(s) : Primary biliary cholangitis, Sulfasalazine, Ursodeoxycholic acid nonresponse, Gut microbiota, Bile acids

1419 - Evodiamine alleviates liver fibrosis by targeting the ANXA2 PI3K AKT CCND1 axis in hepatic stellate cells

Yong Sun¹, Zongyi Liu¹, Jing Xiao¹, Hang You¹, Yu Zhang¹, Li Wei¹, Ning Ling¹, Hong Ren¹, Peng Hu¹, Mingli Peng¹

The Second Affiliated Hospital, Chongqing Medical University, Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Institute For Viral Hepatitis, Chongqing-China¹

Background / Hypothesis: Liver fibrosis is a pivotal pathological process in chronic liver disease progression, characterized by hepatic stellate cell (HSC) activation and excessive deposition of extracellular matrix. Currently, no highly effective anti-fibrotic drugs are available for clinical use. This study aimed to screen natural compounds derived from clinically used

ORAL ABSTRACTS

traditional Chinese medicine (TCM) anti-fibrotic formulations for their HSC-targeting activity and to investigate their mechanisms of action.

Materials and Methods: Using network pharmacology combined with ADME screening, potential core active components were screened from Anluo Huaxian Pills, Fuzheng Huayu Formula, and Biejia Ruangan Formula. The inhibitory effects of candidate compounds on HSC activation were evaluated in a TGF- β 1-induced LX-2 cell model. The in vivo efficacy of evodiamine (EVO) was comprehensively assessed in three liver fibrosis models: CCl₄-induced hepatotoxic, DDC diet-induced cholestatic, and high-fat diet combined with CCl₄ (HFD+CCl₄)-induced NASH-related liver fibrosis. Direct molecular targets were identified using DARTS, biolayer interferometry (BLI), and cellular thermal shift assay (CETSA). Further mechanistic insights were gained through gene silencing, overexpression, and pathway intervention studies.

Results: Among the 23 candidate compounds, evodiamine significantly inhibited the expression of TGF- β 1-induced HSC activation markers (TGF- β , COL1A1, and α -SMA) and effectively suppressed HSC proliferation. All three liver fibrosis models confirmed that evodiamine (50 mg/kg/day) markedly ameliorated liver injury (ALT, AST), reduced HSC activation and collagen deposition, and showed no observable organ toxicity. Additionally, it improved cholestatic parameters (ALP, Tbil, TBA) in the DDC model and alleviated metabolic disturbances (dyslipidemia and insulin resistance) in the NASH model. Mechanistic studies revealed that Annexin A2 (ANXA2) is a direct target of evodiamine in HSC. ANXA2 was highly expressed in activated HSCs and fibrotic liver tissues, with levels correlating positively with fibrosis severity. Evodiamine promoted ANXA2 ubiquitination and proteasomal degradation, inhibited the downstream PI3K/AKT signaling pathway, and downregulated CCND1 expression, thereby blocking HSC activation and proliferation. Functional assays confirmed that ANXA2 inhibition replicated the anti-fibrotic effects of evodiamine, while its overexpression attenuated the drug's efficacy.

Conclusions: This study successfully identified the natural compound evodiamine from traditional Chinese medicine formulations as a potent inhibitor of HSC activation. We demonstrate for the first time that evodiamine exerts its anti-fibrotic effects by directly targeting ANXA2/PI3K/AKT/CCND1 axis in HSCs. These findings provide an experimental basis for developing evodiamine as a promising candidate for the treatment of liver fibrosis.

Keyword(s) : Evodiamine, liver fibrosis, hepatic stellate cells, Annexin A2, PI3K/AKT

1422 - Unveiling the pathogenesis and early warning biomarkers of acute liver failure associated with disulfidptosis through bioinformatics analysis and experimental validation

Qi Yang ¹, Xiaoxuan Liu ¹, Wenling Wang ¹, Yu Chen ¹, Li Bai ¹

Beijing Youan Hospital, Capital Medical University, Fourth Department Of Liver Disease, Beijing-China ¹

Background / Hypothesis: Acute liver failure (ALF) represents a clinical syndrome with rapid onset and high mortality. Nevertheless, the pathogenesis, early warning and treatment of ALF remain to be elucidated. Disulfidptosis is a newly identified form of regulated cell death. The potential role and clinical value of disulfidptosis in ALF has not been explored yet. **Materials and Methods:** We employed bioinformatics analysis, machine learning, and experimental validation to investigate this hypothesis. Four microarray datasets (GSE14668, GSE38941, GSE62029 as training datasets, and GSE96851 as the independent validation cohort) were retrieved from the Gene Expression Omnibus (GEO) database using the search terms 'acute liver failure' and 'ALF'. ALF-related modules were identified using WGCNA. ALF-specific disulfidptosis-related genes (ALF-DRGs) were screened by intersecting module genes, differentially expressed genes (DEGs), and disulfidptosis-related genes (DRGs). Hub genes were identified through machine learning algorithms, and their early warning power was evaluated. Expression levels were validated in ALF mice and patients using qPCR and immunohistochemistry (IHC). Immune infiltration analysis was performed, and transcription factor (TF) and miRNA regulatory networks were predicted.

Results: Eight ALF-DRGs were screened out, of which, four genes including SLC7A11, IQGAP1, GYS1 and PDLIM1 were identified as hub genes. DCA, calibration curve and ROC analysis exhibited their high early warning power for ALF. The mRNA and protein levels of SLC7A11 and IQGAP1 were significantly elevated in the

ORAL ABSTRACTS

livers of ALF mice and patients. Immune infiltration analysis revealed significant correlations between hub genes and various immune cells. Furthermore, TF and miRNA prediction identified potential upstream regulators of hub genes. Conclusions: Disulfidptosis probably holds a pivotal place in the pathogenesis of ALF, and four disulfidptosis-related hub genes exhibit high early warning power for ALF. Our work provides novel insights into the pathogenesis, early warning and treatment of ALF.

Keyword(s) : Acute liver failure; Disulfidptosis; Machine learning; Early warning; Immune infiltration

1423 - Characterisation of people living with chronic hepatitis B virus infection in China and stratification by HBsAg levels

Yuanyuan Kong ¹, Xiaohua Li ², Mei Yang ³, Ying Shen ⁴, Sida Wei ⁴, Xin Li ⁴, Xin He ⁵, Lydia Demetriou ⁶, Menchi Wu ⁷, Huifen Yang ⁸, Jidong Jia ⁹, Myriam Drysdale ¹⁰

Ltd, Innovative Healthcare Solution, Rwe Global, Shanghai-China ⁴ Gsk, Value Evidence And Outcomes, Shanghai-China ⁵ Gsk, Clinical Development, London-United Kingdom ⁶ Gsk, Medical Affairs – Hep, Shanghai-China ⁷ The Second Hospital Of Tianjin Medical University, Department Of Infectious Diseases And Immunology, Tianjin-China ⁸ Beijing Friendship Hospital, Capital Medical University, Liver Disease Center, Beijing-China ⁹ Gsk, Epidemiology, London-United Kingdom ¹⁰

Background / **Hypothesis:**
Chronic hepatitis B virus (HBV) infection is a significant global public health concern, particularly in China where prevalence is high, leading to serious outcomes such as cirrhosis and hepatocellular carcinoma (HCC). Hepatitis B surface antigen (HBsAg) levels impact treatment response, with low levels predicting better outcomes. However, quantitative HBsAg (qHBsAg) testing is not routinely conducted, leading to limited published data. This study describes patients' characteristics, clinical outcomes and HBsAg loss according to different qHBsAg levels measured at the index date among adults with chronic HBV infection in mainland China.

Materials and **Methods:**
This retrospective cohort study used Tianjin regional electronic health records from 82 hospitals in China

(January 1, 2016–December 31, 2023). Adult patients with a documented diagnosis of chronic HBV infection and at least one qHBsAg measurement were eligible. The index date was the date of the first recorded qHBsAg test, which was required to occur within 12 months before or after initial chronic HBV infection diagnosis. Analyses' baseline was set at one year prior to the index date; patients' demographic and clinical characteristics were assessed during the baseline period. A sub-cohort of patients without major liver adverse outcomes (MALO), including compensated or decompensated cirrhosis, HCC or liver transplant at baseline, was identified to estimate rates of subsequent clinical and virological outcomes during follow-up.

Results:

A total of 33,826 patients were included (mean [SD] age 43.3 [13.4] years; 57.8% male). At baseline, 14.4% patients had qHBsAg ≤100 IU/mL, 21.8% >100–≤1000 IU/mL, 21.6% >1000–≤3000 IU/mL and 42.2% >3000 IU/mL. HBeAg positive rates increased with HBsAg levels (8.5% for ≤100 IU/mL to 55.6% for >3000 IU/mL). Among a sub-cohort of 28,731 patients without MALO at baseline (mean [SD] age 41.7 [12.9] years; 55.9% male), 5380 (18.7%) were ever treated with nucleos(t)ide analogues (NAs) and 388 (1.4%) with interferon; 13.4% developed compensated cirrhosis, 8.6% decompensated cirrhosis, 3.9% HCC, and 1.6% died in-hospital or underwent liver transplant during an average follow-up of 4.5 years; 656 (2.3%) achieved HBsAg loss (262 [6.7%] with baseline qHBsAg ≤100 IU/mL, 113 [1.9%] with >100–≤1000 IU/mL, 79 [1.4%] with >1000–≤3000 IU/mL and 202 [1.5%] with >3000 IU/mL). Among those without MALO at baseline who were treated with NAs, 122 (2.3%) experienced HBsAg loss.

Conclusions: This large chronic HBV infection cohort reveals the distribution of qHBsAg levels in real-world clinical settings and may help identify patients more likely to achieve functional cure with emerging therapies.

Funding: GSK (study 219254).

1426 - Double plasma molecular adsorption system improves 90 day survival in patients with acute on chronic liver failure

Xiao Che ¹, Jingran Jiao ¹, Shuang Li ¹, Manman Xu ¹, Yu Chen ¹
Beijing You'an Hospital, Capital Medical University, Beijing Key Laboratory Of Liver Regeneration And

ORAL ABSTRACTS

Artificial Liver Transformation Research, Beijing-China ¹

Background / Hypothesis: Acute-on-chronic liver failure (ACLF) is a clinical syndrome with high mortality, characterized by rapid hepatic deterioration triggered by an acute insult in individuals with underlying chronic liver disease. As a liver replacement therapy, artificial liver support systems are now extensively employed in the management of ACLF. However, the survival benefits of the double plasma molecular adsorption system (DPMAS) and its combined modalities remain incompletely elucidated and warrant further investigation.

Materials and Methods: Clinical data of hospitalized ACLF patients admitted to Beijing You'an Hospital, Capital Medical University, from January 2022 to June 2025 were prospectively collected, with 90-day follow-up. ACLF was diagnosed according to at least one of the following: Asian Pacific Association for the Study of the Liver (APASL), European Association for the Study of the Liver (EASL), or the 2025 Chinese guideline. Kaplan-Meier analysis evaluated survival, and univariable and multivariable Cox regression assessed the prognostic impact of DPMAS.

Results: A total of 624 ACLF patients were enrolled and divided into the DPMAS group (n=235) and control group (n=389) according to DPMAS therapy (alone or combined). After 1:1 propensity score matching (PSM) based on MELD, MELD-Na, and ACLF grades, 235 patients remained in each group. Post-matching, 90-day transplant-free survival was higher in the DPMAS group than in controls (58.3% vs. 43.4%, $P < 0.05$). Stratified analysis by ACLF grade showed a significant survival benefit of DPMAS in grade 0-1 patients (64% vs. 48%, $P < 0.05$), but not in grades 2 or 3. When stratified by MELD-Na, DPMAS conferred a survival advantage in patients with MELD-Na ≥ 25 (53% vs. 29%, $P < 0.05$), but not in lower tiers. In patients with ACLF grade 0-1 and $15 \leq \text{MELD-Na} < 25$, 90-day survival was higher in the DPMAS group (60% vs. 43%, $P < 0.05$). Multivariate Cox analysis in this subgroup indicated that DPMAS independently reduced 90-day mortality by 44% (HR = 0.56, 95% CI: 0.37–0.89, $P < 0.05$).

Conclusions: DPMAS therapy was associated with a significant reduction in mortality among ACLF patients, with the most pronounced benefit observed in those with ACLF grades 0-1 and $15 \leq \text{MELD-Na} < 25$.

Keyword(s) : DPMAS, ACLF, Prognosis, ACLF grades, MELD-Na

1431 - Persistent sarcopenia confers a cumulative risk of fibrosis progression and liver related events in biopsy proven metabolic dysfunction associated fatty liver disease

Siru Wu¹, Shuyan Chen¹, Yameng Sun¹, Xiaofei Tong¹, Mengyang Zhang¹, Xiao Han¹, Chenglin Sun¹, Yankun Gao¹, Xiaoning Wu¹, Hong You¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China ¹

Background / Hypothesis: Baseline sarcopenia is associated with fibrosis progression and liver-related events (LREs) in patients with metabolic dysfunction-associated fatty liver disease (MAFLD), yet the prognostic value of its dynamic status remains unclear. We aimed to investigate the effect of dynamic changes in sarcopenia status on LREs and fibrosis progression characterized by liver stiffness measurement (LSM) increasing across risk thresholds.

Materials and Methods: Patients with biopsy-proven MAFLD were enrolled from a prospective cohort with follow-up every 6 months for longitudinal assessment of LSM and appendicular skeletal muscle mass (ASM). ASM was measured via bioelectrical impedance analysis (BIA). Sarcopenia was defined as ASM/body weight $< 29.0\%$ in men and $< 22.9\%$ in women, or an ASM/BMI ratio < 0.789 in men and < 0.512 in women. Primary endpoints were liver fibrosis progression (defined as an upward LSM transition from < 10 kPa to 10–15 kPa, or from 10–15 kPa to ≥ 15 kPa), non-invasive diagnosis of clinically significant portal hypertension (CSPH, Baveno VII criteria) and LREs (decompensated cirrhosis, liver transplantation, hepatocellular carcinoma, and liver-related death). Patients were stratified by dynamic sarcopenia status into non-sarcopenia (no occurrence) and sarcopenia (any occurrence) groups; the latter was subdivided into persistent (present at all visits) and non-persistent sarcopenia (incident or reversed sarcopenia). Prognostic risk was quantified using conventional and time-dependent Cox regression analyses.

Results: A total of 239 patients were included. Sarcopenia was identified in 67 (28.0%) patients at a median age of 53 years (IQR: 39–60), with 65.7% being female. During a median follow-up of 36 months, disease progression occurred in 34 (14.2%) patients. Progression rates were significantly higher in the sarcopenia group compared to the non-sarcopenia group (22.4% vs 11.1%, $P = 0.024$; Log-rank $P = 0.025$). In multivariate Cox regression adjusted for age, baseline diabetes, creatinine, PLT, and ALB, sarcopenia remained an independent risk factor for disease progression (HR=2.153, 95% CI: 1.067–4.343, $P=0.032$). Subgroup analysis revealed that persistent sarcopenia accounted

ORAL ABSTRACTS

for the principal risk of disease progression compared to the non-sarcopenia group (26.3% vs 11.1%, $P = 0.014$), whereas non-persistent sarcopenia showed no significant risk. Time-dependent Cox analysis confirmed the significant dynamic risk of sarcopenia in both univariate (HR=1.039, 95% CI: 1.006-1.073, $P = 0.019$) and multivariate analysis (HR=1.036, 95% CI: 1.003-1.071, $P = 0.032$). Conclusions: Dynamic sarcopenia status is significantly associated with the risk of disease progression, and persistent sarcopenia confers a substantial cumulative risk of disease progression, independent of metabolic comorbidities.

1436 - HBV Inhibits Stress Granule Formation by Hijacking SG Core Proteins into the Nucleocapsids

Danjuan Lu ¹, Yi Wang ¹, Ting Zhang ¹, Wenhui Song ¹, Xiangmei Chen ¹

Peking University Health Science Center, Department Of Microbiology And Infectious Disease Center, Beijing-China ¹

Background / Hypothesis: Hepatitis B virus (HBV) infection is the leading cause of chronic hepatitis B, cirrhosis, and hepatocellular carcinoma (HCC) worldwide. Due to the incomplete understanding of the mechanisms of virus-host interactions, there is currently a lack of effective therapeutic drugs for chronic hepatitis B. Stress granules (SGs) are membrane-less cellular compartments that form upon exposure to various environmental stressors including viral infection, and play a critical role in the antiviral response of host cells. Many viruses have developed distinct strategies to suppress SG assembly for survival. However, the relationship between HBV and SG formation remains unknown.

Materials and Methods: In this study, we performed immunofluorescence staining of G3BP1 and used confocal microscopy to examine the impact of HBV replication on SG formation. The role of viral proteins in SG assembly was investigated by overexpressing assay. To determine whether the suppression of SGs is mediated by encapsidation process, we treated cells with CpAMs or mutated key packaging sites mutations (polymerase R105A or core Y132A). Meanwhile, polysome profiling and ribosome sequencing were performed to investigate the effect of SGs on viral translation and replication.

Results: Our study indicated that although HBV infection and replication induce phosphorylation of eIF2 α -the trigger of SG formation, no SGs were observed in HBV-replicating cells. Conversely, HBV infection and replication significantly inhibit SG formation triggered by various stimuli. This inhibitory effect was abolished by treatment with the CpAMs, and the mutation in key packaging sites, indicating that encapsidation process is essential for HBV-mediated SG suppression. Mechanistically, proteomic analysis of nucleocapsid-associated proteins revealed the sequestration of SG core components within viral capsids. Overexpression of these SG proteins rescued SG formation, confirming their functional hijacking by HBV. On the other hand, we confirmed SGs mediated the arrest of HBV translation, thereby suppressing viral replication. Conclusion: HBV replication subverts SG formation by sequestering core SG components into capsids, sustaining viral replication by evading translational arrest, which offers critical insights into the HBV-host interaction and viral replication strategy.

Conclusions: HBV replication subverts SG formation by sequestering core SG components into capsids, sustaining viral replication by evading translational arrest, which offers critical insights into the HBV-host interaction and viral replication strategy.

1447 - N acetyl cysteine plus corticosteroid versus corticosteroid alone for treatment of acute severe autoimmune hepatitis a randomized clinical trial

Ahad Eshraghian ¹, Alireza Taghavi ¹, Alireza Shamsaeefar ², Saman Nikeghbalian ²
Avicenna Transplant Hospital, Gastroenterology And Hepatology, Shiraz-Iran ¹ Avicenna Transplant Hospital, Transplant Surgery, Shiraz-Iran ²

Background / Hypothesis: Corticosteroids are mainstay of treatment in patients with acute severe autoimmune hepatitis (AS-AIH). However, a proportion of these patients will need liver transplantation due to liver failure and its complications. While N acetyl cysteine (NAC) has been used in patients with acute liver failure, there is no data about its usefulness in patients with AS-AIH. In this study, we aimed to investigate the impact of NAC in treatment of patients with AS-AIH.

ORAL ABSTRACTS

Materials and Methods:
In a prospective controlled trial, patients diagnosed with AS-AIH were randomized to receive prednisolone alone or prednisolone plus N acetyl cysteine (150 mg/kg/hour then 12.5 mg/kg/hour for 4 hours and 6.25 mg/kg/ hour for 16 hours). Intravenous NAC (600 mg twice daily) was continued for the next 3 days. Prednisolone was started with a dose of 60 mg per day for the first 10 days and tapered with 10 mg every 10 days. Patients were followed for 6 months. Primary outcome was liver transplant free survival and secondary outcomes were time to recovery and overall survival. Recovery was defined as decreasing INR below 1.5 (INR <1.5) with declining aminotransferase and bilirubin. AS-AIH was defined based on the international autoimmune hepatitis group score as acute presentation of AIH with an international normalized ratio (INR) ≥ 1.5 and without liver cirrhosis and hepatic encephalopathy.

Results:

A total of 57 patients diagnosed with AS-AIH and mean age of 31.03 ± 8.95 years were included. There were 47 women (82.5 %) and 10 men (17.5 %). Thirty one patients were assigned to receive NAC and prednisolone and 26 patients were assigned to receive prednisolone alone. Liver transplant free survival was 93.4 ± 4.5 % in patients who received NAC and 72.7 ± 8.8 % in patients who did not receive NAC (log rank, $P=0.025$). In a multivariable cox regression model treatment with NAC was an independent predictor of liver transplant free survival at 6 months follow-up (HR: 8.84; 95 % CI: 1.17 – 66.66; $P=0.035$). Overall survival was 93.5 ± 4.4 % in patients who received NAC and 88.5 ± 6.3 % in patients who did not receive NAC(log rank, $P=0.47$). Time to recovery was shorter in patients who received NAC compared to those who did not receive NAC (OR: 4.86; 95 % CI: 1.49- 15.79; $P=0.007$).

Conclusions:

Treatment with NAC added to corticosteroid was associated with improved transplant free survival and will shorten time to recovery in patients with AS-AIH.

Keyword(s) : acute severe autoimmune hepatitis; N acetyl cysteine; liver transplantation; Corticosteroid

1456 - Determination of Ankyrin Repeats Domain (ANK) of RNASE L Gene in Hepatitis C Patients and its effects on Viral Load

Anum Liaquat Ali¹, Sikandar Ali²
Smbbmc, Pathology, Karachi-Pakistan Civil Hospital,

Nicu,

Karachi-Pakistan

2

Background / Hypothesis:

: Hepatitis C virus (HCV) is one of the major global causes of death. Different types of gene are involved as Ankyrin repeat domains of RNASE L gene. It performs a significant role in antiviral response, regulated by interferon, and involved in cleavage of RNA. Therefore, aim of this study was to identify Ankyrin repeat domain expression in Hepatitis C positive patients and correlate it with viral load of Hepatitis C.

Materials and Methods:

: In this study, a total of 80 HCV positive patient's whole blood samples were investigated. RNA was extracted from plasma followed by Real Time PCR for quantization of HCV viral load and genotypic analyses. DNA was also extracted from these samples followed by PCR amplification of Ankyrin repeat domain of RNASE L gene. Data was analyzed using SPSS

Results:

All of the patients (n=80) included in study had HCV infection. Mean age of patients was 50.86 ± 14.84 years. Among them, 48(63.8%) were males and 32 (36.1%) were females. Majority of patients were males and belonged to age group 58-73 years age. All HCV infected individuals 36 (45%) had HCV genotype 3 and had viral loads mean range 837404.21 ± 1302 . Therefore, Ankyrin repeats domain of RNASE L gene expression was high in HCV patients sample with viral load of 17.00 ± 15.1 .

Conclusions:Ankyrin repeat domain expression was observed in Hepatitis C patients and its significant correlation with viral load of Hepatitis C. Ankyrin repeat domain of RNASE L gene in conjunction with therapeutic intervention are required for establishing better strategies for controlling HCV infection.
Keywords: Hepatitis C Virus; Ankyrin Repeat; Ribonuclease L; Polymerase Chain Reaction (PCR).

1459 - Revisiting HepaScore New Evidence for Non Invasive Fibrosis Assessment in Indonesian Patients with Chronic Hepatitis B

Meti Metiani¹, Muhammad Begawan Bestari¹, Eka Surya Nugraha¹, Dolvy Girawan¹, Nenny Agustanti¹, Ali

ORAL ABSTRACTS

Djumhana¹, Siti Aminah¹
Universitas Padjadjaran, Hasan Sadikin General Hospital,
Gastroenterohepatology Division, Department Of
Internal Medicine, Bandung-Indonesia¹

Background / Hypothesis:
Liver fibrosis assessment is essential in the management and prognosis of chronic hepatitis B (CHB). Although liver biopsy remains the gold standard, its invasiveness and risks highlight the need for accurate non-invasive alternatives. This study aimed to re-evaluate HepaScore — a novel fibrosis index — and compare its diagnostic performance with APRI and FIB-4 using transient elastography (TE) as the reference standard. To our knowledge, this is the first study to apply HepaScore in an Indonesian CHB cohort.

Materials and Methods:
This cross-sectional diagnostic study included 90 CHB patients, equally divided into fibrosis (n=45) and non-fibrosis (n=45) groups based on TE results. Univariable and bivariate analyses, along with Receiver Operating Characteristic (ROC) curve testing, were performed to assess diagnostic accuracy. Metrics including AUC, sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), and likelihood ratio (LR) were calculated for HepaScore, APRI, and FIB-4.

Results:
HepaScore demonstrated the highest diagnostic performance with an AUC of 0.860 (95% CI: 0.771–0.924; $p < 0.001$), outperforming APRI (AUC 0.796, 95% CI: 0.698–0.874) and FIB-4 (AUC 0.623, 95% CI: 0.515–0.723). When combined with APRI, HepaScore achieved an optimal AUC of 0.895 (95% CI: 0.813–0.950; $p < 0.001$). The HepaScore-APRI combination improved diagnostic accuracy to 86.7% (sensitivity 84.4%, specificity 88.9%).

Conclusions:
HepaScore shows superior diagnostic accuracy compared with APRI and FIB-4 in detecting liver fibrosis among CHB patients. Combining HepaScore with APRI yields the most reliable non-invasive approach, particularly valuable in resource-limited settings where TE is unavailable.

Keyword(s) : HepaScore; APRI; FIB-4; chronic hepatitis B; liver fibrosis; non-invasive diagnosis; transient elastography.

1461 - A Retrospective Study on PD 1 CTLA 4 Bispecific Antibody Therapy Promoting Partial Functional Cure of Hepatitis B in Patients with HBV Related Hepatocellular Carcinoma
Chuyue Xiong¹, Jianing Wang², Yang Li², Fanping Meng²

The Fifth Medical Center Of PLA General Hospital, Senior Department Of Infectious Diseases, Beijing-China¹ The Fifth Medical Center Of Chinese PLA General Hospital, Senior Department Of Infectious Diseases, Beijing-China²

Background:
Immunocheckpoint inhibitors (ICIs), particularly those targeting programmed death-1 (PD-1) and cytotoxic T-lymphocyte-associated protein 4 (CTLA-4), have shown potential in reversing T-cell exhaustion in chronic hepatitis B (CHB). While PD-1 monotherapy trials demonstrate preliminary efficacy, the role of CTLA-4 targeting in CHB remains unclear. This study evaluated the impact of PD-1/CTLA-4 bispecific antibody therapy on hepatitis B surface antigen (HBsAg) clearance in patients with HBV-related hepatocellular carcinoma (HCC).

Materials and Methods:
In this retrospective cohort study, 78 HCC patients receiving PD-1/CTLA-4 bispecific antibody therapy at the Fifth Medical Center of the Chinese PLA General Hospital (September 2022–October 2024) were screened. After applying inclusion criteria, 20 HBV-HCC patients comprised the PD-1/CTLA-4 group. Using propensity score matching (1:2), a control group (n=39) receiving PD-1 inhibitor monotherapy was matched for gender, age, HBV DNA load, and HBsAg titer. Factors associated with HBsAg loss or >1 log decline were analyzed via competing risk Cox regression.

Results:
The baseline characteristics of the two groups showed no significant differences. With a median follow-up time of 17.8 months, one patient (5.8%) in the PD-1/CTLA-4 group achieved HBsAg loss, while no patients in the PD-1 group reached this endpoint. The incidence of HBsAg decline >1 log was 20.00% (5/20) in the PD-1/CTLA-4 group compared to 7.69% (3/39) in the PD-1 group (Fig.1 A). Competing risk Cox regression analysis revealed that the cumulative incidence of HBsAg loss or decline >1 log was significantly higher in the PD-1/CTLA-4 group than in the PD-1 group ($P = 0.017$) (Fig.1 B). After adjusting for competing risks of mortality, multivariate analysis confirmed that PD-1/CTLA-4 therapy (hazard ratio [HR] 5.119; 95% CI 1.337–19.603; $p = 0.017$), HBV DNA ≥ 1000 IU/mL (HR 0.998; 95% CI

ORAL ABSTRACTS

0.996-1.000; $p = 0.032$), and total bilirubin (TBIL) level (HR 0.859; 95% CI 0.740-0.997; $p = 0.046$) were significantly associated with HBsAg loss or decline >1 log (Fig.1 C).

Analysis of overall survival (OS) showed no significant difference between the PD-1/CTLA-4 group and the PD-1 group (Fig.1 D). Furthermore, HBsAg loss or decline was not correlated with OS in both groups (Fig.1 E). However, a trend toward improved OS was noted in PD-1/CTLA-4 responders (Fig.1 F-G).

Conclusions:

PD-1/CTLA-4 bispecific antibody therapy significantly enhances HBsAg clearance compared to PD-1 monotherapy in HBV-HCC patients, supporting further investigation of dual ICI strategies for CHB functional cure. Larger prospective studies are needed to validate these findings.

Keyword(s) : Immunocheckpoint inhibitors; Chronic hepatitis B; PD-1/CTLA-4 bispecific antibody; Functional cure

1463 - Real World Outcomes of Durvalumab Plus Tremelimumab (STRIDE) for Unresectable Hepatocellular Carcinoma in Japanese Patients

Jikei University School Of Medicine, Division Of Gastroenterology And Hepatology, Department Of Internal Medicine, Tokyo-Japan³
Showa Medical University Koto Toyosu Hospital, Digestive Disease Center, Tokyo-Japan⁴
Tokyo Women's Medical University, Department Of Medical Oncology, Tokyo-Japan⁵
Department Of Medicine, Nihon University School Of Medicine, Division Of Gastroenterology And Hepatology, Tokyo-Japan⁶

Background / Hypothesis: Atezolizumab plus bevacizumab has been widely adopted as first-line therapy for unresectable hepatocellular carcinoma (uHCC). In Japan, the durvalumab plus tremelimumab regimen (STRIDE) was approved in December 2022. STRIDE is distinct from prior systemic therapies for HCC in that it consists solely of immune checkpoint inhibitors without VEGFR inhibition. Notably, STRIDE has demonstrated durable long-term survival, with reported 5-year and 6-year survival rates of 19.4% and 17.1%, respectively.

However, concerns remain regarding early disease progression and the comparatively high incidence of immune-mediated adverse events (imAEs), and the optimal patient population for STRIDE remains unclear. This study aimed to evaluate real-world treatment outcomes and identify clinical indicators that may guide therapy selection.

Materials and Methods: We retrospectively analyzed 65 patients with uHCC who received STRIDE and were registered in a multi-center cohort study of hepatobiliary malignancies (BLOOM study) up to October 2025. Patient characteristics, objective response rate (ORR), disease control rate (DCR), progression-free survival (PFS), and imAEs were evaluated.

Results:

The median age was 68 years (range 15–86), and 55 patients (84%) were male. Etiology included HCV in 8 patients (12%), HBV in 8 (12%), and non-viral disease in 49 (76%). ECOG performance status was 0/1 in 53/12 patients. Child–Pugh scores were 5/6/ ≥ 7 in 30/21/14 patients, and the median ALBI score was -2.36 (range -3.8 to -1.26). BCLC stage was B/C in 19 (29%)/46 (71%). STRIDE was administered as first-line therapy in 43 patients (64%) and as second-line or later in 22. Among 58 evaluable patients, ORR was 20% (12/58), and DCR was 50% (29/58). Median PFS was 6.1 months (95% CI: 3.7–not reached). STRIDE as initial treatment showed numerically higher ORR (25% vs. 13%; $P = 0.329$) and significantly longer PFS compared with later-line use (not reached vs. 2.7 months; HR, 0.31; 95% CI, 0.15–0.60; $P < 0.01$). IMAEs occurred in 24 patients (36%), including 11 with ≥ 3 events. The most frequent severe toxicities were colitis, adrenal insufficiency, and dermatologic events (each $n=2$).

Conclusions:

Real-world data suggest that STRIDE provides superior PFS when used as initial treatment, supporting the clinical importance of tremelimumab single priming at treatment initiation. Early-line use may maximize therapeutic benefit in patients with uHCC.

Keyword(s) : hepatocellular carcinoma,STRIDE

1466 - A new prediction model based on plasma ammonia and the Chinese Group on the Study of Severe Hepatitis B ACLF II score for patients with Hepatitis B virus related acute on chronic liver failure.

ORAL ABSTRACTS

Yuan Zhu ¹, Yunyun Wang ¹, Yan Li ¹, Weijun Zhou ¹,
Yijing Cai ¹, Mingqin Lu ¹
The First Affiliated Hospital Of Wenzhou Medical
University, Department Of Infectious Diseases,
Wenzhou-China ¹

Background / **Hypothesis:**
Early risk prediction is essential to reduce the mortality
of patients with hepatitis B virus-related acute-on-
chronic liver failure (HBV-ACLF). We aim to establish a
new short-term prognosis (28 days) model for patients
with HBV-ACLF.

Materials and **Methods:**
We designed a new model (COSSH II -AMM) based on
the serum ammonia (AMM) and the Chinese Group on
the Study of Severe Hepatitis B-ACLF- II score (COSSH-
ACLF II s) by multivariate COX regression analysis in
the deriving cohort of 408 patients with HBV-ACLF from
October 2012 to August 2024. External validation was
carried out using data from another 92 patients with
HBV-ACLF.

Results:
The serum ammonia/reference laboratory upper limit of
normal for ammonia (AMM-ULN) levels were
significantly elevated in non-survivors compared to
survivors (1.2 vs. 0.88, $P < 0.001$). The cut-off of AMM-
ULN was 1.6 determined by using X-tile. With an area
under the area under the curve (AUROC) of 0.875 for 28-
day mortality prediction, the COSSH II-AMM model
showed significantly better performance than existing
prognostic models (Child-Pugh: AUROC=0.725; MELD:
AUROC=0.820; AARC: AUROC=0.833; CLIF-C ACLF:
AUROC=0.853; COSSH-II-ACLF: AUROC=0.860). The
cut-off of COSSH II-AMM was 6.4 determined by using
X-tile. Kaplan-Meier analysis revealed significantly
divergent survival curves between patients with COSSH
II-AMM scores < 6.4 and those with scores ≥ 6.4 ($P <$
0.0001). The COSSH II-AMM scoring system
demonstrated significantly improved concordance
between predicted and observed overall survival (OS)
outcomes in the derivation cohort when compared with
conventional prognostic models.

Conclusions:

Our study substantiated the prognostic value of blood
ammonia levels in predicting 28-day mortality among
HBV-ACLF patients. The novel prognostic score (COSSH
II-AMM) significantly improves survival prediction
accuracy in patients with HBV-ACLF.

Keyword(s) : Hepatitis B virus; Acute-on-chronic liver
failure; Ammonia; Prediction model; Mortality.

1468 - Multicenter evaluation of the efficacy and safety of rechallenge with immune checkpoint inhibitors in unresectable hepatocellular carcinoma

Jian-hong Zhong ¹, Jing-kun Chen ¹, Jia-liang Wei ²,
Zhen-dong Yang ², Shao-ping Liu ³
Guangxi Medical University Cancer Hospital,
Department Of Hepatobiliary Surgery, Nanning-China ¹
First Affiliated Hospital Of Guangxi Medical University,
Department Of Oncology, Nanning-China ² Guigang
People's Hospital, Department Of Hepatobiliary
Surgery, Nanning-China ³

Background / Hypothesis: Immune checkpoint inhibitors
(ICIs) are a standard treatment for unresectable
hepatocellular carcinoma, but sometimes they must be
discontinued because of resistance or immune-related
adverse events. The present study explored whether
later resuming ICI therapy in such patients
("rechallenge") can improve their prognosis.

Materials and Methods: Data were retrospectively
analyzed for patients treated between March 2019 and
May 2024 at 12 medical centers in China. Patients had
unresectable hepatocellular carcinoma and were initially
treated with ICIs, which were discontinued due to
resistance or severe immune-related adverse events and
then later resumed. Event-free survival, objective
response and disease control based on RECIST 1.1
criteria, as well as incidence and severity of immune-
related adverse events, were assessed separately during
first- and second-line ICI therapy.

Results: The final analysis included 272 patients (247
men) with a median age of 50 (IQR 43-58) years old at
enrollment; first-line ICIs were discontinued in 253
patients (93.0%) because of tumor progression. Both
first- and second-line therapies lasted a median of 3.0
months and, for approximately 80% of patients,
involved the combination of ICIs and targeted agents
rather than ICI monotherapy. During first- or second-
line therapy, respective median event-free survival times
were 5.3 (95% CI 4.7-5.9) months and 4.4 (95% CI 3.8-
5.0) months, objective response rates were 23.2% and
18.4%, disease control rates were 69.9% and 48.2%, and
rates of immune-related adverse events of grades 3-4
were 18.4% and 19.9%. Objective response was
observed in 26 patients (9.6%) during both therapy lines,
while 10 (12.2%) suffered disease progression during
first-line therapy yet achieved partial response during
second-line treatment. No deaths due to immune-
related adverse events occurred during the study.

Conclusions: ICI rechallenge following tumor

ORAL ABSTRACTS

progression or severe immune-related adverse events can benefit some patients with unresectable hepatocellular carcinoma without posing additional safety risks.

Keyword(s) : Hepatocellular Carcinoma, Immune Checkpoint Inhibitors, Rechallenge, Tumor Progression

1469 - Targeting NEK9 in hepatocellular carcinoma to remodel immune microenvironment and enhance immunotherapy

Guofang Lu¹, Yulong Shang¹
Xijing Hospital, Air Force Medical University, Gastroenterology And Hepatology, Xi-China¹

Background / **Hypothesis:**
Hepatocellular carcinoma (HCC) is a leading cause of cancer-related mortality, often associated with immune evasion that hampers the effectiveness of therapies. This study explores the role of NEK9, a kinase involved in regulating immune microenvironment remodeling in HCC, and its potential as a therapeutic target to enhance the efficacy of immune checkpoint inhibitors, such as PD-L1 blockade.

Materials and **Methods:**
We analyzed NEK9 expression in clinical HCC samples and its correlation with prognosis. Genetic manipulation and pharmacological inhibition of NEK9 were employed in HCC cell lines and mouse models. The effects of NEK9 on immune cell infiltration, PD-L1 expression, and tumor progression were assessed. The combination of NEK9 inhibition and PD-L1 blockade was tested to evaluate its therapeutic potential.

Results:
NEK9 expression was significantly elevated in HCC tissues and correlated with poor prognosis. Mechanistically, NEK9 facilitated the stabilization of NF- κ B2 by phosphorylating TRIM28 and USP46, leading to increased PD-L1 expression and myeloid-derived suppressor cell (MDSC) accumulation. Inhibition of NEK9 reduced PD-L1 levels, restored CD8⁺ T cell infiltration, and improved the response to PD-L1 blockade, demonstrating enhanced antitumor effects both in vitro and in vivo.

Conclusions:
NEK9 plays a crucial role in immune evasion in HCC by stabilizing NF- κ B2 and promoting PD-L1-mediated immune suppression. Targeting NEK9 can effectively remodel the tumor immune microenvironment, enhancing the efficacy of immunotherapies, particularly in combination with immune checkpoint inhibitors.

Keyword(s) : Hepatocellular carcinoma, kinase, immunotherapy

1471 - Biomolecular Mapping of Circulating Extracellular Vesicles to Develop AI Driven Prognostic Panels for Stratifying Acute Liver Failure Patients at Risk of Early Mortality

Neha Sharma¹, Sushmita Pandey¹, Rimsha Saif¹, Vasundhra Bindal¹, Manisha Yadav¹, Sanju Yadav¹, Nupur Sharma¹, Babu Mathew¹, Gaurav Tripathi¹, Vipul Sharma¹, Rakhi Maiwall², Shvetank Sharma¹, Shiv Kumar Sarin², Jaswinder Singh Maras¹
Institute Of Liver And Biliary Sciences, Molecular And Cellular Medicine, New Delhi-India¹ Institute Of Liver And Biliary Sciences, Department Of Hepatology, New Delhi-India²

Background / Hypothesis: Acute liver failure (ALF) is a severe condition with high mortality, marked by microbial and metabolic factors in the blood. Plasma-derived exosomes, reflecting inflammation, offer a non-invasive tool to identify ALF patients at high risk of early mortality.

Materials and Methods: Plasma samples from 320 subjects (270 ALF, 50 healthy) were analyzed for EV isolation using PROSPR, characterized by Transmission Electron Microscopy (TEM), Dynamic light scattering (DLS) and Nano particle tracking analysis (NTA) and Proteomics. Meta-proteomics and metabolomics were performed on 50 ALF and 20 controls. EV data were correlated with clinical parameters and ALF complications. A diagnostic metabolite panel was identified and validated in a separate cohort (220 ALF; 153 non-survivors, 67 survivors) using HRMS and machine learning.

Results: Plasma-derived exosomes (120–200 nm) were characterized with a concentration of $3.25 \times 10^{11} \pm 0.55$ particles/mL, zeta potential of -30.67 ± 3.6 mV, and >20 EV-specific proteins (Vesiclepedia). Metabolomics and meta-proteomics of exosome cargo identified over 1000 metabolites and bacterial peptides from >15 phyla and >25 genera. More than 800 metabolites were differentially expressed in ALF exosomes, with greater differences in non-survivors ($FC > 1.5$, $p < 0.05$). Non-survivor specific metabolites showed increased Sugar metabolism and Beta oxidation of long chain fatty acid, Primary bile acid synthesis linked to advanced glycation end products and inflammation ($p < 0.01$). Bacterial-peptide based alpha/beta diversity was higher in ALF more so in Non-survivors corresponding to increase in Bacteroidota, Actinomycetota functionally linked to energy and xenobiotic metabolism ($p < 0.05$). A strong correlation ($r^2 > 0.91$, $p < 0.05$) between Shannon-metabolome, Shannon-bacterial diversity, functionality,

ORAL ABSTRACTS

and clinical parameters suggest that EV metaproteomic cargo drives metabolomic cargo and its functionality in Non-survivors ($p < 0.05$). Higher EV levels of *Enterococcus faecium* and *Klebsiella pneumoniae* in non-survivors correlated with metabolites and severity ($r^2 > 0.8$, $p < 0.05$). The panel of 5 key EV metabolites (4-Amino-2-methyl-5-phosphomethylpyrimidine (10.9-logFolds), Deoxycholic 3-glucuronide (8.8-logFolds), 2'-Deoxyinosine (4.78-logFolds), D-erythro-1-(Imidazol-4-yl)glycerol 3-phosphate (4.17-logFolds) and Palmitoyl sphingomyelin (3.8-logFolds), showed diagnostic accuracy $> 95\%$ (AUC=0.98) with Hazard Ratio (17.58). In panel of key Metabolites, significant increase in Deoxycholic-3-glucuronide level showed highest normalized importance and predicted early-mortality with $> 95\%$ accuracy/sensitivity/specificity using ANN and ML. Interestingly, beta glucuronidase upregulated (> 2 -fold), leading to a notable rise in conjugation of Deoxycholic Acid into Deoxycholic-3-glucuronide and downregulation of ABCB3 (MRP3) transporter leads regulation of intracellular accumulation of bile acids and activity of MAPK signaling which contributed to hyper-inflammation and oxidative in ALF-non-survivors.

Conclusions: Plasma-derived exosome metabolite cargo panel indicates hyper-inflammation and advanced glycation specific to non-survivors, potentially identifying ALF patients at risk of early mortality.

1472 - Divergent immune resolution and protracted immuno metabolic memory in hepatitis E revealed by cross species multi omics

Yining Liang¹, Tianxu Liu², Xiaoman Liu¹, Lin Wang², Yijin Wang¹
Southern University Of Science And Technology, Department Of Pharmacology, Shenzhen-China¹
Peking University Health Science Center, Department Of Microbiology And Infectious Disease Center, Beijing-China²

Background : Hepatitis E virus (HEV) infection is typically self-limited in immunocompetent hosts but can lead to severe outcomes such as fulminant hepatitis in pregnant women or immunocompromised individuals. Current evidence suggests that liver injury is driven by dysregulated host immunity rather than direct viral cytopathy. To comprehensively delineate the dynamic immune landscape of HEV infection, we applied an

integrated multi-omics and cross-species approach.

Materials and Methods: We performed a longitudinal multi-omics analysis in a rabbit model infected with HEV genotype 3. Liver and serum samples were collected at baseline (HEV-BL), first viremia (HEV-F), peak viremia (HEV-P), and viral clearance (HEV-N) stages. Transcriptomic and proteomic profiles were generated from liver tissues, and metabolomic sequencing was conducted on serum. For cross-species validation, we analyzed public transcriptomic data from HEV gt1- and HCV-infected chimpanzees (GSE22160).

Results:

In rabbits, hepatic transcriptomics revealed phased immune activation with sustained enrichment of adaptive immunity pathways—including T cell activation and antigen presentation—even post-clearance, indicating failure to restore immunological homeostasis. CD8⁺ T cell activity remained suppressed throughout infection, while innate immune populations (eosinophils, neutrophils, Th17 cells) persisted, reflecting a maladaptive state with unresolved inflammation. Proteomic analysis confirmed broad and persistent immune activation, with all differentially expressed proteins upregulated across stages and antigen presentation pathways consistently enriched. Metabolomic profiling identified enhanced T cell-associated pathways (Th1/Th2/Th17 differentiation, NF- κ B signaling) at peak viremia, suggesting metabolic reinforcement of adaptive immunity. Integrated multi-omics highlighted purine metabolism as a cornerstone pathway persistently activated during infection and resolution. Cross-species analysis in chimpanzees demonstrated a potent but transient type I interferon response that resolved rapidly after viral clearance. Critically, comparative profiling with HCV revealed fundamentally distinct immune resolution kinetics: HEV triggered rapid interferon-stimulated gene downregulation post-clearance, whereas HCV maintained sustained immune activation, underscoring a virus-specific host engagement strategy.

Conclusions:

Our findings unveil a protracted immuno-metabolic memory post-HEV clearance, characterized by unresolved innate activation and metabolic reprogramming. This study redefines the paradigm of HEV immunopathogenesis and offers novel insights for biomarker discovery and immunomodulatory interventions in high-risk populations.

1473 - Dominant Neoantigens in Liver Cancer Malignant Ascites

Dongbo Chen¹, Hongsong Chen¹
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China¹

Background / **Hypothesis:**
Neoantigen-based immunotherapies have shown promising efficacy in liver cancer, driven by the strong immunogenicity of neoantigen-reactive T cells, which are key effectors of immune checkpoint blockade (ICB). However, most patients present with advanced disease, limiting access to tumor tissue for neoantigen profiling. Malignant ascites, enriched with tumor cells, offers a feasible liquid biopsy alternative. This study aimed to determine whether dominant neoantigens exist in malignant ascites from advanced liver cancer patients and to assess their potential as personalized immunotherapy targets.

Materials and **Methods:**
Ascites samples from cirrhosis and advanced liver cancer patients were collected. Using flow cytometry, we isolated the 7-AAD⁻ CD45⁻ CD326⁺ tumor cell subset (P7 population). For samples with <2,000 cells, RNA and DNA were amplified using Smart-seq2 and the Discover-sc WGA kit. Whole-exome and RNA sequencing were performed to define somatic mutations and mutational signatures. Candidate neoantigens were predicted using VEP and NetMHCpan-4.1 based on peptide-HLA binding affinity, after removing redundant sequences and accounting for HLA loss-of-heterozygosity. Tetramer staining, flow cytometry, ELISPOT, and ELISA were used to evaluate neoantigen-specific T cells and immunogenicity.

Results:

We established a workflow enabling rare tumor cell isolation from malignant ascites for sequencing. Liver cancer patients showed significantly higher numbers of P7 tumor cells in ascites than in peripheral blood or cirrhotic controls. Single-cell sequencing revealed partial overlap between mutations in ascites-derived cells and primary or metastatic lesions. In eight patients, C>T/G>A transitions predominated, with mutational signatures corresponding to COSMIC signatures 1, 3, 12, 15, and 30. NetMHCpan analysis identified multiple putative neoantigens derived from TOP3A, TUBB6, NUTM2G, AFAP1, FGD2, NFKBIZ, and CLDND1. Tetramer assays confirmed neoantigen-specific T cells in ascites, characterized by high CD39 expression. Functional assays validated strong immunogenicity of an HLA-A*02:01-restricted AFAP1-derived neoantigen,

suggesting it as a dominant candidate.

Conclusions:

Malignant ascites from advanced liver cancer patients provides a valuable source for identifying dominant neoantigens, offering a practical strategy for discovering actionable targets in individuals lacking tumor tissue for neoantigen-based personalized immunotherapy.

Keyword(s) : liver cancer, ascites, dominant neoantigens, immunotherapy

1476 - Prediction of microvascular invasion in HCC using spatiotemporal radiomics of contrast enhanced ultrasound a deep learning model with tumor microenvironment correlation

Chuan Pang¹, Jie Yu¹, Ping Liang¹
Chinese PLA General Hospital, Interventional Ultrasound, Beijing-China¹

Background / **Hypothesis:**
The presence of microvascular invasion (MVI) in hepatocellular carcinoma (HCC) is a critical prognostic indicator, but it can only be diagnosed by postoperative histopathology. Contrast-enhanced ultrasound (CEUS), with its dynamic microvascular imaging capability, holds promise in prediction of MVI.

Materials and **Methods:**
Leveraging TimeSformer to construct and evaluate the deep learning model MAPUSE for predicting MVI, we utilized a total of 5,148 CEUS videos (>3,300,000 frames) from 1,716 HCC patients across 23 nationwide centers. After training (n=495) and validating (n=213), MAPUSE was tested on two hold-out test cohorts from the same 23 centers using different microbubble agents - Sonovue (n=92) and Sonazoid (n=98), three subgroups (tumor size >5cm, 3-5cm and <3cm) and two prospective cohorts from southern and northern China (n=120 & 130). Additionally, we conducted a transcriptomics analysis on bulk RNA sequencing data from 203 patients and single-cell RNA sequencing data from 12 patients in the training and validation cohorts. We also explored the self-attention mechanism of MAPUSE in the prospective cohort. Using overlap weighting method to mimic RCT, we tested the clinical implications of MAPUSE for immunotherapy in a cohort of 568 HCC patients after ablation, whose MVI status could not be histopathologically confirmed.

Results:
AUCs of MAPUSE in prediction of MVI in Sonovue set, Sonazoid set and both sets were 0.835, 0.858 and 0.851,

ORAL ABSTRACTS

respectively. In subgroup analysis, MAPUSE showed excellent performance in >5cm tumors (AUC=0.978) and good performance in 3-5cm tumors (AUC=0.814) and <3cm tumors (AUC=0.756). In two prospective cohorts, MAPUSE achieved AUCs of 0.886 and 0.847. The transcriptomics analysis revealed a significant association between MAPUSE and immune processes involving infiltration of CD8+ T cells. By exploring the self-attention mechanism, downregulated CD8+ T cells were observed within surgical section corresponding to peri-tumor strong attention areas. Additionally, patients after ablation with positive MVI predicted by MAPUSE can benefit from immunotherapy.

Conclusions:

The MAPUSE model is an AI model that potentially enables real-time ultrasound scanning for predicting MVI while visualizing information of the tumor immune microenvironment such as CD8+ T cell infiltration. It can not only realize the preoperative noninvasive detection of MVI, but also provide clinical decision-making basis for patients who cannot obtain pathological MVI diagnosis.

Keyword(s) : microvascular invasion, hepatocellular carcinoma, contrast-enhanced ultrasound, tumor microenvironment

1481 - Development and validation of brain age clock from psychometric hepatic encephalopathy score for early detection of hepatic encephalopathy

Xin Wen¹, Tianyi Xue¹, Ran Fei¹, Suzhen Jiang¹, Yanpei Mai¹, Yanhui Yang¹, Yuxi Shi¹, Qinshuo Wang¹, Huiying Rao¹, Zixing Wang¹
Peking University, Peking University Hepatology Institute, Beijing-China¹

Background / **Hypothesis:**
Brain age models derived from MRI or EEG are constrained by cost and accessibility. The Psychometric Hepatic Encephalopathy Score (PHES), a neuropsychological battery for hepatic encephalopathy (HE) screening, exhibits a strong age dependency, which complicates its original purpose, suggesting its potential as a convenient functional brain age estimator. We propose and validate machine learning-based methods for estimating brain age, and evaluate whether the resulting brain age gap (the difference between predicted brain age and chronological age) serves as a valid tool for early detection of HE.

Materials and **Methods:**
The brain age model was derived from a multi-regional survey of healthy Chinese adults (20-79 years) that

employed a stratified sampling strategy across geographic regions, urban/rural residence, gender, and age groups. Exclusion criteria included hepatic, neurological, and psychiatric conditions, as well as sensory impairments that affected PHES test performance. Five machine learning algorithms were trained to predict chronological age from education level and PHES subtest scores. For clinical validation, a cohort of cirrhosis patients from Peking University People's Hospital was employed for evaluation, where the model's performance in predicting the 6-month risk of hepatic encephalopathy was quantified by the area under the ROC curve (AUC). The screening performance of the brain age gap was compared to the conventional PHES scoring system.

Results:

Three of five PHES tests (NCT-A, NCT-B, and DST) exhibited significant linear relationships with age ($p < 0.001$), which were also key variables selected by Boruta feature selection. These tests, in addition to education level, were used to construct linear regression, random forest, SVM, and XGBoost models, achieving mean absolute errors of 0.518-7.694 years in predicting age, a level that is comparable to and superior to current standards using the brain image approach. When applied to cirrhosis patients, the median model-derived brain age gap was -1.4-2.2 (IQR: 13.7-27.4), with larger gaps correlated with poorer self-perceived health. The novel age-gap approach outperformed conventional PHES scoring in predicting HE onset within 6 months, AUCs of 0.657-0.772 across models vs. 0.512 using the conventional approach (all $p < 0.05$).

Conclusions:

This study used machine learning models that convert PHES results into a brain age gap, which significantly outperformed conventional scoring in detecting hepatic encephalopathy. The observed gap quantifies the accelerated functional brain aging associated with this condition. By repurposing an existing neuropsychological tool, our approach offers a practical alternative to costly neuroimaging. Further validation in larger cohorts is warranted to confirm its clinical utility.

Keyword(s) : hepatic encephalopathy, psychometric hepatic encephalopathy score, machine learning, risk assessment, age clock

1482 - From Gene Expression Profiles to Functional Networks A Multi Omics Integrative Analysis of Methyl Eugenol Promoting Cholangiocarcinoma Development

Limeng Song¹, Yunzhi Shen², Jing Liang³
Tianjin Medical University, Department Of Gastroenterology, Tianjin-China¹ Central

ORAL ABSTRACTS

Hospital, tianjin University/tianjin Third Central Hospital, Hepatobiliary Surgery, Tianjin-China ² Central Hospital, tianjin University/tianjin Third Central Hospital, Department Of Gastroenterology, Tianjin-China ³

Background / **Hypothesis:** Cholangiocarcinoma is a malignant tumour arising within the biliary tract system. In recent years, its incidence has shown an upward trend, characterised by insidious onset, rapid progression, and poor prognosis. Its aetiology remains incompletely understood; beyond known causes such as viral infections and choledochal cysts, environmental factors are increasingly being identified. Methyl eugenol, a naturally occurring compound found in spices and herbs, was classified as a Group 2B carcinogen by the International Agency for Research on Cancer in 2023. Existing research indicates methyl eugenol promotes the development of hepatocellular carcinoma, though its potential role in promoting cholangiocarcinoma requires further investigation.

Materials and **Methods:** This study obtained cholangiocarcinoma RNA-seq data from the TCGA database. Candidate genes were screened via differential analysis ($P < 0.05$, $|\log_2FC| > 1$). WGCNA was employed to identify gene modules correlated with clinical phenotypes. Methyl eugenol targets were predicted through integrated network toxicology analysis. Key genes were selected by combining protein-protein interaction (PPI) networks (STRING confidence > 0.4) and CytoHubba. Biological functions were elucidated through GO and KEGG enrichment analyses, whilst molecular docking validated the binding activity between methyl eugenol and core target proteins.

Results: The co-expression gene module identified by WGCNA as positively correlated with cholangiocarcinoma (MEturquoise module, $Cor=0.91$, $P=3e-17$) yielded 188 methyl eugenol-cholangiocarcinoma intersection targets. GO analysis revealed significant enrichment of target genes in mitotic regulation (BP, $P=1.57e-07$) and chromosome (CC, $P=5.92e-08$). KEGG analysis indicated their regulation of oncogenic pathways including cell cycle ($P=6.24e-06$) and p53 signalling ($P=0.00014$). Integrated STRING and Cytospace analyses identified five key genes (BUB1, CHEK1, PLK1, AURKB, MAD2L1). Molecular docking showed methyl eugenol binds to PLK1 with an affinity of $-6.3 \text{ kcal/mol}^{-1}$, forming

hydrogen bonds (LEU-221) and hydrophobic interactions (VAL-210/LYS-225/HIS-228) to constitute a stable complex, suggesting it may directly activate oncogenic signalling pathways.

Conclusions: These findings indicate that methyl eugenol exposure may enhance the expression of these genes in cholangiocytes, disrupt the cell cycle and promote cell proliferation, thereby aiding in the prediction of patient prognosis and identifying therapeutic targets.

1484 - Exploring the Anticancer Effects of Spirulina Extract in Human Hepatocellular Carcinoma Cells

Esra Bulut-atalay ¹, Rukiye Aslan ², Ceylan Küpeli ³
Sivas Cumhuriyet University, Faculty Of Science, Department Of Biochemistry, Biochemisrty, Sivas-Türkiye ¹ Sivas Cumhuriyet University, Faculty Of Pharmacy, Department Of Pharmaceutical Microbiology, Pharmaceutical Microbiology, Sivas-Türkiye ² Sivas Cumhuriyet University, Cumhuriyet University Graduate School Of Natural And Applied Sciences, Department Of Biochemistry, Biochemisrty, Sivas-Türkiye ³

Background / Hypothesis: Hepatocellular carcinoma (HCC) is among the most common and aggressive liver cancers, often diagnosed at advanced stages and showing limited response to conventional chemotherapies. The search for safer, natural compounds with therapeutic potential has drawn attention to *Spirulina platensis* (*S. platensis*), a microalga widely recognized for its nutritional and biological value. *Spirulina* contains phycocyanin, phenolic acids, carotenoids, and essential amino acids that collectively exert strong antioxidant and anti-inflammatory effects. Despite increasing interest in its health benefits, the direct antitumor activity of *Spirulina* extract can inhibit cell proliferation and induce apoptosis in human hepatocellular carcinoma cells, possibly through oxidative stress modulation and mitochondrial signaling pathways.

Materials and Methods: Pure *S. platensis* powder (analytical grade) was purchased from a certified commercial supplier. The material was stored at room temperature in a dry, dark container until use. For experimental applications, the *Spirulina* powder was dissolved in DMSO. The human hepatocellular carcinoma cell line Huh7 was grown in DMEM containing 10% FBS, 100 Units/ml penicillin and 100

ORAL ABSTRACTS

µg/mL streptomycin, and incubated with 5% CO₂ at 37°C. The cytotoxic effect of *S. platensis* on Huh7 cells was investigated using colorimetric MTT assay. The concentrations of 0.1, 0.5, 1, 2.5, 5, 7.5, and 10 mg/ml were applied to the cells. Results: *S. platensis* was observed to exhibit dose-dependent antiproliferative properties to the Huh7 cell line, and the IC₅₀ value was determined as 5.3±0.46 mg/ml. The results showed that *S. platensis* has high antiproliferative activity at low cytotoxic doses against human hepatocellular carcinoma cells. Conclusions: *S. platensis* exhibited high cytotoxic activity against hepatocellular carcinoma cancer cells. In the future, it is planned to investigate the effects of *S. platensis* on other anticancer hallmarks (proliferation, invasion, and migration) and its antibacterial properties.

Keyword(s) : *Spirulina platensis*, Hepatocellular carcinoma, Anticancer activity, Huh7

1486 - Serum bile acids profile analysis predicts severity and progression of liver disease

Yanpei Mai¹, Qinshuo Wang¹, Suzhen Jiang¹, Linlin Cao², Xin Wen¹, Tianyi Xue¹, Yuxi Shi¹, Yanhui Yang¹, Huiying Rao¹, Zixing Wang¹
Peking University, Peking University Hepatology Institute, Beijing-China¹ Peking University, Peking University People's Hospital Laboratory Department, Beijing-China²

Background: Bile acids profoundly influence the onset and progression of liver disease through signaling regulation, inflammatory responses, and interactions within the gut-liver axis. During the progression from hepatitis to cirrhosis and ultimately hepatocellular carcinoma, the bile acid profile undergoes dynamic changes. However, the association between specific bile acids and distinct stages of liver disease progression remains unclear. Identifying bile acids with stage-specific signatures holds significant value for elucidating the mechanisms of liver disease progression and establishing early warning systems.

Materials and Methods: This study included 889 patients with liver disease from the Peking University Hepatology Institute, categorized as whether of severe conditions (with irreversible liver fibrosis and cirrhosis that is related to fundamental changes in monitoring frequency, complication risks, treatment regimens, and prognosis) and whether of advanced stages (liver function failure or malignant transformation). Predictive capability of different bile acids was initially assessed by regression model and then confirmed by random forest

algorithm for outcome classification. Ten machine learning algorithms were employed to construct liver disease discriminative models. The training-to-test ratio for each model was 7:3, with 5-fold cross-validation applied to calculate predictive performance.

Results: Among all patients, 185 (20.8%) had severe liver diseases, and 117 (13.2%) were in the advanced stage. Among the 15 bile acids, TCDCA, TCA, GCDCA, GCA, and TUDCA demonstrated the strongest predictive ability for liver disease outcomes. Variable importance derived from the random forest algorithm further validated the robust predictive efficacy of these five bile acids. Naive Bayes demonstrated the highest predictive capability for both classification outcomes, effectively distinguishing patients with severe liver disease and those with advanced liver disease with AUC values of 0.873 (0.821–0.925) and 0.901 (0.854–0.948), respectively.

Conclusions: This study found that the serum bile acid profile composed of specific bile acids can effectively distinguish the severity and advanced stage of liver disease. Abnormal changes are closely associated with key pathological processes such as hepatitis, cirrhosis, and the development of hepatocellular carcinoma. Mechanistic and clinical research targeting these bile acids holds promise as a novel strategy for the assessment and treatment of liver disease.

1493 - Clinical determinants of treatment response in Asian hepatocellular carcinoma undergoing lenvatinib therapy the impact of non viral liver etiologies

Lu Li¹, Matthew Shing Hin Chung¹, Rex Wan-hin Hui¹, Xianhua Mao², Chi Leung Chiang¹, Man-fung Yuen¹, Lung-yi Mak¹, Wai-kay Seto¹
The University Of Hong Kong, Department Of Medicine, Hong Kong-China¹ Stanford University Medical Center, Division Of Gastroenterology And Hepatology, Palo Alto-United States²

Background / Hypothesis: Tyrosine kinase inhibitors remain an important treatment option in the systemic therapy of advanced hepatocellular carcinoma (HCC). Increasing evidence indicates that the etiology of HCC influences response to systemic therapy. We aimed to investigate whether viral etiology impacts the survival in patients with HCC receiving lenvatinib.

ORAL ABSTRACTS

Materials and Methods: Patients with HCC treated with lenvatinib from August 2018 to June 2024 were identified from a Hong Kong population-based cohort. Virus-related HCC was defined by virological or serological evidence of hepatitis B virus (HBV) or C (HCV) virus infection. Propensity score matching (PSM) was performed at a 1:1 ratio (viral vs non-viral HCC) to mitigate intergroup confounding. The primary analysis applied an intention-to-treat design to investigate the association between viral etiology and overall survival (OS). Subgroup analyses were further conducted to assess whether this association varied by sex (male, female), presence or absence of type 2 diabetes (T2D), and status of liver cirrhosis. The OS outcomes were evaluated using the log-rank test and adjusted hazard ratios (HRs) were calculated using the Cox proportional hazards model.

Results: This study included 276 PSM-matched patients (mean age 71.3 (± 10.1) years, 77.5% male) with HCC receiving lenvatinib treatment (138 virus-related HCC with 86.2% HBV-related, 138 non-viral HCC). All covariates were well-balanced after PSM. Cirrhosis was present in 224 (81.2%) patients, while 170 (61.6%) patients had T2D. The viral etiology was associated with an increased risk of all-cause death (HR 1.3; 95% CI 1.0-1.7; $P = 0.035$), with a significantly shorter median OS (mOS) when compared to patients with non-viral etiology (8.1 vs 9.5 months, $P = 0.034$). Subgroup analyses in PS-matched cohorts demonstrated viral etiology remained associated with a higher all-cause mortality risk in patients with compensated cirrhosis (HR 2.1; 95% CI 1.3-3.4; $P = 0.003$) and male patients (HR 1.3; 95% CI 1.0-1.8; $P = 0.049$), but not in non-cirrhotic or female patients. Notably, among patients with T2D, viral-related HCC had significantly poorer OS than non-viral HCC (mOS 8.7 vs 9.7 months, $P = 0.049$), with no such significant difference in those without T2D (mOS 7.5 vs 8.5 months, $P = 0.39$).

Conclusions: Among lenvatinib-treated HCC patients, viral etiology was associated with significantly poorer OS than non-viral etiologies, with this association being particularly pronounced in individuals with compensated cirrhosis, or those with T2D. The presence of a non-viral liver disease etiology may aid clinical decision-making of the suitability of tyrosine kinase

therapy for advanced HCC.

1494 - Distinct Clinical Profile of Wilson Disease Related Cirrhosis Insights from a Propensity Score Matched Multicenter Study

Pengyue Zhang ¹, Xiaodan Hong ¹, Zhenhua Zhang ¹
The Second Affiliated Hospital Of Anhui Medical University, Infectious Diseases Department, Hefei-China
¹

Background / Hypothesis:

Wilson disease (WD) is a rare inherited metabolic disorder in which cirrhosis represents a common manifestation and a critical determinant of prognosis. This study aimed to identify risk factors associated with WD-related cirrhosis and delineate complication profile.

Materials and Methods: This retrospective study included patients with WD treated at three large general hospitals between January 2008 and December 2024. To compare the clinical characteristics and complication profiles across different cirrhosis etiologies, propensity score matching (PSM) was applied to evaluate differences between WD cirrhosis and cirrhosis secondary to hepatitis B virus (HBV), autoimmune hepatitis, and alcohol.

Results:

The study enrolled 1,227 participants, comprising 201 patients with WD. Patients with WD demonstrated a significantly higher incidence of cirrhosis and elevated non-invasive fibrosis scores compared to other liver diseases. Multivariate logistic regression identified platelet count as a protective factor for WD related cirrhosis (OR = 0.99, 95% CI: 0.97-0.99, $P = 0.018$). A predictive model incorporating variables such as age and PLT demonstrated good discriminatory performance for identifying WD cirrhosis (AUROC = 0.89, 95% CI: 0.83-0.95). Compared to HBV, autoimmune, and alcohol related cirrhosis, WD cirrhosis was associated with a lower incidence of esophagogastric variceal bleeding (EVB) and hepatocellular carcinoma (HCC), but a higher incidence of liver failure and hepatic encephalopathy.

Conclusions:

Although patients with WD exhibit higher liver fibrosis scores, they demonstrate lower risks of EVB and HCC in

ORAL ABSTRACTS

cirrhosis. Exploring the potential mechanisms is crucial for optimizing follow-up in WD and managing progression in common cirrhosis.

1497 - A Phase I Clinical Trial Evaluating the Safety and Efficacy of the QH 1A Combination Bio artificial Liver Support System Incorporating Ex vivo Mesenchymal Stem Cells for the Treatment of ACLF patients

Liang Peng¹, Jia Chen¹, Wenxiong Xu¹, Lihua Zheng¹, Xiyao Chen¹

The Third Affiliated Hospital Of Sun Yat-sen University, Department Of Infectious Diseases, Guangzhou-China¹

Background / Hypothesis: Acute-on-chronic liver failure (ACLF) has a high mortality rate, and artificial liver support represents an important therapeutic approach. Compared with mechanical artificial liver systems, bio-artificial liver (BAL) support more closely resembles native hepatic function. This study evaluated the safety and preliminary efficacy of the QH-1A combination bio-artificial liver support system incorporating ex-vivo mesenchymal stem cells (MSCs) in ACLF patients.

Materials and Methods: This single-center, open-label Phase I clinical trial (approved by the National Medical Products Administration of China) assessed the safety and preliminary efficacy of QH-1A. Patient plasma was separated using a plasma separator and perfused through an MSC-seeded hollow-fiber cartridge, allowing MSC-derived extracellular vesicles (including exosomes) and other bioactive factors to return to the patient. Participants were enrolled sequentially into escalating duration cohorts of 4 hours (n=3), 6 hours (n=3), and 8 hours (n=3). Follow-up visits were conducted immediately after treatment and on days 3, 7, and 28. Escalation decisions were made by an independent Safety Evaluation Committee based on 28-day safety observations.

Results: From May 2025 to October 2025, nine patients with ACLF were enrolled at the Third Affiliated Hospital of Sun Yat-sen University. Eight cases were HBV-related and one was due to alcoholic liver disease. Cirrhosis was present in 77.8% (7/9) of patients. All participants completed treatment. The 28-day transplant-free survival rate following the first treatment was 88.89%; one patient underwent liver transplantation on day 26 due to lack of clinical improvement. A total of 25 adverse

events occurred during treatment; only one serious adverse event (SAE) was reported and was assessed as unrelated to the study treatment. No events led to treatment discontinuation. Improvements were observed in total bilirubin (TBIL), international normalized ratio (INR), and COSSH-ACLF II score after QH-1A treatment (Figure 1).

Conclusions: The QH-1A bio-artificial liver support system demonstrated favorable safety and tolerability in patients with ACLF and was associated with improvements in liver function, coagulation parameters, and overall clinical severity scores. These findings suggest that QH-1A may represent a promising therapeutic option for the management of ACLF. Further research is needed to validate its safety and efficacy.

Keyword(s) :

1507 - Hyperammonemia in pre hepatic and intrahepatic portal hypertension comparable levels different clinical outcomes

Maria Nadinskaia¹, Kseniya Gulyaeva¹, Evelina Trashkun², Diana Daduns², Maxim Privalov³, Vladimir Ivashkin¹
Sechenov First Moscow State Medical University (sechenov University), The Department Of Propaedeutics Of Internal Disease, Gastroenterology And Hepatology, Moscow-Russia¹ Sechenov First Moscow State Medical University (sechenov University), The Institute Of International Education (iie), Moscow-Russia² Sechenov First Moscow State Medical University (sechenov University), Department Of Oncology, Radiotherapy And Reconstructive Surgery, Moscow-Russia³

Background / Hypothesis: The role of hyperammonemia as a key factor in the development of hepatic encephalopathy (HE) is well established in patients with intrahepatic portal hypertension (PH). However, this association remains poorly characterized in patients with pre-hepatic PH. Aim: To compare the frequency and severity of hyperammonemia and its association with the development of HE in patients with different types of PH.

Materials and Methods: A cross-sectional study enrolled 69 participants: 25 patients with non-cirrhotic, non-malignant portal vein thrombosis (PVT group), 29 patients with liver cirrhosis (LC group), and 15 patients with a combination of cirrhosis and PVT (LC-PVT group). PVT was confirmed by contrast-enhanced computed tomography. According to transient elastography, liver fibrosis stages were F0-F2 in the PVT group and F4 in all patients with cirrhosis. The clinical diagnosis of overt HE

ORAL ABSTRACTS

was based on the West Haven criteria, whereas minimal HE (MHE) was assessed using psychometric tests. Ammonia concentration was measured in capillary blood using the PocketChem BA PA-4140 analyzer (ARKRAY Factory, Inc., Japan). Results: The frequency of HE was approximately 66% in the cirrhosis groups (LC and LC-PVT), compared with 24% in the PVT group ($p = 0.004$). Furthermore, the cirrhosis groups exhibited both overt HE (34%) and MHE (32%), whereas only MHE was identified in the PVT group. Hyperammonemia was observed in 17 (68%) patients in the PVT group, 21 (72%) patients in the LC group, and 14 (93%) patients in the LC-PVT group ($p = 0.176$). The severity of hyperammonemia did not differ significantly between the groups: the median ammonia concentration was 83 (47–118) $\mu\text{mol/L}$ in the PVT group, 95 (51–139) $\mu\text{mol/L}$ in the LC group, and 102 (63–154) $\mu\text{mol/L}$ in the LC-PVT group ($p = 0.217$). The severity of PH was similar across all groups except for moderate-to-severe ascites, which was detected only in the groups with LC. No significant differences were identified in the prevalence ($p = 0.376$) or grade of esophageal or gastric varices ($p = 0.929$), nor in the history of variceal bleeding ($p = 0.773$). In addition, no statistically significant difference was observed in the prevalence of large (≥ 10 mm in diameter) spontaneous and/or surgically created portosystemic shunts ($p = 0.424$). Conclusions: The frequency and severity of hyperammonemia were comparable across different types of PH. However, patients with pre-hepatic PH exhibited a lower degree of HE, possibly reflecting reduced cerebral susceptibility to the neurotoxic effects of ammonia, which warrants further investigation.

Keyword(s) : liver cirrhosis, portal vein thrombosis, portosystemic shunts, hepatic encephalopathy, minimal hepatic encephalopathy

1516 - Serum HBP as a Mechanistic Predictor of Primary Resistance to Atezolizumab plus Bevacizumab in HCC.

Satoshi Narahara ¹, Katsuya Nagaoka ¹, Takehisa Watanabe ¹, Hiroko Setoyama ¹, Kazuhiro Sugi ², Takanori Suzuki ³, Kentaro Matsuura ³, Shinji Itoh ⁴, Masaya Onishi ⁵, Yasuhito Tanaka ¹

Fukuoka-Japan ⁴ The University Of Tokyo, Department Of Computational Biology And Medical Sciences, Graduate School Of Frontier Sciences, Kashiwa-Japan ⁵

Background:

Atezolizumab plus bevacizumab (Atezo+Bev) has become a standard first-line therapy for advanced hepatocellular carcinoma (HCC), yet no validated biomarkers can reliably predict therapeutic efficacy before treatment initiation. This study aimed to identify mechanisms of primary resistance to Atezo+Bev and to establish serum biomarkers with immediate clinical applicability.

Methods:

Spatial transcriptomics (VISIUM and VISIUM HD) and single-cell transcriptomics (Xenium 5K) were performed on eight HCC biopsy or surgical specimens to identify molecular features associated with progressive disease (PD). Treatment responses were classified as responders (CR/PR/SD) or non-responders (PD). Proteins identified in tissue analyses were subsequently evaluated in pretreatment serum samples from a training cohort of Atezo+Bev-treated patients and validated in an independent cohort, totaling 99 patients. Results:

Spatial transcriptomics revealed uniformly high intratumoral expression of heparin-binding protein (HBP) exclusively in the non-responder group. Importantly, pretreatment biopsies displayed the same HBP-high signature, indicating that resistance is pre-existing rather than therapy-induced. Xenium 5K analysis demonstrated dense interaction networks between HBP-expressing HCC cells and M2-polarized macrophages, while VISIUM HD identified ITGA-dependent ligand-receptor signaling as the dominant communication axis. In vitro, recombinant HBP significantly induced CD163 and CD204 expression in human macrophages ($p = 0.023$, $p = 0.003$), whereas ITGA knockdown abrogated this effect ($p = 0.005$, $p = 0.014$). Clinically, patients with high pretreatment serum HBP exhibited significantly shorter PFS based on both median stratification ($p = 0.026$) and ROC-derived cutoff ($p = 0.029$). These findings were independently validated in a separate cohort ($p = 0.050$).

Conclusion:

Pretreatment serum HBP establishes an ITGA-mediated immunosuppressive circuit that confers primary resistance to Atezo+Bev and is a robust, mechanism-based biomarker for predicting non-response before treatment initiation. HBP has immediate translational potential for precision immunotherapy and may guide early treatment selection or intensification strategies in HCC.

1517 - Hepatitis B serology and vaccine response in uveitis patients treated with adalimumab effects of the 1998 national hepatitis B vaccination program in Turkey

Fatma Merve Kocak¹
Beyoglu Eye Training And Research Hospital,
Department Of Infectious Diseases And Clinical
Microbiology, Istanbul-Türkiye¹

Background / Hypothesis:

Adalimumab is an effective biologic agent for noninfectious uveitis but carries a risk of hepatitis B virus (HBV) reactivation under immunosuppression. In Turkey, hepatitis B vaccination was incorporated into the national childhood immunization program in 1998, and this cohort effect is likely to influence HBV seroepidemiology in adults. In this study, hepatitis B serologic profiles and hepatitis B vaccine responses in uveitis patients treated with adalimumab were evaluated, and the impact of the 1998 vaccination program was examined.

Materials and Methods:

This single-center retrospective cohort included patients aged ≥ 18 years who received anti-TNF therapy for uveitis between November 2021 and August 2025. Adalimumab was the only biologic agent. HBsAg, anti-HBs and total anti-HBc IgG results of the patients were recorded from medical records. Patients were grouped by birth year as born before 1998 or in/after 1998, reflecting inclusion in the vaccination program. Anti-HBs-negative patients were scheduled to receive a 0-1-6 HBV vaccination regimen; post-vaccination anti-HBs ≥ 10 mIU/mL was considered a serologic response. Patients with HBsAg or anti-HBc positivity received tenofovir or entecavir prophylaxis according to national guidelines.

Results:

A total of 197 patients (mean age 40.5 ± 14.3 years; 55.8% male) were included; four were HBsAg positive. Among the remaining 193 HBsAg-negative patients, 49.7% were anti-HBs positive and 20.7% were anti-HBc positive. No anti-HBc positivity was detected in patients born in or after 1998, whereas 26.7% of those born before 1998 were anti-HBc positive ($p < 0.001$). Pre-

treatment anti-HBs positivity was 86.0% in patients born in or after 1998 and 39.3% in those born before 1998 ($p < 0.001$). Among anti-HBs-negative patients who completed a three-dose vaccination schedule, approximately half developed seroconversion.

Conclusions:

In uveitis patients treated with adalimumab, adults who were vaccinated against hepatitis B under the 1998 program exhibit a vaccine-based, low-risk serologic profile, whereas older patients frequently lack immunity or show evidence of past infection (anti-HBc positivity), which carries a risk of HBV reactivation. Planned hepatitis B vaccination is often not completed before anti-TNF initiation, and vaccination started during biologic therapy may elicit a suboptimal immune response. Ensuring that candidates for anti-TNF therapy are immune to hepatitis B and do not have evidence of past infection before immunosuppression may reduce HBV reactivation and prevent poor vaccine responses in this vulnerable population.

1525 - A Multi Sectoral Co Payment Model to Reduce Hepatitis C Treatment Costs and Advance Elimination Among Low Income Populations Experience from Yangjiang China

Yuelong Lin¹, Nongwei Luo², Shenghao Li²
Yangchun People's Hospital, Center For Liver Disease, Yangjiang-China¹ Yangxi General Hospital People's Hospital, Center For Liver Disease, Yangjiang-China²

Background / Hypothesis:

Although highly effective direct-acting antivirals (DAAs) are widely available in China, financial barriers remain a major obstacle to hepatitis C elimination among low-income populations. To address this challenge, Yangjiang City launched a pilot project that integrates government insurance, philanthropic assistance, and corporate support to provide affordable antiviral therapy for economically disadvantaged patients.

Materials and Methods:

Patients who met Yangjiang's criteria for "low-income households" (annual household income $< \text{RMB } 47,000$) or were classified by the civil affairs department as expenditure-driven impoverished households were eligible. Each patient received a subsidy of RMB 1,875, which, together with standard medical insurance reimbursement, substantially reduced out-of-pocket costs. Depending on insurance category and whether

ORAL ABSTRACTS

care was delivered at a secondary or tertiary hospital, insured residents paid between RMB 0 and 2,221 for a 12-week course of sofosbuvir/velpatasvir. The program was led by the Chinese Association of STD and AIDS Prevention and Control, supervised by the Yangjiang CDC, and jointly implemented with local hospitals and pharmaceutical partners.

Results:

Since the establishment of the national case reporting system in 2004, Guangdong Province has consistently recorded hepatitis C incidence rates above the national average. Yangjiang, located on the southwestern coast of Guangdong, reported 14,738 cumulative hepatitis C cases from 2004 to 2022. Previous recall efforts performed poorly, with an HCV RNA testing rate of approximately 20% and a treatment rate of about 30%, falling far short of WHO elimination targets; economic hardship appeared to be the main contributing factor. The co-payment program began on July 1, 2025. Here we presented the first phase data. As of October 31, 2025, 32 patients met eligibility criteria, most of the patients were farmers and had low income, all 32 initiated treatment, and 31 had completed therapy, pre-treatment genotype testing is not necessary. None had yet reached the post-treatment Week-4 or Week-12 follow-up time points. All enrolled patients started therapy on the same day they were approved for financial support which was prompt, treatment rate reached 100% in this pilot. Baseline characteristics are summarized in Table 1.

Conclusions:

The multi-sectoral co-payment model in Yangjiang effectively reduced financial barriers and enabled rapid treatment initiation once subsidies were granted. This approach improved antiviral treatment coverage and accessibility, embodied a patient-centered strategy, and accelerated progress toward the city's 2030 HCV elimination goal. The experience provides a scalable and replicable pathway for hepatitis C elimination in resource-limited settings, offering insights not only for China but also for other regions.

Keyword(s) : Multi-Sectoral Co-Payment Model, hepatitis C elimination

1526 - Transcriptional Activity of cccDNA in HBsAg Negative Individuals with a History of Hepatitis B Infection

Yanfei Feng¹, Jianning Jiang¹

The First Affiliated Hospital Of Guangxi Medical University, Department Of Infectious Diseases, Nanning-China

Background:

A significant proportion of hepatocellular carcinoma (HCC) cases occur in individuals who are hepatitis B surface antigen (HBsAg)-negative. These patients, often perceived as having resolved infection, remain at risk for HBV reactivation during immunosuppression, highlighting the persistence of a viral reservoir. This study aimed to quantify the covalently closed circular DNA (cccDNA) reservoir and investigate its transcriptional activity in the livers of HBsAg-negative individuals to elucidate its link to HCC pathogenesis.

Materials and Methods:

We collected liver tissue and serum samples from 68 HBsAg-negative, anti-HBc-positive patients, categorized into three groups: the HBV-related HCC group (HBV-HCC, n=34), the Treated group (post-antiviral therapy, n=15), and the Natural Clearance control group (n=19). A group of 38 HBsAg-positive patients (<100 IU/mL) with HCC (n=22) or under therapy (n=16) was also enrolled (Table1). For HCC patients, paired samples from both the tumor and the peritumoral tissue were collected. Intrahepatic cccDNA and total HBV DNA (tDNA) levels were precisely quantified using Droplet Digital PCR. Serum pregenomic RNA (pgRNA) was measured to assess cccDNA transcriptional activity.

Results:

- 1.Serum pgRNA was undetectable in all 68 HBsAg-negative patients. In the HBV-HCC group, peritumoral tissues harbored significantly higher cccDNA levels than tumor tissues(Figure1).
- 2.A clear gradient of intrahepatic viral reservoir size was observed: HBsAg-positive > HBsAg-negative (HCC/Treated) > Natural Clearance group. This gradient was consistent for both cccDNA and tDNA in peritumoral(Figure2) and Treated groups(Figure3). The tDNA/cccDNA ratio showed no significant differences among most groups but was higher in the HBsAg-positive and negative Treated groups compared to the Natural Clearance group.
- 3.Notably, among HBsAg-negative individuals, no significant differences in cccDNA, tDNA, or their ratio were found between the HBV-HCC and Treated groups(Figure4).

Conclusions:

Our study demonstrates that a substantial cccDNA reservoir persists in the liver of HBsAg-negative individuals, with the highest levels found in peritumoral

ORAL ABSTRACTS

tissue. The viral load correlates with clinical status, indicating that HBsAg seroclearance does not equate to viral eradication. The undetectable pgRNA and stable tDNA/cccDNA ratio suggest the reservoir is largely transcriptionally silent. The lack of viral load difference between HBsAg-negative HBV-HCC and Treated groups implies that hepatocarcinogenesis may be driven more by past viral integration or indirect oncogenic effects rather than ongoing viral replication. These findings underscore the risk associated with this residual reservoir and question the sensitivity of pgRNA as a sole marker for its transcriptional activity.

1527 - Development and Validation of an Early Diagnostic Model to Distinguish Bacterial Infection in Patients with Acute on Chronic Liver Disease (AoCLD) and Systemic Inflammatory Response Syndrome (SIRS)

Ruochan Chen¹
Xiangya Hospital, Infectious Disease, Changsha-China¹

Background / Hypothesis: Early differentiation between infectious and non-infectious systemic inflammatory response syndrome (SIRS) in patients with acute-on-chronic liver disease (AoCLD) remains challenging. This study aimed to develop and validate an early diagnostic model to accurately identify infection status in AoCLD patients with SIRS, thereby guiding targeted anti-infective therapy and improving clinical management.

Materials and Methods: Based on two multicenter prospective cohorts from the Chinese Acute-on-Chronic Liver Failure (CATCH-LIFE) study, 515 AoCLD patients with SIRS were randomly divided into a training cohort (n=361) and a validation cohort (n=154). In the training cohort, predictive factors for infection were screened using logistic regression, least absolute shrinkage and selection operator (LASSO) regression, multicollinearity analysis, and stepwise regression. Restricted cubic splines (RCS) were employed to explore nonlinear relationships and interaction effects. A nomogram model was subsequently constructed. The model's performance was evaluated using receiver operating characteristic (ROC) curves, calibration curves, and decision curve analysis (DCA), with internal validation via bootstrap method.

Results: The final model incorporated five clinical indicators: jaundice, ascites, neutrophil count (N), albumin (ALB), and C-reactive protein (CRP). CRP exhibited a significant nonlinear relationship with infection risk ($P < 0.001$) and was included as a spline term, while an interaction term between ALB and jaundice was incorporated. The model demonstrated excellent discrimination, with area under the ROC curve (AUC) of 0.840 (95% CI: 0.788-0.888) in the training cohort and 0.865 (95% CI: 0.803-0.927) in the validation cohort, significantly outperforming single biomarkers. Calibration curves showed high consistency between predicted and observed probabilities. DCA indicated substantial clinical net benefit across threshold probabilities. A clinical decision pathway was developed based on the nomogram's risk prediction and optimal DCA threshold.

Conclusions: The early diagnostic model developed in this study effectively differentiates between infectious and non-infectious SIRS in AoCLD patients, potentially reducing unnecessary antimicrobial exposure and improving clinical outcomes.

Keyword(s) : Acute-on-Chronic Liver Disease (AoCLD), Systemic Inflammatory Response Syndrome (SIRS), Infection, Early Diagnosis, Risk Factors

1528 - Palliative care reduces disease time burden but is under utilized in terminal stage hepatocellular carcinoma

Matthew Shing-hin Chung¹, Rex Wan-hin Hui¹, Lu Li¹, Xianhua Mao², Chi-leung Chiang³, Carlos King-ho Wong⁴, Ian Chi-kei Wong⁵, Ka-shing Cheung¹, Man-fung Yuen¹, Wai-kay Seto¹, Lung-yi Mak¹
The University Of Hong Kong, Medicine, Hong Kong-Hong Kong SAR, China¹ Stanford University, Medicine, Stanford-United States² The University Of Hong Kong, Clinical Oncology, Hong Kong-Hong Kong SAR, China³ The University Of Hong Kong, Public Health, Hong Kong-Hong Kong SAR, China⁴ The University Of Hong Kong, Pharmacology And Pharmacy, Hong Kong-Hong Kong SAR, China⁵

Background / Hypothesis: Guidelines recommend palliative care (PC) in hepatocellular carcinoma (HCC) patients, especially at the terminal stage. However, the PC utilization patterns and its impact on disease time burden have not been studied.

ORAL ABSTRACTS

Materials and **Methods:** HCC patients diagnosed at the terminal stage (never received any anti-cancer therapy) and who have died between 2003 – 2024 were identified from a territory-wide population-based cohort in Hong Kong. PC utilization was defined as patients who received any specialist PC consultation or inpatient hospice care within the 3 months before death. PC utilization patterns in different time periods were reported. Disease time burden was analyzed by percentage of days at home (%DAH) – defined as percentage of days not requiring healthcare utilization (inpatient stays, emergency department attendance, day procedures, blood tests, and imaging) in the last 3 months of life.

Results:

This study included 12556 patients with HCC at the terminal stage (mean age 68.8 years, 76.5% male, 61.7% with viral hepatitis, 46.2% with cirrhosis, mean MELD score 10.8, mean AFP 42816.1 ng/mL) with an average survival of 142.1 (95% CI 135.4 – 148.9) days after HCC diagnosis. Only 18.0% of the cohort (2254 patients) received PC in the 3 months preceding death. The PC contact rate has remained similar in different time periods (17.9% in 2003 – 2008, 19.0% in 2009 – 2014, 17.5% in 2015 – 2019, 16.1% in 2020 – 2024; all $p > 0.05$). The time interval between PC contact and death also remained static (average 20.6 days in 2003 – 2008, 22.5 days in 2009 – 2014, 22.4 days in 2015 – 2019, 19.3 days in 2020 – 2024; all $p > 0.05$). PC contact led to significantly higher %DAH (45.0% in PC group vs 40.6% in non-PC group; $p < 0.001$), and this difference was mainly driven by reduced time burden on inpatient stay (47.1% in PC group vs 51.7% in non-PC group; $p < 0.001$) and emergency department attendance (0.8% in PC group vs 1.0% in non-PC group; $p < 0.001$). The impact of PC on disease time burden remained robust in propensity-score matched and multivariate analyses, respectively.

Conclusions:

PC significantly reduced disease time burden in terminal HCC in this real-world cohort. However, PC has remained under-utilized in the past 2 decades. Proactive and earlier PC referral may improve quality of life in terminal HCC.

Keyword(s) : Hepatocellular carcinoma, Palliative care, Disease time burden

1529 - CD39 Promotes Angiogenesis and Poor Prognosis in Hepatocellular Carcinoma via Activation of the PI3K AKT Signaling Pathway

Zhengen Cao¹, Yuanxv Zhang¹, Yunqi Ji¹, Junxiao Guo¹, Weifeng Zhao¹

The First Affiliated Hospital Of Soochow University, Department Of Infectious Diseases, Soochow-China¹

Background / **Hypothesis:** Hepatocellular carcinoma (HCC) is one of the most common and aggressive malignancies worldwide, characterized by rapid progression, a highly angiogenic phenotype, and a high risk of metastasis and recurrence. Accumulating evidence implicates CD39 in the development of multiple cancers through diverse mechanisms. However, the specific role of tumor cell-derived CD39 in HCC progression, particularly in the regulation of angiogenesis and the underlying molecular pathways, remains poorly defined.

Materials and **Methods:** Expression of CD39, CD31, VEGFA and pan-cytokeratin (PANCK) in HCC tissues was evaluated by immunohistochemistry and multiplex immunofluorescence, and the prognostic significance of CD39 expression was assessed using Cox regression analyses. VEGFA expression and secretion in HCC cell lines were quantified by Western blotting, real-time quantitative PCR and ELISA. The effects of tumor cell-conditioned medium on human umbilical vein endothelial cell (HUVEC) proliferation were determined by CCK-8 assays, whereas Transwell migration and invasion assays and tube-formation assays were used to evaluate HUVEC motility and in vitro angiogenic capacity. Phosphorylation of PI3K, AKT and mTOR was examined by Western blotting. A subcutaneous xenograft model in nude mice was established to investigate the impact of CD39 on HCC angiogenesis in vivo.

Results:

CD39 was upregulated in HCC tissues, and high CD39 expression was associated with a shorter 1-year progression-free survival. Public database analyses further revealed a close association between CD39 expression and angiogenesis-related gene signatures. Functionally, conditioned medium from CD39-overexpressing HCC cells enhanced HUVEC proliferation, migration, invasion and tube formation. Mechanistic studies showed that CD39 promoted VEGFA synthesis and secretion by HCC cells, which was corroborated in clinical samples in which CD39 expression in tumor cells positively correlated with CD31 and VEGFA levels. Upregulation of CD39 was accompanied by increased phosphorylation of PI3K, AKT

ORAL ABSTRACTS

and mTOR, together with augmented production and release of VEGFA by HCC cells, indicating that CD39 may drive HCC angiogenesis through activation of the PI3K/AKT/mTOR pathway and subsequent VEGFA upregulation. Consistently, in a nude mouse subcutaneous xenograft model, CD39 expression significantly promoted intratumoral angiogenesis in vivo.

Conclusions:

Our study identifies CD39 as an independent predictor of poor prognosis in patients with hepatocellular carcinoma. We delineate a pivotal role for CD39 in driving HCC angiogenesis and demonstrate that CD39 activates the PI3K/AKT signaling pathway to enhance VEGFA production and secretion by tumor cells, thereby promoting angiogenesis both in vitro and in vivo. These findings highlight CD39 as a promising therapeutic target in HCC, particularly in the context of anti-angiogenic strategies.

Keyword(s) : Hepatocellular carcinoma, CD39, Angiogenesis, Prognosis, PI3K/AKT signaling pathway

1531 - Dynamic changes in gut microbiota associated with HBsAg decline in chronic hepatitis B patients undergoing IFN treatment

Wei Tan ¹, Wenxin Xu ¹, Junjie Chen ¹, Xiaoqi Yu ¹, Demin Yu ¹, Xinixn Zhang ¹
Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Shanghai,, Department Of Infectious Diseases, Research Laboratory Of Clinical Virology,, Shanghai-China ¹

Background / Hypothesis:
Recent studies have demonstrated a close interaction between chronic hepatitis B (CHB) and gut microbiome dysbiosis as well as the effects of antiviral treatment with Nucleos(t)ide analogues (NAs) on gut microbiota dysbiosis. However, the impact of interferon (IFN) treatment on gut dysbiosis remains to be elucidated.

Materials and Methods:
Treatment-naïve CHB patients were prospectively recruited and received PEG-IFN- α 2b (n=26) or NAs (n=50) treatment, with 34 healthy individuals (HC) as controls. All subjects were age-gender matched. Fecal samples were collected at serial treatment time points for metagenomic sequencing.

Results:

Chronic HBV infection is associated with gut microbiota dysbiosis compared to HC, and IFN treatment

significantly impacts gut microbial α - and β -diversity metrics more than NAs treatment. Two distinct enterotypes (C1-Prev/ C2-Bifi) were identified among CHB patients. During IFN treatment, enterotypes changed with HBsAg response (decline >50%). Non-responders shifted from C1-Prev to C2-Bifi, while responders mostly kept the C1-Prev enterotype. Trajectory analysis revealed 81 taxa with opposite temporal trends and 124 taxa with concordant trends between the two treatments. Furthermore, a significantly higher number of differentially abundant bacterial species were observed between IFN responders and non-responders in comparison to the nucleoside analog group (277 taxa vs 76 taxa). Multiple short-chain fatty acid (SCFA)-producing genera decreased in IFN non-responders while remaining stable or increasing in responders.

Conclusions: The study indicates that IFN treatment significantly disrupts the gut microbiota of CHB patients, and SCFA correlate with HBsAg response to IFN treatment.

Keyword(s) : chronic hepatitis B; gut microbiota; antiviral treatment; interferon

1533 - Sex differences in cirrhosis among untreated chronic hepatitis B a 10 year longitudinal cohort study from China

Qiao Tang ¹, Yuan-hai Zhou ¹, Peng Hu ¹
The Second Affiliated Hospital Of Chongqing Medical University, Department Of Infectious Diseases, Chongqing-China ¹

Background / Hypothesis:

Current guidelines for antiviral treatment of chronic hepatitis B (CHB) are based on age, alanine aminotransferase (ALT) levels, viral load, a family history of hepatitis B virus (HBV)-related cirrhosis or hepatocellular carcinoma, while not considering sex factor.

Materials and Methods:

This retrospective longitudinal cohort study included 1,543 untreated CHB patients (760 males and 774 females) not meeting antiviral treatment criteria in previous guidelines and investigated sex differences in liver disease progression according to the latest Chinese guidelines for the prevention and treatment of CHB (2022).

ORAL ABSTRACTS

Results:

The cumulative incidence of cirrhosis was significantly higher in males compared with females among all untreated CHB patients (23.1% vs 7.9%, $p < 0.001$), treatment-eligible patients (25.3% vs 8.0%, $p = 0.001$), and treatment-ineligible patients (20.6% vs 7.3%, $p < 0.001$). Sex male was strongest risk factor of cirrhosis (HR, 2.474; 95% CI, 1.628-3.760; $p < 0.001$) among treatment-naïve CHB patients. Males showed a relatively high incidence of cirrhosis although not meeting antiviral treatment criteria, while females showed a relative low incidence of cirrhosis although meeting antiviral treatment criteria. In treatment-eligible females, those with abnormal ALT (10.4%) showed a numerically higher incidence of cirrhosis compared with those with normal ALT. In treatment-ineligible patients, male sex and HBeAg-positivity were risk factors of cirrhosis.

Conclusions:

In conclusion, males showed a higher risk of cirrhosis than females in treatment-naïve CHB patients. Expanding antiviral treatment criteria may be considered in male patients, but not in female patients. Initiating antiviral treatment may be stratified by sex and HBeAg status.

Keyword(s) : sex differences; cirrhosis; chronic hepatitis B; treatment-naïve; antiviral treatment criteria.

1542 - Mechanistic Insights into the Protective Effects of Faecalibacterium prausnitzii and Its Metabolite Short Chain Fatty Acids on Biliary Injury in Primary Biliary Cholangitis

Qi Wang¹, Wenying Qiao², Huichun Xing¹, Minghui Li¹, Ronghua Jin²
Beijing Ditan Hospital, Center Of Liver Disease Division, Beijing-China¹ Beijing Ditan Hospital, National Center For Infectious Diseases, Beijing-²

Background / Hypothesis: Primary biliary cholangitis (PBC) is a chronic cholestatic liver disease that primarily affects middle-aged women. Studies suggest that alterations in the gut microbiome are closely associated with the pathogenesis and treatment of PBC, but the underlying mechanisms remain unclear.

Materials and Methods: This study first conducted gut microbiota analysis of fecal samples from PBC patients and healthy controls using metagenomic sequencing, with 16S and other

methods employed to identify differential microbial taxa. Subsequently, a bile duct ligation (BDL) mouse model was established and treated with *F. prausnitzii* (1×10^9 CFU/day), while ductular reaction and liver fibrosis were evaluated through histopathological staining. For in vitro experiments, a GDCD-induced injury model using human primary biliary epithelial cells (HiBECs) was developed, followed by treatment with varying concentrations of short-chain fatty acids (SCFAs). Furthermore, ChIP assays were performed to detect H3K27ac modification levels, elucidating the specific mechanism by which SCFAs exert their effects through epigenetic regulation of the ELF3/PI3K-Akt pathway. All data were statistically analyzed using two-tailed t-tests/ANOVA with FDR correction ($P < 0.05$ considered statistically significant).

Results:

We found that *F. prausnitzii* was significantly reduced in the gut microbiota of PBC patients. Supplementation with *F. prausnitzii* markedly improved BDL-induced biliary injury, including cholangitis, bile duct hyperplasia, and liver fibrosis, while also restoring gut microbial balance and intestinal barrier function. These beneficial effects were linked to short-chain fatty acids (SCFAs) produced by *F. prausnitzii*. Mechanistic studies revealed that *F. prausnitzii*-derived SCFAs enhanced histone H3K27 acetylation, upregulating the transcription factor ELF3 and subsequently activating the PI3K-Akt signaling pathway to promote bile duct cell repair.

Conclusions:

This study demonstrates that *F. prausnitzii* exerts protective effects in PBC. Its depletion in PBC patients and its therapeutic potential in alleviating cholangitis and liver fibrosis, along with restoring gut function, highlight its promising clinical application for PBC treatment.

Keyword(s) : Metagenomics, Primary Biliary Cholangitis, Faecalibacterium prausnitzii, Biliary Response

1551 - Non Invasive Detection of Esophageal Varices in Compensated Cirrhotic Patients

Mohamed Abdel-samiee¹, El-sayed Tharwa¹
National Liver Institute, Menoufia University, Hepatology And Gastroenterology, Shebin El-kom-Egypt¹

Background / Hypothesis: Varices are present in 30-40 % of patients with compensated cirrhosis (Child-Pugh class A). Although screening endoscopy for esophageal varices (O.V.) is recommended to all patients with cirrhosis, this recommendation is not a result of

ORAL ABSTRACTS

evidence-based data. We studied the association of (platelet count/spleen diameter ratio, insulin resistance and splenoportalindex) and the presence of O.V. in patients with compensated cirrhosis.

Materials and Methods: 124 patients with compensated liver cirrhosis due to chronic hepatitis C virus were studied. After clinical, laboratory, ultrasound examinations, all patients underwent screening endoscopy and O.V. were reported as present or absent. According to presence or absence of varices; two groups were described: group I without varices and group II with varices.

Results: Among 124 patients with mean age of (51.81 ± 12.94) , 2 groups were described: group I (30 patients) and group II (94 patients) with a male majority (20 patients in group I and 66 patients in group II). In group I and group II: the mean platelet count/spleen diameter ratio was $(1022.6 \pm 73.36, 608.76 \pm 58.44)$ respectively, the mean insulin resistance value was $(2.426 \pm 0.618, 3.081 \pm 0.474)$ respectively. The mean splenoportalindex (SPI) value was $(2.878 \pm 0.870, 6.349 \pm 0.514)$ respectively. For platelet count/spleen diameter ratio and SPI, the sensitivity was (95.7%), specificity (83.3%) and accuracy (92.7%). For platelet count/spleen diameter ratio and insulin resistance (IR), the sensitivity was (70.2%), specificity (86.7%) and accuracy (74.1%). For IR and SPI, the sensitivity was (70.2%), specificity (76.7%) and accuracy (71.7%). For the three predictors combined, the sensitivity was (78.7%), specificity (82.2%) and accuracy (79.5%).

Conclusions: Low platelet count/spleen ratio and high SPI are very useful non invasive predictors for the presence of O.V. that could be used either separately or combined to decrease the number of upper GIT endoscopies needed in cirrhotic patients management. However, IR as a non invasive predictor is still in need for further evaluation.

Keyword(s) : oesophageal varices; Liver; Cirrhosis, Non-invasive

1552 - Multi Omics Integration Identifies a Prognostic Signature Guiding Precision Survival in Advanced HCC

Fengha Yan¹, Feixiang Xiong², Yang Wang², Xiaomin Ji², Tong Wu², Yang Zhou², Xuejie Zhang², Qandan Chen²

², Ronghai Huang², Yuyong Jiang², Yixin Hou²
Beijing Ditan Hospital, Capital Medical University, Beijing Institute Of Infectious Diseases, Beijing-China¹
Beijing Ditan Hospital, Capital Medical University, Center Of Integrative Medicine, Beijing-China²

Background / Hypothesis: Hepatocellular carcinoma (HCC) remains a leading cause of cancer-related mortality globally, with over 70% of patients diagnosed at intermediate or advanced stages (BCLC B/C) where curative treatments are no longer feasible. Current prognostic tools are inadequate to capture the heterogeneity of outcomes in this population, underscoring the critical need for integrated predictive models that incorporate multimodal data.

Materials and Methods: Plasma samples were collected from 242 patients with advanced HCC (BCLC B–D) who received first-line systemic therapy at Beijing Ditan Hospital, Capital Medical University, from January 2020 and December 2023. Plasma proteomic profiling was performed using the DB4000 Deep Blood DIA Proteome platform with data-independent acquisition and Astral mass spectrometry. Proteomic differences between survivors and non-survivors were assessed via principal component and differential abundance analyses. Candidate biomarkers were validated by ELISA, and their cellular origins and prognostic relevance were explored using single-cell RNA sequencing of HCC tissues.

Results:

Among 154 HBV-HCC patients with 1-year follow-up, 47 (30.5%) died. Using mRMR and LASSO regression, we identified 15 proteins associated with 1-year mortality. Multivariate logistic regression further refined a model incorporating four proteins (EGFLAM, HTRA3, ADGRG2, AGXT) and two clinical variables (K+, GGT). The model demonstrated strong predictive performance (AUC: 0.939, accuracy: 0.841, $p < 0.05$) and favorable clinical utility on decision curve analysis. All biomarkers except AGXT were significantly upregulated in deceased patients (FDR-adjusted $p < 0.05$), and ELISA confirmed these trends. The model effectively stratified mortality risk across treatment subgroups (conservative vs. ICI-based). Single-cell transcriptomics revealed predominant expression of these proteins within the tumor microenvironment.

Conclusions:

ORAL ABSTRACTS

This study comprehensively analyzed the plasma proteomic landscape of HCC and provided a promising blood based tool for predicting the risk of death in patients with advanced HCC and precision immunotherapy.

Keyword(s) : Hepatocellular carcinoma, plasma proteomic, survival prognosis, machine learning model

1555 - Concordance Between Ultrasound Steatosis Grading and Elastography CAP Classification A Case Series of Chronic HBV Patients on TAF Therapy

Elif Nur Özbay Haliloğlu¹, Zeynep Tekin Taş¹
University Of Health Sciences, Sincan Training And Research Hospital, Infectious Diseases And Clinical Microbiology, Ankara-Türkiye¹

Background / Hypothesis: Tenofovir alafenamide fumarate (TAF) therapy, along with accompanying metabolic factors, may influence hepatic steatosis in chronic hepatitis B (HBV). While ultrasonographic (USG) steatosis grading is widely used in clinical follow-up, it remains an operator-dependent and subjective modality. This study aimed to evaluate the concordance between steatosis grading by USG and by the more specialized, less accessible Controlled Attenuation Parameter (CAP) measurement performed via elastography, both assessed during the same clinical visit.

Materials and Methods: This single-center, consecutive case series included chronic HBV patients aged ≥ 18 years on TAF therapy who presented to the infectious diseases outpatient clinic and had both USG-based steatosis grading (S0–S3) and elastography-CAP results available from the same visit. Patients with significant alcohol use, concomitant chronic liver diseases (HCV/HDV, autoimmune liver disease, Wilson's disease, hemochromatosis), acute hepatitis flares, or incomplete USG/CAP data were excluded. CAP categories were defined as follows: S0 ≤ 0.63 , S1: 0.64–0.72, S2: 0.73–0.82, and S3 ≥ 0.83 dB/m. Discrepancies between USG and CAP classifications were analyzed, and findings were reported in counts and percentages. **Results:** The median age of the 16 included patients was 57.5 years, with 56.2% being female. Steatosis grading by USG revealed 10 patients with S0, 3 with S1, and 3 with S2, while CAP identified 13 patients as S0, 1 as S1, and 2 as S2. Full concordance between the two methods was observed in 12 patients (75.0%), with a one-stage discrepancy in 2 patients (12.5%), and a greater-than-one-stage discrepancy in 2 patients (12.5%). A heatmap (Figure 1) illustrates concordance between USG and CAP classifications, with diagonal cells indicating perfect agreement.

In 3 patients (18.8%), USG classified steatosis at a higher stage than CAP. All USG-S0 cases matched with CAP-S0. USG-S1 cases were distributed across CAP S0–S2, while 67% of USG-S2 cases were classified as CAP-S0, and 33% as CAP-S2. Regarding lipid profiles: LDL ≥ 130 mg/dL was observed in 7 patients (43.8%), LDL ≥ 160 mg/dL in 1 patient (6.3%), and triglycerides ≥ 150 mg/dL in 6 patients (37.5%). **Conclusions:** There was a high concordance rate between USG and CAP assessments, with clinically significant discrepancies limited to a minority. USG demonstrated a slight tendency to overclassify steatosis. Despite the small sample, these findings support the practical use of USG in steatosis monitoring among HBV patients on TAF, though CAP may be useful in borderline cases.

Keyword(s) :

1559 - SIRPA as a Novel Regulator of T Cell Apoptosis in Hepatocellular Carcinoma Implications for Immunotherapy

Xue Zhang¹, Dongbo Chen¹, Hongsong Chen¹
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China¹

Background / Hypothesis: Immune checkpoint inhibitors (ICIs) were effective in only 20% of advanced hepatocellular carcinoma (HCC), suggesting the presence of additional immune evasion mechanisms.

Materials and Methods: In this study, we employed a CRISPR library to screen key genes associated with T-cell apoptosis and identified differentially expressed genes (DEGs) in tumor-infiltrating lymphocytes (TILs) from HCC patients with high concentrations of interleukin-2 (IL-2). Integration analysis revealed signal regulatory protein alpha (SIRPA) as a novel regulator of T cell apoptosis in HCC, distinct from its classical role as a macrophage inhibitory receptor. In addition, the function of SIRPA was verified in vivo and in vitro using Sirp α ^{-/-} mice and T cells derived from PBMC.

Results:

In vitro, SIRPA deficiency reduced apoptosis in human and mouse T cells, while its overexpression promoted apoptosis. In vivo, the degree of tumor suppression strongly correlated with Sirp α deficiency in T cells, with even haploinsufficient Sirp α exerting anti-tumor effects. After macrophage depletion, Sirp α ^{-/-} mice showed

ORAL ABSTRACTS

significantly increased proportions of functional CD8+ T cells in peripheral blood and tumor tissues, along with elevated granzyme B (GZMB) levels compared to wild-type (WT) mice, confirming that Sirp α deficiency in T cells resists apoptosis. Notably, in adoptive immunotherapy, TCR-T cells overexpressing SIRPA exhibited significantly reduced killing function, and tumor-bearing mice receiving Sirp α -/- CD3+ T cells inhibited tumor growth compared to those receiving T cells from WT. Mechanistically, SIRPA upregulated EGR4 to activate the Bcl-2/Bax pathway, promoting T-cell apoptosis.

Conclusions:

Targeting SIRPA may suppress HCC progression by inhibiting T-cell apoptosis, offering a novel immunotherapeutic strategy.

1560 - Correlation between transient elastography and liver biopsy in CHB patients with elevated HBV DNA

Dr	with normal ALT	normal ALT
Arifa	Tasnim	

National Gastroenterology Institute And Hospital, Medical Gastroenterology, Dhaka-Bangladesh

Background / Hypothesis: Chronic hepatitis B (CHB) is a significant global health burden, leading to liver fibrosis and cirrhosis. Many CHB patients with elevated hepatitis B virus (HBV) DNA levels have persistently normal alanine aminotransferase (ALT), complicating fibrosis assessment. Liver biopsy is the gold standard for fibrosis evaluation but has limitations, necessitating non-invasive alternatives like transient elastography (TE).

Materials and Methods: A cross-sectional study was conducted at the Department of Hepatology, Bangabandhu Sheikh Mujib Medical University, Dhaka, from June 2019 to February 2020. Forty CHB patients (HBsAg positive >6 months, ALT <40 IU/L, HBV DNA >2,000 IU/mL) underwent TE and percutaneous liver biopsy. Fibrosis stages were evaluated using the METAVIR scoring system. TE findings were correlated with histological fibrosis using Pearson's correlation test, with statistical analysis performed via SPSS version 23.

Results: The mean age of patients was 30.20 ± 8.3 years, with a male predominance (75%). TE classified 77.5% of patients as having F0-F1 fibrosis and 22.5% as F2 fibrosis. Histological analysis identified 57.5% with F0-F1 fibrosis and 42.5% with significant fibrosis (F2-F4). TE and biopsy findings showed a positive correlation ($p < 0.001$). The receiver-operating characteristic (ROC) curve for TE demonstrated an area under the curve (AUC) of 0.774, with a cut-off value of 5.9 kPa yielding a sensitivity of 70% and specificity of 91% for detecting significant fibrosis.

Conclusions: TE shows a strong correlation with liver biopsy findings in CHB patients with normal ALT, demonstrating its potential as a reliable, non-invasive alternative for fibrosis assessment. Utilizing TE in clinical settings could enhance early detection and management of liver fibrosis, reducing the need for invasive biopsies.

1564 - Second line Therapy after Immunotherapy for Unresectable Hepatocellular Carcinoma a Multicenter Data Registry Analysis

Takeshi Okamoto¹, Yuta Maruki², Tsunekazu Oikawa³, Takayoshi Ito⁴, Shunsuke Kondo⁵, Yukinobu Watanabe⁶, Hiroko Hosoi², Naoki Sasahira¹, Takuji Okusaka²
Cancer Institute Hospital Of Japanese Foundation For Cancer Research, Department Of Hepato-biliary-pancreatic Medicine, Tokyo-Japan¹ National Cancer Center Hospital, Department Of Hepatobiliary And Pancreatic Oncology, Tokyo-Japan² Jikei University School Of Medicine, Division Of Gastroenterology And Hepatology, Tokyo-Japan³ Showa Medical University Koto Toyosu Hospital, Digestive Disease Center, Tokyo-Japan⁴ Tokyo Women's Medical University, Department Of Medical Oncology, Tokyo-Japan⁵ Nihon University School Of Medicine, Division Of Gastroenterology And Hepatology, Tokyo-Japan⁶

Background / Hypothesis: Evidence on second-line treatment in systemic treatment for unresectable hepatocellular carcinoma (uHCC) is limited. This study investigated the efficacy of second-line treatment after first-line immunotherapy using clinical data from seven high-volume institutions

ORAL ABSTRACTS

in Tokyo, Japan.

Materials and Methods: Patients who received first-line immunotherapy for uHCC at the participating between August 2018 and June 2025 were extracted for analysis from a multicenter data registry (BLOOM study). Outcomes of patients receiving second-line treatment with or without immune checkpoint inhibitors (ICIs) were compared.

Results:

Of the 188 patients receiving first-line treatment with atezolizumab/bevacizumab (AB, n = 159) or durvalumab/tremelimumab (DT, n = 29), 83 (44%) went on to receive second-line systemic treatment (AB: 66, 41% vs. DT: 17, 58%, p = 0.067). There was no significant difference in median overall survival (OS) or progression-free survival (PFS) between first-line AB and DT.

Excluding seven patients who participated in second-line clinical trials or with insufficient data, 76 patients undergoing second-line treatment after immunotherapy were analyzed. Of these, 13 received ICIs with or without VEGF inhibitors (ICI group), while 63 were treated solely with VEGF inhibitors (non-ICI group). The median age at the start of first-line therapy was 68 years, and 82% were male. Etiologies were hepatitis B/C/non-viral in 8/12/56 patients. Child-Pugh score 5/6/7/8/9: 55/14/5/0/1. BCLC stage A/B/C: 3/28/45. 21% had macrovascular invasion and 36% had extrahepatic spread. There were no significant differences in these characteristics between groups. Objective response to first-line therapy was higher in the ICI group (42% vs. 13%, p = 0.034). Second-line objective response rates (25% vs. 21%, p > 0.99) and disease control rates (58% vs. 68%, p = 0.73) were comparable. There were no significant differences in median first-line OS (not reached vs. 26.0 months, p = 0.23), median second-line OS (not reached vs. 16.9 months, p = 0.26), or second-line PFS (3.7 vs. 4.1 months, p = 0.49) between groups. Patients with favorable response to first-line immunotherapy were more likely to also have favorable response to second-line therapy (57% vs. 15%, p = 0.027) and had longer median second-line PFS than those who did not (19.7 vs. 7.4 months, p = 0.049), regardless of choice of second-line therapy.

Conclusions:

Choice of second-line therapy after first-line immunotherapy did not affect outcomes in this multicenter cohort. Favorable response to first-line therapy was associated with favorable response to second-line therapy and with longer second-line PFS,

suggesting a possible carryover effect.

Keyword(s) : hepatocellular carcinoma, liver cancer, immune checkpoint inhibitors, second-line therapy, systemic therapy

Background: In China, most HCC is HBV-related with high post-radical surgery recurrence. We explored the application of Peg-IFN- α combined with nucleoside(tide) analogues(NAs) to evaluate the efficacy and safety of Peg-IFN- α in reducing the incidence of HCC in patients with HBV related cirrhosis and reducing the recurrence of HCC in patients after radical surgery. **Methods:** The analysis was conducted in the data of 1 year from a multi-center, prospective, real-world cohort study (the TERMINATOR Project) from China. The cirrhosis group was consisted of compensated HBV related cirrhosis patients, and the HCC group was consisted of patients with HBV-related HCC who underwent radical surgery. Patients were given Peg-IFN- α combined with first-line NAs, including ETV, TDF, TAF,

ORAL ABSTRACTS

or TMF.
Results: As of November 2025, this study enrolled 426 patients with HBV-related cirrhosis and 97 with HCC. 149 cirrhosis and 54 HCC patients completed 24-weeks treatment. 79 and 28 patients completed 48-weeks treatment, respectively. At baseline, 41.08% of cirrhosis and 12.37% of HCC patients had detectable HBV DNA. After 24 weeks of treatment, only 8.05% of the cirrhosis group and 9.26% of the HCC group had detectable HBV DNA. HBsAg clearance was observed in 4.03% of the cirrhosis group and 5.56% of the HCC group. Clinically, one cirrhosis patient (0.67%) developed HCC, and two HCC patients (3.70%) experienced recurrence. At the 48-week visit, virological response was complete, with 100% of patients in both groups achieving undetectable HBV DNA. HBsAg clearance rates were 7.59% in the cirrhosis group and 3.57% in the HCC group. No cirrhosis patients developed new HCC, and one HCC patient (3.57%) had a recurrence. No decompensated cirrhosis occurred. Thrombocytopenia was the main adverse event.
Conclusions: Using Peg-IFN- α combined with NAs treatment, the incidence of HCC was low in patients with HBV related cirrhosis and the recurrence rate was low in patients with HBV related HCC after radical surgery. The patients were safe and the incidence of decompensated cirrhosis seldomly occurs.

1567 - Multi omics Analysis of Bile Acid Dysregulation in Hepatitis E virus Infection

Conglin Zhao ¹, Shuai Tao ², Qiang Li ¹, Chong Chen ³, Liang Chen ¹

Shanghai Public Health Clinical Center, Fudan University, Department Of Liver Disease, Shanghai-China ¹

Shanghai Public Health Clinical Center, Fudan University, Scientific Research Center, Shanghai-China ² Shanghai Public Health Clinical Center, Fudan University, Department Of Infectious Diseases, Shanghai- ³

Background / Hypothesis: Hepatitis E virus (HEV) infection can lead to acute hepatitis and potentially progress to acute liver failure, but the underlying mechanisms of bile acid metabolism disruption remain poorly understood. Bile acid homeostasis is crucial for liver function and is regulated by complex interactions between hepatic enzymes, transporters, gut microbiota, and metabolic pathways. This study aimed to comprehensively characterize bile acid metabolism dysregulation in HEV patients through integrated analysis of serum and fecal metabolomics, gut microbiota composition, and hepatic molecular

expression profiles.

Materials and Methods: We enrolled 15 acute hepatitis E (AHE) patients, 16 HEV-related acute liver failure (HEV-ALF) patients, and 15 healthy controls. Targeted bile acid metabolomics was performed on serum and fecal samples, with measurement of serum fibroblast growth factor 19 (FGF19) and 7 α -hydroxy-4-cholesten-3-one (C4) levels. Gut microbiota analysis was conducted using 16S rRNA sequencing of fecal samples. Liver tissue samples were analyzed using HE staining, immunohistochemical staining for key bile acid metabolism molecules, and quantitative PCR analysis of related gene expression.

Results: Patients with HEV infection exhibited elevated serum levels of total bile acids and primary conjugated bile acids, while fecal levels of total bile acids and secondary bile acids were significantly decreased. In patients with acute hepatic failure caused by hepatitis E, serum FGF19 levels were markedly increased and C4 levels were substantially reduced. Intestinal microbiota analysis revealed a declining trend in the abundance of bacterial genera responsible for bile acid metabolism in hepatitis E patients. Hepatic tissue from hepatitis E patients demonstrated pronounced cholestasis, hepatic inflammation, and necrosis. Immunohistochemical analysis of liver tissue showed significantly decreased levels of farnesoid x receptor (FXR) and bile salt export pump (BSEP), accompanied by a marked elevation in FGF19. Gene expression analysis in hepatic tissue revealed decreased mRNA expression of cholesterol 7 α -hydroxylase (CYP7A1) and sterol 12 α -hydroxylase (CYP8B1), which are responsible for bile acid synthesis, as well as reduced mRNA expression of bile acid transporters BSEP and sodium-taurocholate cotransporting polypeptide (NTCP). Furthermore, the mRNA expression of FXR, a key regulator of bile acid homeostasis, was decreased, while FGF19 mRNA expression was increased.

Conclusions: Our findings reveal comprehensive bile acid metabolism disruption in HEV infection, characterized by impaired hepatic bile acid transport, altered gut-liver axis signaling, and gut microbiota dysbiosis. The severity of metabolic dysregulation correlates with disease progression, providing insights into HEV pathogenesis and potential therapeutic targets.

1568 - Role of CD146 High Endothelial Cells in Vascular Remodeling and Fibrosis Progression in Cirrhotic Liver A Single Cell Transcriptomic Study

Bingqing Yang¹, Chenxue Hou², Yue Li², Qi Wang¹
Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases, Beijing-China¹ Beijing Ditan Hospital, Capital Medical University, Clinical Laboratory, Beijing-China²

Background / **Hypothesis:**
During liver cirrhosis, capillarization of liver sinusoidal endothelial cells (LSECs) and abnormal vascular remodeling drive persistent fibrosis, yet the signaling that links endothelial activation to fibroblast activation remains unclear. CD146 levels in serum and liver tissue increase with cirrhosis severity, suggesting a role in fibrogenesis. This study aimed to define the lineage features of CD146-high endothelial cells and their crosstalk with fibroblasts in human cirrhotic liver using single-cell transcriptomic and histological evidence.
Materials and **Methods:**
The public single-cell RNA-sequencing dataset GSE136103, including liver samples from healthy controls and patients with cirrhosis, was analyzed. After quality control, dimensionality reduction and clustering, major cell types were annotated using canonical markers. Endothelial cells were further subclustered to identify LSEC, arterial, venous and lymphatic subsets and to compare MCAM (CD146), STAB2, VCAM1 and other gene expression patterns. Ligand-receptor analysis was used to explore endothelial-fibroblast signaling associated with MCAM-high endothelial cells. In an independent liver cohort, CD146 and VWF co-immunofluorescence was performed to validate endothelial expression.

Results:
Six major cell populations were identified: Kupffer cells, endothelial cells, hepatocytes, NK cells, T cells and fibroblasts. MCAM expression was significantly upregulated in cirrhotic liver and mainly restricted to endothelial cells. In healthy livers, LSECs showed high expression of STAB2 and CLEC4G, whereas cirrhotic LSECs displayed reduced STAB2 and increased MCAM and VCAM1, consistent with a capillarized LSEC profile. Joint STAB2-MCAM analysis showed cirrhosis-derived cells enriched in an STAB2^{low}/MCAM^{high} population, while healthy cells were predominantly STAB2-high/MCAM-low, indicating an association between CD146-related endothelial activation and sinusoidal-to-capillary-like transition. Immunofluorescence confirmed increased

CD146+/VWF+ endothelial cells in cirrhotic versus normal liver. SPP1-ITGA5-ITGB1 and SPP1-ITGAV-ITGB1 axes were enriched between MCAM-high endothelial cells and fibroblasts, suggesting pathological endothelial-fibroblast crosstalk.
Conclusions:

This study delineates CD146-high endothelial cell lineages in human cirrhotic liver and identifies SPP1-integrin-mediated signaling potentially linking LSEC capillarization to fibroblast activation. CD146 may therefore not only mark cirrhosis progression but also promote fibrosis-related vascular remodeling, providing a potential target for anti-fibrotic strategies disrupting endothelial-fibroblast crosstalk.

1573 - Comparison of ALBI PALBI MELD and Child-Pugh Scores in Chronic Liver Disease Evidence from Bangladesh

A B M Shakil Gani¹, Uzzal Kanti Debnath¹, Sabbir Hossain¹, Nur Alam¹, Zannatul Habiba¹, Ankita Banik¹, Rebeka Sultana Mousumi¹, Sourav Kumar Saha¹, Nure Alam¹, Tasnim Mahmud²
Dhaka Medical College Hospital, Hepatology, Dhaka-Bangladesh¹ North South University, Public Health, -²

Background / **Hypothesis:**

Accurate evaluation of hepatic reserve is vital for prognosis in chronic liver disease (CLD). Conventional models such as the Model for End-Stage Liver Disease (MELD) and Child-Turcotte-Pugh (CTP) scores are widely used but include subjective parameters and laboratory variability. The Albumin-Bilirubin (ALBI) and Platelet-Albumin-Bilirubin (PALBI) scores are objective indices derived from routinely measured biochemical parameters. The efficacy of the ALBI or PALBI scores has not been validated in Bangladeshi adults with liver cirrhosis. This study aimed to determine the correlation of ALBI and PALBI with MELD and CTP scores and to compare their predictive value in Bangladeshi patients with CLD of mixed etiologies.

Materials and **Methods:**
A cross-sectional study was performed on 105 patients with established CLD. Demographic, clinical, and laboratory data were collected to calculate ALBI, PALBI, MELD, and CTP scores. Correlations were analyzed using Spearman's rank test, while one-way ANOVA and chi-square tests evaluated associations with age and etiology. Hierarchical linear regression models were applied to assess the independent predictive contributions of ALBI and PALBI to MELD and CTP.

ORAL ABSTRACTS

Results:

Both ALBI and PALBI showed significant positive correlations with MELD ($p = 0.539$ and 0.625 , $p < 0.001$) and with CTP ($p = 0.721$ and 0.679 , $p < 0.001$). Neither MELD nor CTP varied significantly with age ($p = 0.526$, 0.733), though etiological causes differed by age ($p < 0.001$). Regression analysis identified PALBI as a stronger predictor of MELD ($\Delta R^2 = 0.085$, $p < 0.001$), while ALBI contributed more uniquely to CTP ($\Delta R^2 = 0.054$, $p = 0.001$).

Conclusions:ALBI and PALBI demonstrated strong correlations with conventional liver severity scores, supporting their utility as objective, simple, and economical indices of hepatic dysfunction. PALBI better reflected MELD-related systemic effects, whereas ALBI correlated more closely with CTP, representing hepatic reserve and function.

Keyword(s) : ALBI, PALBI, MELD, Child–Pugh, chronic liver disease, hepatic reserve, Bangladesh

1576 - Qilingxiaoji formula and the effective ingredients inhibit hepatocellular carcinoma progression by inhibiting miR32 GPR180 signaling pathway

Yilan Yang¹, Xiaoxiao Yu¹, Yunfeng Guan¹, Man Li¹, Yueqiu Gao¹
Shuguang Hospital, Affiliated To Shanghai University Of Traditional Chinese Medicine, Shanghai Key Laboratory Of Traditional Chinese Clinical Medicine, Shanghai-China¹

Background / Hypothesis:Hepatocellular carcinoma (HCC) is one of the most prevalent malignant tumors globally. The Qilingxiaoji formula (QLXJ), traditional Chinese medicine, has been used empirically for treating HCC.To investigate the anti-tumor effects of QLXJ and its active components and elucidate the underlying anti-tumor mechanisms.
Materials and Methods:A retrospective study was conducted to evaluate the clinical effects of QLXJ from 2019.01-2023.07. A mouse subcutaneous model and a diethylnitrosamine (DEN) and carbontetrachloride(CCl4)-induced HCC model were built to definite the therapeutic effects of QLXJ. Differential gene expression in tumors was analyzed by RNA-sequencing. The potential active components of QLXJ were identified through UPLC-Q-TOF-MS combined with network pharmacology. Cell viability

and proliferation were assessed using CCK8 and EdU staining assays, and apoptosis was analyzed by flow cytometry. Knock-down and activation of GPR180 were employed in cell models. Phosphorylation of Smad3 and HDAC4 were inhibited to explore the contribution of the Smad3/HDAC4 signaling pathway in the anti-HCC effects of kaempferol.

Results:QLXJ significantly reduced the tumor recurrence in the 2nd year after operation (40.5% vs 23.0%, $P = 0.002$). In addition, QLXJ inhibited HCC growth in both mouse models. RNA-sequencing and experimental validation revealed that GPR180 may be a potential target of QLXJ. Network pharmacology and UPLC-Q-Orbitrap-MS identified kaempferol as an active component of QLXJ. Kaempferol inhibited the proliferation and induced apoptosis of hepatoma Huh7 and H22 cells. Kaempferol downregulated the expression of GPR180 and decreased phosphorylated proteins of Smad3 and HDAC4. Furthermore, knock-down of GPR180 inhibited the proliferation and induced apoptosis of HCC cells, synergistically with kaempferol. CTHRC1, a ligand of GPR180, attenuated the kaempferol-induced inhibition of proliferation and apoptosis in HCC cells, and increased the levels of p-Smad3 and p-HDAC4. Inhibition of Smad3 and HDAC4 did not increase apoptotic cell death induced by kaempferol. In vivo studies showed that kaempferol significantly could inhibit the tumor growth in subcutaneous model, reducing tumor volume (731.4 ± 169.8 vs 308.8 ± 137.1 mm³, $P < 0.05$) and tumor weight (2.24 ± 1.17 vs 0.96 ± 0.68 g, $P < 0.05$), with a tumor inhibition rate of 57.06%.
Conclusions:QLXJ inhibits tumor growth in both subcutaneous and DEN/CCL4 induced orthotopic HCC models, and kaempferol, as an active component of QLXJ, prevents hepatoma cells proliferation and induces apoptosis via inhibiting miR-32 mediated GPR180/Smad3/HDAC4 signaling pathway.

Keyword(s) : hepatocellular carcinoma, Qilingxiaoji formula, kaempferol, GPR180, miR-32

1580 - Prognostic Evaluation of Hepatocellular Carcinoma Impact of Etiological Factors on Survival Outcomes

Ali Çağrı Oral¹, Sedat Çiçek¹, Abdullah Mübin Özercan¹, Ali Barutçu², Mehmet Yalnız¹, Ibrahim Halil Bahçecioglu¹
Department Of Gastroenterology, Gastroenterology, Elazığ-Türkiye¹ Department Of Internal Medicine, Internal Medicine, Malatya-Türkiye²

Background / Hypothesis:Hepatocellular carcinoma (HCC) is a highly lethal malignancy that develops in the

ORAL ABSTRACTS

setting of diverse etiological factors. Prognostic evaluation in HCC primarily relies on established scoring systems such as the Barcelona Clinic Liver Cancer (BCLC) staging system, the Model for End-Stage Liver Disease (MELD), and the Child–Pugh classification. More recently, the Albumin–Bilirubin (ALBI) score has been adopted as an additional prognostic indicator reflecting systemic inflammation, hepatic functional reserve, and nutritional status. The objective of this study was to assess the influence of different etiological factors on the prognosis of patients with HCC.

Materials and Methods: A total of 173 patients diagnosed with hepatocellular carcinoma (HCC) and followed at our clinic were retrospectively analyzed. The etiological distribution was as follows: HBV (n=96), HCV (n=11), chronic Delta hepatitis (HDV) (n=20), MAFLD (n=12), and unknown etiology (n=34). For all patients, hemogram and biochemical parameters, BCLC and ALBI scores, MELD and Child–Pugh classifications, survival duration, and mortality outcomes were recorded. Comparisons between etiological groups were performed using the Fisher–Freeman–Halton test for categorical variables and the Kruskal–Wallis test, with a p-value <0.05 considered statistically significant.

Results: No statistically significant difference in mortality was observed among the etiological groups (p = 0.82). Mortality rates were 59.4% in HBV, 45.5% in HCV, 50% in Delta hepatitis, 61.8% in unknown etiology, and 58.3% in MAFLD. A statistically significant difference in mean age was detected across the groups (p < 0.001), with patients in the Delta hepatitis group (58.80 ± 11.71) being significantly younger. No significant intergroup differences were observed regarding survival duration (p = 0.09), ALBI score, BCLC stage, Child–Pugh classification (p = 0.23), or MELD score (p = 0.51).

Conclusions: This study indicates that the underlying etiology of hepatocellular carcinoma does not significantly influence mortality, survival outcomes, or established prognostic scoring systems, including ALBI, BCLC, Child–Pugh, and MELD. Although patients with Delta hepatitis developed HCC at a younger age, this did not translate into a difference in prognosis. These findings suggest that HCC exhibits a comparable prognostic course across different etiological

backgrounds, highlighting the need for larger, multicenter studies to further elucidate the impact of etiology on clinical outcomes.

Keyword(s) : Delta hepatitis, hepatocellular carcinoma (HCC)

1581 - Continuing or Switching Systemic Therapy Combined with Locoregional Therapy Defines a Personalized Strategy for Oligoprogression in HCC A Multicenter Retrospective Study

Hongli Yu Yu¹, Caiyun Peng Peng¹, Fuchuan Wang Wang¹, Shuai Wang Wang¹, Yinyin Li¹, Qiqi Liu Liu², Qiang Zhu Zhu³, Hang Zheng Zheng⁴, Yinying Lu Lu¹, Jiamin Cheng Cheng¹
Chinese PLA General Hospital, Senior Department Of Hepatology, Beijing-China¹ Shandong Provincial Hospital, Cheeloo College Of Medicine, Shandong University, Department Of Gastroenterology, Jinan-China² Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Infectious Disease, Jinan-China³ The First Affiliated Hospital Of Wenzhou Medical University, Wenzhou, Department Of Gastroenterology, Wenzhou-China⁴

Background / Hypothesis: The optimal management of oligoprogression during first-line immune checkpoint inhibitor-based therapy for advanced hepatocellular carcinoma (HCC) remains unclear. This study compared the outcomes between continuing first-line systemic therapy combined with locoregional therapy (FLST+LRT), switching to second-line systemic therapy combined with LRT (SLST+LRT), or switching to SLST alone.

Materials and Methods: This multicenter, retrospective study enrolled 226 patients with oligoprogressive HCC. Patients were stratified into FLST+LRT (n = 87), SLST+LRT (n = 93), and SLST alone (n = 46) groups. Overall survival (OS) and progression-free survival were analyzed. Factors associated with overall were identified.

Results: Median OS was significantly longer in both FLST+LRT (26.4 months) and SLST+LRT (24.9 months) groups compared to SLST alone (18.1 months; p = 0.041 and p = 0.029, respectively). Subgroup analyses demonstrated that among durable responders, FLST+LRT achieved a median OS of 42.5 months, superior to SLST+LRT (19.1 months, p = 0.049) and SLST alone (18.3 months, p = 0.006). In non-durable responders, SLST+LRT resulted in

ORAL ABSTRACTS

longer median OS than both FLST+LRT ($p = 0.030$) and SLST alone ($p = 0.042$). For intrahepatic progression, both LRT-based strategies improved OS compared to SLST alone ($p = 0.004$ and $p < 0.001$, respectively). Multivariate analysis identified ALBI grade (hazard ratio [HR] 1.846, $p = 0.013$), no LRT after oligoprogression (HR 1.683, $p = 0.040$) and AFP > 200 ng/mL (HR 1.795, $p = 0.012$) as independent prognostic factors for OS.

Conclusions: Integrating locoregional therapy for oligoprogressive HCC significantly improves survival compared to switching systemic therapy alone. Treatment should be individualized based on the prior response duration and progression pattern.

1587 - Remodeling of the bile acid connectome across the hepatitis cirrhosis hcc axis network analysis reveals stage specific hubs and potential therapeutic targets

Qinshuo Wang¹, Yanpei Mai¹, Suzhen Jiang¹, Linlin Cao², Xin Wen¹, Tianyi Xue¹, Yuxi Shi¹, Yanhui Yang¹, Huiying Rao¹, Zixing Wang¹
Peking University, Peking University Hepatology Institute, Beijing-China¹ Peking University, Peking University People's Hospital Laboratory Department, Beijing-China²

Background / **Hypothesis:**
While bile acids (BAs) are established players in liver disease progression and are components of predictive models, the dynamics of BA networks across disease stages remain unexplored. We hypothesize that the transition from hepatitis to cirrhosis and hepatocellular carcinoma (HCC) is driven not just by changes in individual BA concentrations, but by a fundamental rewiring of BA interaction networks. This study aims to systematically map and quantify the BA network topology across this disease spectrum to identify hub BAs that may coordinate metabolic dysregulation.

Materials and **Methods:**
We prospectively enrolled 889 patients from Peking University Hepatology Institute in 2025, categorized into six groups: Hepatitis B (HBV), MAFLD, HBV-MAFLD, compensated cirrhosis (CC), decompensated cirrhosis (DC), and HCC. Serum levels of individual BAs were quantified using LC-MS/MS. For each group, a BA co-abundance network $G=(V,E)$ was constructed, where

nodes (V) represent BAs and edges (E) represent strong correlations ($|\text{Spearman's } r| > 0.65$, capturing both synergistic and inhibitory relationships. Network topology was analyzed using density, clustering coefficient, and modularity. Cross-group comparisons of BA profiles and core identities pinpointed hub BAs whose relative changes are linked to global network restructuring.

Results:

We found significant differences in network structure across the Hepatitis-Cirrhosis-HCC Axis. Specifically, network density-reflecting the frequency of interactions between bile acids- increased from 0.09-0.14 (MAFLD, HBV and overlap), 0.15-0.17 (CC and DC), to 0.22 (HCC); clustering coefficient-reflecting the degree of collaboration among BAs within functional modules-rose from 0.58 to 0.74 accordingly. Analysis of network hubs revealed that UDCA as a core BA in MAFLD, where as glycine-conjugated BAs dominated the other groups. That is, GDCA composed 6.4%-8.1% of the BA pool for HBV (with/ without MAFLD; 6.1-7.7 times higher than reference level), and was identified as a driver for progression to CC. GCDCA becomes the hub when further progressing to DC, whereas GCA acts as a consistent hub within the networks throughout the full disease spectrum.

Conclusions:

This work moves beyond individual BA quantification to define the "BA connectome" in liver disease. Identifying the dynamic hub BAs provides novel insights into the critical control points of metabolic dysregulation at each stage. These hubs represent potential biomarkers for disease monitoring and novel therapeutic targets for interrupting progression. Our network analysis framework offers a powerful paradigm for understanding complex metabolic interactions in hepatobiliary diseases.

1588 - Role and Mechanism of TGFβ pSAP Signaling in Regulating Hepatocyte Macrophage Crosstalk in Metabolic Dysfunction Associated Steatohepatitis

Zheng Liu¹, Qiyuan Huang², Hao Wang², Yang Che³
The First Affiliated Hospital With Nanjing Medical University, General Surgery, Nanjing-China¹ The First Affiliated Hospital With Nanjing Medical University, Hepatobiliary Center, Nanjing-China² The First Affiliated

ORAL ABSTRACTS

Hospital With Nanjing Medical University, Blood Transfusion, Nanjing-China ³

Background / Hypothesis: Metabolic dysfunction-associated steatohepatitis (MASH) is an escalating public health challenge in China, driven by increasing rates of obesity and type 2 diabetes. Dysregulated sphingolipid metabolism has been implicated in disease progression, yet the underlying mechanisms remain poorly defined.

Materials and Methods: Liver tissues from patients with MASH and matched controls were analyzed for GlcCer (18:1/16:0) levels. Hepatocyte-specific Psap knockout (Psap^ΔHKO) and myeloid-specific Gpr37 knockout (Gpr37^ΔMKO) mice were generated and fed a Western diet for 26 weeks to establish experimental MASH models. Targeted lipidomics, spatial transcriptomics, and single-cell transcriptomics were applied to investigate hepatic lipid metabolism, inflammation, and fibrosis-related pathways.

Results: TGFβ signaling was found to induce prosaposin (pSAP) glycosylation in hepatocytes, promoting its extracellular secretion. MASH livers exhibited marked accumulation of GlcCer (18:1/16:0), while extracellular glycosylated pSAP activated GPR37 in macrophages, triggering enhanced TGFβ secretion. This TGFβ-enriched environment further amplified pSAP glycosylation and secretion, driving MASH progression through two mechanisms: (1) accumulated GlcCer competitively inhibited HSC70-PLIN2 interaction, impairing lipophagy-mediated lipid droplet degradation; and (2) glycosylated pSAP activated GPR37 signaling in macrophages, reinforcing TGFβ release and establishing a hepatocyte-macrophage-TGFβ positive feedback loop.

Conclusions: These findings identify the TGFβ/pSAP axis as a key regulator of hepatocyte-macrophage crosstalk in MASH, advancing mechanistic understanding and highlighting novel therapeutic opportunities. Furthermore, circulating glycosylated pSAP may serve as a promising biomarker for MASH diagnosis.

1589 - Intermittent therapy restores anti HBV efficacy of IFN by reducing elevated dysfunctional HLA-DR+CD38hiCD8+ T lymphocytes

Yanjie Lin ¹, Yao Xie ², Minghui Li ²
Peking University Ditan Teaching Hospital Department

Of Hepatology Division 2, Beijing-China ¹ Beijing Ditan Hospital, Department Of Hepatology Division 2, Beijing-China ²

Background / Hypothesis: After long-term interferon (IFN) therapy, some patients experience a stagnation of hepatitis B surface antigen (HBsAg) levels. Only after IFN intermittent therapy do the antiviral efficacy continue. Here, We aimed to explore the immunological mechanisms underlying this phenomenon in patients with chronic hepatitis B (CHB).

Materials and Methods: After conducting a prospective recruitment of CHB patients, IFN therapy was administered to some patients in the Naive group and the nucleoside (nucleotide) analogue (NA)-treated group. For those in the IFN-treated plateau group (abbreviated as Plateau group) who experienced stagnation in HBsAg decline during IFN therapy, IFN intermittent therapy was employed, followed by IFN retreatment. At the corresponding time points, peripheral blood samples were collected to measure clinical indicators. Flow cytometry was used to assess cell phenotype and function, and Luminex multiplex assays were employed to evaluate the levels of soluble mediators in plasma.

Results:

A total of 151 patients were enrolled. The Plateau group exhibited a significant increase in the percentage of HLA-DR+CD38dim subgroup and a significant decrease in HLA-DR+CD38hi subgroup in T lymphocytes after 12-24 weeks of IFN intermittent therapy. After another 12-24 weeks of IFN retreatment, the HLA-DR+CD38dim subgroup markedly decreased while the latter significantly increased. Concurrently, both the HBsAg and the HLA-DR+CD38hi subgroup in T lymphocytes were remarkably lower than the levels of baseline at IFN discontinuation. Additionally, only in CD8+ T lymphocytes, HLA-DR+CD38hi subgroup expressed lower levels of co-stimulatory molecules and cytotoxic functions compared to the activated HLA-DR+CD38dim subgroup. Finally, plasma cytokine results showed IFN-inducible protein (IP)-10 was the strongest correlation with HLA-DR+CD38hiCD8+ T lymphocytes during IFN-based antiviral therapy.

Conclusions:

The emergence of the IFN-treated plateau phase may be associated with an excessively high proportion of

ORAL ABSTRACTS

dysfunction HLA-DR+CD38hiCD8+ T lymphocytes, indicating impaired cytotoxic function. IFN intermittent therapy can reverse this phenomenon. Furthermore, IP-10 may serve as a plasma cytokine marker for predicting antiviral efficacy.

Keyword(s) : chronic hepatitis B, interferon, HLA-DR+CD38+CD8+ T lymphocytes, plateau phase, intermittent therapy

1592 - Fibroscan role in determining the patients who are at high risk for developing HCC in 1000 cirrhotic Egyptian patients.

Mohamed Abdel-samee¹, Abdel Ghani Atef abdel Ghani²

National Liver Institute, Menoufia University, Hepatology And Gastroenterology, Shebin El-kom-Egypt¹ Specialized Medical Center-damas Liver Center, Git And Hepatology, Hepatology, Mansoura-Egypt²

Background / Hypothesis:Hepatocellular carcinoma (HCC) is common primary malignancy of the liver and one of the most frequent causes of death in patients with liver cirrhosis. Nowadays, liver stiffness measured noninvasively by transient elastography has been reported to be well correlated with histologically assessed liver fibrosis stage. The aim of this study was to study the role of ultrasound elastography (FibroScan) in early detection of HCC in cirrhotic patients as well as verifying whether it could be used as a tool for identifying cirrhotic patients who are at high risk of developing HCC.

Materials and Methods:

This study was conducted on 1000 patients with cirrhosis of both sexes. The studied patients were classified into: group I which included 500 patients with cirrhosis and HCC diagnosed by ultrasound examination and confirmed by triphasic computed tomography and group II which included 500 patients with cirrhosis and without evidence of HCC diagnosed by clinical, laboratory and ultrasound examination. Patients with morbid obesity, ascites, hepatic metastatic lesions and patients with HCC beyond Milan criteria were excluded from this study. Tumour characteristics were assessed. Tumor staging was done using Okuda, CLIP, VISUM and Tokyo staging systems. Transient elastography was done for all patients and all their results were expressed in kilopascal.

Results:

Patients with HCC had a mean age of 57.3 years old, while cirrhotic non-HCC patients are younger with a mean age of 51.4 years old. Also HCC commonly presented in males (86%) more than females (14%). Liver stiffness was significantly higher in HCC patients compared to cirrhotic patients. The sensitivity and specificity in diagnosis of HCC were 76% and 87% respectively at cut-off of 30.5 kpa with 91.8% accuracy. Fibroscan has a positive significant correlation with tumour size ($P<0.001$), Child-Pugh ($P<0.001$), Okuda classification ($P<0.001$), CLIP staging ($P<0.001$) and Tokyo classification ($P<0.001$) among HCC patients. It was found that likelihood of HCC risk was correlated with increase of liver stiffness. At liver stiffness of 25-30 kpa the probability of HCC is 93% so, these patients should undergo close follow up. Patients with stiffness ≥ 30 kpa had HCC.

Conclusions:

According to this study, fibroscan has an important role in early detection of HCC in cirrhotic patients with cut off 30.5 Kpa. Cirrhotic patients with liver stiffness ≥ 30 kpa are most likely to have HCC. Cirrhotic patients with liver stiffness ≥ 25 kpa need close follow up as they are at high risk to develop HCC.

1596 - ABT score based clinical model predicts prognosis in unresectable hepatocellular carcinoma treated with TACE combined with Bevacizumab and Sintilimab therapy

Minjun Liao¹, Huiying Rao²

1. peking University People's Hospital, Beijing-China¹ Peking University People's Hospital, Peking University People's Hospital, Beijing-China²

Background / Hypothesis:TACE combined with Bevacizumab and Sintilimab (T-B-S) therapy demonstrated promising treatment effects and improved prognosis in unresectable hepatocellular carcinoma (uHCC). However, biomarkers for predicting the treatment efficacy remains to be further explored. In this study, we aimed to construct a noninvasive and easily assessable clinical model, in order to predict prognosis of uHCC receiving T-B-S therapy. Materials and Methods:156 uHCC patients received T-B-S therapy were retrospectively recruited. Univariate and multivariate Cox regression analyses were used to identify independent prognostic factors for overall

ORAL ABSTRACTS

survival (OS). Model prediction potential was assessed by area under the receiver operating curve (ROC) and C-index. Survival curves were compared by Kaplan-Meier method.

Results: 156 uHCC patients were divided into training and validation cohorts (86 and 70 cases), and among all patients, 43 achieved complete response, 53 showed partial response, 32 had stable disease and 28 had progressive disease. The objective response and disease control rate were 61.5 and 82.1%, respectively. 23 patients underwent sequential resection (12 in training cohort and 11 in validation cohort). Univariate and multivariate Cox regression analyses identified alkaline phosphatase to prealbumin ratio (APR) > 0.96, BCLC-C stage and TBIL >17 µmol/L as independent predictors of poor survival, which consist of the ABT score. The area under the ROC of ABT model for predicting 2-year OS was 0.823 in training cohort and 0.828 in validation cohort. 2-year OS of different risk groups defined by ABT based clinical model were 89.8%, 43.7%, and 12.9%, respectively ($p < 0.0001$).
Conclusions: The T-B-S therapy showed promising treatment efficacy. ABT based clinical model was constructed to predict survival of uHCC receiving T-B-S treatment and the ABT model performed well in risk stratification.

Keyword(s) : Unresectable hepatocellular carcinoma, T-B-S therapy, Prognostic model, Progression-free survival.

1598 - Pneumonia incidence and pathogen spectrum in liver transplant recipients a decade long retrospective analysis comparing pre coronavirus disease 2019 and pandemic era temporal patterns and risk factors

Zehra Ikbal Karabal¹, Iftihar Köksal², Tonguç Utku Yılmaz³, Ebrahim Ferozie¹
Acibadem University Faculty Of Medicine, Medicine Faculty, Istanbul-Türkiye¹ Acibadem University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Istanbul-Türkiye² Acibadem University Faculty Of Medicine, Transplantation And General Surgery, Istanbul-Türkiye³

Background/Hypothesis: Liver transplant recipients face substantially elevated pneumonia risk due to pre-existing immune dysfunction from cirrhosis and intensive post-transplant immunosuppression, contributing significantly to morbidity and mortality. Pneumonia accounts for 15.5% of infection-related deaths in this population. Most studies lack detailed analysis of pre-transplant liver-specific risk factors, including severity scores (MELD, Child-Pugh) and

metabolic status. This study examines whether pneumonia incidence and pathogen distribution vary across post-transplant periods and are influenced by these specific factors. The Coronavirus Disease 2019 (COVID-19) pandemic potentially altered infection epidemiology, and this research will assess whether the shift toward stricter infection control and altered antibiotic use is reflected in measurable changes in multidrug-resistant bacterial and fungal pneumonia rates.

Materials and Methods: This retrospective cohort study includes 812 adult liver transplant recipients (≥18 years) at Acibadem Atakent Hospital from September 2015 to September 2025. Pneumonia diagnosis will follow CDC criteria with clinical and radiological confirmation. Data will be stratified into pre-COVID (September 2015-February 2020) and COVID-19 era (March 2020-September 2025) periods. Variables extracted will include MELD/Child-Pugh scores, liver disease etiology, immunosuppression details, and viral serostatus. Pneumonia episodes will be classified by timing: early (0-30 days), intermediate (31-180 days), and late (>180 days), and by acquisition type (Community-Acquired, Healthcare-Associated, Nosocomial). Incidence rates per 1000 patient-years will be calculated and multivariable Cox regression with time-dependent covariates will be used to identify independent risk factors ($p < 0.05$).

Results: The large cohort of 812 patients will define dynamic shifts in pathogen distribution and antimicrobial resistance patterns across early, intermediate, and late periods. Results will define distinct pathogen profiles for each period, focusing on multidrug-resistant organisms. Key liver-specific risk factors, such as high pre-transplant MELD score and immunosuppressive regimen, will be identified with Hazard Ratios. Dedicated analysis will quantify changes in overall incidence and MDR organism and viral pneumonia rates between pre-COVID and COVID-19 eras.

Conclusions: This study will fill important gaps in understanding post-transplant pneumonia through its decade-long, multi-dimensional analysis and COVID-19 era comparison. Findings will inform organ-specific

ORAL ABSTRACTS

infection prevention protocols, including targeted prophylaxis recommendations (e.g., fungal/viral agents), and refine antimicrobial stewardship programs. Results will guide therapy selection and management, ultimately improving safety and outcomes in liver transplant recipients.

Keyword(s) : liver transplantation, pneumonia, pathogen spectrum, immunosuppression, post-transplant infection

1602 - The Association Analysis of Metabolic Comorbidities and the 10 Year Prognosis of Hepatic Events in Chronic Hepatitis B Patients

Xiaomin Ji ¹, Xuejie Zhang ¹, Feixiang Xiong ¹, Yang Zhou ¹, Yuxin Li ¹, Peipei Meng ¹, Hao Yu ¹, Jialiang Chen ¹, Tong Wu ¹, Juqiang Han ², Yixin Hou ¹
Beijing Ditan Hospital, Capital Medical University, Center Of Integrative Medicine, Beijing-China ¹ The Seventh Medical Center Of PLA General Hospital, Department Of Ambulatory Medicine, Beijing-China ²

Background / **Hypothesis:**
Chronic hepatitis B (CHB) patients face persistent risk of hepatocellular carcinoma(HCC) and liver-related mortality despite nucleos(t)ide analogue-induced viral suppression. The prognostic significance of metabolic comorbidities (diabetes, hypertension, dyslipidemia) on long-term outcomes remains inadequately quantified. To determine whether metabolic disorders independently predict 10-year liver-related events (HCC, transplantation, mortality) in CHB.

Materials and **Methods:**
This retrospective cohort analyzed 1,717 CHB patients from Beijing Titan Hospital(2010–2020). Metabolic comorbidities were ascertained by chart review. Liver-related events were assessed using Kaplan-Meier analysis and multivariable Cox regression.

Results:
The 10-year cumulative incidence of liver-related events was 9.03%. Metabolic comorbidities significantly elevated risk: hypertension (10.38%), diabetes (16.92%), and dyslipidemia (9.52%) (all p<0.05). Multivariable Cox regression identified ≥2 metabolic comorbidities as an independent predictor of adverse outcomes (adjusted HR 2.41; 95% CI 1.72–3.38; p<0.001), irrespective of baseline MELD score. Noncirrhotic HBeAg-negative patients with low HBV DNA (<2000 IU/mL) but metabolic comorbidities exhibited substantially increased event risk.

Conclusions:

Metabolic comorbidities independently escalate 10-year liver event risk in CHB, particularly with multiple disorders. Integrated management concurrently targeting viral suppression and metabolic pathways is essential, even in virologically controlled patients.

Keyword(s) : Metabolic comorbidities; Chronic Hepatitis B(CHB); Liver-related events; Prognosis.

1603 - FcγR II B mediates CD8+ T cells dysfunction in Hepatocellular Carcinoma

Qianting Guan ¹, Meiwen Han ¹, Fangfei Yan ¹, Ming Wang ¹, Haoran Zhang ¹, Junpeng Zhang ¹, Shuzhi Dong ¹, Dong Xi ¹, Qin Ning ¹
State Key Laboratory For Diagnosis And Treatment Of Severe Zoonotic Infectious Disease, Huazhong University Of Science And Technology, Department And Institute Of Infectious Disease, Tongji Hospital, Wuhan-China ¹

Background / **Hypothesis:**
Reversing the functional inhibition of CD8+ T cells is key to overcoming challenges of immunotherapy in hepatocellular carcinoma (HCC). FcγR II B is an inhibitory receptor expressed on various immune cells, including B cells, macrophages, and CD8+ T cells. Soluble fibrinogen-like protein 2 (sFGL2), a functional ligand of FcγR II B, has been reported to play an important role in promoting the growth of several cancers. However, the direct impacts of FcγR II B on CD8+ T cells remain to be clarified. Here, our aim is to elucidate the role of FcγR II B, specifically sFGL2-FcγR II B axis, in the direct suppression of CD8+ T cells in HCC.
Materials and **Methods:**
Murine HCC models were established through subcutaneous or orthotopic injection of Hepa1-6 cells in wild-type (WT), fcgr2b^{-/-} or fgl2^{-/-} C57BL/6J mice. Expression of FcγR II B on subsets of CD8+ T cells and immunosuppressive effects of FcγR II B were identified in the murine HCC models by multicolor flow cytometry. Features of FcγR II B expression in CD8+ T cells were also verified in murine models of melanoma (B16), colon cancer (MC38) and glioma (GL261). Murine HCC tissues were analyzed by ELISA, multiplex immunohistochemistry and co-immunoprecipitation to evaluate the expression level of sFGL2 and interactions between sFGL2 and FcγR II B. Functional markers associated with sFGL2-FcγRIIB axis in CD8+ T cells were identified by multicolor flow cytometry.

Results:

ORAL ABSTRACTS

FcγR II B expression was mainly observed on activated CD8⁺ T cells in murine HCC, melanoma, colon cancer and glioma models. Conventional fcgr2b knockout effectively controlled tumor growth (murine HCC models) and increased the number of tumor-infiltrating CD8⁺ T cells. Compared to WT CD8⁺ T cells, the fcgr2b knockout CD8⁺ T cells downregulated expression of Caspase-3 and Caspase-7 and enhanced cytotoxicity. Besides, ELISA confirmed a high sFGL2 expression in murine HCC tissues. Co-immunoprecipitation and multiple immunofluorescences demonstrated an interaction and co-localization between sFGL2 and FcγR II B. Furthermore, compared to FcγRIIB⁻ CD8⁺ T cells, knockout of fgl2 significantly reduced the expression of Caspase-3, Caspase-7 in FcγR II B⁺ CD8⁺ T cells. Conclusions:

Our results identify FcγR II B as a new immune checkpoint of CD8⁺ T cells, which severely limits anti-tumor immunity. Targeting FcγR II B may represent a promising strategy for treatment of HCC.

1607 - From Dysbiosis to Prediction A Novel Gut Microbiota-Derived Index for Spontaneous Bacterial Peritonitis in HBV Related Cirrhosis
Zhewen Zhou¹, Xiu Sun¹, Danying Cheng¹, Huichun Xing¹

Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases Division 3, Beijing-China¹

Background / Hypothesis: Spontaneous bacterial peritonitis (SBP) is a severe complication of hepatitis B virus (HBV)-related cirrhosis, in which gut microbiota dysbiosis plays a pivotal role. This study aimed to characterize microbial alterations, establish a microbiota-derived index (SBP-MI), evaluate longitudinal changes, and develop an SBP risk prediction model (SBP-RP).

Materials and Methods: A total of 135 participants were included: healthy controls (n=40), compensated cirrhosis (n=30), cirrhosis with ascites but without SBP (n=40), and SBP (n=25). Fecal 16S rRNA sequencing and clinical data were obtained. An additional 140 cirrhotic patients with ascites were prospectively followed for 6 months, with SBP occurrence as the endpoint; 40 provided paired fecal samples. SBP-MI was constructed from key microbial shifts, and multivariable Firth logistic regression identified independent predictors.

Results: SBP was characterized by enrichment of pathogenic taxa (Escherichia-Shigella, Klebsiella, Veillonella, Streptococcus) and depletion of short-chain fatty acid producers (Prevotella, Roseburia, Faecalibacterium, Bacteroides), forming the basis of SBP-MI. During follow-up, improved patients had greater microbial diversity and beneficial commensals, whereas progression was linked to Haemophilus expansion. SBP-MI effectively tracked these changes and outperformed the Hepatitis B Cirrhosis Dysbiosis Index. Multivariable analysis identified INR, previous history of SBP, and SBP-MI as independent predictors. The SBP-RP yielded an AUC of 0.91, with calibration that appeared acceptable in this cohort.

Conclusions: Distinct dysbiosis characterizes SBP. SBP-MI captures microbial imbalance and progression, while the SBP-RP model integrating microbial and clinical factors provides promising predictive value for early risk stratification.

Keyword(s) : HBV-related cirrhosis, spontaneous bacterial peritonitis, gut microbiota-derived index, 16S rRNA, prediction model

1608 - Two Year Follow up of a Dose Escalation Trial of Mesenchymal Stromal Cell Therapy for Decompensated Liver Cirrhosis
Lei Shi¹, Ziying Zhang², Kaidi Zhu¹, Mengqi Yuan¹, Jiaqi Xiong¹, Zeyi Zhang¹, Tengyun Dong³, Jianyu Li³, Yu Zhang³, Yonggang Li¹, Zhe Xu¹, Lei Huang¹, Fu-sheng Wang¹

The Fifth Medical Center Of Chinese PLA General Hospital, Senior Department Of Infectious Diseases, National Clinical Research Center For Infectious Diseases, Beijing-China¹ Peking University, 302 Clinical Medical School (the Fifth Medical Center Of Chinese PLA General Hospital), Beijing-China² Canbio Cell & Gene Engineering Corp., Ltd, Wuhan Optics Valley Zhongyuan Pharmaceutical Co., Ltd, Wuhan-China³

Background / Hypothesis: Decompensated liver cirrhosis (DLC) imposes a substantial global health burden with limited therapeutic options. Mesenchymal stromal cell (MSC) therapy has shown potential benefits in DLC; however, optimal dosing strategies and dose-dependent safety and efficacy in humans remain unclear. We conducted a Phase Ia trial (NCT05227846) using a single-arm, dose-

ORAL ABSTRACTS

escalation design to evaluate the safety and tolerability of MSC therapy in patients with DLC and to collect preliminary therapeutic signals over a 2-year follow-up period.

Materials and Methods: Patients were assigned to one of four single-dose MSC cohorts: Cohort I (5.0×10^7 cells), Cohort II (1.0×10^8 cells), Cohort III (1.5×10^8 cells), and Cohort IV (2.0×10^8 cells). Follow-up assessments were conducted at 3 days, 7 days, 14 days, 28 days, and at 3, 6, 9, 12, 15, 18, 21, and 24 months post-treatment. The primary safety endpoint was the incidence of adverse events (AEs). Preliminary therapeutic signals included changes in Child–Pugh and MELD scores, liver function parameters and quality of life. Additional outcomes included DLC-related complications, progression to liver failure and liver transplant-free survival.

Results:

Among 15 participants, 13 experienced a total of 24 AEs (86.67%). In Cohort I, all 3 participants reported 4 AEs; in Cohort II, all 3 participants reported 9 AEs; in Cohort III, all 6 participants reported 10 AEs; and in Cohort IV, 1 of 3 participants reported 1 AE. No grade ≥ 3 AEs leading to withdrawal occurred, and no dose-limiting toxicities were observed. Following infusion, MELD scores showed a decreasing trend from Day 3 onward in Cohorts II, III, and IV, with Cohort IV maintaining values below baseline throughout the 15-month observation period. Child–Pugh scores decreased from Day 3 in Cohorts I, III, and IV, with Cohort IV remaining below baseline throughout the 24-month follow-up. These findings suggest a potential therapeutic advantage at higher dosage.

Conclusions:

MSC therapy demonstrated good safety and tolerability across all cohorts, with no severe AEs, dose-limiting toxicities, or unexpected serious adverse reactions during the 2-year follow-up. All cohorts exhibited early improvements in MELD and Child–Pugh scores, with the most pronounced and sustained improvements observed in Cohorts III and IV. These results support further evaluation in a multicenter controlled trial.

1609 - Prediction of Liver Related Events Using Non invasive Fibrosis Scores in Patients with Metabolic Dysfunction–Associated Fatty Liver Disease

Yankun Gao¹, Shuyan Chen¹, Xiao Han¹, Chenglin Sun¹, Xiaoning Wu¹, Hong You¹, Yameng Sun¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹

Background / Hypothesis: To assess the ability of non-invasive fibrosis scores to predict liver-related events (LREs) in patients with metabolic dysfunction–associated fatty liver disease (MAFLD).

Materials and Methods: We prospectively enrolled patients with biopsy-confirmed MAFLD at Beijing Friendship Hospital from 2018 to 2025 and conducted follow-up. Demographic and laboratory data were collected. Evaluated non-invasive scores included liver stiffness measurement (LSM) by transient elastography, APRI, FIB-4, NFS, Agile 3+, Agile 4, and FAST. LREs were defined as hepatic decompensations, hepatocellular carcinoma, death, liver transplantation, or clinically significant portal hypertension (CSPH) according to the Baveno VII consensus. Patients were stratified into risk categories based on established cut-offs for each score. The cumulative incidence of LREs across strata was compared using Kaplan–Meier analysis, and Cox regression models were used to evaluate the predictive performance of each score.

Results:

A total of 226 patients with biopsy-proven MAFLD were included, of whom 70 (31.0%) were male, with a median age of 54 years (IQR: 41–61) and a median follow-up of 36 months. Twenty-two patients (9.7%) developed LREs. Compared to the non-LRE group, the LRE group had higher baseline levels of total bilirubin, creatinine, LSM, and non-invasive fibrosis scores, as well as a higher prevalence of diabetes, but lower platelet counts (all $P < 0.01$). During follow-up, LSM and all non-invasive scores remained elevated in the LRE group. Risk stratification revealed that patients in the high-risk category of each score had the highest 3-year cumulative incidence of LREs (LSM ≥ 15.0 : 39.4%; APRI ≥ 1.5 : 27.3%; FIB-4 > 2.67 : 31.6%; NFS > 0.676 : 37.8%; FAST ≥ 0.67 : 22.1%; Agile3+ ≥ 0.679 : 27.3%; Agile4 ≥ 0.565 : 35.9%), all significantly higher than in low- and

ORAL ABSTRACTS

intermediate-risk groups ($P < 0.01$). In univariable Cox regression, LSM and all non-invasive scores were significantly associated with an increased risk of LREs (LSM: HR = 2.44, 95% CI: 1.88–3.17; APRI: HR = 1.74, 95% CI: 1.30–2.33; FIB-4: HR = 1.80, 95% CI: 1.45–2.24; NFS: HR = 3.79, 95% CI: 2.44–5.89; Agile3+: HR = 17.66, 95% CI: 4.79–65.07; Agile4: HR = 3.39, 95% CI: 2.24–5.13; FAST: HR = 2.88, 95% CI: 1.63–5.10).

Conclusions:

MAFLD patients with baseline LSM or non-invasive fibrosis scores in the high-risk range are at significantly increased risk of liver-related events.

1615 - Mechanistic Study of Celiac Sympathetic Denervation in the Treatment of Metabolic Dysfunction Associated Steatohepatitis (MASH)

Yi Xu¹, Gaojun Teng²
Southeast University, Medical School, Nanjing-China¹
Southeast University, Zhongda Hospital, Nanjing-China²

Background / Hypothesis: Metabolic dysfunction-associated steatohepatitis (MASH) is a complex hepatic disorder characterized by pathological lipid accumulation, chronic inflammation, and hepatocellular injury. Emerging evidence implicates the sympathetic nervous system (SNS) in the pathogenesis of MASH. This study aims to elucidate the regulatory mechanisms of celiac sympathetic denervation in MASH progression.

Materials and Methods: A murine MASH model was established through a high-fat, high-cholesterol, and high-sucrose diet. Sympathetic denervation was achieved via two approaches: chemical ablation using intraperitoneal 6-hydroxydopamine (6-OHDA) and ethanol-based celiac sympathetic denervation. Hepatic norepinephrine (NE) levels, serum biochemical profiles, and histopathological analyses were employed to evaluate the therapeutic effects of sympathetic modulation on MASH progression. The pathways associated with sympathetic nerve modulation in metabolic dysfunction-associated steatohepatitis (MASH) were identified through an integrated multi-omics approach combining hepatic and intestinal metabolomics, proteomics, and metagenomics analyses.

Results: Celiac sympathetic denervation significantly

attenuated hepatic lipid accumulation, reduced inflammatory infiltrates, and improved glucose tolerance in diet-induced MASH mice. Mechanistically, this intervention disrupted sympathetic overactivation, thereby ameliorating metabolic dysregulation and hepatocellular injury. Integrated multi-omics analyses revealed that sympathectomy exerts modulatory effects on multiple hepatic pathways involved in fatty acid oxidation, glucose metabolism regulation, cholesterol metabolism, and bile acid biosynthesis.

Conclusions: Our findings provide preclinical evidence supporting sympathetic neuromodulation as a novel therapeutic approach for MASH, offering insights into its pathophysiological mechanisms.

1619 - Safety and Effectiveness of Peginterferon Alfa 2b Combined with Tenofovir Amibufenamide in Patients with Chronic Hepatitis B

Qing-lei Zeng¹, Ru-yue Chen¹, Sheng-li Ma², Yu-meng Zhu³, Yue-hang Wang⁴, Zhuang-zhuang Zhai⁴, Xue-jing Yu⁴

The First Affiliated Hospital Of Zhengzhou University, Department Of Infectious Diseases And Hepatology, Hengzhou City, Henan Province-China¹ The People's Hospital Of Yongcheng City, Department Of Infectious Diseases, Yongcheng-China² The Luoyang Central Hospital, Department Of Infectious Diseases, Luoyang-China³ Department Of Infectious Diseases And Hepatology, Department Of Infectious Diseases And Hepatology, Zhengzhou-China⁴

Background / Hypothesis: Data on the combination of Peg-IFN α -2b and tenofovir amibufenamide (TMF) remain limited. This study aims to evaluate the safety and effectiveness of Peg-IFN α -2b combined with TMF in patients with CHB. Materials and Methods:

Patients treated with TMF (25 mg/day) and Peg-IFN α -2b (180 μ g/week) from January 2022 to May 2025 were retrospectively enrolled from three hospitals in Henan, China. This study included two groups: the switch combination group, consisting of patients who transitioned from nucleos(t)ide analog (NA) monotherapy to a combination of TMF and Peg-IFN α -2b; and the treatment-naïve combination group, comprising patients who received TMF plus Peg-IFN α -2b as initial therapy. The primary endpoint of this study was the rate of hepatitis B surface antigen (HBsAg) loss at 48 weeks of treatment, the secondary endpoints were

ORAL ABSTRACTS

the rate HBV DNA undetectable (<25 IU/mL) and safety profiles during treatment.

Results:

A total of 180 patients were enrolled, with 120 patients in the switch group and 60 patients in the treatment-naïve group. The treatment period of NA monotherapy in switch group was 67.45 ± 35.36 months. At baseline, the age, HBV DNA, hepatitis B e antigen (HBeAg), HBsAg, alanine aminotransferase (ALT) levels of the patients in the switch group and treatment-naïve group were 38.48 ± 0.89 vs. 37.20 ± 1.28 years ($p=0.413$), 4.1 (2.6, 6.5) vs. 4.9 (3.1, 7.8) log₁₀ IU/mL ($p=0.169$), 255.0 (11.0, 406.6) vs. 304.9 (12.1, 459.7) PEIU/mL ($p=0.536$), 2.63 ± 1.14 vs. 2.79 ± 1.18 log₁₀ IU/mL ($p=0.370$), 34.10 ± 4.31 vs. 50.14 ± 6.62 U/L ($p=0.037$), respectively; At 48 weeks of treatment (Figure 1), the HBV DNA undetectable rates were 99.17% vs. 96.67% ($p=0.537$), the HBeAg clearance rates were 76.67% vs. 42.86% ($p=0.026$), the HBsAg loss rates were 44.16% vs 28.33% ($p=0.040$), in the switch group and treatment-naïve group, respectively. Regarding laboratory abnormalities, the main adverse events during treatment were the ALT elevation (57.50% vs. 33.33%, $p=0.002$), leukopenia (46.67% vs. 31.67%, $p=0.054$), neutropenia (45.83% vs. 28.33%, $p=0.024$), thrombocytopenia (65.83% vs. 40.00%, $p=0.001$), in the switch combination group and treatment-naïve combination group, respectively. Only one patient presented with elevated total bilirubin (39.2 µmol/L). No serious adverse events occurred.

Conclusions:

At week 48 of treatment, the switch combination group exhibited significantly higher rates of HBsAg loss and HBeAg seroconversion compared to the treatment-naïve combination group. Both groups maintained a favorable overall safety profile throughout the treatment period. These findings suggest that initiating therapy with nucleos(t)ide analogs followed by combination with Peg-IFN α may be a reasonable and promising strategy to promote HBsAg

1624 - A Noninvasive Model Based on Liver and Spleen Microcirculatory Perfusion Parameters for Predicting High Risk Varices in CHB Related Cirrhosis

Chenglin Sun¹, Hao Ren², Xiaowei Ai¹, Shuyan Chen¹, Yameng Sun¹, Hong You¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹ Beijing Friendship Hospital, Capital Medical University Department Of radiology, Beijing-China²

Background

/

Hypothesis:

Hepatic and splenic microcirculatory perfusion is closely associated with the development of portal hypertension. This study aimed to evaluate the utility of liver and spleen microcirculatory perfusion parameters in ruling out high-risk varices (HRV) in chronic hepatitis B (CHB) -related cirrhosis patients receiving antiviral therapy.

Materials

and

Methods:

CHB-related cirrhosis patients receiving antiviral therapy who underwent both upper gastrointestinal endoscopy (EGD) and upper abdominal IVIM (Intravoxel Incoherent Motion) imaging between January 2020 and October 2025 were retrospectively enrolled. Based on EGD findings, patients were classified into high-risk and non-high-risk varices groups. Univariate and multivariate regression analyses were performed to identify potential predictors of HRV, and a predictive model was subsequently established using binary logistic regression. The diagnostic performance, spared EGD rate, and safety profile of this model were compared with FIB-4, APRI, Baveno VI criteria ($LSM < 15$ kPa and $PLT > 150 \times 10^9/L$).

Results:

A total of 113 patients were included, with a mean age of 60 ± 9 years, and 71 (62.8%) were male. The alanine aminotransferase level was 32.9 (24.0, 57.0) U/L, and the median liver stiffness measurement was 16.6 (13.0, 20.9) kPa. Among the enrolled patients, 40.7% (46/113) had HRV. Among all clinical and IVIM parameters evaluated, hepatic D* and splenic D* emerged as the only independent predictors, each reflecting microcirculatory perfusion of the liver and spleen, respectively. These two parameters were then incorporated to construct the Hepato-Splenic Microcirculatory Perfusion Model (HS-MPM). Compared with APRI (AUROC: 0.632) and FIB-4 (AUROC: 0.674), HS-MPM exhibited superior diagnostic accuracy (AUROC: 0.897). With an acceptable risk of missing HRV (4.3%), the proportion of endoscopies that could be safely avoided increased from 21.2% using the Baveno VI criteria to 39.8% with HS-MPM.

Conclusions:

HS-MPM, derived from hepatic and splenic microcirculatory perfusion parameters, represents a

ORAL ABSTRACTS

potential noninvasive tool for ruling out HRV and reducing unnecessary endoscopic examinations.

Keyword(s) : Chronic hepatitis B; Cirrhosis; High-risk varices; Microcirculatory perfusion; Noninvasive model

1625 - Alcohol Consumption Accelerates Liver Fibrosis in Chronic Hepatitis B Evidence from Mendelian Randomization and a Prospective Cohort Study

Yu Zhang¹, Minghui Li¹, Huichun Xing¹
Beijing Ditan Hospital Of Capital Medical University,
Department Of Hepatology, Beijing-China¹

Background / Hypothesis: Observational studies have suggested that alcohol consumption increases the risk of chronic liver diseases, but the causal role of alcohol consumption for viral hepatitis remains unclear. We used Mendelian randomization (MR) to predict the effect of alcohol consumption on viral hepatitis B. To delineate the impact of alcohol consumption on viral load, liver inflammation, and fibrosis progression in patients with chronic hepatitis B (CHB) through a prospective cohort study. Materials and Methods: Up to 45 single-nucleotide polymorphisms were used as instrumental variables for alcohol consumption. Genetic association estimates for viral hepatitis were obtained from large-scale consortia and UK Biobank. Analyses were conducted using the inverse variance-weighted, weighted median, MR-PRESSO, MR-Egger, and multivariable MR methods. A prospective cohort of hospitalized patients with chronic hepatitis B and a history of alcohol use was enrolled between 2019 and 2024. These patients were followed for 24 months to assess changes in viral load, liver inflammation, and fibrosis progression.

Results:

Genetically predicted alcohol consumption was consistently associated with viral hepatitis B (HBV) across the different analyses. The odds ratios (ORs) per 1-SD increase of log-transformed alcoholic drinks per week were 1.27 ([95% CI, 1.12–1.45] $P=2.87 \times 10^{-4}$) for HBV in the inverse variance-weighted analysis. Compared to the non-drinking group, patients in the moderate-to-heavy drinking group showed no significant difference in HBV DNA levels ($P=0.84$). However, they exhibited significantly lower rates of ALT/AST normalization ($P=0.007$) and faster progression of liver fibrosis ($P=0.003$). This association demonstrated a dose-effect relationship, where even light drinking exerted adverse effects on fibrosis regression, albeit to a lesser extent than moderate-to-heavy consumption.

Conclusions:

This study provides evidence of a causal relationship between higher alcohol consumption and increased risk of HBV. Even light to moderate alcohol intake can act synergistically with viral hepatitis to promote rapid liver disease progression. Therefore, abstinence from alcohol is strongly recommended to protect liver health, particularly for individuals with HBV infection, with the aim of enhancing the clinical efficacy of antiviral therapy and preventing accelerated disease progression in chronic viral hepatitis.

Keyword(s) : alcohol consumption, Hepatitis B virus, Mendelian randomization, Prospective cohort study, Liver fibrosis

1629 - Analysis of Risk Factors and Establishment of a Predictive Model for Liver Disease Severity in Non Alcoholic Fatty Liver Disease

Ziyu Zhang¹, Xinxin Li¹, Yaqin Zhang¹, Weihua Cao¹, Hongxiao Hao¹, Yuanjiao Gao¹, Xiaoxue Chen¹, Yao Xie¹, Minghui Li¹
Beijing Ditan Hospital, capital Medical University,
Department Of Hepatology Division 2, Beijing-China¹

Background / Hypothesis: To identify risk factors associated with liver disease severity in patients with non-alcoholic fatty liver disease (NAFLD) and develop a risk prediction model. Materials and Methods: Clinical data were collected from NAFLD patients diagnosed via liver biopsy at the Second Department of Hepatology, Beijing Ditan Hospital, Capital Medical University, from January 2018 to December 2022. Patients were initially grouped by ALT levels to analyze its limitations in NAFLD diagnosis. Pathological reports were used to classify patients into non-significant (S/F/G < 2) and significant (S/F/G ≥ 2) groups based on fibrosis (S), inflammation (G), and steatosis (F) severity. Logistic regression identified independent risk factors for liver disease severity, and a predictive model was established. Model performance was validated using the area under the curve (AUC).

Results:

Significant differences were observed between ALT-normal and ALT-abnormal groups in AST, GGT, ALP, BMI, hyperlipidemia prevalence, age, and diabetes prevalence ($P < 0.05$). Univariate analysis revealed age, BMI, AST, ALB, ALP, TG, and high-calorie diet as significant variables ($P < 0.05$) across inflammation, steatosis, and fibrosis subgroups. When stratified by inflammation severity, multivariate analysis identified sex, age, BMI, ALB, and PclII as independent predictors of significant inflammation in NAFLD. High BMI and hyperlipidemia were risk factors for NAFLD steatosis.

ORAL ABSTRACTS

When grouped by fibrosis severity, age, height, BMI, ALB, and PcllI emerged as independent predictors of pathologically significant fibrosis in NAFLD. Patients with $G \geq 2$ and/or $S \geq 2$ were classified as the significant pathology group, while others formed the non-significant group. A logistic regression model was constructed using regression coefficients and constants, $P=1/(1+e^{-Y})$, $Y=-12.486+0.913 \times \text{Sex} + 0.442 \times \text{BMI} + 0.04 \times \text{PcllI} - 0.085 \times \text{ALB}$. The area under the ROC curve was 0.833 (95% CI: 0.797–0.869), with a maximum Youden index of 0.456, corresponding to sensitivity and specificity of 67.3% and 83.3%, respectively.

Conclusions:

Sex, BMI, PcllI, and ALB are closely associated with NAFLD severity. The logistic regression model demonstrates potential clinical utility for predicting significant liver pathology.

Keyword(s) : Non-alcoholic fatty liver disease, ALT, Inflammation, Steatosis, Fibrosis

1634 - Integrated Plasma and Fecal Metabolic Profiling in Alcoholic Cirrhosis Association with Gut Microbiota Dysbiosis

Yifan Xu¹, Minghui Li², Huichun Xing¹
Beijing Ditan Hospital, capital Medical University, Center Of Liver Disease Division3, Beijing-China¹ Beijing Ditan Hospital, capital Medical University, Center Of Liver Disease Division2, Beijing-China²

Background / Hypothesis:

The gut microbiota is critically involved in the progression of alcohol-related liver disease. However, comprehensive research simultaneously characterizing the specific alterations in gut microecology and the corresponding changes in host plasma and fecal metabolites in patients with alcoholic liver cirrhosis (ALC) remains limited, leaving their potential roles and clinical implications not fully understood.

Materials and Methods:

This case-control study enrolled male patients with ALC (n=27) and healthy controls (HC, n=24). Researchers performed 16S rRNA gene sequencing on fecal DNA to profile the gut microbiota. Additionally, untargeted liquid chromatography–mass spectrometry (LC-MS) metabolomics was applied to analyze both plasma and fecal samples. Differences in microbial composition and metabolite profiles were compared, and their associations with each other were evaluated.

Results:

The study revealed significant gut dysbiosis in ALC patients. At the genus level, there was a notable increase in opportunistic pathogens like *Veillonella*, *Lactobacillus*, *Streptococcus*, *Klebsiella*, and *Escherichia*, alongside a decrease in beneficial commensals such as *Ruminococcus*, *Bacteroides*, *Alistipes*, and *Prevotella*.

Metabolically, bile acid and amino acid pathways were highly disturbed. In plasma, primary and secondary bile acids (e.g., CA, DCA) and aromatic amino acids (e.g., phenylalanine, tyrosine) and their derivatives (e.g., indole) were significantly elevated, while beneficial metabolites like taurine and betaine were decreased. Crucially, correlation analysis showed that the enriched pathogenic genera (*Streptococcus*, *Lactobacillus*, *Veillonella*) were positively correlated with these accumulating harmful plasma metabolites and negatively correlated with the depleted commensal bacteria.

In feces, the levels of specific bile acids (DCA, LCA, CDCA, UDCA) were lower, while amino acids were elevated, indicating a systemic metabolic disruption. These fecal metabolites also showed significant correlations with the dysbiotic gut microbiota.

Conclusions: The proliferating opportunistic pathogens are strongly associated with the accumulation of harmful metabolites in the circulation, including specific bile acids and amino acid derivatives. These findings suggest that specific intestinal bacteria contribute directly to the progression of ALC by regulating host bile acid and amino acid metabolism, highlighting the gut-liver axis as a critical therapeutic target.

1640 - The β hydroxybutyrylation modification of ACSL4 inhibits the growth of hepatocellular carcinoma

Xiangchang Zeng¹, Deliang Huang¹, Jun Chen¹
Department Of Liver Diseases, Shenzhen Third People's Hospital, The Second Affiliated Hospital Of Southern University Of Science And Technology, Shenzhen-China¹

Background / Hypothesis:

Hepatocellular carcinoma is one of the main causes of cancer-related deaths. Lysine β -hydroxybutyrylation (Kbhb) is a post-translational modification induced by ketone body metabolites, particularly β -hydroxybutyric acid (BHB). Kbhb plays a crucial role in multiple human

ORAL ABSTRACTS

diseases by regulating multiple biological processes, including gene transcription, enzyme activity, and protein stability. However, the role of Kbh**b** in hepatocellular carcinoma has not yet been fully elucidated.

Materials and **Methods:** Proteomic quantification of lysine β -hydroxybutyrylation was conducted on 16 pairs of human hepatocellular carcinoma tissues and adjacent tissues by mass spectrometry. The key Kbh**b** sites affecting β -hydroxybutyrylation of ACSL4 were analyzed and identified through mass spectrometry, immunoprecipitation (IP), amino acid site mutation, and site-specific antibody construction methods. The enzyme that catalyzes the addition of BHB to ACSL4 Lys702 was determined. The effect of K702- β -hydroxybutyrylated ACSL4 on tumor growth was evaluated in vitro.

Results:

28618 lysine β -hydroxybutyrylation (Kbh**b**) sites in 6621 proteins were identified, among which 26761 sites in 6001 proteins were quantified. Comparing cancerous and adjacent non-cancerous tissues, numerous differentially expressed proteins and Kbh**b** sites were observed, including 2159 up-regulated sites and 586 down-regulated sites. Among them, the ACSL4 protein K150, K231, K383, K576, K587, K702 sites enriched in the fatty acid degradation pathway ranked among the top down-regulated sites in hepatocellular carcinoma. Mutating them into Kbh**b**-deleted mutation (arginine, R) or Kbh**b**-mimicking mutation (glutamine, Q) revealed that K702R significantly reduced the β -hydroxybutyrylation level of ACSL4 and its protein expression compared with wild-type ACSL4, while K702Q increased these indicators. IP assays showed the P300 over-expression led to an increase in the Kbh**b** levels of ACSL4 and Lys702, whereas overexpression of CBP or KAT8 did not significantly alter these levels. Furthermore, ACSL4 K702Q markedly suppressed the proliferation of HepG2 and Huh7 cells compared with wild-type ACSL4. Interestingly, K702R counteracted the inhibitory effect of BHB on the growth of liver cancer cells.

Conclusions:

Our data established the protein lysine β -hydroxybutyrylation landscape of hepatocellular carcinoma and identified that the Lys702 β -hydroxybutyrylation regulated the expression of ACSL4 protein. In addition, P300 mediated the β -hydroxybutyrylation of ACSL4 to inhibit the growth of hepatocellular carcinoma. This study has unraveled a novel mechanism regulating ACSL4, providing potential targets and strategies for the treatment of

hepatocellular

carcinoma.

Keyword(s) : β -hydroxybutyrylation, ACSL4, hepatocellular carcinoma, post-translational modification

1642 - Heme oxygenase 1 inhibiting mitochondrial apoptosis in metabolic associated fatty liver disease

Dongdong Li ¹, Zhongwen Wang ¹, Jingxian Cheng ¹, Jingyu Xie ¹, Wen Zhao ¹, Zhixing Du ¹, Chuanmiao Liu ¹
First Affiliated Hospital Of Bengbu Medical University, Department Of Infectious Disease And Hepatology, Bengbu-China ¹

Background:

Heme oxygenase-1 (HO-1), a key enzyme in antioxidant defense, protects against chronic liver inflammation and fibrosis. Endoplasmic reticulum (ER) stress-mediated necroptosis is known to contribute to hepatic injury. Hence, we investigated the function of HO-1 in the development of MASH and the underlying mechanisms involving endoplasmic reticulum (ER) stress-mediated necroptosis.

Materials and **Methods:** Mice fed the methionine- and choline-deficient (MCD) diet for 4 weeks and cultured human hepatocytes treated with free fatty acids (FFAs) for 24 hours were utilized as in vivo and in vitro MASH models, respectively, pharmacological interventions and genetic modifications were employed to up- or downregulate HO-1.

Results:

MCD-fed mice developed severe hepatosteatosis, hepatocyte ballooning, focal necrosis, and inflammatory cell infiltration, along with swollen or disrupted rough ER and elevated biomarkers of ER stress and necroptosis in the liver. Administration of hemin, a HO-1 inducer, in MCD-fed mice upregulated HO-1 in the liver, downregulated ER stress and necroptosis, ameliorated steatohepatitis, and decreased serum ALT and AST. Meanwhile, the HO-1 inhibitor ZnPP showed the opposite effects. In cultured human hepatocytes, HO-1 overexpression reduced while HO-1 silencing exacerbated FFAs-induced ER stress and downstream necroptosis biomarker expression and steatohepatitis injury. In addition, downregulating ER stress with an ER stress suppressor inhibited hepatocellular necroptosis. Mechanistically, HO-1 suppressed ER stress by downregulating GRP78. Finally, elevated HO-1 levels were detected in the liver and serum of MASH patients.

Conclusions:

HO-1 protects against the development of MASH by inhibiting ER stress-mediated hepatocellular necroptosis. HO-1 may serve as a potential therapeutic

ORAL ABSTRACTS

target for MASH.

1646 - Mapping the Global Network of Viral Hepatitis A B C and E Unveiling Disease Specific Epidemic Architectures through Complex Network Analysis

Yuxi Shi¹, Yanpei Mai¹, Yanhui Yang¹, Suzhen Jiang¹, Xin Wen¹, Tianyi Xue¹, Qinshuo Wang¹, Yafen Liu¹, Huiying Rao¹, Zixing Wang¹
Peking University, Peking University Hepatology Institute, Beijing-China¹

Background / Hypothesis: The global burden of viral hepatitis remains a formidable public health challenge, with HBV and HCV alone accounting for 1.3 million deaths annually. Traditional surveillance, reliant on national reports and regional aggregates, fails to capture the complex interconnectedness driving these epidemics. This study employs complex network theory to uncover the fundamental architectural patterns governing the global persistence and diffusion of Hepatitis A, B, C, and E.

Materials and Methods: We constructed static and dynamic networks using Global Burden of Disease data from 1990-2021. Static networks comprised high-incidence countries (top 50%) as nodes, connected by edges determined as a high Spearman correlation coefficient (>0.9) in incidence rates. Dynamic networks employed 10-year sliding windows with 1-year steps based on this foundation to capture temporal evolution. Key metrics were calculated to quantify structural characteristics: density (measuring overall connection tightness), efficiency (reflecting global transmission capacity), clustering coefficient (indicating local interconnection strength) and modularity (measuring the degree of network division into separate communities). Degree centrality was employed to identify network hub nations.

Results: We identified distinct topological architectures for hepatitis subtype networks. Hepatitis B exhibited a dense, integrated network (density=0.75, efficiency=0.90) showing significant increases in connectivity (density from 0.372 to 1.000, $ptrend<10^{-7}$) alongside modularity decline (from 0.132 to 0.000,

$ptrend<10^{-6}$), forming a single connected component with emerging community structures. In parallel, hepatitis A demonstrated high connectivity (efficiency=0.91) with strong local clustering (clustering coefficient=0.99), yet displayed progressive fragmentation despite a stable low modularity (0.01). In stark contrast, hepatitis C presented a sparse and fragmented architecture (density=0.22, efficiency=0.55) with the highest modularity (0.22) and five connected components (Figure 1), showing accelerating structural polarization despite gradual density increases (from 0.264 to 0.433, $ptrend<10^{-4}$). Hepatitis E maintained a stable hybrid structure (density=0.37, efficiency=0.93) with increasing modularity (from 0.056 to 0.119, $ptrend<10^{-5}$). Analysis of degree centrality identified Comoros as a critical hub consistently maintaining strong correlations with 40-91 high-epidemic countries across all four diseases networks, while Equatorial Guinea, Eritrea, Benin, Sao Tome and Principe and Lao People's Democratic Republic emerged as pivotal hubs across three different disease networks.

Conclusions: This study reveals disease-specific topological architectures that demand distinct strategies for achieving global elimination goals. For highly integrated networks like HBV's, we recommend establishing coordinated sentinel systems in hub nations to monitor progress and elimination barriers. For fragmented networks like HCV's, the identified hub nations provide critical insights into cluster-specific topological patterns, enabling targeted module-level interventions.

Keyword(s) : viral hepatitis, complex network analysis, epidemic topology, public health, global health

1647 - Antiviral Therapy in Patients with HBV Infection in the HBeAg Negative Indeterminate Phase

Mingyang Feng¹, Xiaoyin Wang¹, Kehui Liu¹, Gangde Zhao¹, Xiaolin Wang¹, Baoyan An¹, Lanyi Lin¹, Yezhou Ding¹, Hui Wang¹
Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Department Of Infectious Diseases, Shanghai-China¹

Background / Hypothesis: Emerging data suggest that a substantial proportion of patients with chronic hepatitis B (CHB) do not fall into any of the defined phases and are considered indeterminate. Current practice guidelines do not recommend antiviral therapy for CHB patients in the

ORAL ABSTRACTS

indeterminate phase. However, these CHB patients have a significantly high risk of hepatocellular carcinoma. We aimed to investigate liver pathological changes and assess the effects of antiviral treatment on CHB patients in the HBeAg-negative indeterminate phase.

Materials and Methods: We retrospectively analyzed the outcomes of antiviral therapy for CHB patients in the HBeAg-negative indeterminate phase who underwent liver biopsy and were treated with nucleoside/nucleotide analogues (NAs) for up to 96 weeks compared with HBeAg-negative chronic infection. Phases of natural history were determined according to the AASLD practice guidance.

Results:

A total of 392 HBeAg-negative patients were enrolled in this study. Of these, 192 were in the defined phase and 200 were in the indeterminate phase. Approximately 75% of CHB patients in the indeterminate phase showed hepatic inflammatory necrosis $\geq$ G2 (significant inflammation) and/or fibrosis $\geq$ S2 (significant fibrosis). The rate of undetectable HBV DNA in chronic infection and indeterminate phase groups totally was ~91.1%, ~99.5%, ~100%, 100% or 96.5%, 98.5%, 99.5% 99.5% at week 12, 24, 48 or 96, respectively. The ALT normalization rates were 55.7%, 74.2%, 80.7%, and 83.9% in the defined phase group, contrasted with 37.5%, 50.0%, 64.3%, and 69.6% in the indeterminate phase group at 12, 24, 48, and 96 weeks, respectively. With prolonged antiviral therapy, surface antigen levels gradually decreased in both groups; however, no patient had loss of hepatitis B surface antigen.

Conclusions:

Majority of CHB patients in the indeterminate phase had significant liver histological changes. Antiviral therapy can effectively inhibit HBV replication in these CHB patients regardless of ALT levels, although hepatitis B surface antigen loss were low.

Keyword(s) : CHB; Antiviral Therapy; Indeterminate Phase

1649 - Platelet Albumin Bilirubin (PALBI) Score A non invasive Predictor of Esophageal Varices in Patients with Liver Cirrhosis Compared to Child Turcotte Pugh (CTP) Score

Zannatul Habiba¹, A.b.m Shakil Gani¹, Mahbuba Tabashsum¹, Uzzal Kanti Debnath¹
Dhaka Medical College Hospital, Hepatology, Dhaka-Bangladesh¹

Background

/

Hypothesis:

Esophageal varices are serious consequences of portal hypertension in patients of liver cirrhosis, carrying a high risk of fatal bleeding. Early and non-invasive identification of patients at risk of OV is essential for initiating prophylactic treatment. The established Child-Turcotte-Pugh (CTP) score while widely used for assessing prognosis, relies on subjective parameters (ascites, encephalopathy). Consequently, objective, laboratory-based scores such as the Albumin-Bilirubin (ALBI) score and its derivative, the Platelet-Albumin-Bilirubin (PALBI) Score (incorporating platelet count, a marker of portal hypertension), have emerged as promising non-invasive alternatives for risk stratification and prediction of clinical outcomes.

Materials

and

Methods:

This cross-sectional study was done in the Department of Hepatology, Dhaka Medical College Hospital (DMCH), Bangladesh from January to August 2025. Total 80 patients were included. The PALBI score (calculated as $S.A \times PLT$) and the standard ALBI score were determined. The CTP classification was also recorded. Esophageal varices were expected as "present" when the OV score was ≥ 1 . Diagnostic accuracy was assessed using Receiver Operating Characteristic ROC curve analysis for the PALBI score and the CTP score, and sensitivity and specificity were calculated for selected cutoffs.

Results:

In a total 80 patients, 77 (96.2%) had esophageal varices (OV ≥ 1). The mean ALBI score was -1.788 ± 0.759 and the mean PALBI score was $515.7 \pm 310.8 \times 10^3$. The PALBI score was found to have excellent diagnostic ability to predict patients with and without esophageal varices AUC = 0.926. In comparison, the CTP score showed perfect diagnostic ability AUC = 1.000 in this cohort, while the ALBI score had good ability AUC = 0.853. Furthermore, the PALBI score showed a moderate, statistically significant inverse correlation with the CTP score ($r = -0.486$, $p < 0.001$), confirming its validity as a marker of liver function severity. The sensitivity and specificity for PALBI $\leq 500 \times 10^3$, PALBI $\leq 650 \times 10^3$ were 59.7% and 100.0%, and 72.7% and 100.0%, respectively.

Conclusions:

ORAL ABSTRACTS

PALBI score was found to have excellent ability to diagnose patients with and without esophageal varices, performing significantly better than the ALBI score alone. Although the CTP score achieved perfect discrimination in this specific cohort, PALBI is a simple, objective, and reproducible noninvasive marker that correlates strongly with disease severity and provides high accuracy for risk stratification.

Keyword(s) : PALBI Score, Esophageal varices, CTP Score, Liver Cirrhosis.

1652 - Investigating the Role of Gut Microbiota Derived Valine in Treating MAFLD through PPAR Signaling

Minshan Huang¹, Hang Chen¹, Hui Wang¹, Mengwei Li¹, Da Wang¹, Jianjun Liu², Yinglei Miao¹, Lanqing Ma¹
Kunming First Affiliated Hospital Of Kunming Medical University, Hepatology, Kunming-China¹ Kunming Medical University, Hepatology, Kunming-China²

Background / Hypothesis: With its complex pathogenesis, MAFLD has placed gut microbiota-centered therapies, informed by the gut-liver axis, in the spotlight.

Materials and Methods: An MAFLD cell model and high-fat diet (HFD)-fed mice were treated with L-Valine (LV). Hepatic steatosis, insulin resistance, and liver histopathology were assessed. Key proteins (PPAR α , ZO-1) were analyzed by Western blot.

Results: ① LV levels are inversely associated with the severity of MAFLD and LV ameliorated MAFLD's a cellular model (Fig 1-2).

② LV intervention significantly altered body fat content and liver metabolism, and improved HFD-induced insulin resistance in mice (Fig 3-5).

③ LV treatment alleviated intracellular lipid accumulation and improved liver histopathology of mice (Fig 6-7).

④ LV ameliorated MAFLD by activating the PPAR α pathway (Fig 8).

⑤ LV intervention partially reversed the HFD-induced downregulation of ZO-1 protein expression (Fig 9).

Conclusions: Our findings demonstrate that L-Valine

ameliorates MAFLD by activating the PPAR α signaling pathway and Strengthening the intestinal barrier, leading to reduced hepatic steatosis and improved systemic metabolism.

Keyword(s) : L-Valine; MAFLD / MASLD; PPAR α ; gut microbial metabolite

1653 - Efficacy of sofosbuvir velpatasvir in patients with hepatitis C virus genotype 3 infection

Menghan Jin¹, Airong Hu², Suwen Jiang², Haojin Zhang³, Ming Wei⁴, Shiyang Fan³, Shiqi Yang⁵
Ningbo University Health Science Center, Hepatology Department, Ningbo-China¹ Liver Diseases Center, Ningbo Institute Of Liver Diseases, Ningbo No. 2 Hospital, Hepatology Department, Ningbo-China² School Of Medicine, Shaoxing University, Hepatology Department, Shaoxing-China³ Ma'anshan Fourth People's Hospital, Hepatology Department, Ma-China⁴ Graduate School Of Wenzhou Medical University, Hepatology Department, Wenzhou-⁵

Background: With the widespread clinical application of pangenotypic direct-acting antiviral agents, the cure rate for hepatitis C has significantly improved. However, treating hepatitis C virus (HCV) genotype (GT) 3 remains a major clinical challenge, and real-world data for this genotype in Eastern China remain limited. This study aimed to evaluate the efficacy of sofosbuvir/velpatasvir (SOF/VEL) in achieving a sustained virological response at 12 weeks post-treatment (SVR12) and its impact on related clinical parameters in patients with HCV GT 3 infection.

Methods: A total of 223 patients with HCV GT 3 infection who received SOF/VEL, with or without ribavirin (RBV), at Ningbo Second Hospital and Ma'anshan Fourth People's Hospital from March 2019 to March 2025 were retrospectively enrolled. Clinical data were systematically collected to analyze baseline characteristics, diagnostic and treatment details, and comorbidities. The primary endpoint was the overall SVR12. The prevalence of comorbidities in this population and the impact of SOF/VEL on clinical parameters were also evaluated.

Results: Among the 223 enrolled patients, GT 3a and 3b accounted for 17% (37/223) and 83% (186/223), respectively. Those with a history of drug use, co-infection with HBV, HIV, and syphilis accounted for

ORAL ABSTRACTS

44.84% (100/223), 3.59% (8/223), 4.04% (9/223), and 13.45% (30/223), respectively. Concurrent fatty liver disease, liver cirrhosis, and hepatocellular carcinoma were present in 34 (15.25%), 63 (28.25%), and 7 (3.14%) patients, respectively. Efficacy analysis showed an overall SVR12 rate of 96%, with rate of 92% in HCV GT 3a and 98% in HCV GT 3b. Additionally, the normalization rates of alanine transaminase (ALT) (91.03% vs 18.39%) and aspartate aminotransferase (AST) (89.69% vs 24.22%) were significantly higher at the end of treatment compared with baseline (all $P < 0.001$). At 12 weeks post-treatment, significant improvements from baseline were observed in the levels of total bilirubin ($Z = -4.170$), ALT ($Z = -8.986$), AST ($Z = -8.563$), white blood cell count ($Z = -3.044$), platelet count ($Z = -4.943$), APRI ($Z = -7.454$) and FIB-4 ($Z = -6.027$) (all $P < 0.01$).

Conclusions:The SOF/VEL regimen achieved a high sustained virologic response rate and significantly improved both liver function and fibrosis markers in patients with HCV GT 3 infection.

Keyword(s) : Hepatitis C virus, Sofosbuvir-velpatasvir, Cirrhosis, Genotype, Treatment

1656 - Analysis on the differences of clinicopathological characteristics in drug induced liver injury patients with positive or negative autoantibodies and different clinical types

Suwen Jiang¹, Airon Hu¹, Menghan Jin², Haojin Zhang³, Shiqi Yang⁴, Shiyang Fan³
Liver Diseases Center, Ningbo Institute Of Liver Diseases, Ningbo No. 2 Hospital, Hepatology Department, Ningbo-China¹ Ningbo University Health Science Center, Ningbo University Health Science Center, Ningbo-China² School Of Medicine, Shaoxing University, Hepatology Department, Shaoxing-China³ Graduate School Of Wenzhou Medical University, Hepatology Department, Wenzhou-China⁴

Background:To investigate the differences in clinical and pathological characteristics among patients with drug-induced liver injury (DILI) by autoantibody status and R value-based clinical types to inform clinical practice.

Methods:This study included 138 patients hospitalized from January 2016 to July 2023 with biopsy-confirmed DILI. Patients were grouped by autoantibody results (positive/negative) liver histopathological changes (<

G2 and $\geq$ G2, < G3 and $\geq$ G3, < G4 and G4, < S2 and $\geq$ S2, < S3 and $\geq$ S3, < S4 and S4, mild pathological injury [$< G2 + < S2$] and significant pathological injury [$\geq G2$ and/or $\geq S2$] and R values for DILI classification ($R \geq 5$: hepatocellular injury type; $2 < R < 5$: mixed type; $R \leq 2$: cholestatic type), with clinicopathological characteristics compared.

Results:Of the enrolled patients, 79 were autoantibody-negative and 59 were autoantibody-positive, including 59 cases (100.00%) positive for anti-nuclear antibody and 8 cases (13.56%) positive for anti-mitochondrial antibody. Traditional Chinese Medicine (including single herbs, herbal dietary supplements, or compound preparations) accounted for the highest proportion of medications causing DILI (55/138, 39.86%). The autoantibody-positive group exhibited significantly higher levels of serum globulin (GLB) ($t = 2.983$), alkaline phosphatase ($Z = 2.042$), and adenosine deaminase (ADA) ($Z = 2.582$), and a lower albumin (ALB)/GLB ratio ($t = 2.211$) compared to the negative group (all $P < 0.05$). The autoantibody-positive group had a higher mean Ridit value for liver inflammation activity grade (G) ($u = 2.302$, $P = 0.021$) and a higher proportion of $\geq G3$ and G4 ($\chi^2 = 4.471, 6.478$; $P = 0.034, 0.011$). Among the $R \geq 5$, $2 < R < 5$, and $R \leq 2$ groups, significant differences were observed in serum total bilirubin (TBil) ($H = 11.166$), alanine aminotransferase (ALT) ($H = 109.01$), aspartate aminotransferase (AST) ($H = 75.663$), ALT/AST ratio ($H = 23.096$), adenosine deaminase (ADA) ($H = 34.013$), and gamma-glutamyl transferase (GGT) ($H = 9.831$) (all $P < 0.01$). The $2 < R < 5$ group had the highest mean Ridit value for G and the highest proportion of $\geq G3$ grades, with significant differences among the three groups ($\chi^2 = 7.385, 7.163$; all $P < 0.05$). Independent risk factors for G severity were ALB, GGT, and ALT/AST; for advanced fibrosis stage (S) were ALT/AST, platelet count, and ALB; and for combined G/S severity were GGT, ALB, and ALT/AST.

Conclusions:The clinical and pathological features of DILI vary across different disease states. Autoantibody-positive DILI and mixed-type DILI ($2 < R < 5$) are associated with more severe liver inflammation grades.

Keyword(s) : Drug-induced liver injury, Autoantibody, Clinical types, Pathology, Clinical characteristics

1661 - Clinical Characteristics of Autoimmune Hepatitis in Patients with Hepatitis B-D Coinfection

ORAL ABSTRACTS

A	Case	Series
Zain Majid ¹ , Siut, Gastroenterology,	Nasir Luck ¹ Karachi-Pakistan	1

Background / Hypothesis:

Patients infected with hepatitis B and D coinfection are frequently seen in clinical practice. However, their association with autoimmune hepatitis (AIH) is an unusual phenomenon

Materials and Methods:
We through this case series highlighted six patients having this uncommon association. These patients had presented to our outpatients' department and were thoroughly investigated. Their baseline laboratory parameters, serology, imaging and endoscopic findings were recorded, following which liver parenchymal biopsies were done for most of them.

Results:
Most of them were managed with tablet entecavir along with azathioprine and were kept on close follow-up for any possible deterioration.

Conclusions:
Our case series highlights this rare association, which should be kept in mind in patients with HBV and HDV coinfection presenting with deranged LFTs.

Keyword(s) : Hepatitis B; Hepatitis D; AIH
1662 - Socioeconomic Disparities and Potential Impact of Delayed Presentation on the Burden of Portal Hypertension in a Bangladeshi Tertiary Care Setting
Md. Sabbir Hossain¹, A B M Shakil Gani¹, Saad Ahmed Tanmoy¹, Ihteshamul Hoq Dew¹, Md. Tanveer Rahman Rashed², Md. Nur Alam¹, Ankita Banik¹, Rebeka Sultana Mousumi¹
Dhaka Medical College Hospital, Hepatology, Dhaka-Bangladesh¹ Rajshahi Medical College Hospital, Hepatology, Rajshahi-Bangladesh²

Background / Hypothesis:

Portal hypertension is a major cause of morbidity in South Asia, yet the influence of socioeconomic disparities and delayed presentation on disease severity remains insufficiently defined. We hypothesized that lower socioeconomic status contributes to advanced-stage cirrhosis, more severe variceal burden, and higher

rates of hepatocellular carcinoma at presentation.

Materials and Methods:

A cross-sectional observational study was conducted in a tertiary care hospital from December 2024 to June 2025. A total of 118 adults diagnosed with portal hypertension based on endoscopic, radiologic, and biochemical criteria were enrolled consecutively. Socioeconomic status was defined using monthly household income and categorized into lower, middle, and higher classes according to standard income-based thresholds. Variceal grades were stratified across socioeconomic groups. Cirrhosis was classified as compensated or decompensated. Categorical variables were compared using chi-square or Fisher's exact test, with significance set at p<0.05.

Results:
The cohort had a mean age of 46.85 ± 13.90 years; 85.6% were males. Most participants belonged to the middle (54.2%) or lower (36.4%) socioeconomic classes. Hepatitis B was the predominant etiology (65.3%). Cirrhosis was present in 94.9% of patients, and 85.6% presented with decompensated disease. Among decompensated cirrhosis patients (n=101), 39 (38.6%) were lower class, 57 (56.4%) middle class, and 5 (5%) higher class, showing a significant association between socioeconomic status and cirrhosis stage ($\chi^2=10.30$, p=0.0058). Variceal severity demonstrated a strong socioeconomic gradient. Grade III varices occurred in 60.5% of lower-class, 71.9% of middle-class, and only 18.1% of higher-class patients, a significant association ($\chi^2=16.22$, p=0.0027). Overall, 77.1% had moderate to large varices. Hepatocellular carcinoma was detected in 24 patients (20.3%). HCC showed significant socioeconomic variation: 13 lower-class, 7 middle-class, and 4 higher-class patients ($\chi^2=7.83$, p=0.0199), indicating disproportionate HCC burden in lower-income groups. Other complications included splenomegaly (82%), anemia (70%), ascites (66%), hematemesis (59%), and hepatic encephalopathy (37%).

Conclusions:
This study highlights that portal hypertension in Bangladesh is predominantly driven by chronic hepatitis B infection, with a striking male predominance and a high rate of decompensated cirrhosis at presentation. Most patients present with advanced disease and complications reflecting delays in diagnosis. Lower

ORAL ABSTRACTS

socioeconomic status is significantly associated with decompensated cirrhosis, severe variceal grades, and higher rates of hepatocellular carcinoma, reflecting major disparities in early detection and access to care. Targeted community screening and strengthened referral pathways are essential to reduce the burden of advanced portal hypertension.

Keyword(s) : portal hypertension, socioeconomic status, delayed presentation, variceal severity, hepatocellular carcinoma, cirrhosis, Bangladesh

1664 - Matrix Stiffness Suppresses Hepatitis B Virus Replication via YAP Mediated Intrinsic Antiviral Signaling

Hua-xiang Yang¹, Hui-guo Ding², Xin Gao³, Xiao-cong Liu¹, Wu Wen¹

West China School Of Medicine, Sichuan University, Sichuan University Affiliated Chengdu Second People's Hospital, Department Of Gastroenterology And Hepatology, Chengdu-China¹ Beijing You'an Hospital Affiliated To Capital Medical University, Department Of Gastroenterology And Hepatology, Beijing-China² Shanxi Provincial People's Hospital, Department Of Gastroenterology And Hepatology, Taiyuan-China³

Background / Hypothesis: Elucidating the intrinsic host mechanisms that constrain hepatitis B virus (HBV) replication is a fundamental question in hepatology. Independent of its biochemical composition, the extracellular matrix provides potent physical cues that govern cell fate and function. Given the physiological variations in liver tissue stiffness, we hypothesized that biomechanical signals represent a previously unexplored layer of regulation in hepatotropic virus-host interactions.

Materials and Methods: Primary hepatocytes were cultured on tunable hydrogels engineered to mimic distinct mechanical microenvironments. The impact of substrate stiffness on the HBV replication cycle and the associated mechanotransduction signaling pathways was systematically dissected. Gain- and loss-of-function studies for the transcriptional co-activator YAP (Yes-associated protein) were conducted to define its precise role. A targeted functional screen identified YAP-responsive genes with anti-HBV activity. The clinical relevance of this mechanosignaling axis was interrogated through single-cell RNA-sequencing analysis of liver biopsies from male patients with active HBV infection. The therapeutic efficacy of targeting this pathway was validated in male HBV-hydrodynamic injection mouse models using a small-molecule YAP

agonist.

Results:

High matrix stiffness, mimicking a fibrotic mechanical environment, potently suppressed HBV replication in primary hepatocytes. This antiviral state was mechanistically linked to the activation and nuclear translocation of YAP. Ectopic YAP activation was sufficient to suppress HBV transcription and antigen production, whereas its inhibition attenuated the stiffness-mediated antiviral effect. Subsequent screening identified several YAP-target genes that confer robust, cell-intrinsic resistance to HBV. Crucially, single-cell resolution analysis of human liver tissues revealed a significant negative correlation between the cell-autonomous YAP signaling signature and the intracellular load of HBV transcripts. Consistent with these findings, pharmacological potentiation of YAP signaling in vivo effectively curtailed viral replication in a male mouse model of HBV infection.

Conclusions:

This study delineates a novel innate antiviral mechanism wherein the biomechanical property of the liver microenvironment is sensed by hepatocytes through YAP activation to orchestrate a cell-intrinsic defense program against HBV. Our data establish YAP-mediated mechanosignaling as a fundamental host pathway that can be harnessed to suppress HBV. This discovery provides a new conceptual framework for understanding liver-virus interactions and identifies mechanosignaling components as potential targets for developing novel antiviral strategies.

1672 - Hepatic steatosis in Wilson disease phenotype or metabolic comorbidity

Veronica Cumpata¹, Adela Turcanu², Doina Secu³, Victoria Sacara³

"nicolae Testmitanu" State University Of Medicine And Pharmacy, Department Of Family Medicine, Chisinau-Moldova¹ "nicolae Testmitanu" State University Of Medicine And Pharmacy, Discipline Of Gastroenterology, Chisinau-Moldova² Mother And Child Health Care Institute, Laboratory Of Human Molecular Genetics, Chisinau-Moldova³

Background / Hypothesis: Hepatic steatosis (HS) is a common manifestation in Wilson disease (WD), primarily related to mitochondrial dysfunction induced by toxic hepatic copper accumulation, which disrupts lipid metabolism. With increased survival and transition

ORAL ABSTRACTS

of patients into adulthood, cardiometabolic risk factors may additionally contribute to the development of metabolic-associated steatosis. Distinguishing copper-induced steatosis from metabolic steatosis is essential for assessing fibrosis progression risk and optimizing patient management. The aim of this study was to determine the prevalence and characteristics of HS in patients with WD.

Materials and Methods: A retrospective descriptive study was conducted, including 53 patients diagnosed with WD between 2016–2024. HS evaluation was based on clinical criteria (body mass index, waist circumference), biochemical parameters (glucose, lipid profile), and imaging (ultrasound or computed tomography, FibroScan). DNA sequencing by the Sanger method was performed using the Taq DyeDeoxy Terminator Cycle sequencing kit (Applied Biosystems) with an ABI-Prism 3100 genetic analyzer (Applied Biosystems)

Results: Cohort analysis identified three clinico-imaging subgroups. Group 1 – 33 patients (53% males), mean age 20.2 ± 6.5 years, without clinical-imaging signs of HS, mean liver stiffness 10.1 ± 6.2 kPa, mean steatosis 241 ± 125.5 dB/m ($p > 0.05$). Group 2 – 16 patients (63% males), mean age 25.7 ± 8.1 years, without clinico-biochemical changes but with imaging findings suggestive of HS, mean liver stiffness 11.2 ± 5.6 kPa, mean steatosis 262 ± 165.1 dB/m ($p > 0.05$). Group 3 – 4 patients (100% males), with mean body mass index 28.83 ± 1.83 kg/m², mean waist circumference 105 ± 3.56 cm, mean HDL-cholesterol 0.825 ± 0.28 mmol/L, mean triglycerides 2.10 ± 0.79 mmol/L, mean liver stiffness 14.7 ± 7.1 kPa, and mean steatosis 285.5 ± 154.1 dB/m ($p < 0.05$). Genetic variants identified in Group 3 included: p.H1069Q, p.G1341D, p.Phe764=, p.Met769Hisfs*26.

Conclusions: HS is present in approximately one-third of patients with WD, and nearly 8% exhibit an associated metabolic component. The mixed phenotype with metabolic involvement appears correlated with age and the accumulation of cardiometabolic risk factors. Systematic integration of metabolic assessment in WD monitoring may improve risk stratification and personalized therapeutic management, with potential benefits for fibrosis progression and long-term outcomes.

Keyword(s) : Wilson disease, hepatic steatosis, cardiometabolic risk

Background / **Hypothesis:** Hepatitis B virus (HBV) infection remains a major public health concern in Ghana, where prevalence is high despite the availability of an effective vaccine. Informal sector workers represent a large proportion of the national workforce but have limited access to preventive health services. This study assessed hepatitis B vaccination coverage and its predictors among informal sector workers in Kejetia market, Kumasi, Ghana.

Materials and **Methods:** A cross-sectional survey was conducted among 809 market workers selected using stratified random sampling across different occupational groups. Data were collected using structured interviewer-administered questionnaires covering sociodemographic characteristics, HBV awareness and knowledge, and vaccination history. Vaccination uptake was categorized as at least one dose (≥ 1) and full

ORAL ABSTRACTS

coverage (≥ 3 doses). Logistic regression analyses were used to identify predictors of vaccination uptake.

Results:

Overall, only 16.9% had completed the three-dose schedule, though 31.6% of participants reported having received at least one dose of HBV vaccine. While 88.8% of respondents had heard of HBV infection, 76.5% reported very little or no knowledge about the disease, and 49.7% did not know its routes of transmission. Vaccination uptake was significantly higher among those who had received HBV-related health education (62.7%) compared to those who had not (15.3%, $p < 0.001$). In the multivariate logistic regression model, ≤ 30 years (aOR = 2.209, 95% CI [1.140-4.282], $p = 0.019$), secondary education (aOR = 2.426, 95% CI [1.220-4.824], $p = 0.012$), and tertiary education (aOR = 4.796, 95% CI [2.121-10.845], $p < 0.045$) were the independent predictors of vaccination status.

Conclusions:

HBV vaccination coverage among informal sector workers in Kejetia Market is alarmingly low despite high general awareness of the infection. Sociodemographic factors and receipt of HBV-related health education strongly influenced uptake. These findings underscore the urgent need for targeted health education and subsidized vaccination programs tailored to informal sector workers in Ghana to achieve national HBV elimination goals.

1676 - Predictive Factors of Tyrosine Kinase Inhibitor Response in Patients with Advanced Hepatocellular Carcinoma

Hayriye Dilan Çağlar¹, Zuhat Uraççi², Kendal Yalçın³
Dicle University Faculty Of Medicine, Internal Medicine, Diyarbakir-Türkiye¹ Dicle University Faculty Of Medicine, Medical Oncology, Diyarbakir-Türkiye² Dicle University Faculty Of Medicine, Gastroenterology, Diyarbakir-Türkiye³

Background / Hypothesis: Hepatocellular carcinoma (HCC) is the most common primary liver malignancy and carries a poor prognosis in advanced stages. Tyrosine kinase inhibitors (TKIs) are standard systemic therapies, but patient responses vary. Identifying predictive factors may optimize patient selection and individualized treatment. We hypothesized that hepatic function, tumor characteristics, and baseline laboratory

parameters influence TKI response and survival.

Materials and Methods: This retrospective study included 103 advanced HCC patients treated with sorafenib or regorafenib between 2009 and 2025. Demographics, clinical scores (ECOG, Child-Pugh, MELD, ALBI), laboratory markers, imaging findings, toxicity, treatment response (mRECIST), progression-free survival, and overall survival were analyzed. Kaplan-Meier and Cox regression were used.

Results: Among patients treated with sorafenib ≥ 3 months: partial response 13.1%, stable disease 45.9%, progression 41%. Significant OS predictors: sex, Child-Pugh stage, tumor involvement pattern, extrahepatic metastasis, portal vein thrombosis, BCLC stage. Independent predictors of shorter progression-free survival: MELD-Na score, ECOG performance, Child-Pugh C, diffuse tumor involvement, portal vein thrombosis. ALBI score was protective. Hand-foot syndrome was the most common toxicity requiring dose reduction.

Conclusions: Liver reserve (MELD-Na, ALBI), bilirubin levels, performance status, tumor pattern, and portal vein thrombosis strongly influence TKI response and survival. These factors support more accurate patient selection and individualized treatment strategies.

1677 - Establishment of the TBRI Biobank for Liver Diseases Advancing Research Translation and Precision Medicine in Hepatology

Eman El-ahwany¹, Hoda Abu-taleb², Mona Zoheiry¹
Theodor Bilharz Research Institute, Immunology, Giza-Egypt¹ Theodor Bilharz Research Institute, Environmental Research, Giza-Egypt²

Liver diseases including viral hepatitis, nonalcoholic fatty liver disease, autoimmune hepatitis, metabolic disorders, and hepatocellular carcinoma (HCC) remain major global health challenges. In Egypt, the burden is particularly high, with the world's highest prevalence of hepatitis C virus (HCV) and an increasing incidence of HCC. Despite the success of direct-acting antivirals (DAAs), many patients continue to experience serious complications, underscoring the urgent need for early diagnostic and prognostic tools.

ORAL ABSTRACTS

To address this need, establishing an integrated infrastructure that links high-quality clinical data with advanced molecular and genetic technologies is essential. Biobanks play a pivotal role in this effort by enabling the systematic collection, processing, and preservation of human biospecimens that support precision (personalized) medicine. Disease-specific biobanks accelerate biomarker discovery, facilitate targeted drug development, and enhance research quality.

This work focuses on establishing the Theodor Bilharz Research Institute (TBRI) Biobank for liver diseases, which stores blood, serum, buffy coat, and DNA samples from adult patients. To date, 1,000 blood samples have been collected, forming a robust resource for future molecular and clinical investigations. The biobank provides researchers with integrated socio-demographic data, longitudinal clinical records, and high-quality biospecimens to support both retrospective and prospective studies. Through this infrastructure, the TBRI Biobank aims to advance biomarker discovery, foster innovation in hepatology, and ultimately enhance public health and personalized patient care.

Keyword(s) : Liver Diseases- Biobank- Personalized Medicine

1679 - PASSIVE TOBACCO SMOKE INDUCED CHANGES IN THE EXPRESSION OF IRON METABOLISM GENES IN MOUSE PUPS

Naseer Kawish¹, Amin Arif¹, Tasleem Akhtar², Ayesha Majid³, Muddasir Hassan Abbasi⁴, Nadeem Sheikh¹, Muhammad Babar Khawar⁵
University Of The Punjab, Institute Of Zoology,, Lahore-Pakistan¹ University Of Health Sciences,, 2department Of Pharmacology, Lahore-Pakistan² University Of Okara, Department Of Zoology, Okara-Pakistan³ Guangzhou Medical University, Guangzhou Women And Children, Guangzhou-China⁴ Yangzhou University, Institute Of Translational Medicine, Medical College,, Yangzhou-China⁵

Background / Hypothesis:
Tobacco smoke has a global impact, particularly on pregnant women and their newborns. Maternal tobacco smoke exposure is associated with different pregnancy complications and outcomes, viz., less development and dysfunction of vital organs and regulatory pathways. This study focused on the impact of the whole gestation

period passive tobacco smoke exposure (PTS) on the heart and liver functions, and some iron regulatory and inflammatory gene expression in neonates. Materials and Methods: Randomly selected PTS-exposed neonates of the pregnant mice were processed by anesthetizing them hypo-thermally/cryothermally, followed by their dissection to excise the heart and liver under a magnifying glass. All the pups have proceeded for morphometric measurements, cardio, hepatic histological, and gene expression analysis. Results:

A significant reduction was observed in all morphometric parameters: viz litter size, birth weight, crown-rump, and heart and liver weight. Furthermore, PTS induced microarchitectural changes in cardiomyocytes with the formation of edema, hemorrhage, lymphocytic infiltration, and cardiomyolysis while liver histology revealed central canal distortion, hemolysis, sinusoidal space, and fused nuclei. Collagen, glycogen, and iron deposition were also evident in the Masson trichrome, Periodic acid Schiff, and Prussian blue stains. The gene expression analysis of Dmt-1, TfR-1, Hamp, and HO-1 showed upregulation, while some genes, Hfe, Fpn-1, Ferritin H, and HJV showed downregulation. Furthermore, the mRNA expression of TNF- α was upregulated, and the IL-6 expression was downregulated in neonates of PTS-exposed mice. The current study has highlighted that PTS exposure to neonates during gestation can induce changes in hepatocytes and regulatory pathways. Conclusions:

Therefore, such long-term exposure to passive tobacco smoke must be checked for healthy pregnancy outcomes, and implementation of preventable, controllable measures, the revision of legislation, and safety guidelines must be followed to reduce the frequency of congenital defects.

1690 - Off Therapy Outcomes After Long Term Nucleos(t)ide Analogue Treatment in HBeAg Negative Chronic Hepatitis B

Esra Sevgili Cepe¹, Petek Şarlak Konya¹, Neşe Demirtürk²

Afyonkarahisar Sağlık Bilimleri Üniversitesi Hastanesi, Enfeksiyon Hastalıkları Ve Klinik Mikrobiyoloji, Afyonkarahisar-Türkiye¹ Afyon Sağlık Bilimleri Üniversitesi Hastanesi, Infection Diseases And Clinical Microbiology, Afyonkarahisar-Türkiye²

Background / Hypothesis:

ORAL ABSTRACTS

Long-term nucleos(t)ide analogue (NA) therapy effectively suppresses HBV replication and reduces the risk of cirrhosis, hepatic decompensation, and liver-related mortality in patients with chronic hepatitis B(CHB)(1,2). However, HBsAg seroclearance remains rare during continuous therapy, with annual rates below 0.5%(3,4). Achieving HBsAg loss is considered a key step toward functional cure. APASL guidelines allow NA discontinuation after at least two years of undetectable HBV DNA demonstrated on three measurements six months apart (5,6). The optimal timing for stopping NAs in HBeAg-negative patients remains debated. Increasing evidence suggests that NA withdrawal may enhance HBsAg loss in carefully selected patients(4,7–13). This study evaluated virological relapse, biochemical relapse, sustained off-therapy response, and HBsAg seroclearance after NA cessation in HBeAg-negative CHB patients.

Materials and Methods:

This retrospective study included CHB patients treated with NAs for at least four years. Eligible patients were HBeAg-negative, had undetectable HBV DNA, and normal ALT values at discontinuation. All patients were followed closely with serial laboratory assessments. Virological relapse, biochemical relapse, sustained response (HBV DNA <2000 IU/mL and normal ALT), and HBsAg clearance were recorded.

Results:

Thirty patients were included, with follow-up ranging from nine months to four years. All patients experienced virological relapse shortly after NA discontinuation, while 11 patients(36%) developed biochemical relapse. A sustained off-therapy response (HBV DNA below 2000 IU/L, normal ALT) was achieved in 18 patients (%60). Among these, 4 patients (13%) cleared HBsAg (in the 12th, 18th, 40th and 48th months). 4-year rate of HBsAg clearance of 36% among sustained biochemical/virological responders who stopped NAs treatment. 2 patients(6,6%) with virological and/or biochemical relapses were retreated with oral antiviral agents, without evidence of liver decompensation; HBsAg was not lost in either case. The increase in ALT level occurred either concomitantly with the reappearance of HBV DNA or 1–2 months later. The duration of biochemical relapses was transient in most of the patients. The limitations of this study are the small number of patients and short follow-ups, which increases

heterogeneity. In this study, HbsAg seroclearance improved over a period of 12 to 48 months. Therefore, if patients were followed for longer periods, the HbsAg seroclearance rate would be expected to be over 13%.

Conclusions:

In HBeAg-negative CHB patients, NA discontinuation after four to five years appears safe when accompanied by close monitoring. Sixty percent of patients maintained a sustained response, and 13% achieved HBsAg loss. These findings support the potential role of treatment withdrawal in promoting functional cure in selected patients.

Keyword(s) : HBsAg seroclearance after NA cessation , virological relapse, biochemical relapse, sustained off-therapy response

1694 - Non Invasive Evaluation of Fibrosis Regression in HBV and HCV A Real World Comparative Analysis

Hamza Benazzouz ¹, Mohamed Borahma ¹, Fatimazahra Chabib ¹, Nawal Lagdali ¹, Selma Sebbah ¹, Fatimazahra Ajana ¹, Maryeme Kadiri ¹
Ibn Sina University Hospital, Faculty Of Medicine And Pharmacy Of Rabat. Mohammed V University, Medecine C Hepatogastroenterology Departement, Rabat-Morocco ¹

Background

Chronic hepatitis B (CHB) and chronic hepatitis C (CHC) both lead to progressive liver fibrosis, yet fibrosis remodeling may differ according to viral etiology. FIB-4 and APRI are widely used to evaluate fibrosis evolution, but comparative data on fibrosis regression dynamics between CHB and CHC remain scarce. This study aimed to compare fibrosis regression in CHB and CHC using non-invasive biological scores (FIB-4 and APRI) before and after antiviral management.

Materials and Methods:

This retrospective, descriptive, and analytical study was conducted over an 8-year period in a gastroenterology department. FIB-4 and APRI were calculated at baseline and after 48 weeks of follow-up. Normality was assessed using Shapiro–Wilk test. Paired comparisons were performed using the Wilcoxon signed-rank test, and intergroup comparisons of Δ FIB-4 and Δ APRI used the Mann–Whitney U test. Fibrosis evolution was categorized as regressive, stable, or progressive according to predefined score changes.

ORAL ABSTRACTS

Results:

The study included 125 CHB and 165 CHC patients. CHB patients were younger than CHC patients (mean 46.9 vs median 60 years). In CHB, fibrosis stages were as follows: F0 in 14(11.2%) patients, F1 in 76(60.8%), F2 in 22(17.6%), F3 in 2(1.6%), and F4 in 11(8.8%). In contrast, CHC patients presented with more advanced fibrosis, with F1 in 37 patients (29.4%), F2 in 31(24.6%), F3 in 24 (19%), and F4 in 32(25.4%). Baseline fibrosis scores were lower in CHB than CHC (median FIB-4: 1.65 [0.82–2.48] vs 3.19 [1.48–4.35]; APRI: 0.57[0.27–1.11] vs 1.00[0.44–1.93]). In CHB, FIB-4 decreased to 0.90[0.63–1.40] and APRI to 0.25[0.19–0.38]; median Δ FIB-4 was $-0.31[-1.21; 0.11]$ and Δ APRI $-0.18[-0.58; 0.01]$ (both $p < 0.01$). In CHC, FIB-4 decreased to 1.36[0.91–2.16] and APRI to 0.37[0.25–0.51]; median Δ FIB-4 was $-1.26[-2.97; -0.26]$ and Δ APRI $-0.54[-1.52; -0.14]$ (both $p < 0.001$). The decline in fibrosis scores was significantly greater in CHC than CHB (Δ FIB-4 $p < 0.001$; Δ APRI $p < 0.001$). Categorical evolution showed fibrosis regression in 64% of CHB vs 86% of CHC patients, with progression observed in 17% vs 14%, respectively.

Conclusions:

Both CHB and CHC cohorts demonstrated significant fibrosis regression assessed by non-invasive biological markers, but the magnitude of improvement was markedly greater in CHC than CHB. This difference may partly reflect the fact that CHC patients in our cohort were diagnosed at a more advanced stage, with higher baseline fibrosis levels, allowing a larger margin for measurable regression after viral eradication. These findings underline the value of FIB-4 and APRI in monitoring fibrosis evolution and highlight distinct remodeling profiles depending on viral etiology, with more pronounced regression after HCV cure than HBV suppression.

1698 - Etiological Predictors of Portal Vein Thrombosis in Patients with Porto Sinusoidal Vascular Disease

Rajaa Boukhraiss¹, Mohamed Borahma¹, Fatima Zahra Chabib¹, Nawal Lagdali¹, Selma Sebbah¹, Fatima Zohra Ajana¹, Meryem Kadiri¹
Université Mohammed V, Rabat, Morocco, Department Of Hepatogastroenterology C, Rabat-Morocco¹

Background

Hypothesis:

Porto-sinusoidal vascular disease (PSVD) is an important cause of non-cirrhotic portal hypertension. Portal vein thrombosis (PVT) is a frequent and clinically significant complication in PSVD, but its determinants remain unclear. Whether PVT arises primarily from portal hypertension-related hemodynamic changes or from underlying prothrombotic conditions is debated. This study aimed to identify clinical, biological, and etiological factors associated with PVT in PSVD.

Materials and Methods:

We conducted a single-center, retrospective study of histologically confirmed PSVD patients between January 2018 and April 2025. Patients lost to follow-up or with revised diagnoses were excluded. The cohort was stratified by the presence or absence of PVT. Statistical analyses were performed using Jamovi software; $p < 0.05$ was considered significant.

Results:

Fifty-eight patients were included (median age 42 years; M/F ratio 0.6). PVT was present in 33 patients (56.9%), mostly at initial diagnosis; secondary thrombosis occurred in 5 cases (15.2%). Among PVT cases, 57.6% were complete and 42.4% partial. Univariate analysis showed no association between PVT and age, sex, prothrombin time, collateral venous circulation, portal hypertension decompensation, or endoscopic signs. Interestingly, thrombocytopenia ($p = 0.0033$) and splenomegaly ($p = 0.0023$) were more frequent in patients without PVT. Etiological assessment revealed that all PVT patients had at least one prothrombotic condition, including antiphospholipid syndrome (20.8%), myeloproliferative neoplasms (15%), protein S deficiency (13.2%), protein C deficiency (11.3%), estrogen-progestin contraception (9.4%), pernicious anemia (7.5%), paroxysmal nocturnal hemoglobinuria, Behçet's disease, factor V Leiden mutation, or prior abdominal surgery. In contrast, >70% of patients without PVT had no identifiable prothrombotic factor ($p < 0.0001$).

Conclusions:

In PSVD, PVT is strongly associated with underlying prothrombotic conditions, while patients without thrombosis are predominantly idiopathic. These findings support systematic etiological screening to improve thrombotic risk stratification and guide management.

Keyword(s) : Porto-sinusoidal vascular disease; Portal vein thrombosis; Non-cirrhotic portal hypertension

1708 - Males are emerging as the primary high risk population for gallbladder and biliary tract cancers

Xiaoxiao Wang¹, Ran Fei¹, Xin Ai¹, Yijun Shi¹, Zhenyu Wang¹, Rui Huang¹, Huixin Liu², Feng Liu¹, Huiying Rao¹, Yannan Liu³, Zixing Wang¹
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China¹ Peking University People's Hospital, Department Of Clinical Epidemiology And Biostatistics, Beijing-China² Beijing Hospital, General Surgery Department, Beijing-China³

Background / **Hypothesis:**
Gallbladder and biliary tract carcinoma (GBTC) is a highly lethal malignancy with a considerable global burden. Understanding its sex-specific, age-related, and geographic trends is essential for precision prevention and public health planning. This study assessed the global burden of GBTC from 1990 to 2021, projected trends to 2040, and examined associations with age, sex, geographic location, and the Socio-demographic Index (SDI).

Materials and **Methods:**
All GBTCs were coded as C23-C24.9. Age-standardized incidence rates (ASIRs), mortality rates (ASMRs), disability-adjusted life years (DALYs), and total percentage change were used to quantify the disease burden. Associations between SDI and ASMRs were examined across regions, and temporal trends were projected to 2040 using ARIMA modeling.

Results:
In 2021, 216,768 new GBTC cases and 171,961 deaths occurred, with an ASIR of 2.56 and an ASMR of 2.04 per 100,000. From 1990-2021, global ASIR, ASMR, and DALY rates declined by 11.5%, 24.1%, and 26.2%, respectively, with steeper declines among females. Male incidence surpassed females in 2013 and is projected to remain higher through 2040, particularly among males aged 70-94 years. Furthermore, since 2013, both the incidence and intensity of male predominance increased globally. South Asia showed the largest increase in death percentages, while Latin America and Europe declined, mainly due to reduced female deaths. The highest national ASIRs were observed in Chile.

Conclusions:
Despite global declines, rising male incidence and persistent mortality in high-SDI regions highlight widening disparities. Targeted interventions for older men and high-burden regions are urgently needed to

reduce the future GBTC burden.

Keyword(s) : Gallbladder and biliary tract carcinoma (GBTC); Global burden of disease; incidence; mortality; prediction

1713 - Hepatocyte myb like swirm and mpn domains 1 exacerbates liver fibrosis by stabilizing gelsolin via k29 linked deubiquitination

Han Ding¹, Le Wang², Jianni Qi³, Songbo Zhao³, Qiang Zhu⁴

Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Gastroenterology, Ji Nan-China¹ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Geriatric Gastroenterology, Ji Nan-China² Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Central Laboratory, Ji Nan-China³ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Infectious Diseases, Ji Nan-China⁴

Background / **Hypothesis:**
Hepatocyte autophagy acts as a protective brake during liver fibrosis. We found that the deubiquitinase Myb-like SWIRM and MPN domains 1 (MYSM1) is selectively and markedly upregulated in hepatocytes in human cirrhosis and multiple murine fibrosis models. Its precise role in fibrogenesis remains unknown. We hypothesized that MYSM1 suppresses hepatocyte autophagy by deubiquitinating a novel substrate, thereby increasing TGF- β 1 release and driving hepatic stellate cell activation.

Materials and **Methods:**
MYSM1 expression and cellular localization were determined in human fibrotic livers and two murine models (CCl₄ and bile duct ligation) using snRNA-seq and primary hepatocyte isolation. Hepatocyte-specific MYSM1 knockout mice and AAV8-TBG-mediated hepatocyte-specific overexpression/knockdown of MYSM1, gelsolin (GSN), and ATG5 were generated. Autophagic flux was evaluated by mRFP-GFP-LC3, transmission electron microscopy, and LC3-II turnover. MYSM1-GSN interaction and K29-linked ubiquitination were dissected using Co-IP/mass spectrometry, linkage-specific assays, and MPN-domain mutants. Hepatic stellate cell activation was assessed using conditioned medium from manipulated hepatocytes.

Results:
Hepatocyte-specific MYSM1 deletion dramatically attenuated fibrosis in both CCl₄ and BDL models, restored autophagic flux, and reduced TGF- β 1 secretion.

ORAL ABSTRACTS

Conversely, MYSM1 overexpression worsened fibrosis. Interactome and transcriptomic analyses identified GSN as the key MYSM1 substrate. MYSM1 directly bound GSN and removed K29-linked ubiquitin chains via its MPN domain, markedly stabilizing GSN protein. GSN overexpression completely reversed the anti-fibrotic and pro-autophagic effects of MYSM1 knockout, whereas GSN knockdown phenocopied MYSM1 deletion. Simultaneous MYSM1 and GSN inactivation showed additive protection. Blocking autophagy with ATG5 knockdown abolished all benefits. Conditioned medium from MYSM1-deficient hepatocytes induced significantly less hepatic stellate cell activation.

Conclusions:

We delineate a novel MYSM1–GSN–autophagy–TGF- β 1 axis in hepatocytes that drives liver fibrosis progression. MYSM1 stabilizes GSN through K29-linked deubiquitination, inhibits autophagy, and amplifies TGF- β 1-mediated hepatic stellate cell activation. Targeting the MPN-domain deubiquitinase activity of MYSM1 represents a promising hepatocyte-specific therapeutic strategy.

1715 - THE OUTCOME PREDICTION ROLE OF RED CELL DISTRIBUTION WIDTH IN 1000 HOSPITALIZED CIRRHOTIC EGYPTIAN PATIENTS

Mohamed Ahmed Samy Kohla ¹, Mohammed Fathy Ragab ², Heba Samy Ghanem ³, Mohamed Abdel-samee ¹, Ashraf Kamel Abougaba ¹, Eman Abdelsameea ¹
National Liver Institute, Menoufia University, Hepatology And Gastroenterology, Shebin El-kom-Egypt ¹ Tanta Elminshawy Hospital, Microbiology, Tanta-Egypt ² National Liver Institute, Menoufia University, Clinical Pathology, Shebin El-kom-Egypt ³

Background / Hypothesis:
A systemic inflammatory response syndrome (SIRS) is linked to red cell distribution width (RCDW), which produces pro-inflammatory signals that act directly on hematopoietic stem cells in the bone marrow. This stimulation may cause alterations in the membrane of red blood cells (RBCs), as assessed by RCDW, which have been linked to increased morbidity and death in a number of systemic disorders. This study aimed to evaluate RCDW as a predictor of outcome in hospitalized cirrhotic patients.

Materials and Methods:
This prospective cross-sectional study was conducted on 1000 patients. The outcome was assessed by days of

hospitalization; mortality in hospitalized patients or during short-term follow-up (3 months) and rehospitalization during follow-up of 6 months.

Results:

Male represented 69.6%. Mean age was 57.67 ± 13.07 years old. Baseline co-morbidities were recorded as the presence of diabetes mellitus (200 patients) and hypertension (400 patients). Hepatitis C virus was the commonest etiology of the diseased liver (90%). Child-Pugh classes A, B and C of studied patients represented (21.2%, 38.8% and 40%). The survived patients during follow-up represented 63.3%. Area under the curve for RCDW was 0.923 (95% CI, 0.904–0.943), 0.910 for C-reactive protein (95% CI, 0.890–0.930), 0.904 for Hb (95% CI, 0.883–0.925) and 0.903 for platelets (95% CI, 0.882–0.924). RCDW cutoff point at 21.35 for predicting survival had sensitivity 93%, specificity 91%, accuracy 92%, positive predictive value 85 and negative predictive value 96. Regression analysis revealed a significant positive association between both RCDW and white blood cells with mortality.

Conclusions:

RCDW could provide useful information for predicting the length of hospitalization and survival in hospitalized cirrhotic patients.

Keyword(s) : RED CELL DISTRIBUTION WIDTH ; outcome; cirrhosis; hospitalized

1717 - A new switch for lactate accumulation in metabolic dysfunction associated steatotic liver disease

Miaomiao Tian ¹, Yuzhu Song ², Huiling Cao ¹, Jianni Qi ³, Zhen Yang ²
Shandong Provincial Hospital Affiliated To Shandong First Medical University, Gastroenterology, Ji Nan-China ¹ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Infectious Diseases Department, Ji Nan-China ² Shandong Provincial Hospital Affiliated To Shandong First Medical University, Central Laboratory, Ji Nan-China ³

Background / Hypothesis: Lactylation is a novel epigenetic modification that converts lysine ϵ -amino groups into lactyllysine via enzyme-catalyzed reactions using lactate as a donor. Functioning as a "metabolic-epigenetic" switch, lactylation regulates chromatin, protein structure, and signaling pathways, exerting

ORAL ABSTRACTS

multifaceted effects across immune and metabolic systems. Metabolic dysfunction-associated steatohepatitis (MASLD) ranks among the world's most prevalent chronic liver diseases. Its core pathogenesis centers on insulin resistance, which drives abnormal lipid accumulation in the liver. Metabolic dysregulation triggered by insulin resistance establishes lactate as a key substrate for de novo lipid synthesis in hepatocytes. The differential uptake of lactate by hepatocytes and hepatic stellate cells (HSCs) promotes glycolysis, lipid deposition, oxidative stress, and HSC activation. This process determines the progression rate and prognosis of MASLD from simple fatty liver to steatohepatitis and fibrosis. Although drug development holds promise for alleviating MASLD and improving outcomes, researchers face challenges: exploring novel targets to optimize therapeutic strategies is essential for achieving superior efficacy.

Materials and Methods: This review was compiled through systematic literature retrieval. Databases searched included PubMed, Web of Science, China National Knowledge Infrastructure (CNKI), and Wanfang Data, with the search conducted up to November 2025. Chinese search terms included "lactylation," "liver disease," and "MASLD." Inclusion criteria were: (1) formally published Chinese or English literature; (2) Research content related to lactylation, liver disease, or MASLD; (3) Document types included original research, reviews, and high-quality conference papers. Exclusion criteria: Duplicate publications, incomplete data, or documents with low relevance to the topic. Finally, the eligible documents were summarized, synthesized, and analyzed to form the content of this review.

Results: This paper focuses on recent advances in histone and non-histone lactylation research, comparing three novel epigenetic dimensions: L-lactylation, D-lactylation, and N-ε-carboxyethyl lactylation. It also reviews the current status of lactylation studies in MASLD. Finally, it identifies existing research gaps and unresolved issues in lactylation studies within the MASLD context.

Conclusions: Lactylation may serve as a bridge between lipid deposition, inflammation, and fibrosis, thereby holding potential for achieving targeted MASLD

therapy.

Keyword(s) : metabolic dysfunction-associated steatotic liver disease, lactate, lactylation, insulin resistance

1722 - Paraneoplastic Hyperbilirubinemia in Hodgkin's Lymphoma An Uncommon Presentation with Significant Diagnostic and Therapeutic Challenges

Jasmin Gundayao¹, Julieta Cervantes¹, Federico Peralta¹, Rafael Mendoza¹
St. Lukes Medical Center- Bonifacio Global City, Gastroenterology, Taguig City-Philippines¹

Background: Hodgkin's Lymphoma (HL) can rarely cause paraneoplastic hyperbilirubinemia, creating a diagnostic dilemma when liver dysfunction appears without biliary obstruction or hepatic disease. This presentation often mimics drug-induced liver injury (DILI), making it difficult to distinguish between treatment toxicity and a tumor-related process. Clarifying the true cause is critical, as management and chemotherapy decisions differ significantly between DILI and paraneoplastic syndromes.

Case Presentation: A 36-year-old man with classical HL presented with isolated jaundice and was found to have markedly elevated total, direct, and indirect bilirubin, as well as increased transaminases and alkaline phosphatase, despite no history of liver disease or alcohol use. Extensive infectious and autoimmune testing was unrevealing, and imaging showed no hepatic lesions, biliary obstruction, or abnormal metabolic activity. He was started on corticosteroids and Brentuximab-based therapy, but progressive hyperbilirubinemia raised concerns for DILI, a paraneoplastic process, or possible Vanishing Bile Duct Syndrome (VBDS); liver biopsy demonstrated ductopenia without meeting criteria for VBDS. Given the rising bilirubin, treatment was switched to an AVD regimen (with reduced-dose Adriamycin) while continuing corticosteroids. This modification led to a steady and significant decline in bilirubin levels, accompanied by clinical improvement and PET-CT-confirmed metabolic remission. The patient's response supported a paraneoplastic etiology of his hyperbilirubinemia, responsive to targeted lymphoma therapy.

Conclusion: This case highlights a rare presentation of paraneoplastic hyperbilirubinemia in HL and the need for comprehensive evaluation of liver dysfunction in oncology patients and underscores the importance of flexibility in modifying chemotherapy regimens based

ORAL ABSTRACTS

on evolving clinical status.

Keyword(s) : Hodgkin's Lymphoma, Paraneoplastic Hyperbilirubinemia, DILI

1725 - Suboptimal sensitivity of quantitative HBcrAg assay for managing HBeAg negative chronic hepatitis B

Ruifeng Yang¹, Hongsong Chen²
Peking University Shougang Hospital, Clinical Laboratory, Beijing-China¹ Peking University People's Hospital, Hepatology Institute, Beijing-China²

Background / **Hypothesis:**
HBV core-related antigen (HBcrAg) aids in diagnosis of HBeAg-negative chronic hepatitis B (ENH) and predicting nucleos(t)ide analogues (NAs) cessation. However, serum HBcrAg level in ENH patients is generally low, and the sensitivity of the HBcrAg assay was inconsistently reported in previous studies. The factors contributing to this inconsistent sensitivity remain unclear. We therefore aimed to investigate the sensitivity-related factors of the HBcrAg assay. **Materials** and **Methods:**
ENH patients treated with tenofovir (TDF) for at least two years were included. Serial serum HBcrAg was tested using the Lumipulse HBcrAg quantitative assay. Baseline HBV genotype and core antigen amino acid mutations were detected by Sanger sequencing. Serum HBcrAg, HBsAg, HBV DNA and pre-genomic RNA (pgRNA) levels were dynamically monitored over 2 years of treatment. **Results:**

The functional sensitivity of the HBcrAg assay was 0.96~1.12 kU/ml, and carry-over contamination from anti-HBc assay was identified as a potential interference factor. A total of 78 ENH patients treated with TDF were enrolled. Serum HBcrAg level in ENH patients was low (1.74 ± 1.03 log₁₀ kU/ml) and correlated well with HBV DNA regardless of genotypes (genotype B, $R=0.66$; Genotype C, $R=0.74$; both $P<0.01$). However, genotype affected the correlations of HBcrAg with HBsAg and pgRNA: positive correlations were observed in genotype C (HBcrAg vs HBsAg: $R=0.67$, $P<0.001$; HBcrAg vs pgRNA: $R=0.57$, $P<0.001$), but not in genotype B (HBcrAg vs HBsAg: $R=0.32$, $P=0.18$; HBcrAg vs pgRNA: $R=0.29$, $P=0.22$). Notably, for baseline serum samples, 14.10% (11/78) of patients had underestimated HBcrAg levels, including 4 with false-negative results; these patients harbored more amino acid mutations in the three core epitopes targeted by the Lumipulse assay.

After 2 years of TDF treatment, the reductions of HBsAg, HBcrAg and HBV pgRNA were 0.23 log₁₀ IU/ml (7.43%), 0.96 log₁₀ kU/ml (55.57%) and 1.91 log₁₀ copies/ml (63.46%), respectively. HBcrAg clearance occurred later than pgRNA clearance (23.08% [18/78] vs 37.18% [29/78] of patients with negative results). HBcrAg and HBV pgRNA remained positively correlated in genotype-C patients during treatment. Two patients showed false-negative HBcrAg with persistently positive pgRNA, which was associated with more core antigen mutations.

Conclusions:

The HBcrAg assay has insufficient sensitivity for managing ENH, partially attributed to core antigen epitope mutations. Combining HBcrAg with pgRNA may improve the accuracy of ENH diagnosis and prediction of relapse after NA discontinuation.

Keyword(s) : HBeAg-negative chronic hepatitis B (ENH); HBV core-related antigen (HBcrAg); pre-genomic RNA (pgRNA); assay sensitivity

1726 - Glucagon like peptide 1 receptor agonists and reduced liver and non liver complications in patients with type 2 diabetes and viral hepatitis

Xinrong Zhang¹, Scott Barnet², Linda Henry², Ramsey Cheung², Mindie H. Nguyen²
Sun Yat-sen University, Department Of Epidemiology, Guangzhou-China¹ Stanford University Medical Center, Division Of Gastroenterology And Hepatology, Palo Alto-United States²

Background / **Hypothesis:**

Glucagon-like peptide-1 receptor agonists (GLP-1RA) are a novel class of anti-diabetic drugs that can treat obesity and type 2 diabetes (T2D) and has been shown to reverse steatohepatitis and reduce cardiovascular risk. T2D and viral hepatitis frequently coexist and worsen liver and non-liver outcomes, but effective pharmacological therapies are limited. We aimed to evaluate the long-term effect of GLP-1RA on liver and non-liver complications among patients with T2D and viral hepatitis in the United States.

Materials and **Methods:**

Patients with T2D and viral hepatitis initiating GLP-1RA were included from 2007 to 2022 in Merative™ MarketScan® Research Databases. Primary outcomes included (1) hepatocellular carcinoma (HCC) and cirrhosis, and (2) cardiovascular disease (CVD), chronic kidney disease (CKD), and non-liver cancer. Propensity

ORAL ABSTRACTS

score matching was applied to balance baseline characteristics and Cox regression models were conducted to estimate hazard ratio (HR) and 95% confidence interval (CI).

Results:

61,164 patients with T2D and viral hepatitis were initially analyzed. Patients with and without GLP-1RA use were 1:4 matched by propensity score for their demographics, comorbidities, and background medications. A total of 9,499 patients with T2D and viral hepatitis (2,133 in GLP-1RA and 7,366 in non-GLP-1RA group; mean age 57.2 years and 41% were female at baseline) were included. Compared with non-GLP-1RA group, GLP-1RA use was associated with 34% lower risk of any liver-related outcomes (HR 0.66, 95% CI 0.53-0.81; $P<0.001$), 50% lower risk of HCC (HR 0.50, 95% CI 0.29-0.88; $P=0.016$), 35% lower risk of cirrhosis (HR 0.65, 95% CI 0.52-0.80; $P<0.001$), 18% lower risk of CVD (HR 0.82, 95% CI 0.66-1.02; $P=0.079$), 34% lower risk of CKD (HR 0.66, 95% CI 0.53-0.83; $P<0.001$), and 28% lower risk of non-liver cancer (HR 0.72, 95% CI 0.53-0.99; $P=0.042$) (Table 1). Compared with dipeptidyl peptidase-4 inhibitors as active comparator, GLP-1RA use was associated with significantly lower risks of any liver-related outcomes (HR 0.70, 95% CI 0.51-0.95, $P=0.024$), HCC (HR 0.48, 95% CI 0.24-0.98, $P=0.045$), cirrhosis (HR 0.68, 95% CI 0.50-0.93, $P=0.016$) and CKD (HR 0.63, 95% CI 0.44-0.89, $P=0.010$). These significant relationships still were observed when we repeated the analysis using inverse probability of treatment weighting for the balance of patient characteristics (HR: 0.53-0.77).

Conclusions:

In a nationwide real-world cohort, GLP-1RA use was associated with a substantially lower risk of liver and non-liver complications than non-GLP-1RA group among patients with T2D and viral hepatitis. Large-scale randomized clinical trials are warranted.

Keyword(s) : Glucagon-like peptide-1 receptor agonists, type 2 diabetes, viral hepatitis, liver outcomes, cardiovascular disease, chronic kidney disease, non-liver cancer

1727 - Diagnosis of the differentials of ascites in low resource settings.

Riad Mohammad Moshaed Hossain¹, Md Golam Azam¹, Indrajit Kumar Datta¹, Abdullah Al Mamoon¹
Birdem General Hospital, Gastroenterology, Dhaka-

Bangladesh

1

Background / Hypothesis: A High serum ascites albumin gradient (SAAG) is highly suggestive of portal hypertension. Common causes of low-SAAG ascites are tuberculous peritonitis and peritoneal metastasis, and the differentiation between them is challenging. PCR with ascitic fluid or diagnostic laparoscopy appears to be an ideal tool for diagnosing tuberculous or metastatic peritonitis, but it is not available in all centres.

Materials and Methods: This is an observational study. A total of 25 patients with low SAAG ascites were included. Means are compared with the Independent-sample t-test. Cut-off value, sensitivity and specificity are measured with the ROC curve. This study was carried out at the Gastroenterology Department of BIRDEM General Hospital, Dhaka, Bangladesh.

Results:

Among 25 patients with low SAAG ascites, 12 were due to peritoneal metastasis and 9 were due to peritoneal TB.

SAAG in peritoneal met 08.21 ± 2.99 and in peritoneal TB 06.87 ± 1.34 (p-value 0.219)
Ascitic Fluid Glucose in peritoneal met 07.13 ± 2.38 and in peritoneal TB 04.82 ± 1.55 (p-value 0.016)
Ascitic Fluid Protein in peritoneal met 43.39 ± 13.35 and in peritoneal TB 63.47 ± 10.51 (p-value 0.001)
Ascitic Fluid Albumin in peritoneal met 24.53 ± 7.49 and in peritoneal TB 30.38 ± 5.36 (p-value 0.051)
Ascitic Fluid ADA in peritoneal met 18.04 ± 7.31 and in peritoneal TB 39.61 ± 13.15 (p-value <0.001)
Ascitic Fluid Cholesterol in peritoneal met 99.31 ± 38.51 and in peritoneal TB 107.22 ± 19.53 (p-value 0.573)
Ascitic fluid glucose <5.6 mg/dl suggests Peritoneal TB (p-value 0.016) with 75% sensitivity and 78% specificity.
Ascitic fluid Protein >57.7 gm/dl suggests Peritoneal TB (p-value 0.001) with 87% sensitivity and 78% specificity.
Ascitic fluid ADA >31.5 U/L significantly suggests Peritoneal TB (p-value <0.001) with 94% sensitivity and 78% specificity.

Conclusions: This small sample sized study shows low ascitic fluid glucose (<5.6 mmol/L), high ascitic fluid protein (>57.7 gm/dl), and ADA (>31.5) significantly

ORAL ABSTRACTS

suggest tuberculous peritonitis and exclude malignant ascites in patients with low SAAG ascites. Although the proposed results are not confirmatory, we may apply empirical anti-tuberculous treatment in low-resource settings.

Keyword(s) : Serum ascites albumin gradient-SAAG, Tuberculosis-TB

1729 - The expression of Fmnl1 in monocyte derived macrophages promotes hepatic inflammation in MAFLD

Zilong Wang ¹, Rui Huang ¹, Zixing Wang ¹, Feng Liu ¹, Huiying Rao ¹, Xiaoxiao Wang ¹
Peking University Hepatology Institute, Peking University People's Hospital, Beijing-China ¹

Background / Hypothesis: Metabolic dysfunction-associated fatty liver disease (MAFLD) is a chronic, progressive liver disorder characterized by complex interactions among immune cells, with macrophage-driven inflammation playing a pivotal role in disease progression. FMNL1, a member of the formin protein family, is involved in cytoskeletal remodeling and cell migration. However, its specific role in the pathogenesis of MAFLD remains unclear.

Materials and Methods: Single-cell RNA sequencing with pseudotime analysis was employed to profile FMNL1 expression during monocyte-to-macrophage differentiation. Myeloid-specific Fmnl1 knockout and control mice were established and subjected to choline-deficient high-fat diet (CDHFD) or western diet with fructose/CCl₄ to model MAFLD progression. Human MAFLD tissues and mouse livers were analyzed by immunohistochemistry and multi-color immunofluorescence for FMNL1 expression and localization. Histopathological assessment included H&E and Sirius Red staining for steatosis, inflammation and fibrosis. Flow cytometry of Percoll-isolated hepatic nuclei characterized monocyte-derived macrophages and M1/M2 populations. *in vitro*, PMA-differentiated THP-1 macrophages with lentiviral-mediated FMNL1 knockdown underwent Transwell migration assays and phalloidin-based F-actin staining. Mechanistic studies included RNA sequencing, co-immunoprecipitation-mass spectrometry, and Cdc42 activity pull-down assays in FMNL1-knockdown cells.

Results: Immunohistochemical analysis revealed a significant

upregulation of FMNL1 in both human MAFLD and CDHFD mouse livers, predominantly localized to monocyte-derived macrophages. Notably, the degree of hepatic inflammation was reduced in myeloid-specific Fmnl1 knockout mice, which also exhibited a decreased number of monocyte-derived macrophages and a reduction in M1 macrophages. FMNL1 expression was markedly induced during PMA-mediated differentiation of THP-1 macrophages and was also increased in bone marrow-derived macrophages (BMDMs) stimulated with MSF. FMNL1 knockdown resulted in impaired F-actin polymerization and significantly reduced macrophage migratory capacity. Transcriptomic profiling of FMNL1-knockdown cells demonstrated significant enrichment in pathways related to GTPase activity and Rho signaling. Additionally, co-immunoprecipitation and mass spectrometry identified Cdc42 as a key binding partner of FMNL1. Importantly, PMA stimulation triggered a time-dependent activation of Cdc42 (in its GTP-bound form), which was associated with enhanced macrophage migration. This Cdc42 activity was essential for FMNL1 upregulation via the MAPK signaling pathway (MEK/ERK). Finally, FMNL1 depletion impaired the M1 polarization capacity of BMDMs.

Conclusions: A novel mechanistic pathway is proposed in which inflammatory signals activate Cdc42, leading to the upregulation of FMNL1 expression through the MAPK pathway. Elevated FMNL1 facilitates actin cytoskeleton reorganization, promoting the recruitment and M1 polarization of monocyte-derived macrophages, thereby exacerbating liver inflammation. Targeting the Cdc42-FMNL1 axis may represent a promising therapeutic strategy for the management of MAFLD.

1732 - Associations of sweetened beverages consumption with the risk of MASLD and its related outcomes across genetic risk profiles a prospective population based cohort study

Jian Zhao ¹, Zhijie Lu ¹, Xue Gao ², Giovanni Targher ³
Southern University Of Science And Technology, School Of Public Health And Emergency Management, Shenzhen-China ¹ Shanxi Medical University, School Of Public Health, Taiyuan-China ² University Of Verona, Department Of Medicine, Verona-Italy ³

Background / Hypothesis: To examine the associations of the intake of sugar-sweetened beverages (SSBs),

ORAL ABSTRACTS

low/no-sugar-sweetened beverages (LNSSBs), and fruit juices (FJs) with incidence and progression of metabolic dysfunction-associated steatotic liver disease (MASLD), including cirrhosis, liver cancer, and liver-related mortality, and to evaluate whether these associations vary by genetic risk.

Materials and Methods: Of the 502,151 participants in the UK Biobank, 170,918 who completed at least one web-based 24-hour dietary recall (Oxford WebQ) were included in the analyses after excluding individuals with baseline liver-related disease or implausible energy intake. For genetic stratification analyses, individuals of non-European ancestry or with missing genetic data were excluded, resulting in a sub-cohort of 142,065 participants. Analyses were conducted using Cox proportional hazards models after multiple imputation. The primary outcome was incident MASLD. Secondary outcomes were new-onset cirrhosis, liver cancer and liver-related mortality.

Results: During a median follow-up of 14 years among 170,918 participants, 1,904 MASLD cases, 566 cirrhosis cases, 146 liver cancer cases, and 274 liver-related deaths were documented. Consumption of >2 servings/day was associated with higher MASLD risk for both SSBs (hazard ratio [HR]: 1.57, 95% confidence interval [CI]: 1.28-1.93) and LNSSBs (HR: 2.40, 95% CI: 2.03-2.83), while <1 serving/day of FJs was associated with lower risk (HR: 0.82, 95% CI: 0.74-0.90) compared with non-consumption. Among those with low genetic risk, >2 servings/day of SSBs was associated with greater MASLD risk (HR: 1.95, 95% CI: 1.28-2.98) than in those with high genetic risk (HR: 1.17, 95% CI: 0.77-1.76). Similarly, the associations of LNSSBs and FJs with MASLD were more pronounced among individuals with low genetic risk.

Conclusions: Higher consumption of SSBs and LNSSBs was associated with increased risk of MASLD and related outcomes in a dose-dependent manner, whereas moderate FJs intake was inversely associated with these risks. Participants with low genetic risk were more susceptible to the effects of beverage consumption on MASLD and cirrhosis.

1735 - Policy Blind Spots and Clinical Realities Determinants of Continued Alcohol Use in Alcohol Associated Liver Disease at India's First Integrated AUD-ALD Clinic

Mohit Varshney¹, Shiv Sarin²
Institute Of Liver And Biliary Sciences, Psychiatry And Addiction Medicine, New Delhi-India¹ Institute Of Liver And Biliary Sciences, Hepatology, New Delhi-India²

Background:

Alcohol-associated liver disease (AaLD) is a significant public health concern, particularly in the USA, where alcohol use is on the rise. Despite medical advice to abstain, many patients with liver damage continue to consume alcohol. While external and internal triggers for relapse have been identified, limited research has explored the interplay of dependence severity, harm perception, and motivational readiness in this group.

Methods:

A cross-sectional survey was conducted at the Integrated AUD clinic of Institute of Liver and Biliary Sciences (ILBS), New Delhi. A total of 3759 (over a period of two years (2022-2024) patients with AaLD were referred and categorized as "cases" (n=2932; alcohol use within the last 60 days) and "controls" (n=827; abstinent for more than 60 days). Patients were seen and managed by dedicated addiction specialist and team with Institutional protocols. Data were collected using a semi-structured clinical proforma, the Severity of Dependence Scale (SDS), and the Readiness to Change Questionnaire (RTCQ). Comparisons were made using chi-square and Mann-Whitney U tests to assess differences in clinical variables, dependence severity, harm perception, and motivational stages.

Results:

Participants had a mean age of 43.8 years (SD=19.4), all being male. Most (77%) reported a history of daily or near-daily alcohol use, with over 60% having consumed alcohol for more than 6 years. Compared to controls (Mean SDS=6.41), Cases (Mean SDS=7.10) had significantly higher SDS scores ($p<0.001$), indicating greater dependence, and were more likely to be in the pre-contemplation or contemplation stages rather than action stage of change ($p=0.001$). Compared to controls, cases demonstrated significantly lower awareness regarding the harms of alcohol, its addictive potential, and the importance of quitting after liver disease diagnosis (all $p<0.001$). Biomarker comparisons showed higher bilirubin levels and MELD scores in current users.

Conclusion:

High dependence, low motivation to change, and poor

ORAL ABSTRACTS

harm perception appear to be key contributing factors for continued alcohol use. This is first of its kind integrated AUD-ALD clinic data in India, that combine motivational enhancement, psychoeducation, and dependence treatment to support sustained abstinence cirrhosis patients under the same roof; and provides an opportunity to scale up integrated AUD clinics in the country and globally.

1738 - Combination Therapy with Toll like receptor 7 Agonist and Programmed Death Ligand 1 Antibody Restores HBV Specific CD8+T Cells in Virally suppressed Chronic Hepatitis B
Yuying Chen¹, Di Wu¹, Ting Wu¹, Weiming Yan¹, Qin Ning¹

Tongji Hospital, Tongji Medical College, Huazhong University Of Science And Technology, Department And Institute Of Infectious Disease, Wuhan-China¹

Background / **Hypothesis:**
In a randomized, controlled phase II trial (OCEANcure05, NCT 04202653), combination therapy with the TLR7 agonist TQ-A3334 and the anti-PD-L1 antibody TQ-B2450 effectively reduced hepatitis B surface antigen (HBsAg) in nucleos(t)ide analogue (NAs)-experienced chronic hepatitis B (CHB) patients, with favorable safety and tolerability. This study aimed to delineate the immunologic features induced by the combination regimen and their relationships with clinical efficacy.

Materials and **Methods:**
24 NAs-experienced CHB patients were randomized into NAs monotherapy, dual therapy with NAs plus TLR7 agonist, or triple therapy with NAs, TLR7 agonist and PD-L1 antibody. After 24 weeks of treatment, patients were followed-up until Week 48. The dynamics of serum cytokine levels from baseline to end of treatment (EOT) were measured by Meso Scale Discovery electrochemiluminescence assay (MSD). The immune status of CD4+T cells, CD8+T cells, and HBV-specific CD8+T cells from PBMC were evaluated by flow cytometry. Single-cell RNA sequencing was performed on PBMC from representative patients. In vitro PBMC-HepAD38 co-culture system was employed for validation.

Results:

In the triple therapy group, serum IFN- γ , IP-10, and sPD-L1 levels were significantly elevated, while sPD-L1 levels were markedly decreased at Week 12. Serum IL-21 levels

were profoundly increased and were higher than those in the dual therapy group at EOT. The triple therapy group demonstrated enriched effector phenotypes of CD4+T and CD8+T cells. Transcriptomic analysis revealed an enrichment of IL-21-related gene sets in CD4+T cells from triple therapy patients at EOT. In vitro, TLR7 agonist plus PD-L1 antibody increased IL-21+CD4+T frequency and supernatant IL-21 level compared to TLR7 alone. The triple therapy group exhibited superior HBV-specific CD8+T cell responses at EOT. The frequencies of core-IFN- γ +, CD107a+, and polymerase-IFN- γ +CD8+T cells increased from baseline and higher than those in dual therapy group. In vitro, PD-L1 antibody plus TLR7 agonist enhanced core-specific CD8+T responses, whereas the addition of IL-21/IL-21R blockade abolished these effects. Triple therapy triggered STAT3 phosphorylation in CD4+T cells and enriched the JAK-STAT signaling pathway. Targeted inhibition of STAT3 in CD4+T cells blocked the triple therapy-induced augmentation of core-specific CD8+T cell response, HepAD38 lysis, and suppression of HBV DNA and HBeAg levels.

Conclusions:

The combination of TLR7 agonist and PD-L1 antibody drives STAT3-dependent IL-21 secretion from CD4+T cells, thereby enhancing HBV-specific CD8+T cell responses and suppressing viral replication via the IL-21/IL-21 receptor pathway. This mechanism may contribute to the enhanced efficacy of triple therapy in NAs-experienced CHB patients.

Keyword(s) : combination therapy, chronic hepatitis B, HBV specific CD8+T, IL-21

1747 - Predictive Biomarkers for Hepatitis E Virus Related Acute Liver Failure Based on Lipidomics and Transcriptomics

Luyu Wang¹, Changyi Ji¹, Mengmeng Gu², Jian Wu²
Bengbu Medical University, School Of Laboratory Medicine, Bengbu-China¹ Suzhou Municipal Hospital, Medical Laboratory Center, Suzhou-China²

Background: Hepatitis E virus (HEV) is a major cause of acute viral hepatitis globally. Although usually self-limiting in healthy individuals, it can progress to severe hepatitis or acute liver failure (ALF). This study aimed to provide biomarkers for patient with Hepatitis E virus-related acute liver failure (HEV-ALF) using lipidomics and transcriptomics.

Methods: We enrolled 150 participants, including 50 acute hepatitis E (AHE) patients, 50 HEV-ALF patients, and 50 healthy controls (HCs). Lipidomics analysis was

ORAL ABSTRACTS

performed using LC-MS/MS, with differential lipids screened based on a variable importance in projection (VIP) score > 1.0, an absolute fold change (FC) > 1.5, and a p-value < 0.05. Additionally, 43 paired whole blood samples (15 AHE, 15 HEV-ALF, 13 HCs) were collected for transcriptomics. Differentially expressed genes were identified using $p < 0.05$ and $FC > 1.0$. Results: Lipidomics analysis identified 750 significantly altered lipid metabolites. Compared to HCs, the AHE group exhibited 444 differential lipids (190 upregulated, 254 downregulated). Between the HEV-ALF and AHE groups, 306 differential lipids were identified, all upregulated. Machine learning was employed to identify optimal lipid marker panels: the best combination for distinguishing AHE from HCs was Cer(d18:1/23:1); TG(6:1COOH/9:0/9:0); LPC (29:2). Using this panel, the AdaBoost classifier achieved an AUC of 1.0, and the Light Gradient Boosting Machine (LightGBM) achieved an AUC of 0.960. For distinguishing HEV-ALF from AHE, the best marker was DG (21:4/18:0), with the Light Gradient Boosting Machine (LightGBM) yielding an AUC of 0.770. Subsequent validation using multiple algorithms (Decision Tree (DT), Support Vector Machine (SVM), Random Forest (RF), K-Nearest Neighbors (KNN), Naive Bayes (NB), Logistic Regression (LR)) for AHE vs. HCs showed that all AUCs exceeded 0.95. For HEV-ALF vs. AHE, the SVM and NB both achieved AUCs above 0.84. Transcriptomics analysis identified 6093 differentially expressed genes. Compared to HCs, the AHE group had 5114 differential genes (1554 upregulated, 3560 downregulated). Comparing HEV-ALF to AHE revealed 979 differential genes (499 upregulated, 480 downregulated). Finally, integrated bioinformatics analysis of differential lipids and genes was conducted to explore the associated molecular mechanisms. Conclusion: This multi-omics study delineates the molecular landscape of HEV infection and progression. We identified significant lipid metabolic and transcriptomic disruptions in AHE and HEV-ALF patients. Machine learning-derived lipid panels showed exceptional diagnostic potential, while transcriptomics revealed key genes and pathways involved in disease progression. Our findings provide novel insights into HEV pathogenesis and offer a foundation for early diagnosis and targeted interventions.

1753 - Allogeneic Umbilical Cord Mesenchymal Stem Cell Transplantation in Patients with Cirrhosis Caused by Hepatitis B A Single Center Case Series

Jason Phowira¹, Alfiyyah Rizqy¹, Chyntia Olivia Maurine Jasirwan¹

Faculty Of Medicine, Universitas Indonesia, Department Of Internal Medicine, Jakarta-Indonesia¹

Background:

Chronic hepatitis B is a major cause of cirrhosis and liver failure, with limited treatment options beyond transplantation. Mesenchymal stem cell (MSC) therapy offers regenerative, antifibrotic, and immunomodulatory potential. Umbilical cord-derived MSCs provide a readily available, low-immunogenic source suitable for allogeneic use. This study evaluated the safety and preliminary efficacy of allogeneic umbilical cord MSC transplantation in patients with decompensated cirrhosis secondary to chronic hepatitis B.

Methods:

This phase I-II, open-label, single-arm trial evaluated the safety and preliminary efficacy of allogeneic umbilical cord-derived MSC transplantation in patients with decompensated cirrhosis due to chronic hepatitis B (ClinicalTrials.gov: NCT04357600). Adults aged 18–65 years with Child-Pugh B cirrhosis stable on antiviral therapy were enrolled through consecutive sampling. Exclusion criteria included malignancy, coinfection, major comorbidities, pregnancy, alcohol dependence, or prior transplantation. GMP-grade MSCs were verified by surface markers (CD73+, CD90+, CD105+) and sterility testing. Each patient received 10–100 million MSCs intravenously over 30 minutes after standard premedication and hydration. Hemodynamic parameters were monitored for 24 hours. Follow-up at 1, 3, and 6 months included laboratory tests and clinical evaluation, with liver ultrasonography at 6 months to assess safety and early efficacy.

Results:

All six male patients (aged 37–60 years) with decompensated cirrhosis completed the intravenous administration of MSC infusion without adverse reactions or hemodynamic instability. At one month post-infusion, significant hematologic improvements were observed: hemoglobin, hematocrit, erythrocytes, platelets, and leukocytes all increased ($p < 0.05$), suggesting enhanced marrow activity and immunomodulatory effects. Coagulation parameters remained stable overall, though individual cases showed shortened PT and reduced INR. Liver enzymes (AST, ALT) remained within baseline ranges, and direct bilirubin decreased significantly at three months ($p = 0.048$). Synthetic function improved, with albumin and total

ORAL ABSTRACTS

protein rising significantly at one month ($p=0.018$ and $p=0.023$, respectively), accompanied by an improved albumin/globulin ratio ($p=0.012$). Transient elastography showed marked reductions in liver stiffness in two patients, indicating potential antifibrotic effects. Individual variations were noted, but overall trends favored improved hematologic and hepatic parameters without safety concerns. One patient (Case 5) experienced septic shock resulting in death, deemed unrelated to therapy.

Conclusions:

Allogeneic umbilical cord-derived MSC transplantation was safe and well-tolerated in patients with decompensated cirrhosis secondary to chronic hepatitis B, showing potential regenerative and antifibrotic effects through improvements in hematologic indices, serum albumin, and liver stiffness. These preliminary findings warrant further evaluation in larger, controlled trials to confirm therapeutic efficacy and long-term outcomes.

1754 - The mechanism of TMBIM5 in ameliorating alcohol related liver disease by regulating mitochondrial dynamics

Qi Shen Shen¹, Tian Xia Xia¹, Ruibing Li Li¹, Mianyang Li¹

The First Medical Center Of The PLA General Hospital, Laboratory Medicine, China-China¹

Background / Hypothesis: ALD is a group of metabolic disorders induced by prolonged and heavy alcohol consumption. However, there are many limitations in the treatment of ALD. TMBIM5 has been shown to maintain the normal function of mitochondria in other diseases, but its role in ALD is unclear. This study aimed to investigate its role and mechanism of TMBIM5 in the development of ALD.

Materials and Methods: The mechanism was investigated TMBIM5 in alcohol-induced in vivo and in vitro models. The pathological changes were observed by H&E and Masson staining. Inflammation, apoptosis, and mitochondrial function were evaluated by qPCR, Western blotting, immunofluorescence, ROS production, ATP levels, JC-1 staining, MPTP opening, and oxygen consumption rate trials. And the CO-IP experiments and a series of mutant plasmids of TMBIM5 were constructed to further clarify the molecular mechanism.

Results:

A significant decrease in TMBIM5 protein expression was observed in alcohol-induced groups, while no significant change is observed at the mRNA level. TMBIM5 deficiency further aggravated alcohol-induced liver injury, whereas overexpression alleviated these damage. In addition, we found that TMBIM5 overexpression attenuated alcohol-induced mitochondrial oxidative stress and preserved mitochondrial function. Furthermore, we elucidate alcohol induces post-transcriptional degradation of TMBIM5 by downregulating the expression of mitochondrial fission proteins, while upregulating fusion proteins, ensuring the stability of mitochondrial structure and function, thereby protecting hepatocytes from alcohol damage.

Conclusions:

TMBIM5 can alleviate hepatocyte injury by regulating mitochondrial dynamics, positioning it as a promising therapeutic strategy.

Background / **Hypothesis:**
Atezolizumab plus bevacizumab is widely used as first-line therapy for advanced hepatocellular carcinoma (HCC). Etiologic and immunologic heterogeneity in HCC may influence the tumor immune microenvironment and treatment response, although vascular endothelial growth factor (VEGF) inhibition may reduce such variation. We hypothesized that survival outcomes and immune-related adverse events (irAEs) would be comparable between viral and non-viral HCC after rigorous adjustment for baseline characteristics.

Materials and **Methods:**
This real-world, retrospective study included 1,115 patients with advanced HCC treated at nine tertiary centers between 2021 and 2025. Patients were classified as viral (hepatitis B or C virus) or non-viral (alcohol-associated, metabolic dysfunction-associated, or cryptogenic). Propensity score matching was performed using nearest-neighbor matching (1:1 ratio) without replacement and with a caliper of 0.1 of the standard deviation of the logit. A total of 217 matched pairs were analyzed. Overall survival (OS), progression-free survival (PFS), and irAEs, including proteinuria associated with VEGF inhibition, were analyzed. Kaplan-Meier curves, Cox proportional hazards models, and standardized mean differences (SMDs) were used to evaluate covariate balance and outcomes. Differences in irAEs were compared using chi-square tests.

Results:
Baseline characteristics were well balanced after matching (all SMD <0.1). OS did not differ between viral and non-viral groups (log-rank $p=0.92$; HR 0.99, 95% CI 0.78–1.25). PFS was also comparable (log-rank $p=0.91$; HR 0.99, 95% CI 0.80–1.22). Survival curves for both OS and PFS were nearly superimposed, with no clinically meaningful differences observed between etiologic

subgroups. The incidence of irAEs was similar (non-viral 53.6% vs viral 50.9%; $p=0.633$). Proteinuria occurred more frequently in the non-viral group (21.1% vs 13.5%), although this difference was not statistically significant ($p=0.095$).

Conclusions:

In this propensity-matched cohort, etiology did not affect survival outcomes with atezolizumab plus bevacizumab, supporting its use as first-line therapy for advanced HCC regardless of underlying etiology. Additional prospective research is required to confirm these results.

1758 - Predictive Role of Spleen Stiffness in Gastrointestinal Bleeding for Patients with Unresectable Hepatocellular Carcinoma Undergoing Systemic Therapy

Yue Huang ¹, Hong Peng ¹, Xinhua Luo ¹
Guizhou Provincial People's Hospital, Infectious Disease, Guiyang-China ¹

Background / **Hypothesis:**
Systemic therapy has demonstrated efficacy in delaying disease progression among patients with unresectable hepatocellular carcinoma (u-HCC). However, the occurrence of gastrointestinal bleeding (GIB) significantly influences the selection of appropriate systemic treatment regimens. Consequently, predicting GIB is paramount for optimizing clinical decision-making. This study aims to identify risk factors for GIB in HCC patients undergoing systemic therapy.

Materials and **Methods:**
We conducted a retrospective analysis of 412 patients with cirrhosis and u-HCC admitted to Guizhou Provincial People's Hospital between June 2023 and March 2025. Following multiple imputation for missing data, patients were randomly stratified into training and test sets. Predictive features were selected using Least Absolute Shrinkage and Selection Operator (LASSO) regression and subsequently incorporated into machine learning (ML) models. Through feature importance analysis, we identified features common across all models and those demonstrating significant clinical relevance to bleeding risk. These features were then subjected to receiver operating characteristic (ROC) prediction analysis. Additionally, Kaplan-Meier survival curves and log-rank tests were employed to evaluate the predictive utility of these features for bleeding events.

Results:

ORAL ABSTRACTS

Results: The Spleen Stiffness Measurements (SSM) demonstrated significant diagnostic accuracy for GIB, yielding an area under the curve (AUC) of 0.821 (95% CI: 0.767–0.874, $P < 0.001$) with an optimal cutoff value of 45.5. Kaplan-Meier analysis revealed significantly shorter GIB-free survival in patients with $SSM > 45.5$ compared to those with $SSM \leq 45.5$ (log-rank $P < 0.0001$).

Conclusions: SSM, identified via ML models and validated through ROC and survival analyses, serves as a reliable predictor for GIB in u-HCC patients. It facilitates early risk stratification and guides targeted interventions to mitigate bleeding-related morbidity.

Keyword(s) : Spleen Stiffness Measurements, unresectable hepatocellular carcinoma, Systemic therapy

1768 - ALT Trajectories Differentiated by Early Treatment Response Determine Long Term Outcomes in Autoimmune Hepatitis

Chao Cai¹, Shang Wenxuan Shang¹, Wang Dingzhou Wang², Lu Mingqin Lu¹
The First Affiliated Hospital Of Wenzhou Medical University, Department Of Infectious Diseases, Wenzhou-China¹ The First Affiliated Hospital Of Wenzhou Medical University, Department Of Ultrasonography, Wenzhou-China²

Background / Hypothesis: In autoimmune hepatitis (AIH), alanine aminotransferase (ALT) is a central biomarker for monitoring treatment response. Current treatment guidelines establish the normalization of ALT within six months as a key criterion for complete biochemical response, which is linked to improved long-term outcomes. However, this paradigm relies solely on a single-timepoint absolute value and employs an extended observation window that may delay necessary treatment adjustments. The significance of early ALT dynamics and their role in shaping long-term ALT trajectories remain unclear. We aimed to characterize long-term ALT trajectories based on early treatment response and to evaluate the relationship between these longitudinal ALT profiles and subsequent clinical events.

Materials and Methods: This retrospective study included AIH patients with elevated baseline ALT who underwent liver biopsy. Participants were stratified into responders and non-responders according to whether ALT normalized within 3 months of treatment initiation. ALT trajectories were

modeled using a generalized additive mixed model (GAMM), and the joint model was applied to assess the association between longitudinal ALT changes and clinical events.

Results:

Among 41 AIH patients followed for a median of 37 months, 56% achieved ALT normalization within 3 months. A total of 5 clinical events (12.2%) occurred during follow-up. GAMM analysis revealed a significant interaction between time and early treatment response (Pinteraction < 0.001), with markedly different ALT trajectories between groups: responders showed a steep initial decline ($\beta = -0.363$), whereas non-responders exhibited minimal improvement ($\beta = -0.049$). After the initial 3-month period, ALT levels stabilized in both groups, with no significant further change (Pinteraction = 0.29). In the joint model, longitudinal increases in ALT were significantly associated with an increased risk of clinical events (HR 2.8 per 50% increase; 95% CI 1.0–7.9; $p = 0.047$).

Conclusions:

Early non-response to treatment is associated with persistently elevated ALT levels. Our findings suggest that assessing treatment response at 3 months may offer a clinically useful, earlier opportunity to identify complete biochemical response. Furthermore, longitudinal ALT trajectories are significantly linked to clinical events in AIH, underscoring the critical importance of monitoring these dynamic trends throughout the course of treatment.

Keyword(s) : autoimmune hepatitis, Liver biopsy, alanine aminotransferase, outcome

1769 - Admission NLR and APRI as Practical Low Cost Predictors of Severity in Cirrhosis Data from an Indian Tertiary Center

Udit Vaish¹, Priyanka Jadhav¹, Smita Patil¹
Dr. D.y. Patil School Of Medicine, General Medicine, Navi Mumbai-India¹

Background / Hypothesis: Cirrhosis in low and middle income settings often presents at advanced stages, with high rates of decompensation and limited access to elastography, specialized prognostic scoring, or timely imaging. At many centers, clinicians must triage patients using only bedside assessment and routine laboratory tests. This highlights a need for simple, inexpensive marker that can support early severity assessment at the point of

ORAL ABSTRACTS

admission. Inflammation-derived indices and basic fibrosis surrogates obtained from standard blood investigations may offer practical value in such environments.

This study evaluates whether the Neutrophil-Lymphocyte Ratio (NLR) and the AST-to-Platelet Ratio Index (APRI) can meaningfully reflect disease severity and patterns of decompensation in cirrhotic patients presenting to a tertiary care hospital in Mumbai, India, and whether these readily available markers can assist early clinical stratification.

Materials and Methods: This cross-sectional study included 140 adult cirrhotic patients admitted between April 2024 and April 2025. Admission laboratory tests were used to calculate Neutrophil-Lymphocyte Ratio (NLR) and AST-to-Platelet Ratio Index (APRI). Severity was classified using Child-Pugh scores, and decompensation events were documented clinically. NLR and APRI were compared across severity grades and correlated with decompensation using ANOVA and chi-square testing.

Results: Among 140 cirrhotic patients, admission Neutrophil-Lymphocyte Ratio (NLR) and AST-to-Platelet Ratio Index (APRI) rose consistently with disease severity. Mean NLR increased from 3.5 in Child-Pugh A to 6.2 in B and 10.8 in C ($p < 0.001$). APRI showed a similar progression, rising from 1.1 to 1.9 and 3.2 respectively ($p < 0.001$). Elevated NLR (≥ 6) strongly correlated with major decompensation at presentation, including ascites and hepatic encephalopathy. A combined high-risk profile (NLR ≥ 6 plus APRI ≥ 1.5) identified 84 per cent of all patients presenting with at least one significant decompensating event, compared with 38 per cent when both markers were low ($p < 0.001$). These trends remained consistent across etiologies.

Conclusions: NLR and APRI, calculated from universally available admission laboratories, provide meaningful insight into both severity and early decompensation in cirrhosis. Their strong correlation with Child-Pugh class and

clinical instability supports their use as rapid, low-cost indicators at first medical contact. In resource-limited hepatology settings, these markers can help identify high-risk patients before advanced scores, imaging, or elastography are available. Incorporating NLR and APRI into routine initial assessment may strengthen early triage, guide clinical prioritisation, and improve frontline decision-making for cirrhotic patients in everyday practice.

Keyword(s) : Cirrhosis, NLR, APRI, India

1771 - Our Journey Towards a Dedicated Transjugular Intrahepatic Portosystemic Shunt (TIPSS) Service Teamwork Makes the Dream Work
Hak Keith Leung¹, Eric Chung², Hing Wa Yip³, Mohd Aizuddin Mohd Zulaistri⁴, Nithia Subramaniam⁵, Shahredhan⁵, Shahrani⁵

University Of Malaya, Medicine, Kuala Lumpur-Malaysia
¹ University Of Malaya, Radiology, Kuala Lumpur-Malaysia
² University Of Malaya Medical Centre, Anaesthesiology, Kuala Lumpur-Malaysia
³ Univeristy Of Malaya, Medicine, Kuala Lumpur-Malaysia
⁴ University Of Malaya Medical Centre, Medicine, Kuala Lumpur-Malaysia
⁵

Background / Hypothesis: Transjugular intrahepatic portosystemic shunt (TIPSS) is a well-established intervention for the management of portal hypertension and its complications. Although widely available in many developed countries, resource limitations, lack of expertise, and infrastructural barriers have historically impeded its implementation in Malaysia. Establishing a dedicated TIPSS service requires strong multidisciplinary collaboration to optimise patient selection, ensure procedural success, and provide coordinated post-procedural care.

Materials and Methods: We describe our centre's initial experience in developing a dedicated TIPSS service, with procedures performed despite significant logistical constraints.

Results: Over an 8-month period, 15 TIPSS procedures were attempted, with 14 successful (technical success rate 93.3%). Indications included variceal bleeding—both salvage and pre-emptive (66.7%)—and refractory ascites (33.3%). Underlying etiologies of portal hypertension were alcohol-related cirrhosis (13%), hepatitis B or C cirrhosis (33.3%), metabolic dysfunction-associated steatohepatitis (27%),

ORAL ABSTRACTS

autoimmune liver disease (7%), cryptogenic cirrhosis (7%), and non-cirrhotic portal hypertension (20%). Technical success was defined as creation of a functional portosystemic shunt with adequate reduction of the portosystemic gradient. Clinical outcomes assessed included bleeding control, ascites response, iatrogenic complications, post-TIPSS hepatic encephalopathy (HE), post-TIPSS heart failure (HF), duration of hospitalisation, and in-hospital mortality. Most patients demonstrated rapid haemodynamic and clinical improvement. No post-TIPSS HE occurred. One patient developed acute HF. Two patients experienced iatrogenic complications: one hepatic artery injury requiring embolisation (TIPSS remained successful), and one portal vein injury in which the TIPSS procedure was abandoned and primary portal vein repair was performed. Overall, 87% of patients were discharged within 7 days post-TIPSS. No in-hospital mortality was reported.

Conclusions:

Our early experience demonstrates that a dedicated TIPSS service—driven by collaborative multidisciplinary teamwork—can be successfully established even within a resource-limited environment. Through collaborative effort, TIPSS has evolved from a distant dream to a practical and impactful treatment option for patients with complex portal hypertension in Malaysia.

Keyword(s) : TIPSS, Liver cirrhosis, Liver fibrosis, portal hypertension

1775 - Longitudinal Analysis Reveals Comparable ALT Trajectories and Achievement of Biochemical Remission Regardless of Baseline Fibrosis in Autoimmune Hepatitis

Wenxuan Shang¹, Chao Cai¹, Dingzhou Wang², Mingqin Lu¹

The First Affiliated Hospital Of Wenzhou Medical University, Department Of Infectious Diseases, Wenzhou-China¹ The First Affiliated Hospital Of Wenzhou Medical University, Department Of Ultrasonography, Wenzhou-China²

Background / Hypothesis:

There is limited data on whether significant liver fibrosis impacts the treatment response in autoimmune hepatitis (AIH). Studies examining the association between liver fibrosis and long-term longitudinal ALT data are lacking. We aimed to investigate the association between longitudinal Alanine aminotransferase (ALT) over time and significant liver

fibrosis in AIH patients.

Materials and Methods: This retrospective review included 41 patients with AIH. All patients underwent liver biopsy at baseline and received standard treatment according to the EASL AIH guidelines. Significant liver fibrosis was diagnosed with a modified Ishak score $\geq$ S3. Patients were categorized into two groups based on their baseline fibrosis status: significant fibrosis and non-significant fibrosis. The association between ALT and clinical types was analyzed using a generalized additive mixed model (GAMM).

Results:

A total of 41 patients (80.4% female, 46.3% with significant fibrosis) were assessed, yielding 744 longitudinal ALT measurements. The GAMM analysis revealed that the longitudinal trajectory of ALT over time did not differ significantly between the two fibrosis groups (p for interaction = 0.819). Both groups had a steeper decline in ALT in the early stage of treatment and were stable thereafter. The monthly decline in Log₁₀(ALT) was -0.022 units (95% CI: -0.031 to -0.014) in the significant fibrosis group, compared to -0.021 units (95% CI: -0.029 to -0.013) in the non-significant fibrosis group.

Conclusions:

Longitudinal analysis via GAMM indicates that significant fibrosis does not impede the achievement of biochemical remission in AIH patients under standard treatment.

1776 - Immune characteristics of peripheral blood cells in inactive hepatitis B surface antigen carriers treated with interferon

Jianxia Dong¹, Shan Ren¹, Pengxuan Wu¹, Jing Zhao¹, Xinyue Meng¹, Haitian Yu¹, Siqi Zhang¹, Xinyue Chen¹, Sujun Zheng¹

Beijing Youan Hospital, Capital Medical University, The First Unit, Department Of Hepatology, Beijing-China¹

Background / Hypothesis:

Predictors of functional cure in inactive HBsAg carriers treated with pegylated interferon- α -2b (Peg-IFN- α) remain unclear. We investigated early immune signatures using mass cytometry.

ORAL ABSTRACTS

Materials and **Methods:**
Among 240 screened inactive carriers (HBsAg<1000 IU/mL, HBeAg-negative, HBV DNA <2000 IU/mL, normal ALT), 166 were randomized 2:1:1 to continuous Peg-IFN- α weekly for 48 weeks (n=90), intermittent Peg-IFN- α (n=48), or untreated observation (n=28). A balanced subset of 94 patients (47 cured [CR] vs 47 non-responders [NR] at week 48) underwent PBMC analysis at baseline, week 12, and week 48 by mass cytometry (CyTOF) using a 37-marker panel covering T, B, NK, and monocyte subsets.

Results:

Week-48 HBsAg clearance rates were 31.1% (28/90) in the continuous arm, 18.8% (9/48) in the intermittent arm, and 3.6% (1/28) in the observation arm ($P<0.001$). In the immune cohort, baseline CR patients had lower CD4+ naïve T cells ($15.3 \pm 5.6\%$ vs $20.8 \pm 6.9\%$, $P=0.004$) and higher immature B cells ($5.4 \pm 2.5\%$ vs $3.7 \pm 2.0\%$, $P=0.007$). At week 12, CR showed robust T-cell restoration versus NR: CD4+ central memory ($6.4 \pm 3.0\%$ vs $3.1 \pm 1.9\%$), CD4+ effector memory ($19.1 \pm 5.9\%$ vs $11.8 \pm 4.7\%$), CD8+ effector memory T cells ($29.4 \pm 8.2\%$ vs $17.3 \pm 6.8\%$), and reduced PD-1+Eomes+ exhausted CD8+ T cells ($6.6 \pm 2.8\%$ vs $14.1 \pm 4.5\%$) (all $P<0.001$). Week-12 memory T-cell expansion combined with exhaustion reduction predicted HBsAg clearance (AUC=0.937).

Conclusions:

Continuous 48-week Peg-IFN- α achieved the highest functional cure rate (31.1%). Early (week 12) restoration of CD4+/CD8+ memory T cells with reversal of exhaustion is the dominant immune predictor of HBsAg seroclearance. Week-12 CyTOF monitoring may enable response-guided therapy.

Keyword(s) : hepatitis B, inactive carrier, HBsAg clearance, pegylated interferon, mass cytometry, memory T cell, T-cell exhaustion

1781 - An Endothelial Related Gene Signature Derived from Integrative Transcriptomics Predicts HCC in Cirrhosis

Jiahao Yuan¹, Jingyu Zhang¹, Wei Cheng¹, Zilin Ma¹, Han Tang¹, Xiaohan Zuo¹, Min Cong¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹

Background

Liver cirrhosis is a major global health challenge and a key risk factor for hepatocellular carcinoma (HCC), a malignancy with high mortality due to late diagnosis. This study aimed to integrate single-cell RNA

sequencing (scRNA-seq) and bulk RNA sequencing (bulk RNA-seq) data, using single-cell data to identify Endothelial-associated transcriptomic changes during the progression from cirrhosis to HCC, and using bulk data to validate these findings in independent cohorts, while developing predictive models for early risk assessment.

Materials and **Methods:**
We integrated scRNA-seq (GSE136103, GSE202642 and GSE242889) and bulk RNA-seq datasets (GSE25097 and GSE14323) derived from cirrhosis and HCC liver tissues. hdWGCNA of Endothelial scRNA-seq data was used to identify Endothelial-associated gene modules whose hub genes significantly overlapped with Endothelial DEGs. Gene expression and network analyses were performed, and candidate genes were used to construct diagnostic models with LASSO regression. Model performance was evaluated using ROC curves.

Results:

We identified eleven Endothelial-associated genes, among which OIT3, FCN2, CXCL12, TYROBP, AKAP12, PDK4, FCN3, ALDOB and ALB were upregulated in HCC, ZFAND2A and GNG11 were downregulated in HCC, indicating an activated state of endothelial cells characterized by immunomodulation, metabolic reprogramming, and a pro-angiogenic niche that collectively fosters tumor progression and immune evasion. Based on these findings, we established predictive models using LASSO, which stratified cirrhotic patients from RNA-seq datasets into high- and low-risk groups according to cutoff values. The model demonstrated high diagnostic performance (AUC=0.998).

Conclusions:

This study highlights the critical role of Endothelial-associated transcriptomic remodeling in liver disease progression. The machine learning-based predictive model offers a promising approach for early diagnosis and clinical decision-making in patients with cirrhosis.

Keyword(s) : scRNA-seq; liver cirrhosis; hdWGCNA; machine learning; predictive model

1782 - An Evaluation of the Effectiveness of Entecavir in Patients with Acute Chronic Hepatitis B liver Failure

Sharker, Mohammad Shahadat Hossain¹, Salimur Rahman², S.k.m. Nazmul Hasan³, Lucky Siddiquei⁴

ORAL ABSTRACTS

Kurmitola General Hospital, Hepatology, Dhaka-Bangladesh ¹ Bangladesh Medical University (bmu), Hepatology, Dhaka-Bangladesh ² Shaheed Syed Nazrul Islam Medical College, Hepatology, Kishoreganj-Bangladesh ³ Dr. Amanat Khan Hospital. Mirpur, Hepatology, Dhaka-Bangladesh ⁴

Background:

Entecavir has been shown to be effective in randomized controlled trials in highly selected patients with hepatitis B virus infection. Entecavir does not cure HBV and may not prevent complications of hepatitis B such as cirrhosis of the liver or liver cancer. The dose is double for people who have persistent hepatitis viremia (the presence of virus in the blood) while taking lamivudine or have lamivudine resistance. It is recommended to take entecavir on an empty stomach, two hours before or after a meal. For some people, hepatitis B infection become chronic, meaning it lasts more than six months. Having chronic hepatitis B increases your risk of developing liver failure, liver cancer or cirrhosis a condition that permanently scars the liver. This study is aimed to evaluate the efficacy of Entecavir in chronic hepatitis B patients in the real-world setting.

Methodology:

In this study a total of 32 acute chronic Hepatitis B liver failure patients (age > 18 years with both sexes but male predominant) were included in Hepatology department of Bangladesh Medical University (BMU), Dhaka from January 2013 to December 2015. The patients were randomized into two groups: Entecavir group (N=32) and followed at least for 03 months.

Results:

Altered level of consciousness was present in 14 (43.8%) patients, moderate ascites in 26 (81.3%), and encephalopathy in 16 (50.0%) in the entecavir group. Differences were not statistically significant ($p > 0.05$). Mean laboratory values were: total count $10181.3 \pm 3594.1/\text{mm}^3$, serum bilirubin 22.0 ± 5.7 mg/dl, ALT mean rank 18.0 U/L, AST mean rank 17.8 U/L, prothrombin time 23.1 ± 4.2 sec, INR 2.0 ± 0.3 , serum albumin 2.3 ± 0.5 g/dl, serum creatinine 0.85 ± 0.31 mg/dl, serum sodium 134.1 ± 5.2 mmol/l, serum potassium 3.7 ± 1.0 mmol/l, MELD score 26.5 ± 2.0 , and Child-Pugh score 12.0 ± 1.5 ($p > 0.05$). After three months of entecavir therapy, mean serum bilirubin improved from 22.0 ± 5.7 to 5.1 ± 1.7 mg/dl; INR from 2.0 ± 0.3 to 1.4 ± 0.2 ; serum albumin from 2.3 ± 0.5 to 3.1 ± 0.3 g/dl; Child-Pugh score from 12.0 ± 1.5 to 9.3 ± 0.9 ; and MELD score from 26.5 ± 2.0 to 17.0 ± 2.1 . Negative mean rank ALT was 4.0 U/L (sum of rank 8.0); positive

mean rank and sum of ranks were 0. Differences were statistically significant ($p < 0.05$).

Conclusion:

Entecavir is very potent anti-HBV drug with a high genetic barrier to resistance, highly effective in lamivudine-naïve CHB patients and most promising for their long-term treatment but not very suitable for CHB patients harboring LAM resistant HBV mutants.

Keyword(s) : Entecavir, hepatitis B, HBV

1783 - LLGL1 Loss Attenuates Hippo Signaling and Sustains Pro oncogenic YAP Activity in Hepatocellular Carcinoma Cells

Gökhan Yildiz ¹, Soner Karabulut ²
Karadeniz Technical University Faculty Of Medicine, Medical Biology, Trabzon-Türkiye ¹ Karadeniz Technical University Graduate School Of Health Sciences, Medical Biology, Trabzon-Türkiye ²

Background / Hypothesis: Liver cancer is the sixth most frequently diagnosed malignancy worldwide but persists as the third leading cause of cancer-related deaths. Approximately 85% of primary liver tumors are hepatocellular carcinoma (HCC). Dysregulation of the Hippo signaling pathway is a well-established driver of HCC development and progression. LLGL scribble cell polarity complex component 1 (LLGL1), a conserved regulator of epithelial polarity, has been implicated in Hippo pathway modulation across several cancer types; however, its mechanistic role in HCC remains largely undefined. Given the central role of Hippo signaling in controlling proliferation and tissue homeostasis, defining LLGL1-dependent regulatory mechanisms may provide new insight into polarity-signaling crosstalk in HCC. In this study, we sought to investigate how LLGL1 influences Hippo pathway activity in HCC cells.

Materials and Methods: LLGL1 knockout (KO) Huh-7 cells were established via CRISPR/Cas9n-mediated gene disruption. Hippo signaling activation was induced by plating cells at high confluency. Expression levels of core Hippo pathway proteins were analyzed by Western blotting and quantified across biological replicates. All experiments were performed under standardized culture conditions to ensure reproducibility, and statistical analyses were performed with $p < 0.05$ considered significant.

Results: Protein analyses revealed that key molecular markers of Hippo pathway activation [phosphorylated (p)-MOB1 (Thr35), p-LATS1/2 (Ser909/Ser872), p-YAP (Ser127), p-TAZ (Ser89), and p-YAP (Ser397)] were

ORAL ABSTRACTS

significantly upregulated in confluent control cells ($p < 0.05$ for all), confirming robust pathway activation under high-density conditions. LLGL1 deficiency markedly altered this response. Total MOB1 levels were reduced 2.4-fold in LLGL1 KO cells compared with controls ($p = 0.0003$). Furthermore, p-TAZ (Ser89), a post-translational modification that promotes cytoplasmic retention and functional inactivation of TAZ, was reduced 1.4-fold in LLGL1 KO cells compared to controls ($p = 0.03$). In contrast, levels of p-YAP (Ser397), a phosphorylation event associated with proteasomal degradation of YAP, were not significantly altered in LLGL1 KO cells ($p = 0.58$), suggesting impaired YAP turnover and sustained YAP transcriptional activity.

Conclusions: This study provides the first evidence that LLGL1 contributes to Hippo tumor-suppressive signaling in HCC cells. Loss of LLGL1 leads to decreased MOB1 and reduced p-TAZ (Ser89) levels, together with unchanged p-YAP (Ser397), collectively indicating attenuated Hippo pathway activity and persistent pro-oncogenic YAP signaling. These findings position LLGL1 as a potential regulator of Hippo-mediated growth control in HCC and highlight the importance of polarity-Hippo pathway interactions in liver tumor biology.

1785 - Automatic Detection of Hepatocellular Carcinoma on MRI Using a Lesion Aware Fine Tuning Framework

Cong Wang¹, Shenghong Ju¹
Southeast University, Department Of Radiology,
Zhongda Hospital, Medical School, Southeast
University, Nanjing-China¹

Background / Hypothesis: Automated segmentation of hepatocellular carcinoma (HCC) on MRI can substantially improve the efficiency of clinical workflows and imaging research. However, small HCCs (< 3 cm) and atypical HCCs often present low contrast, blurred boundaries, and non-classic enhancement patterns, making them prone to being missed by deep learning models.

Materials and Methods: This study included contrast-enhanced MRI examinations of 263 patients with HCC. An nnUNetV2-based model was developed for automatic liver and tumor segmentation, with a specific focus on improving the recall of small and atypical lesions. An initial model was trained using the full dataset to ensure robust performance for large lesions. Subsequently, 26 cases containing small-volume or

atypical HCCs were used for targeted fine-tuning by employing lesion-centered patch sampling and resampling strategies, while inheriting the weights of the initial model to enhance sensitivity to small tumor foci.

Results: The fine-tuning strategy significantly enhanced the model's detection capability for small and atypical HCC. The overall model Dice score improved from 0.803 before fine-tuning to 0.906, while the tumor category Dice score substantially increased from 0.6369 to 0.8423. After fine-tuning, the tumor IoU rose from 0.576 to 0.765, indicating a notable improvement in the model's recall ability for small lesions. Meanwhile, the liver segmentation performance remained stable, demonstrating that the fine-tuning strategy targeting small lesions did not compromise the segmentation accuracy of the overall structure.

Conclusions: By combining small-lesion resampling, lesion-centered patch augmentation, and nnUNetV2-based weight-inheritance fine-tuning, the proposed model achieves substantially improved recall of small and atypical HCCs while maintaining excellent liver segmentation accuracy. This strategy provides a practical and clinically valuable approach for enhancing early HCC detection on MRI.

1798 - East Asian subgroup analysis of the global Phase 3 GLISTEN study of linerixibat for the treatment of cholestatic pruritus in patients with primary biliary cholangitis (PBC)

Jidong Jia¹, Qinglong Jin², Xiong Ma³, Weiwei Mu⁴, Kazuhito Kawata⁵, Atsumasa Komori⁶, Akari Suyama⁷, Brooke M Currie⁸, Jennifer Shannon⁹, Megan M McLaughlin¹⁰, Atsushi Tanaka¹¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹ The First Hospital Of Jilin University, Changchun-China² Shanghai Renji Hospital, Shanghai Jiao Tong University, Shanghai-China³ Gsk, Beijing-China⁴ Hamamatsu University School Of Medicine, Shizuoka-Japan⁵ Nho Nagasaki Medical Center, Nagasaki, Japan, Nagasaki-Japan⁶ Gsk K.k., Tokyo-Japan⁷ Gsk Collegeville, Pa-United States⁸ Gsk Durham, Nc-United States⁹ Gsk Collegeville Pa, -United States¹⁰ Teikyo University School Of Medicine, Department Of Medicine, Tokyo-Japan¹¹

Background / Hypothesis: Cholestatic pruritus in PBC is common, debilitating, and negatively impacts quality of life. In the global Phase 3 GLISTEN study (NCT04950127), a statistically significant

ORAL ABSTRACTS

improvement in pruritus and pruritus-related sleep interference was observed with linerixibat, a minimally absorbed ileal bile acid transporter inhibitor in registration phase for the treatment of pruritus in PBC. Here, we report the results for the East Asian subgroup (EAS; China and Japan) and for all participants in GLISTEN.

Materials and Methods:
In this double-blind, randomised, placebo-controlled study, adult patients with PBC and moderate-to-severe pruritus received oral linerixibat 40 mg or placebo twice daily. Stable background therapy was allowed. Pruritus severity and pruritus-related sleep interference were self-assessed daily using a 0–10 numerical rating scale. Primary endpoint: change from baseline in monthly itch score (worst weekly score of each month) over 24 weeks. Secondary endpoints included change from baseline in monthly sleep score (worst weekly sleep score of each month) over 24 weeks.

Results:

In total, 238 patients were randomised, including 72 in the EAS. Over 24 weeks, linerixibat resulted in significantly greater pruritus improvement than placebo (least-squares [LS] mean change: –2.86 vs –2.15, $p=0.0013$ overall; –2.63 vs –1.71 in EAS). After 24 weeks, the observed mean (SD) changes from baseline in pruritus were –3.66 (2.50) for linerixibat and –2.82 (2.32) for placebo overall, and –3.41 (2.23) versus –2.03 (1.61) in EAS. At Week 24, a ≥ 3 -point reduction in pruritus was achieved by 56% of patients on linerixibat versus 43% on placebo overall, and by 55% versus 34% in EAS. Improvement in pruritus with linerixibat was rapid and superior to placebo (LS mean change at Week 2: –1.78 vs –1.07, $p=0.0002$ overall; –1.56 vs –0.66 in EAS). Linerixibat significantly improved pruritus-related sleep interference over 24 weeks versus placebo (LS mean change: –2.77 vs –2.24, $p=0.024$ overall; –2.18 vs –1.61 in EAS). Gastrointestinal adverse events (AEs) were reported more frequently with linerixibat than placebo; diarrhoea occurred in 61% versus 18% overall and 74% versus 19% in EAS (mostly mild to moderate). Treatment discontinuation due to diarrhoea occurred in 4% of patients on linerixibat overall and 0% in EAS.

Conclusions:

In patients with PBC and moderate-to-severe pruritus, linerixibat rapidly and significantly improved pruritus and pruritus-related sleep interference versus placebo. Although gastrointestinal AEs were more frequent with

linerixibat, they were manageable and rarely led to discontinuation. Efficacy, safety, and tolerability of linerixibat in the EAS were consistent with the overall results.

1802 - Hesperidin inhibits HBV via promoting macrophage M1 polarization through activation of the NF κ B CXCL TNF α pathway

Yilan Yang ¹, Fengjie Qiao ¹, Yunfeng Guan ¹, Man Li ¹, Yueqiu Gao ¹

Shuguang Hospital, Affiliated To Shanghai University Of Traditional Chinese Medicine, Shanghai Key Laboratory Of Traditional Chinese Clinical Medicine, Shanghai-China ¹

Background / Hypothesis:Chronic hepatitis B (CHB) seriously threat human health worldwide. Although antiviral drugs were commonly used in treatment of CHB clinically, they cannot completely eliminate the virus. Macrophages, as antigen-presenting cells, are an important component of innate immunity. Their polarization towards M1 can inhibit HBV infection by promoting the expression of cytokines such as TNF α . Hesperidin exhibits significant antiviral activity via promoting polarization towards M1 of macrophage.

Materials and Methods:Construct a mouse model of HBV infection by injecting rAAV8-HBV1.3 adenovirus into the tail vein of mice. Enzyme linked immunosorbent assay was used to detect the levels of HBsAg and HBeAg in the serum of HBV infected mice, and real-time qPCR was used to detect the expression levels of macrophage polarization related factors in the liver of HBV infected mice. Application of transcriptomics technology and bioinformatics analysis enrichment analysis to screen and predict potential pathways and targets for anti HBV effects of Hesperidin polarized macrophages. Differential gene expression was validated on THP-1 cell lines using PCR and ELISA. ELISA was used to detect HBsAg and HBeAg levels in HepG2.2.15 cells after differential gene intervention, Western blot was used to validate potential pathways, and PCR was used to validate differential gene expression in vivo.

Results:Enzyme linked immunosorbent assay detected that hesperidin can significantly reduce the levels of HBsAg and HBeAg in the serum of HBV infected mice. Real time qPCR results showed that Hesperidin can promote macrophage polarization towards M1 phenotype and inhibit cell polarization towards M2

ORAL ABSTRACTS

phenotype in the liver of HBV infected mice. Compared with the control group, hesperidin treatment affected the expression of 233 genes, of which 122 genes were upregulated and 111 genes were downregulated. The GO and KEGG pathway analysis results indicate that the IL-17 signaling pathway regulated by chemokines including CXCL and TNF α is significantly enriched. CXCL do not directly reduce the levels of HBsAg and HBeAg, but TNF α can inhibit their production, while CXCL can promote secretion of TNF α in macrophage. At the same time, through positive feedback regulation, CXCL activate NF κ B, further upregulated levels of TNF α . Conclusions: Hesperidin reduces the levels of HBsAg and HBeAg in animal serum and increases the expression of genes related to M1 polarization in macrophages in the liver. Hesperidin increases the levels of CXCL and TNF α production by activating the NF κ B pathway, thereby exerting anti HBV effects.

Keyword(s) : Chronic hepatitis B, macrophage, M1 polarization, hesperidin, CXCL

1804 - LOXL1 G153D Mutation Impairs Liver Fibrosis Regression by Enhancing Extracellular Matrix Stabilization

Wen Zhang¹, Wenyue Wu¹, Hong Li², Ning Zhang¹, Ziyang Pan², Haodong Ma², Caihong Wang¹, Xuzhen Yan², Aiting Yang², Wei Chen², Hong You¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹ Beijing Friendship Hospital, Capital Medical University, Beijing Clinical Research Institute, Beijing-China²

Background / Hypothesis: Lysyl oxidase-like 1 (LOXL1) is a copper-dependent enzyme essential for extracellular matrix (ECM) cross-linking, contributing to tissue remodeling and fibrotic processes. Although LOXL1 mutations have been shown to enhance ECM cross-linking in glaucoma, their involvement in liver fibrosis remains insufficiently understood.

Materials and Methods: Genomic DNA from 168 patients with chronic hepatitis B (CHB)-related liver fibrosis was analyzed to identify LOXL1 single-nucleotide polymorphisms (SNPs) and assess their association with fibrosis progression and regression. To validate functional relevance, heterozygous Loxl1 G153D mutant mice were generated and exposed to carbon tetrachloride (CCl₄) to induce liver fibrosis, followed by spontaneous regression after withdrawal. The biological impact of the Loxl1 G153D mutation was further examined using an integrated

multi-omics strategy, including decellularized liver proteomics, transcriptomics, and metabolomics.

Results:

Patients carrying the heterozygous LOXL1 G153D mutation exhibited a significantly lower fibrosis reversal rate after 78 weeks of antiviral therapy (AVT) compared with non-mutant patients (26.3% vs. 52.4%, $p = 0.025$). Post-AVT, mutation carriers showed higher serum ALT and GGT levels, increased liver stiffness measurements (LSM), and elevated Ishak fibrosis scores. In vivo, Loxl1 G153D mice demonstrated greater inflammatory infiltration, lipid accumulation, and pronounced perisinusoidal fibrosis during spontaneous regression following CCl₄-induced injury. Mechanistically, metabolism-related pathways were predominantly activated during fibrosis progression, whereas inflammation-associated pathways were enriched during regression. Decellularized liver mass spectrometry further showed that the Loxl1 G153D mutation enhances ECM cross-linking and stabilization. In hepatic stellate cells (HSCs), the mutation promoted LOXL1 protein translocation to the cell membrane and extracellular compartment, markedly increasing HSC migration and contractility. Collectively, these findings indicate that the LOXL1 G153D mutation enhances extracellular LOXL1 secretion, strengthens ECM cross-linking and deposition, and disrupts fibrosis regression.

Conclusions:

Our findings demonstrate that the heterozygous LOXL1 G153D mutation is associated with impaired liver fibrosis regression following AVT in patients with CHB. This clinical association is supported by mechanistic evidence from Loxl1 G153D mutation mouse models, revealing a previously unrecognized role of LOXL1 in shaping the hepatic fibrosis regression microenvironment.

Keyword(s) : liver fibrosis; regression; extracellular matrix; chronic hepatitis B; hepatic stellate cells

1805 - Clinical Validation and Diagnostic Value Assessment of Plasma GSTM3 as a Novel Biomarker for Liver Fibrosis

Chenxue Hou¹, Yuanying Zhao¹, Qi Wang², Yue Li¹
Beijing Ditan Hospital, Capital Medical University, Clinical Laboratory, Beijing-China¹ Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases, Beijing-China²

Background: Liver fibrosis is a critical pathological

ORAL ABSTRACTS

process in the progression of chronic liver disease to cirrhosis. Its dynamic reversible nature offers important opportunities for clinical intervention. However, the mechanisms underlying fibrosis reversal remain unclear, and the lack of accurate non-invasive diagnostic biomarkers significantly hinders early intervention and treatment monitoring. Our previous study in a mouse model of liver fibrosis demonstrated that GSTM3 expression was significantly elevated during fibrosis progression and gradually decreased during reversal, suggesting its close association with fibrosis severity and potential involvement in its regulation. This study aims to evaluate the clinical feasibility and diagnostic value of plasma GSTM3 as a novel biomarker for liver fibrosis.

Methods: Liver tissue specimens from 48 patients with different stages of liver fibrosis were collected from Beijing Ditan Hospital and categorized into S0, S1-2, and S3-4 groups based on the modified Scheuer scoring system. Immunohistochemistry was used to detect GSTM3 expression in liver tissues to validate its correlation with fibrosis progression. To further explore its potential as a non-invasive biomarker, plasma samples from 180 liver fibrosis patients and 50 healthy controls were analyzed for GSTM3 levels using ELISA.

Results: Immunohistochemistry revealed a significant positive correlation between GSTM3 expression in liver tissues and fibrosis severity. Weak expression was observed in the S0 group, markedly elevated levels in the S1-2 group, and the highest expression in the S3-4 group, demonstrating a gradient increase with fibrosis progression. Plasma GSTM3 levels also showed a stage-dependent increase: 8.14 ng/ml in healthy controls, 14.97 ng/ml in the S1-2 group, and 36.20 ng/ml in the S3-4 group. This trend of increasing GSTM3 levels with advancing fibrosis remained consistent across individual stages and different grouping methods. ROC curve analysis indicated that plasma GSTM3 levels possess good diagnostic performance for significant liver fibrosis ($S \geq 2$), with an AUC reaching 0.8213, suggesting its considerable potential as a non-invasive diagnostic biomarker for assessing the progression of liver fibrosis.

Conclusion: Clinical data confirm that GSTM3 exhibits a clear stage-dependent increase with liver fibrosis progression, consistent with prior animal experiments. These findings suggest that GSTM3 not only plays a critical role in liver fibrosis development but also holds promise as a non-invasive biomarker for clinical diagnosis and disease monitoring.

1812 - Clinical characteristics and influencing factors of porto sinusoidal vascular disease patients with

metabolic dysfunction associated steatotic liver disease

Weihua Cao¹, Yao Xie¹, Minghui Li¹
Beijing Ditan Hospital, Capital Medical University,
Hepatology Division², Beijing-China¹

Background: / **Hypothesis:**
The confluence of porto-sinusoidal vascular disease (PSVD) and metabolic dysfunction-associated steatotic liver disease (MASLD) presents a complex clinical scenario, potentially accelerating disease progression. This study aims to explore the Clinical characteristics and influencing factors of PSVD patients with MASLD.

Materials and Methods:
This retrospective study included patients who underwent liver biopsy were diagnosed with PSVD at Beijing Ditan Hospital as shown in Figure 1. Patients were stratified into two groups: patients with MASLD (PSVD with MASLD group), and patients without MASLD (PSVD without MASLD group). Clinical features and risk factors were analyzed to identify features specific to PSVD with or without MASLD. Nomogram model was used for diagnostic prediction of PSVD patients with MASLD.

Results:
A total of 285 PSVD patients undergoing liver biopsy were enrolled, including PSVD with MASLD group (n=91) and PSVD without MASLD group (n=194). The proportion of females was higher than that of males in PSVD with MASLD group. Compared to PSVD without MASLD group, PSVD with MASLD group exhibited higher levels of NE, hemoglobin (HGB), platelet (PLT) count, alanine aminotransferase (ALT), albumin (ALB), total cholesterol (TC), triglyceride (TG), low density lipoprotein (LDL), prothrombin activity (PTA), and controlled attenuation parameter (CAP), while lower high density lipoprotein (HDL), international normalized (INR), FIB-4, and liver stiffness measurement (LSM), as shown in Table 1. Liver pathology findings revealed a higher proportion of nodular regenerative hyperplasia ($p=0.000$) in PSVD with MASLD group, while lower obliterative portal venopathy ($p=0.000$), irregular dilation of hepatic sinusoids ($p=0.000$), and perisinusoidal fibrosis ($p=0.011$) (Table 2). Stratified analysis of the two patient groups showed that PSVD patients with MASLD had significantly higher proportions of males, diabetes, hyperlipidemia, $PLT \geq 150 \times 10^9/L$, $LSM \geq 10$ kPa, and $FIB-4 > 3.25$, compared to PSVD patients without MASLD (Table 3). Univariate and multivariate logistic regression analysis revealed that HGB [OR 1.039, 95%CI (1.019-1.060), $p=0.000$], ALT

ORAL ABSTRACTS

[OR 1.011, 95%CI (1.001-1.020), $p=0.026$], TC [OR 1.925, 95%CI (1.330-2.786), $p=0.001$], HDL [OR 0.166, 95%CI (0.063-0.434), $p=0.001$], CAP [OR 1.011, 95%CI (1.002-1.020), $p=0.019$], and Whether with hyperlipidemia [OR 9.491, 95%CI (4.398-20.481), $p=0.000$], emerged as independent risk factors for PSVD patients with MASLD, as shown in Table 4. Nomogram model revealed that AUC 0.880, 95% CI (0.839-0.921), and the specificity of this model is 0.897 (Figure 2).

Conclusions:

HGB, ALT, TC, HDL, CAP, and hyperlipidemia were independent influencing factors for PSVD patients with MASLD. Nomogram model can effectively predict the disease risk of PSVD patients in the population with MASLD.

1813 - Unmasking the unknown the unexpected discovery of hepatic epithelioid hemangioendothelioma

Johanna Lynne La Rosa-rimorin¹, Jose Guillain Cataluña¹

St. Luke's Medical Center - Quezon City, Institute Of Digestive And Liver Diseases, Quezon City-Philippines¹

Background / Hypothesis: Epithelioid hemangioendothelioma (EHE) is a rare tumor of vascular endothelial cell origin that is composed of epithelioid and histiocyte-like vascular endothelial cells in mucus or fibrotic matrix. It affects the liver, lungs, mediastinum and other sites, but the liver is the most commonly involved site.

Materials and Methods: A 63-year-old female patient, diagnosed case of Papillary Thyroid Carcinoma s/p total thyroidectomy and radioactive iodine had an incidental finding of hypovascular liver nodules at segments VIII and II on whole abdomen CT scan requested for monitoring of renal cyst Bosniak 1. She was asymptomatic and physical examination was unremarkable. Further investigation was done with PET CT scan and MRI followed by percutaneous needle biopsy of the lesion. She then underwent hepatic resection of the involved segments. After discussion with a multidisciplinary team, no further treatment was given and active surveillance was done.

Results: PET CT scan and MRI were equivocal for metastasis. Histologic examination of percutaneous

needle biopsy specimen revealed a vascular tumor for which hemangioendothelioma is considered. Liver volumetric study was done with noted adequate future liver remnant. Hepatic resection of the involved segments and subsequent histopathologic examination showed 1.5 and 2cm at segment II and VIII, respectively with vascular invasion and mitotic activity that ranges from 0-1/10 high power field. A repeat MRI of the liver with Primovist after 6 and 12 months revealed no new lesion.

Conclusions: Hepatic EHE is an extremely rare tumor that can only be confirmed by histologic examination. Given its rarity, there are no standardized guidelines for its treatment. The treatment options are broad which include chemotherapy/radiotherapy, ablation, surgery, liver transplantation as well as active surveillance. Compared with other malignant tumors of the liver, HEHE has a good prognosis.

Keyword(s) : Hepatic epithelioid hemangioendothelioma; Hepatic resection; Case report

1815 - Efficacy of Silybin Phospholipid Complex in Metabolic Associated Fatty Liver Disease

Qianli Zhao¹, Manman Xu¹, Junfeng Li², Ming Kong¹, Yu Chen¹

Beijing Youan Hospital, Capital Medical University, Fourth Department Of Liver Disease, Beijing-China¹ The First Hospital Of Lanzhou University, Department Of Liver Disease, Lanzhou-China²

Background / Hypothesis: silybin phospholipid complex is a commonly used hepatoprotective agent in clinical practice. In vitro studies have demonstrated its efficacy in alleviating hepatic steatosis and liver fibrosis. This study aimed to clinically evaluate the effectiveness of silybin phospholipid complex in improving liver fat content and liver fibrosis in patients with fatty liver disease.

Materials and Methods:

Patients with metabolic-associated fatty liver disease (MAFLD) admitted to Beijing You'an Hospital and the First Hospital of Lanzhou University between 2020 and 2025 were retrospectively enrolled in this study. They were divided into the treatment group and the control group based on whether they received monotherapy with Silybin phospholipid complex. Changes in liver fat content, liver fibrosis indices, and liver function parameters were analyzed between the two groups. The primary outcome was a reduction in liver fat content, and the secondary outcomes were decreases in liver fibrosis indices and liver function parameters.

ORAL ABSTRACTS

Results:

A total of 176 patients were included, with 122 in the treatment group and 54 in the control group. Overall, after 3 and 6 months of continuous medication, the main liver function indicators in the treatment group—ALT (Diff0-3:-10, Diff0-6:-10) and AST (Diff0-3:-7, Diff0-6:-5)—showed a decreasing trend compared to baseline, and the magnitude of reduction at each time point was greater than that in the control group—ALT (Diff0-3:-5, Diff0-6:-1) and AST (Diff0-3:-2.5, Diff0-6:-0.5). The controlled attenuation parameter values in the treatment group (3M: 268.39 ± 59.92 , 6M: 273.02 ± 51.63) were lower than those in the control group (3M: 289.73 ± 61.82 , 6M: 283.91 ± 47.27), and the difference from baseline in the treatment group showed an overall increasing trend (Diff 0-3M: -12.5, Diff 0-6M: -16.5). The treatment group demonstrated a greater reduction in liver stiffness measurement (LSM) values from baseline at both 3 and 6 months (Diff 0-3M: -0.55, Diff 0-6M: -0.3) compared to the control group (Diff 0-3M: -0.1, Diff 0-6M: -0.1).

Conclusions: Silybin phospholipid complex holds promise for reducing liver fat content and alleviating the severity of liver fibrosis in patients with metabolic-associated fatty liver disease, providing a potential therapeutic option for clinical management of this disease.

1816 - The roles of THBS2 SPP1 axis in hepatic stellate cells activation and liver fibrogenesis

Hong Li ¹, Ning Zhang ², Wen Zhang ², Wenyue Wu ², Ziyang Pan ¹, Haodong Ma ¹, Caihong Wang ², Wei Chen ², Hong You ¹
Beijing Friendship Hospital, Capital Medical University, Beijing Clinical Research Institute, Beijing-China ¹ Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China ²

Background / **Hypothesis:** Thrombospondin-2 (THBS2) is markedly upregulated in fibrotic livers and correlates with fibrosis stage, independent of etiology. This study aimed to elucidate the role and underlying mechanisms of hepatic stellate cell (HSC)-derived THBS2 in HSC activation and the progression of liver fibrosis.

Materials and **Methods:**

We generated HSCs-specific Thbs2 knockout mice (Thbs2 Δ HSC) and HSCs-specific human THBS2 knock-in mice (hTHBS2 KI HSC). Liver fibrosis was induced by intraperitoneal injection of carbon tetrachloride (CCl₄) or by bile duct ligation (BDL). The role of the THBS2-SPP1 axis in fibrogenesis was investigated using a dual targeting approach: extracellular SPP1 was neutralized by intraperitoneal administration of an anti-mouse SPP1 antibody (inVivoMAb), while intracellular SPP1 was suppressed using AAV6-GFAP-shSpp1; both strategies were validated in parallel in vitro. Furthermore, we identified and validated a THBS2-specific inhibitor and combined it with an SPP1-targeting small molecule inhibitor to evaluate the therapeutic potential of dual THBS2-SPP1 targeting for the treatment of liver fibrosis.

Results:

Thbs2 Δ HSC mice exhibited significantly reduced hepatic inflammation and fibrosis in both CCl₄- and BDL-induced models. Conversely, hTHBS2KI HSC mice displayed markedly aggravated hepatic inflammation and fibrotic progression. Mechanistic studies revealed that Thbs2 knockdown in HSCs substantially suppressed the expression of the pro-fibrotic effector Spp1, while THBS2 overexpression robustly enhanced both SPP1 expression and its secretion—findings consistently validated in vitro. Notably, molecular interaction assays confirmed that THBS2 directly interacts with SPP1 in a dimeric configuration. Furthermore, we found intraperitoneal administration of inVivoMAb anti-mouse SPP1 neutralizing antibody and AAV6-GFAP-shSPP1-mediated Spp1 silencing significantly attenuated fibrotic progression in CCl₄-treated hTHBS2KI HSC mice, demonstrating distinct anti-fibrotic efficacy through coordinated blockade of extracellular SPP1 signaling and intracellular SPP1 biosynthesis. Additionally, we identified a novel THBS2 inhibitor through integrated virtual drug screening and surface plasmon resonance (SPR) validation. Pharmacodynamic evaluations confirmed the compound's potent anti-fibrotic effects in both CCl₄- and 3,5-diethoxycarbonyl-1,4-dihydrocollidine (DDC)-induced liver fibrosis mouse models, with significant improvements in histopathological features.

ORAL ABSTRACTS

Conclusions:

Our findings demonstrate that HSC-derived THBS2 drives liver fibrogenesis through the regulation of SPP1. Concerted targeting of the THBS2-SPP1 axis presents a promising therapeutic strategy for significantly mitigating liver fibrosis.

Keyword(s) :

1818 - Selective Inhibition of Hepatic Stellate Cell Derived Microfibril associated glycoprotein 4 Attenuates Liver Fibrosis

Wenyue Wu¹, Wen Zhang¹, Hong Li¹, Haodong Ma¹, Ziyang Pan¹, Caihong Wang¹, Yameng Sun¹, Ning Zhang¹, Xuzhan Yan¹, Aiting Yang¹, Wei Chen¹, Hong You¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹

Background / **Hypothesis:**
Microfibril-associated glycoprotein 4 (MFAP-4) is a member of the fibrinogen-related protein superfamily and a crucial component of the extracellular matrix (ECM). However, its role in the pathogenesis of liver fibrosis remains unclear.

Materials and **Methods:**
Liver biopsy samples from cirrhotic patients with various etiologies and multiple murine models of liver fibrosis were analyzed to determine the expression pattern and cellular origin of MFAP-4. To investigate the in vivo role of MFAP-4 in hepatic stellate cells (HSCs), Mfap4^{fl/fl} mice were administered with an adeno-associated virus serotype 6 (AAV6) vector encoding lecithin-retinol acyltransferase (Lrat)-Cre, achieving HSC-specific deletion of Mfap4 in the carbon tetrachloride (CCl₄) fibrosis model. In vitro, MFAP4 was either overexpressed or silenced in LX-2 cells to assess its effects on HSC activation and fibrogenic properties. Subsequent immunofluorescence staining and collagen gel contraction assays were performed to delineate the mechanisms by which MFAP-4 regulates liver fibrogenesis. To evaluate the therapeutic potential of MFAP-4 inhibition, AAV6 vectors expressing Mfap4-targeting shRNAs under either the U6 promoter or the HSC-specific glial fibrillary acidic protein (GFAP) promoter were administered via tail vein injection in CCl₄ and bile duct ligation (BDL) mouse models. In parallel, a selective small-molecule inhibitor of MFAP-4 was identified through virtual screening and subsequently validated for its antifibrotic efficacy.

Results:

MFAP-4 was predominantly enriched in activated HSCs

and significantly upregulated in advanced liver fibrosis in both humans and mice. HSC-specific suppression of Mfap4 in Mfap4^ΔHSC mice markedly attenuated fibrosis and intrahepatic inflammation after CCl₄ treatment. Mechanistically, MFAP-4 promoted Collagen I and elastin deposition, as well as gel contraction, thereby enhancing ECM stiffness-mediated HSC activation. Notably, selective knockdown of Mfap4 by either AAV6-GFAP-shMfap4 or AAV6-U6-shMfap4 significantly retards liver fibrosis in CCl₄ and BDL models. BJFSH102, a selective small-molecule MFAP-4 inhibitor, ameliorated liver fibrosis by disrupting MFAP-4 interactions with elastin and collagen I in CCl₄ models.

Conclusions:

Our findings indicate that HSC-derived MFAP-4 drives liver fibrogenesis by promoting elastin and collagen I deposition and reinforcing ECM stiffness-mediated HSC activation. Selective inhibition of HSC-derived MFAP-4 effectively attenuates fibrosis, representing a promising therapeutic strategy for liver fibrosis.

1819 - Impact of the expanded program on immunization on Hepatitis B elimination efforts Insights from a Turkish reference center

Rahmet Güner¹, Ahmet Sertçelik¹, Imran Hasanoğlu¹, Ebrar Güney², Ayşe Kaya¹, Fatma Eser¹, Bedia Dinç³, Bircan Kayaaslan¹

1 Ankara Yıldırım Beyazıt University Faculty Of Medicine, 2 Ankara Bilkent City Hospital, Department Of Infectious Diseases And Clinical Microbiology, Ankara-Türkiye¹ Ankara Bilkent City Hospital, Department Of Infectious Diseases And Clinical Microbiology, Ankara-Türkiye² Ankara Bilkent City Hospital, Department Of Medical Microbiology, Ankara-Türkiye³

Background / **Hypothesis:**
Hepatitis B vaccination was introduced globally in the early 1980s. In Türkiye, the first major step toward hepatitis B immunization occurred in 1998, when the vaccine was incorporated into the national childhood immunization schedule within the Expanded Program on Immunization (EPI). Subsequent catch-up campaigns enabled a substantial proportion of individuals born after 1991 to be vaccinated. These efforts are expected to reduce the prevalence of hepatitis B surface antigen (HBsAg) and increase the prevalence of anti-HBs antibodies. This study aimed to assess age-specific patterns of HBsAg and anti-HBs results among individuals tested at Ankara Bilkent City Hospital, a

ORAL ABSTRACTS

major tertiary referral center in Türkiye.

Materials and Methods: Ankara Bilkent City Hospital is a 4,050-bed tertiary reference hospital with a high patient volume. Demographic data and laboratory results of patients who underwent HBsAg or anti-HBs testing between 1 January 2022 and 31 December 2023 were retrieved from electronic medical records. Patients were grouped into 10-year age categories. For each individual, the first available HBsAg (qualitative) and anti-HBs (quantitative) result was recorded. Anti-HBs titers ≥ 10 mIU/mL were considered positive. Age-specific HBsAg and anti-HBs positivity rates were calculated. For anti-HBs titers, the 5th, 10th, 25th, 50th, 75th, 90th, and 95th percentiles were determined.

Results:

Among 443,030 individuals tested for anti-HBs, 2.8% had invalid results; among 558,730 tested for HBsAg, 2.1% were invalid. Of the valid results, 48.0% (206,866/430,832) were positive for anti-HBs, and 2.3% (12,319/546,879) were positive for HBsAg. Age-specific positivity rates are shown in Table 1. The median anti-HBs titer (Q1–Q3) was 7.39 (<3.10–135.39) mIU/mL. Percentile distributions of anti-HBs titers by age group are presented in Table 2.

Conclusions:

A pronounced decrease in HBsAg positivity is observed beginning in the 30–39-year age group, with an even sharper decline in the 0–19-year group, reflecting the impact of universal childhood vaccination after 1998. Although anti-HBs positivity declines rapidly after the first decade of life, this decrease is only modestly reflected in HBsAg positivity until the fourth decade. These findings support the concept that individuals who achieve seroconversion remain protected against hepatitis B despite declining antibody levels, unless they become immunosuppressed. Sustained immunization efforts remain essential for achieving hepatitis B elimination goals in Türkiye, an intermediate-endemic country.

Keyword(s): Hepatitis B, childhood vaccination, anti-HBs titer

1820 - Downstaging by Atezolizumab plus Bevacizumab in Advanced Hepatocellular Carcinoma Identifying Candidates for Conversion Therapy Based on Tumor Biology and Vascular Invasion Patterns

Chihiro Miwa¹, Masanori Inoue¹, Haruka Anzai¹, Watabe Watabe¹, Kazuo Tsubura¹, Minoru Sawada¹,

Makoto Fujiya¹, Takahiro Tsuchiya¹, Ryo Izai¹, Teppei Akatsuka¹, Takuya Yonemoto¹, Sae Yumita¹, Keisuke Koroki¹, Naoya Kanogawa¹, Masato Nakamura¹, Shingo Nakamoto¹, Sadahisa Ogasawara¹, Jun Kato¹ Chiba University, Gastroenterology, Chiba-shi-Japan¹

Background / Hypothesis: Advances in systemic therapy for hepatocellular carcinoma (HCC) have enabled a subset of patients to achieve sufficient tumor response to allow conversion therapy or even cancer-free status. However, the real-world frequency of downstaging and the tumor characteristics associated with successful conversion remain under-investigated. This study aimed to evaluate downstaging outcomes during first-line atezolizumab plus bevacizumab (Atezo+Bev) therapy and to identify clinical factors that contribute to downstaging.

Materials and Methods: We retrospectively analyzed patients with advanced HCC and evaluable intrahepatic lesions who received first-line Atezo+Bev between October 2020 and September 2024. Cumulative downstaging rates were calculated using two criteria: (1) the tumor-based Borderline Resectable (BR) classification, assessing transitions from BR2 to $\leq$ BR1 and from BR1 to resectable (R), and (2) the Milan criteria, evaluating transitions from outside to within the Milan criteria. Factors associated with downstaging were explored using univariable Cox proportional hazards models.

Results:

A total of 178 patients were included. Child–Pugh class A accounted for 157 patients, while BCLC stage B and C were observed in 68 and 94 patients, respectively. Median overall survival for the entire cohort was 15.7 months (95% CI, 13.6–18.5 months). At treatment initiation, 132 patients were classified as BR2 and 30 as BR1. Downstaging from BR2 to $\leq$ BR1 occurred in 25 patients, and BR1 to R in 5 patients. The cumulative BR-based downstaging rates were 14.3% at 6 months and 31% at 12 months. According to the Milan criteria, 170 patients were initially outside the criteria, and 11 achieved downstaging to within the criteria, corresponding to cumulative rates of 7.2% at 6 months and 11% at 12 months.

Univariable Cox analysis identified “solitary intrahepatic tumor with major vascular invasion (Vp4 or Vv3)” as a strong factor associated with successful downstaging

ORAL ABSTRACTS

(HR 3.73, 95% CI 1.59–8.76, $p=0.0025$). In these tumors, downstaging was typically driven not by substantial reduction in tumor size but by decreased arterial enhancement and regression of the tumor thrombus.

Conclusions:

Downstaging during Atezo+Bev therapy was most frequently observed in cases of solitary HCC with advanced macrovascular invasion, where regression of vascular invasion played a dominant role. In contrast, transitions into the Milan criteria were limited, indicating that large-scale tumor shrinkage is uncommon. Solitary tumors with severe vascular invasion may represent promising candidates for conversion therapy during Atezo+Bev treatment.

Keyword(s) : Hepatocellular carcinoma, Downstaging, Atezolizumab plus bevacizumab, Conversion therapy, Macrovascular invasion

1821 - Adolescent MASLD Incidence Trends 1990–2023 Global and National Perspectives

Tianyuan Yang¹, Tong Bu¹, Qi Wang¹
Center Of Liver Diseases, Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases, Beijing-China¹

Background / Hypothesis: Understanding the current burden of adolescent MASLD is essential for effective prevention strategies. This study explores global trends and country-specific trajectories of MASLD incidence among adolescents aged 15–19 years.

Materials and Methods: Age-specific incidence rates (per 100,000) from 1990 to 2023 were obtained from the GBD 2023 database. Country-level incidence rates for 2023 were mapped, and temporal trends were summarized for the top-30 countries, stratified by SDI.

Results:

From 1990 to 2023, the global incidence (both sexes) increased from 866 to 1,085 per 100,000 (+25.2%). Male incidence rose from 1,017 to 1,273 (+25.2%), while female incidence increased from 710 to 887 (+24.9%). A distinct geographic gradient emerged in 2023: the highest incidence levels were found in North Africa and the Middle East, while several Asian countries reported comparatively lower rates. Among the top-30 countries, high-middle SDI nations experienced the steepest and most sustained increases, while many high-SDI countries showed moderate growth with plateaus appearing in the late 2010s. Low and low-middle SDI countries demonstrated gradual but consistent

increases.

Conclusions:

The global incidence of adolescent MASLD has increased significantly since 1990, with the highest rates observed in North Africa and the Middle East and notable growth in high-middle SDI countries. The persistent male excess and widespread upward trends emphasize the urgent need for adolescent-targeted prevention and risk factor control. These trends call for future research to quantify risk contributions and develop comprehensive risk profiles

Keyword(s) : MASLD incidence;GBD;adolescent

1822 - Blood biomarkers for non invasive diagnosis of advanced fibrosis or compensated cirrhosis in chronic hepatitis B

Xin Wang¹, Haiying Zhang¹, Yuyuan Jia¹, Runling Zhang¹, Zhenyu Wang¹, Huiying Rao¹
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China¹

Background / Hypothesis: Currently, hepatitis B virus infection remains a major driver of the global burden of liver disease, contributing to approximately 30% of liver fibrosis/cirrhosis cases and accounting for one-quarter of liver disease-related deaths. The definitive diagnosis of liver fibrosis/cirrhosis still relies on invasive liver biopsy; however, its application in clinical practice is limited due to invasiveness, poor acceptability, high cost, and significant variability. This study aims to identify reliable blood biomarkers or their combinations for the non-invasive diagnosis of chronic hepatitis B with advanced fibrosis or decompensated cirrhosis.

Materials and Methods: We enrolled 252 patients with hepatitis B virus infection from Peking University People's Hospital, Beijing, China. Among them, 132 patients were initially recruited with histologically confirmed advanced fibrosis or decompensated cirrhosis, while the remaining 120 were HBV-infected individuals without fibrosis. The team measured and calculated nine common clinical variables: age, gender, ALT, AST, TBIL, DBIL, PLT, LSM, FIB-4, as well as three candidate serum biomarkers: Golgi protein 73 (GP73), cytokeratin-18 fragment M30 (CK-18 M30), and cytokeratin-18 fragment M65 (CK-18 M65). Using logistic regression and random forest approaches, potential non-invasive diagnostic biomarkers and their combined panels were identified.

ORAL ABSTRACTS

Results:We found that LSM (AUC: 0.898; 95% CI: 0.859–0.938), GP73 (AUC: 0.832; 95% CI: 0.783–0.881), FIB-4 (AUC: 0.719; 95% CI: 0.655–0.782), AST (AUC: 0.684; 95% CI: 0.619–0.75), CK18-M65 (AUC: 0.676; 95% CI: 0.609–0.743), CK18-M30 (AUC: 0.653; 95% CI: 0.585–0.722), and ALT (AUC: 0.62; 95% CI: 0.551–0.689) exhibited certain discriminative ability for patients with chronic hepatitis B (CHB) and advanced fibrosis or decompensated cirrhosis. A panel comprising three parameters (GP73, LSM, FIB-4), designated as N3, differentiated patients with CHB and advanced fibrosis/decompensated cirrhosis from the control group with an area under the receiver operating characteristic curve (AUROC) of 0.908. Furthermore, a panel incorporating seven parameters (GP73, LSM, FIB-4, ALT, AST, CK18-M30, CK18-M65), referred to as N7, identified patients with advanced fibrosis/decompensated cirrhosis with an AUROC of 0.912.

Conclusions:In summary, we have developed a promising blood-based biomarker and corresponding panels for the non-invasive diagnosis of chronic hepatitis B with advanced fibrosis or decompensated cirrhosis. This development holds the potential to assist clinicians in reducing unnecessary liver biopsies.

1824 - Utility of EUS guided Liver Biopsy in Liver Disease.

Nivedita Nivedita¹, Rahul Samanta¹, Prasanta Debnath¹, Pradeepta Sethy¹, Prashant Kumar¹, Nilanjan Mal¹
Manipal Hospital, Gastroenterology, Kolkata-India¹

Background / **Hypothesis:**
Endoscopic Ultrasound guided Liver Biopsy has many advantages over the current standard of care and appears to have fewer contraindications and adverse events. Percutaneous Liver Biopsy has been associated with side effects like pain abdomen and bleeding seen up to 19 % of cases. Endoscopic ultrasound (EUS) guided liver biopsy (EUS-LB) can overcome many limitations of percutaneous liver biopsy and Trans-Jugular Liver Biopsy. It is commonly performed using 19G EUS fine-needle biopsy (FNB) needles.

Materials and **Methods:**
The primary aim of this study was to detect the adequate biopsy rate with EUS guided Liver Biopsy and to detect rate of successful pathological diagnosis. This is a retrospective observational study. Patients undergoing EUS-LB during the study period of January 2023 to June 2025 were taken up for this study. EUS-guided liver biopsies were performed using linear echo endoscope PENTAX Defina EPK 3000 and 19G FNB needle (Acquire TM, Boston Scientific, United States). Procedure was performed by an experienced endoscopist, and all liver biopsy samples were taken using “wet technique” from left lobe of liver using Trans-gastric route. Tissue accusation was performed with single puncture and 3-4 back and forth motions of needle.

Results:

Total 30 patients were taken up for the study. Median age of study population was 59 years, out of which 14 patients were males and 16 were females (46.6% and 53.3%). Adequate biopsy rate (according to European Association for the Study of Liver Disease criteria) was 70%.

Rate of conclusive diagnosis was 96.6% (29/30). The commonest diagnosis was metastatic adenocarcinoma (23.3%), followed by autoimmune hepatitis (13.3%). Mean CPT (Complete Portal Tract) was 7.5 with SD of 2.94 and mean TSL (Total Sample length) was 1.547cm with SD of 0.667 (CI being 95%). Most common adverse effect encountered was pain abdomen (10%).

Conclusions:

EUS-Liver Biopsy technique is characterized by relatively high diagnostic yield and safety. EUS guided Liver Biopsy can have a high histological yield when performed using proper technique. Considering its safety and high rate of biopsy, it can be used as an alternative procedure to Percutaneous Liver Biopsy.

1832 - An Unexpected Turmoil Hepatitis B Reactivation with Atypical Serology Following Neoadjuvant Capecitabine Oxaliplatin in an Unsuspected Patient with Gastric Adenocarcinoma A Multidisciplinary Management Complexity

Adrian Bugayong¹, Heherson Adriano¹
Veterans Memorial Medical Center, Department Of Internal Medicine, Section Of Gastroenterology, Quezon City-Philippines¹

ORAL ABSTRACTS

Background / **Hypothesis:**
Hepatitis B virus (HBV) reactivation is a well-recognized adverse event of immunosuppressive therapy, particularly with certain chemotherapeutic agents and biologics. Continued studies have stratified these agents whether they induce low, moderate or high risk for reactivation based on HBsAg and AntiHBc status. Reactivation can lead to acute liver injury, thereby leading to compromise and delay in oncologic and curative surgery. HBV reactivation induced by Capecitabine and Oxaliplatin, however, is rarely reported.

It is therefore hypothesized that even low-risk agents can cause severe HBV reactivation, particularly in patients without prior HBV screening, emphasizing the need for universal pre-chemotherapy screening and prompt antiviral therapy.

Materials and **Methods:**
A 67-year-old male patient newly diagnosed with non-metastatic gastric adenocarcinoma was given neoadjuvant capecitabine-oxaliplatin for a contemplated curative resection. Patient had new onset jaundice and body weakness post treatment prompting workup with liver biochemical tests consistent with acute liver injury, hence, hepatitis work-up was done including HBsAg, anti-HBc, anti-HBs, HBeAg, anti-HBe, anti-HCV, anti-HAV IgM, HBV DNA, along with liver ultrasound. Upon confirmation of HBV reactivation, tenofovir alafenamide was initiated, with serial monitoring of liver biochemistry and HBV DNA levels performed to assess treatment response.

Results:
Workup was done 4 weeks post Capecitabine and Oxaliplatin treatment revealing acute liver injury with elevated AST (1,359 U/L), ALT (827 U/L) and total bilirubin (252 µmol/L). Ultrasound revealed mild parenchymal changes with no focal lesions. Hepatitis serology: HBsAg (+), antiHBc(-), anti-HBs (-), HBeAg (+), anti-HBe (-), anti-HBc IgM (-), and HBV DNA: 8,560,000 IU/mL, consistent with HBV reactivation in the setting of immunosuppression (an atypical serology). Tenofovir was promptly initiated. Surgery was deferred due to recent acute liver injury. Patient had upper GI bleeding controlled with tumor-directed radiotherapy (5 sessions). Subsequent studies showed decreasing trends of AST, ALT and bilirubin, with HBV DNA decreased to 489,000 IU/mL 4 weeks post-treatment. Subsequently, patient had (+)Anti-HBc and (+)anti-HBe on repeat serology. Patient was eventually cleared for curative surgery after nutritional optimization.

Conclusions:
Although considered low-risk, Capecitabine and Oxaliplatin can cause severe HBV reactivation causing acute liver injury, consequently resulting to delayed oncologic or surgical treatment. Early initiation of antiviral therapy can help stabilize liver function and allow timely continuation of curative cancer treatment. This highlights the importance of universal HBV screening before chemotherapy, including use of low-risk agents particularly in endemic regions.

Keyword(s) : Hepatitis B virus (HBV) reactivation; Atypical serology; Capecitabine-Oxaliplatin; Gastric adenocarcinoma

1834 - The national burden of acute liver failure from 2019 to 2022 A Thailand nationwide population based cross sectional time series study
Rungfah Saehan¹, Apichat Kaewdech², Pimsiri Sripongpun², Naichaya Chamroonkul², Teerha Piratvisuth³, Suthat Liangpunsakul⁴, Ponlagrit Kumwichar⁵

Faculty Of Medicine, Prince Of Songkla University, Internal Medicine, Hatyai-Thailand¹ Faculty Of Medicine, Prince Of Songkla University, Gastroenterology And Hepatology Unit, Division Of Internal Medicine, Hatyai-Thailand² Faculty Of Medicine, Prince Of Songkla University, Nkc Institute Of Gastroenterology And Hepatology, Songklanagarind Hospital, Hatyai-Thailand³ Indiana University School Of Medicine, Division Of Gastroenterology And Hepatology, Department Of Medicine, Indianapolis, Indiana-United States⁴ Faculty Of Medicine, Prince Of Songkla University, Department Of Epidemiology, Hatyai-Thailand⁵

Background / **Hypothesis:**
Acute liver failure (ALF) is a rare but life-threatening condition with extremely high short-term mortality. Despite its substantial impact on the healthcare system, the national burden of ALF in Thailand remains poorly defined. This study evaluated the prevalence, etiologies, complications, and predictors of 30-day mortality among Thai patients with ALF from 2019 to 2022.

Materials and **Methods:**
We conducted a nationwide, population-based, cross-sectional time-series study using Thailand's National Health Security Office (NHSO) database. Adults (≥18 years) with ALF were identified using ICD-10 codes K72.0 and K71.11; patients with cirrhosis (K74,650,658,659,703,729,766,767, I850-851) were excluded. Baseline characteristics, comorbidities,

ORAL ABSTRACTS

etiologies, complications, and procedure claims were extracted from inpatient and outpatient/emergency encounters. Age- and sex-standardized incidence and 30-day mortality rates were analyzed using descriptive statistics and temporal trend analyses with LOESS smoothing. Predictors of 30-day mortality were assessed using multivariable Cox proportional hazards models.

Results:

A total of 7,957 patients with ALF were identified, of whom 57.3% (n=4,560) died within 30 days. Those who died were older (57.2 ± 19.1 vs 47.9 ± 20.3 years; $P < 0.001$) and more often male (65.6%). Most cases occurred in the northeastern (38.6%) and central (22.2%) regions. Etiologies were largely unspecified (82.3%), followed by acute viral hepatitis infection (7.9%), mushroom poisoning (3.9%), alcohol-associated liver disease (ALD) (1.9%), and autoimmune hepatitis (1.8%); drug-related ALF accounted for 1.0%. Acute renal failure (41.6%) and sepsis (13.2%) were the most common complications. Liver transplantation (LT) was performed in only 0.2% of all cases. In multivariable analyses, prior ALF (within one year) was associated with increased 30-day mortality (aHR 1.51; 95% CI 1.29-1.77; $P < 0.001$). Etiologies associated with higher mortality included drug/mushroom poisoning (aHR 1.77), liver and bile duct cancer (aHR 1.35), ALD (aHR 1.19) and acute viral hepatitis (aHR 1.02). Cerebrovascular disease (aHR 0.81; $P = 0.002$) were unexpectedly associated with lower mortality risk.

Conclusions:

ALF is a major public health challenge in Thailand, with >57% short-term mortality and extremely limited access to LT. High-risk etiologies, including viral, toxin-related, and alcohol-associated ALF, contribute substantially to the national mortality burden. Improved early detection pathways, expanded access to advanced liver support therapies, and increased liver transplantation capacity are urgently needed to reduce ALF-related mortality in Thailand.

1836 - Trends in hepatitis B related diseases in Asia 1990 2023 an analysis of the Global Burden of Disease 2023 update

Jingran Jiao¹, Wenling Wang¹, Manman Xu¹, Yu Chen¹

Beijing Youan Hospital, Capital Medical University, Beijing Key Laboratory Of Liver Regeneration And Artificial Liver Transformation Research; Fourth

Department Of Liver Disease (difficult & Complicated, Beijing-China

1

Background / Hypothesis: Although hepatitis B prevention and control measures have been continuously enhanced and vaccination rates have steadily risen, the disease burden among children and adolescents remains significant. The prerequisite for achieving the WHO's goal of completely eliminating viral hepatitis by 2030 is Asia's accurate understanding of the current disease burden, thereby providing a basis for formulating and optimizing intervention measures.

Materials and Methods: Based on the Global Burden of Disease (GBD) 2023 dataset, we extracted data on the burden of hepatitis B in Asia, including acute and chronic forms, as well as overall disease burden, covering incidence, prevalence, mortality, disability-adjusted life years (DALYs), and their corresponding age-standardized rates. To account for differences in geographic distributions within the population, we calculate age-standardized rates based on the age-specific data extracted from the GBD 2023 dataset. To further assess temporal patterns across different age groups, we estimated the average annual percent change (AAPC).

Results: From 1990 to 2023, the overall age-standardized prevalence rates (ASPR) of the total burden related to hepatitis B in Asia declined (AAPC = -4.84%, 95%CI: -5.12% to -4.55%), along with significant reductions in age-standardized mortality and DALYs. Throughout this period, ASPR was consistently higher in men than in women, although women exhibited a faster rate of decline. Age-specific analysis revealed the steepest decline in prevalence among children aged 5-9 years (AAPC = -6.46%, 95%CI: -7.22% to -5.69%). The prevalence of hepatitis B-related liver cancer declined at the slowest rate and even showed an upward trend in the 15-19 age group (AAPC = 0.19%, 95%CI: 0.07% to 0.30%). In contrast, other hepatitis B-related diseases demonstrated an overall decreasing disease burden. Notably, Bhutan experienced the greatest decline in ASPR (AAPC = -8.18%, 95%CI: -8.65% to -7.71%) but also reported the only increase in the age-standardized DALYs (ASDR) in the region (AAPC = 1.04%, 95%CI: 0.39% to 1.70%).

ORAL ABSTRACTS

Conclusions:The Asia burden and trends of hepatitis B decreased significantly in children and adolescents, exhibiting regional and national variations. The decline in the prevalence of hepatitis B-related liver cancer has been slow, indicating the need for timely and targeted interventions to address emerging risks among adolescents.

1837 - Early Ablation for Sub centimeter Hepatocellular Carcinoma Divergent Outcomes in Primary vs Recurrent Tumors over 10 Years

Yan Zhou¹, Xiang Jing¹
Tianjin Third Central Hospital, Ultrasound, Tianjin-China¹

Background / Hypothesis:
Background: The optimal management of sub-centimeter hepatocellular carcinoma (HCC), particularly early ablation versus observation, and outcome differences between primary and recurrent tumors, remains unclear.
Purpose: To compared long-term outcomes of ultrasound-guided percutaneous thermal ablation for sub-centimeter (≤ 1.0 cm) versus 1.0-2.0 cm HCC, analyzing primary and recurrent cases separately.

Materials and Methods:
A retrospective review of 850 patients (494 primary, 356 recurrent HCC) treated with ultrasound-guided percutaneous thermal ablation from January 2014 to June 2024. Overall survival (OS) and recurrence-free survival (RFS) were evaluated using Kaplan-Meier and log-rank tests. Sliding diameter-threshold survival analysis was performed.

Results:
Primary patients with ≤ 1.0 cm tumors showed 100% OS across all follow-up points (1-, 3-, 5-, 7-, and 10 years), with the difference from the 1.0-2.0 cm group (98.5%, 85.2%, 70.6%, 59.7%, and 48.6%) becoming significant only at 10 years ($P=0.047$). Conversely, recurrent HCC patients with ≤ 1.0 cm tumors had significantly better OS than larger recurrent tumors at all timepoints (10-year: 78.9% vs 30.4%; all $P<0.05$). Using 1.5 cm cutoff, primary patients with tumors ≤ 1.5 cm showed improved long-term OS, but this was not observed for recurrent HCC. Sliding-threshold analysis identified survival inflection points at 1.2 cm for primary and 0.9 cm for recurrent tumors.

Conclusions:

Primary and recurrent sub-centimeter HCCs respond differently to early thermal ablation. For recurrent ≤ 1.0 cm lesions, immediate ablation offers clear, size-dependent survival benefits. Conversely, the therapeutic benefit for primary sub-centimeter HCC appears delayed. These distinct patterns suggest that immediate treatment is warranted for recurrent sub-centimeter HCC, while a surveillance strategy may be currently acceptable for primary sub-centimeter HCC.

1843 - Gut Liver Axis Mechanisms Underlying Spontaneous Reversal of Liver Fibrosis A Gut Microbiota Metabolomics Analysis

Yuanying Zhao¹, Chenxue Hou¹, Qi Wang², Yue Li¹
Beijing Ditan Hospital, Clinical Laboratory, Beijing-China¹
¹ Beijing Ditan Hospital, Center Of Liver Diseases, Beijing-China²

Background / Hypothesis:Reversing liver fibrosis is crucial for improving the prognosis of chronic liver disease. The gut microbiota-mediated regulation of the liver-gut axis plays a significant role in this process, yet its dynamic changes and underlying mechanisms during spontaneous fibrosis reversal remain unclear. This study aims to systematically reveal the dynamic patterns of the liver-gut axis during spontaneous fibrosis reversal by integrating gut microbiome and metabolomics data from a mouse model of liver fibrosis reversal. It further explores the intrinsic connections between microbiota and metabolism.

Materials and Methods:Intestinal contents were collected from mice in the control group, liver fibrosis model group, and spontaneous reversal groups at 4 and 12 weeks. Gut microbiota structure was analyzed via 16S rRNA gene sequencing. Metabolic profile dynamics were assessed using non-targeted metabolomics. Comprehensive bioinformatics methods were employed for differential analysis, pathway enrichment analysis, and correlation integration.

Results:Analysis of gut microbiota 16S rRNA sequencing revealed significant differences in β -diversity among the model group, the 4-week reversal group, and the 12-week reversal group, indicating that gut microbiota composition continues to evolve throughout different stages of the reversal process. At the phylum level, the relative abundance of Bacteroidetes decreased throughout the reversal process, while that of Firmicutes

ORAL ABSTRACTS

significantly increased in the 4-week reversal group. Genus-level analysis revealed a significant increase in the relative abundance of Akkermansia in the 12-week reversal group, while the family Fusulinaceae reached its peak in the 4-week reversal group. Non-targeted metabolomics analysis showed that multiple metabolic pathways were significantly altered in the reversal groups compared to the model group. The linoleic acid and α -linolenic acid metabolic pathways exhibited higher impact values during the later stages of reversal; Pathways including taurine metabolism, biotin metabolism, and ascorbic acid metabolism remained continuously active throughout reversal. Integrated analysis of gut microbiota and metabolomics revealed significant correlations between changes in specific bacterial groups and metabolite levels, indicating a close association between microbial restructuring and metabolic reprogramming during liver fibrosis reversal.

Conclusions: By integrating 16S rRNA sequencing with non-targeted metabolomics, this study reveals the dynamic evolution of gut microbiota restructuring and host metabolic profiles during spontaneous reversal of liver fibrosis. The reversal of liver fibrosis may depend on microbiota-metabolism coupling regulation processes dominated by specific functional microbial communities. This work provides theoretical support for elucidating the "liver-gut axis" mechanism underlying fibrosis reversal and lays the theoretical foundation for developing gut microbiota-based intervention strategies for liver fibrosis.

1846 - Patient Derived Liver Organoids as a Translational Platform to Validate Targeted Nanoparticles for Image Guided Liver Cancer Surgery

Zulihumaer Aizimuaji¹, Jinrun Liu¹, Zeyu Zhang², Kai Ma³, Shizhong Yang¹, Jiahong Dong¹
Beijing Tsinghua Changgung Hospital, Hepatopancreatobiliary Center, Beijing-China¹ Beihang University, Biological Engineering, Beijing-China² Tsinghua University, Biomedical Engineering, Beijing-China³

Background / Hypothesis: Accurate visualization of liver cancer margins remains a major challenge during surgical resection. Glypican-3 (GPC3) is a tumor-associated antigen highly expressed in hepatocellular carcinoma (HCC) and certain metastatic liver cancers but absent in normal hepatocytes. This study established a patient-derived

liver organoid platform to validate the tumor selectivity of a GPC3-targeted nanoparticle (TJ12-NP) and to bridge its application to image-guided liver cancer surgery.

Materials and Methods: TJ12-NP was synthesized and labeled with Cy5 or indocyanine green (ICG) for different experimental settings. Cy5-labeled TJ12-NP was used to evaluate tumor-specific uptake in patient-derived organoids representing normal liver, HCC, and colorectal liver metastasis (CRLM). Organoid identities were confirmed by marker profiling through immunostaining. Confocal microscopy was applied to visualize nanoparticle localization, and live-dead assays assessed cytocompatibility. ICG-labeled TJ12-NP was further tested in vivo in Huh-7-bearing nude mice for fluorescence imaging and fluorescence-guided tumor resection.

Results:

Cy5-TJ12-NP exhibited strong and specific accumulation in GPC3-positive HCC organoids and comparable uptake in CRLM organoids, whereas minimal signal was observed in normal liver organoids, confirming tumor-selective targeting. The nanoparticles were well tolerated by organoid. In vivo, ICG-TJ12-NP enabled high-contrast tumor visualization, achieving a markedly higher tumor-to-background ratio compared with non-targeted controls and facilitating complete fluorescence-guided resection.

Conclusions:

This study establishes patient-derived liver organoids as a robust translational platform for validating molecularly targeted nanoparticles. The integration of organoid based specificity testing with preclinical imaging demonstrates a clinically relevant pathway toward precision, image-guided liver cancer surgery.

Keyword(s) : Liver cancer; Nanoparticles; GPC3; Organoid; Image-guided surgery

1848 - Metastatic Liver Involvement from Primary Adamantinoma like Ewing Sarcoma of the Lung in an Elderly Male A Rare Case Presentation
Daniele Alek Calda¹, Federico Iv Peralta¹
St. Luke's Medical Center - Global City, Insitute Of Digestive And Liver Disease, Quezon City-Philippines¹

Background / Hypothesis: Ewing sarcoma is a malignant small round blue cell tumor that primarily affects bone and soft tissue in adolescents and young adults. Adamantinoma-like Ewing sarcoma (ALES) is a rare

ORAL ABSTRACTS

subtype characterized by epithelial differentiation and immunoreactivity for CD99 and cytokeratins. While conventional Ewing sarcomas have a well-documented pattern of metastatic spread—most commonly to the lungs and bone marrow—primary lung ALES is rare, and hepatic metastasis from this origin is exceptionally uncommon.

This report documents a case of hepatic metastasis from a primary pulmonary ALES in a 64-year-old male. To our knowledge, delayed liver metastasis from lung ALES in an elderly patient is exceedingly rare and has limited representation in published literature.

Materials and Methods:We report the case of a 64-year-old male with a prior diagnosis of Adamantinoma-like Ewing sarcoma of the left lung confirmed by core needle biopsy. Two years after initial diagnosis and treatment, the patient presented with epigastric pain, abdominal bloatedness, and shortness of breath. Physical examination revealed hepatomegaly, and imaging via four-phase dynamic computed tomography (CT) of the abdomen demonstrated a large, hypervascular mass in the right hepatic lobe, raising suspicion for malignancy. Fine needle aspiration (FNA) under ultrasound guidance was performed. Histopathological examination revealed round cells arranged in disorganized sheets and aggregates with mild cytologic atypia, scant cytoplasm, and a mitotic count of 0–1 per high power field. These findings were morphologically consistent with metastatic Ewing sarcoma and matched the patient's prior pulmonary ALES diagnosis.

Results: This case illustrates a rare occurrence of liver metastasis developing two years after initial diagnosis of pulmonary ALES. Most hepatic Ewing sarcomas reported in literature are primary hepatic tumors or part of disseminated disease from bone primaries. Delayed solitary liver metastasis from a lung primary is a particularly rare presentation.

Radiologically, the liver mass mimicked hepatocellular carcinoma due to its vascular profile. However, in patients with prior history of ALES or similar malignancies, metastasis should be included in the differential diagnosis. Histopathological and immunohistochemical correlation is indispensable in confirming the diagnosis.

Conclusions: This case highlights a rare instance of delayed hepatic metastasis from pulmonary Adamantinoma-like Ewing sarcoma in an elderly male. Clinicians should maintain a high index of suspicion for metastatic disease in patients with prior rare malignancies who present with new abdominal symptoms. Comprehensive imaging and tissue diagnosis, including histopathology and immunohistochemistry, remain the cornerstone of

accurate identification and management of such atypical metastatic presentations.

Keyword(s) : Adamantinoma-like Ewing Sarcoma, pulmonary sarcoma, liver metastasis, small round blue cell tumor

1849 - Yangyin Fuzheng Jiedu Prescription Reduces Recurrence Risk in Patients with Small Hepatocellular Carcinoma after Minimally Invasive Treatment a Pragmatic Randomized Controlled Trial

Huiwen Yan¹, Zhiyun Yang¹

Beijing Ditan Hospital, Center For Integrative Medicine, Beijing-China¹

Background / Hypothesis:Small Hepatocellular Carcinoma (HCC) often has no symptoms, so it is easily overlooked. Minimally invasive treatment of postoperative recurrence of small HCC is still a clinical problem. This study aims to evaluate the clinical efficacy and safety of Yangyin Fuzheng Jiedu Prescription (YFJP) in the treatment of postoperative recurrence of small HCC through a pragmatic randomized controlled trial (pRCT).

Materials and Methods:A total of 300 newly diagnosed small HCC patients were recruited in this study and randomly divided into control group and YFJP group, with 150 patients in each group. The control group received conventional minimally invasive treatment methods, including radiofrequency ablation and hepatic artery chemoembolization. On the basis of conventional treatment, the YFJP group was combined with YFJP treatment, which was added or decreased according to the symptoms. The treatment period is 12 months, and the overall survival (OS) and recurrence free survival (RFS) of the two groups of patients were followed up and observed.

Results:We were pleasantly surprised to find that the average RFS of the YFJP group patients was 8 months, significantly higher than the control group's 3 months ($P < 0.05$). The postoperative recurrence rate of the YFJP group was significantly lower than that of the control group (30% vs. 52.6%, $P < 0.05$). Secondly, YFJP can significantly reduce the levels of AFP, ALB, and TBIL (all $P < 0.05$). We also found that $ALT \leq 50$ IU/L, $AFP \leq 400$ ng/mL, and receiving TACE combined with RFA treatment are the advantageous populations for the treatment of small HCC with YFJP. In addition, there was

ORAL ABSTRACTS

no significant difference in the incidence of treatment-related adverse events between the two groups ($P > 0.05$).

Conclusions:The YFJP treatment has shown good efficacy and safety in improving the postoperative RFS and reducing the recurrence rate of small HCC patients.

1851 - Inhibiting PPM1D facilitates the phosphorylation and oligomerization of VDAC2 to elicit immunogenic tumor destruction by activating cGAS STING IFN response

Liang Zhang Zhang¹, Sheng Yan Yan¹
Second Affiliated Hospital Of Zhejiang University, School Of Medicine, Department Of Hepatobiliary And Pancreatic Surgery, Second Affiliated Hospital Of Zhejiang University, School Of Medicine, Hangzhou, China, Hangzhou-Chile¹

Background / Hypothesis: Immune checkpoint blockade (ICB) represents an important therapeutic approach for hepatocellular carcinoma (HCC), while resistance to ICB treatment remains challenging. Here we reported oncoprotein protein phosphatase magnesium-dependent 1 δ (PPM1D) as a novel driver for HCC immunotherapy resistance.

Materials and Methods:In vitro and in vivo experiments were constructed to examine the function of PPM1D on HCC behavior. Immunoprecipitation (IP) and mass spectrometry were used to find the interactor of PPM1D. Co-IP, immunofluorescence and DUOLink PLA were used to verify the interaction. ChIP-PCR and luciferase assays were used to confirm the binding of transcription factor on PPM1D promoter.

Results: We showed that tumor cell PPM1D impaired CD8⁺ T-cell cytotoxicity and contributed to HCC progression. Furthermore, we found that tumor cell elevated PPM1D expression in response to effector CD8⁺ T lymphocyte activation via TNF α -NF- κ B signaling. Mechanistically, PPM1D de-phosphorylated mitochondrial outer membrane component VDAC2 to prevent VDAC2 oligomerization in tumor cells, thereby maintaining mitochondrial homeostasis and limiting mitochondrial DNA leakage-triggered, cGAS-STING activation. Blocking PPM1D-dependent VDAC2 dephosphorylation disrupted mitochondrial integrity,

recruiting Parkin to target PKM2 for K48-linked polyubiquitination and proteasome degradation. Also, inhibiting PPM1D improved the cytotoxicity of infiltrating CD8⁺ T lymphocytes and synergized with PD-1 inhibitor in preclinical HCC models without causing remarkable toxicity.

Conclusions: PPM1D orchestrates mitochondrial homeostasis in HCC cells through reducing VDAC2 oligomerization that limits mtDNA leakage to prevent cGAS-STING-IFN response and anti-tumor immunity, revealing PPM1D as a promising therapeutic target.

1857 - Therapeutic Role of N Acetylcysteine in Acute Liver Failure Secondary to Anti Tuberculosis Drug Induced Liver Injury Insights From Indonesia

Alfiyyah Rizqy¹, Jason Phowira¹, Kemal Fariz Kalista¹
Faculty Of Medicine, Universitas Indonesia, Department Of Internal Medicine, Jakarta Pusat-Indonesia¹

Background:

Tuberculosis (TB) remains a major public health problem in Indonesia, one of the world's highest burden TB countries. First-line anti-tuberculosis drugs (ATDs) are highly effective, but frequently associated with drug-induced liver injury (DILI). Severe hepatotoxicity may progress to acute liver failure (ALF), a life-threatening condition associated with high mortality. N-acetylcysteine (NAC), a glutathione precursor with antioxidant and vasodilatory properties, is well established in acetaminophen-induced ALF and has shown emerging benefit in non-acetaminophen etiologies, including ATD-induced liver injury (AT-DILI). This case series presents two patients with AT-DILI progressing to ALF who received intravenous NAC.

Case

presentation:

Case 1: A 50-year-old female with meningoencephalitis, spondylodiscitis, sacroiliitis TB, complicated by type 2 diabetes mellitus and rheumatoid arthritis developed syncope, progressive jaundice, pruritus, and rash while on ATDs. Laboratory evaluation showed coagulopathy (PT ratio: 2.8), hyperbilirubinemia (Total: 18.00 mg/dl, direct: 14.10 mg/dl, indirect: 3.90 mg/dl) and mildly elevated transaminases (ALT 50 U/L; AST 19 U/L) consistent with AT-DILI. Intravenous NAC was administered following the standard protocol: a loading dose of 150 mg/kg over 1 hour, followed by 50 mg/kg over 4 hours, then 100 mg/kg over 16 hours. Continuous infusion of 100 mg/kg/day was maintained until

ORAL ABSTRACTS

improvement in encephalopathy and coagulation parameters. NAC therapy resulted in a gradual decline in coagulation parameter (PT ratio: 1.46), bilirubin (Total: 4.80 mg/dl, direct: 3.71 mg/dl, indirect: 1.23 mg/dl) and transaminase level (ALT 34 U/L and AST 16.5 U/L) within ten days, followed by complete clinical recovery. Case 2: A 32-year-old female with pulmonary TB presented with loss of consciousness consistent with grade III hepatic encephalopathy. She appeared pale and jaundice but hemodynamically stable. Laboratory findings showed severe coagulopathy (PT ratio: >5.9), markedly elevated bilirubin (Total: 18.9 mg/dl, direct: 9.62 mg/dl, indirect: 9.28 mg/dl) and transaminase levels (ALT: 311 U/L; AST: 1023 U/L). Intravenous NAC was administered according to protocol. Transaminases improved gradually (ALT 59 U/L and AST 389 U/L), while coagulation parameter (PT ratio: 6.14) and bilirubin levels (Total: 19,60 mg/dl) remained persistently elevated during observation.

Conclusion:

These cases highlight the potential therapeutic role of N-acetylcysteine in the management of ALF secondary to AT-DILI. NAC administration was associated with improvement of clinical symptoms, coagulation, bilirubin, and liver enzyme profiles. In TB-endemic and resource-limited settings where liver transplantation is not widely available, NAC may offer a valuable therapeutic option. Further prospective studies are required to clarify the efficacy, optimal dosage, and timing of NAC administration in non-acetaminophen ALF, particularly in AT-DILI.

Ordu University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Ordu-Türkiye ¹ Fatsa State Hospital, Infectious Diseases And Clinical Microbiology, Ordu-Türkiye ² Ordu Health Directorate, Directorate Of Public Hospitals Services, Ordu-Türkiye ³

Background / Hypothesis
Ordu Province, located in northern Türkiye, has a population of 770,000 and a surface area of 5,952 km². As highlighted in the WHO 2024 Global Hepatitis Report, global coverage of viral hepatitis is very low. Until the introduction of DAA regimens in our country,

there were a significant number of patients who did not respond to interferon therapy. DAA therapy was provided to a waiting group, treating a substantial patient pool. In this ongoing process, it became necessary to identify patients requiring new diagnoses and treatment. In this study, we present our efforts to increase diagnosis and treatment rates in our province. Materials and Methods
Our HCV elimination project, which adopted a "Test-Treat" strategy, was launched in early 2022. Key objectives included education, collaboration with local health administrators, testing strategies, and treatment phases.

- Education phase: Hospital clinicians, clinicians administering immunosuppressive therapy, primary care physicians, and the public (social media, media, print publications).
 - Collaboration with local health administrators: Meetings and symposiums, revisions to the Hospital Information Management System (HIS). Joint projects to increase rapid testing capacity in the field.
 - Test!: Testing opportunities, screening of family medicine patient records, a reflex testing strategy in laboratory services, and screening of at-risk groups.
 - Treatment!: Referring patients to treatment, active patient monitoring, and ensuring treatment continuity.
- Results

From 2016 to 2020, 174 patients were treated with genotype-specific DAA (SoF or PROD). Between 2020 and the present, 178 patients have received treatment. A total of 352 patients were treated with DAA. The number of anti-HCV and HCVRNA tests performed over the years is shown in the table (Table 1). Conclusions: The project we are working on aims to increase the number of tests in our province and treat positive cases. We must strive for HCV eradication. This effort must be undertaken in collaboration with primary care physicians and healthcare administrators. Global eradication can be achieved through efforts that begin in the smallest living spaces and grow like an avalanche. Our project is ongoing; we await the completion of our joint point-of-care testing projects with the Health Directorate, and the implementation of our screening strategies continues in the field.

1867 - Identification of benefit subgroups from heterogeneous effects of adjuvant transarterial chemoembolization in hepatocellular carcinoma using causal model

Tianyi Xia ¹, Yaoyao Yu ¹, Lingling Gao ², Shenghong Ju ¹

ORAL ABSTRACTS

Zhongda Hospital Southeast University, Radiology, Nanjing-China ¹ Institute Of Large-scale Scientific Facility And Centre For Zero Magnetic Field Science, Beihang University, Biomedical Engineering, Beijing-China ²

Background / Hypothesis: Adjuvant transarterial chemoembolization (TACE) after curative resection for hepatocellular carcinoma (HCC) shows conflicting results, likely due to the heterogeneity of treatment effects (HTEs). We aimed to assess HTE and develop a tool to identify patients most likely to benefit from adjuvant TACE.

Materials and Methods: We retrospectively included HCC patients from 10 tertiary centers (real-world cohort, n = 2,630) between 2012 and 2023 and an independent clinical trial (validation cohort, n = 328). After propensity score matching between patients with and without adjuvant TACE, the real-world cohort was defined as the development cohort (n = 1,632). HTE on overall survival (OS) was assessed using (1) subgroup analyses, (2) Cox regression (risk-based), and (3) causal survival forest (effect-based) in the development cohort. Individual treatment effects were used to inform a policy tree (iTACE), which was validated across various cohorts. Survival analyses were performed using Cox regression and log-rank tests.

Results: A total of 2,958 patients were included (median age, 58 years; 83.6% male). After matching, adjuvant TACE showed no significant average treatment effect on OS [hazard ratio (HR) 0.85, 95% confidence interval (CI) 0.70-1.03, P = 0.1061]. Consistent HTEs were observed across subgroup-, risk-, and effect-based analyses. Patients with microvascular invasion, younger age, or corona enhancement on imaging derived greater survival benefits (P < 0.05). The iTACE stratified patients into recommendation subgroups; those in the rec-adjuvant TACE subgroup achieved better survival (HR 0.54, 95% CI 0.43-0.69), while the rec-active surveillance subgroup had poorer outcomes (HR 1.88, 95% CI 1.32-2.67) in the development cohort (P < 0.05). The stratified treatment effect was confirmed in the validation and real-world cohorts (P < 0.05).

Conclusions: Adjuvant TACE demonstrates significant HTE following curative resection for HCC. An interpretable tool enables the individualized identification of patients likely to benefit from adjuvant TACE, providing a framework for postoperative management.

1883 - Early Onset PSC With Recurrent Cholangitis Requiring Early Transplant Evaluation A Five Year Case Trajectory and Prelude to the Transplant Course

Christine Velasquez¹, Sharlene Nicole Chan², Madaline Eternity Labio³, Jay Villar Dy¹, Angela Marie Olympia-chang¹, Suzette Kho Herman¹, Angelo Lozada¹, Angelo Jonathan Cruz¹

Makati Medical Center, Gastroenterology, Makati-Philippines¹ Makati Medical Center, Internal Medicine, Makati-Philippines² Makati Medical Center, Hepatology, Makati-Philippines³

BACKGROUND

Primary sclerosing cholangitis (PSC) is a progressive cholestatic liver disease that typically follows an unpredictable course. Early-onset PSC is particularly uncommon and often demonstrates a more aggressive trajectory, especially when associated with ulcerative colitis (UC). Recurrent cholangitis, progressive stricturing, and rising biochemical markers may occur despite optimized endoscopic management, underscoring the need for timely transplant referral. This case documents a five-year clinical course of young-onset PSC culminating in early liver transplant evaluation, serving as the prelude to a forthcoming discussion on the transplant process in this patient.

CASE

A 23-year-old Filipino male was diagnosed with UC and PSC at age 18. Over five years, he developed intermittent abdominal pain and diarrhea, with imaging later revealing cholelithiasis. He underwent ERCP with sphincterotomy, biliary stent placement, and subsequent laparoscopic cholecystectomy. Persistent dominant strictures required scheduled ERCP with stent replacement every two years, unusually frequent for a patient this young and indicative of significant large-duct involvement.

PRESENTATION

His disease course was complicated by recurrent episodes of acute cholangitis, including infections involving *E. coli*, *Enterococcus faecalis*, and *Klebsiella* bacteremia, managed with stent exchange and intravenous antibiotics. During the current admission, he presented with a 1-day history of fever, vomiting, and malaise. Examination revealed mild scleral icterus. Laboratories showed marked hepatocellular injury (>10× ULN in AST/ALT), elevated ALP (271 U/L), GGT

ORAL ABSTRACTS

(418 U/L), and direct hyperbilirubinemia, although blood cultures remained negative.

MRCP revealed no biliary obstruction, yet demonstrated hepatomegaly, capsular retraction, and T2 hyperintense lesions in segments V and VIII, consistent with progressive PSC despite ductal patency. Notably, the patient's PIVKA-II level was elevated, raising concern for occult hepatobiliary neoplasia or advanced cholestatic dysfunction despite the absence of a detectable mass. He responded promptly to piperacillin-tazobactam with resolution of fever.

Given his recurrent cholangitis, progressive biochemical injury, and radiologic features suggestive of advancing disease, he was referred early for liver transplant evaluation at age 23. Once recovered from infection, comprehensive transplant work-ups and preoperative preparation were initiated, including laboratory staging, cardiopulmonary clearance, nutritional assessment, and psychosocial evaluation.

CONCLUSION

This case demonstrates the aggressive natural history of early-onset PSC and the limitations of long-term stent therapy in preventing progression. The combination of recurrent infections, rising liver enzymes without obstruction, and PIVKA-II elevation prompted early transplant referral. This report serves as the clinical foundation for a forthcoming follow-up detailing the patient's transplant work-up and perioperative course.

1886 - The role of Alix and VPS4A in autophagy and endosomal pathways and their relation to HBV replication

Jia Li ¹, Thekla Kemper ¹, Shuoping Tong ², Xueyue Wang ³, Yong Lin ⁴, Mengji Lu ¹
University Hospital Essen, Institute For Virology, Essen-Germany ¹ The Warren Alpert School Of Medicine, Brown University, Liver Research Center, Rhode Island Hospital, Providence-United States ² School Of Medicine, Zhejiang University, State Key Laboratory For Diagnostic And Treatment Of Infectious Diseases, The First Affiliated Hospital, Hangzhou-China ³ Chongqing Medical University, The Key Laboratory Of Molecular Biology Of Infectious Diseases Designated By The Chinese Ministry Of Education, Chongqing-China ⁴

Background / Hypothesis: Autophagic and endosomal

pathways coordinately contribute to hepatitis B virus (HBV) production. Alix and VPS4A are two important endosomal sorting complex required for transport (ESCRT) components involved in membrane scission. Previous studies showed that Alix and VPS4A participate in HBV replication and modulate the release of HBV particles. Yet, the mechanisms remain elusive. In the present study, we investigated the roles of Alix and VPS4A in HBV biogenesis in the context of endosomal membrane trafficking and autophagy. Materials and Methods: We examined the production, trafficking, and release of HBV particles by using gene silencing and overexpression of wild-type (WT) and dominant-negative (DN) mutants of Alix and VPS4A in HBV replication cell models. Results: Alix silencing increased the levels of intracellular HBV DNA and subviral particles (SVPs/HBsAg), extracellular HBsAg, and virions, while decreasing the secreted naked capsids. Alix silencing promotes HBsAg secretion along the early endosomes while it reduces HBsAg transported to late endosomes and autophagosomes. Alix silencing impairs autophagosome formation by activating the AKT/MTOR pathway and increasing autophagosome degradation in lysosomes. VPS4A silencing has minimal effects on HBV production, while DN VPS4A significantly blocks HBV secretion. DN VPS4A disrupts endosomal trafficking and HBsAg colocalization within early endosomes and late endosomes, while promoting autophagosome formation and lysosome activity, resulting in HBV degradation.

Conclusions: Our findings demonstrate that the endosomal pathway plays a critical role in HBV progeny secretion, particularly when lysosomal activity is suppressed. Conversely, increased lysosomal function drives HBV degradation through the autophagosome-lysosome pathway.

1889 - Liver Fibrosis Explainable Deep learning Network for Automated Staging by Using Equilibrium Enhanced Phase MR Images

Junhao Zha ¹, Shenghong Ju ¹
Zhongda Hospital, Medical School Of Southeast University, Department Of Radiology, Nanjing-China ¹

Background / Hypothesis: Conventional non-invasive diagnostic modalities, including ultrasound-based liver stiffness measurement (LSM) and serological biomarkers, have been widely adopted in clinical practice. However, their diagnostic accuracy remains limited, often falling short in precisely assessing fibrosis severity. MRI-driven deep learning

ORAL ABSTRACTS

approaches has opened new avenues for non-invasive, quantitative evaluation of liver fibrosis. This study aimed to develop an nnU-Net model for automated liver segmentation and propose a novel explainable framework integrating multi-task contrastive learning with attention mechanisms to autonomously identify and visualize the discriminative MRI patches for fibrosis staging.

Materials and Methods: A total of 706 treat-naïve chronic hepatitis B patients were eligible for this retrospective study. 655 patients in center 1 between May 2015 and July 2022 were randomized into the training (424), validation (99) and internal test (132) set. 51 patients in center 2 between March 2018 and May 2023 were collected as an external test set. The reference standard was biopsy obtained within 6 months of the MR examinations. This study employed VGG-16 as the backbone architecture, designed to integrate contrastive learning for automated patch selection while simultaneously enhancing the network's discriminative capability for fibrosis classification. Input data were L2-normalized and included equilibrium enhanced phase MR images and LSM. An extraction function returned the top nine probability-ranked patches from the contrastive learning task along with clinically significant fibrosis classification predictions ($F \geq 2$). Segmentation performance was quantitatively evaluated using the Dice Similarity Coefficient (DSC) to measure spatial overlap between predicted and ground truth liver masks. All case predictions, labels, and AUCs were systematically recorded. The Integrated Discrimination Improvement (IDI) metric quantified the diagnostic enhancement of the patch-based model over LSM alone.

Results:

The nnU-Net model achieved a training set DSC of 0.95 for liver segmentation across 365 cases. For $F \geq 2$ fibrosis staging, the AUCs demonstrated sliding changes when averaging predictions from top-ranked patches in the internal test set: 0.818 (single best patch), 0.799 (top two), 0.779 (top three), 0.753 (top four), 0.723 (top five), with performance plateauing beyond five patches. The network achieved AUC values of 0.853 (training), 0.835 (validation), 0.818 (internal test), and 0.805 (external test) for $F \geq 2$ fibrosis staging using the "top discriminative patch". A significant difference was observed between the "top discriminative patch" model and the LSM-only approach ($P < 0.0001$), yielding an IDI

value of 0.287.

Conclusions: The proposed framework provides an accurate, automated, and explainable tool for liver fibrosis staging, and could add value to elastography.

1890 - Deep Learning CT Signature for Predicting Occult Liver Metastases and Neoadjuvant Therapy Benefit in Pancreatic Ductal Adenocarcinoma A Multicenter Retrospective Study

Yaoyao Yu¹, Ben Zhao¹, Tianyi Xia¹, Shenghong Ju¹
Zhongda Hospital Southeast University, Radiology, Nanjing-China¹

Background / Hypothesis: To develop a deep learning (DL) framework integrating pancreatic tumor and liver imaging features to predict occult liver metastases (OLM) in pancreatic ductal adenocarcinoma (PDAC), thereby guiding personalized neoadjuvant therapy (NAT).

Materials and Methods: In this multicenter retrospective study (2015-2022), 1,063 patients with PDAC were included: a training cohort ($n = 450$), internal validation cohort ($n = 113$), external validation cohort ($n = 342$), and an NAT cohort ($n = 158$). We developed a Mamba-based model that integrates multi-phase computed tomography features from both primary tumors and liver regions. Its performance was evaluated using the area under the receiver operating characteristic curves (AUCs). To assess clinical utility, survival outcomes were compared between NAT followed by surgery and upfront surgery groups based on model-defined risk stratification. Finally, radiotranscriptomics analysis was employed to elucidate the underlying biological insights.

Results: The Mamba-based model demonstrated robust performance for predicting the OLM in PDAC, with the AUCs of 0.890 (training), 0.820 (internal validation), and 0.806 (external validation), respectively. Model-defined high-risk patients had significantly shorter progression-free survival (PFS: HR = 1.95, $P < 0.001$) and overall survival (OS: HR = 1.96, $P < 0.001$), independent of clinicopathological factors. Notably, NAT conferred significant OS benefits exclusively in model-defined high-risk patients (17.43 vs. 34.10 months; $P < 0.001$), even after propensity score matching (18.03 vs. 34.10 months; $P = 0.003$), while low-risk patients showed no survival benefit. Furthermore, radiotranscriptomics also

ORAL ABSTRACTS

revealed the relative biological aggressiveness of high-risk patients.

Conclusions: The proposed Mamba framework enabled accurate prediction of OLM and may serve as a clinically actionable tool for identifying PDAC patients most likely to benefit from NAT.

1895 - Add on traditional Chinese medicine for hospitalized acute on chronic liver disease
Yufei Bi ¹, Kam Wa Chan ¹, Xianbo Wang ²
Hong Kong Baptist University, Chinese Medicine, Hong Kong-China ¹ Capital Medical University Affiliated Beijing Ditan Hospital, Chinese Medicine, Beijing-China ²

Background / Hypothesis

Acute-on-chronic liver failure (ACLF) carries high short-term mortality. Traditional Chinese Medicine (TCM) is increasingly used as an adjunctive therapy, yet its effectiveness in real-world settings remains insufficiently evaluated. We hypothesized that add-on TCM during hospitalization could improve survival and early clinical recovery in ACLF patients.

Materials and Methods

This retrospective cohort study included hospitalized ACLF patients at Beijing Ditan Hospital in 2023–2024 and 2018–2019. Patients received either standard Western medicine (WM) alone or WM plus TCM. Outcomes were assessed at 4, 12, and 24 weeks. The primary endpoint was short-term mortality; secondary endpoints included changes in liver function, coagulation parameters, inflammatory markers, and MELD and Child–Pugh scores. Baseline imbalances were minimized using inverse probability of treatment weighting (IPTW). Cox proportional hazards models were applied in unmatched and IPTW-adjusted analyses.

Results

Compared with WM alone, add-on TCM was associated with significant reductions in bilirubin levels, inflammatory markers, and severity scores at 4 weeks ($p < 0.05$), while no early improvements were observed in coagulation, liver enzyme, or protein levels ($p > 0.05$). TCM consistently demonstrated survival benefits:

unmatched Cox models showed reduced mortality at 4-, 8-, 12-, and 24-week follow-up ($HR \approx 0.20, 0.36, 0.40$, and 0.38 , respectively). IPTW-adjusted analyses yielded similar hazard ratios ($\approx 0.20, 0.37, 0.41$, and 0.39), indicating a 60%–80% reduction in mortality risk across follow-up periods.

Conclusions

Add-on TCM therapy may significantly reduce short-term mortality and improve bilirubin, inflammatory, and severity-related outcomes in ACLF patients. Consistent findings from both unmatched and IPTW-adjusted Cox models support TCM as a beneficial complementary treatment. Further prospective studies are warranted to confirm these effects.

Keyword(s) : traditional Chinese medicine, acute on chronic liver disease

1897 - Genotype Phenotype Correlation of ATP7B Mutations in Wilson Disease
Siqi Zhang ¹, Wei Hou ¹, Shan Tang ¹, Haitian Yu ¹, Sujun Zheng ²

Beijing You'an Hospital, Capital Medical University, Department Of Liver Diseases I, Beijing-China ¹ Beijing You'an Hospital, Capital Medical University, Department Of Liver Diseases Iv, Beijing-China ²

Background / Hypothesis:

Wilson disease (WD) is an autosomal recessive disorder of copper metabolism caused by mutations in the ATP7B gene. Patients exhibit significant variability in age of onset, affected organs, and disease severity. Clarifying the relationship between genotype and phenotype is essential for understanding WD heterogeneity.

Materials and Methods:

We performed ATP7B gene sequencing in 289 WD patients recruited from two centers in China, analyzed mutation types and homozygous/heterozygous distributions, and selected the five most frequent mutation combinations for further analysis. Skewed continuous variables were compared using the Kruskal-Wallis test, and categorical data were analyzed with the chi-square or Fisher's exact test. Clinical features—including age at diagnosis, serum ceruloplasmin (CER), 24-hour urinary copper, Kayser-Fleischer (K-F) ring presence, and clinical subtype—were compared among genotype groups. Regression models were used to assess interactions between genotype and age at diagnosis on the risk of cirrhosis and liver failure.

ORAL ABSTRACTS

Survival curves were employed to evaluate the prognostic differences of loss-of-function (LOF) mutations across distinct age subgroups.

Results:

The independent effect of genotype on cirrhosis risk approached statistical significance (LOF vs Missense mutation, $p=0.051$). Among diagnosis age <12 years old, patients carrying two 2-LOF mutations had the shortest median survival time (2.0 years), which was significantly worse than the 0-LOF group (7.0 years, $p=0.010$). However, in patients ≥ 12 years old, no significant differences in survival rates were observed among groups, suggesting that the negative impact of LOF mutations is more pronounced in early-onset patients. Patients carrying the p.T1106M/p.R778L combination showed significantly later age at diagnosis, higher CER levels, and slightly lower urinary copper, suggesting a milder clinical phenotype. K-F ring positivity and clinical subtype differed among genotype groups. Interaction analysis revealed that the rate of age-related cirrhosis progression in the p.T1106M/p.R778L group was slower than in the p.R778L/p.R778L reference group, whereas interactions with liver failure risk were not significant.

Conclusions:

The interaction between genotype and age at diagnosis has a regulatory effect on cirrhosis risk, but shows limited impact on liver failure. Loss-of-function mutations significantly negatively affect prognosis in early-onset patients (<12 years), though this effect is attenuated in late-onset patients. The p.T1106M/p.R778L combination can serve as a "mild-type" genetic marker, characterized by delayed disease onset, higher CER levels, and a slower progression to cirrhosis risk.

1899 - Exploring the value of imaging indicators in predicting TACE resistance in hepatocellular carcinoma based on contrast enhanced CT

Ying Lei¹, Shenghong Ju¹
Southeast University, Radiology Department, Nanjing-China¹

Objective: There have been disagreements among various societies regarding the criteria for TACE resistance in the past, and there is currently a lack of reliable models for predicting outcomes and risk

stratification in TACE candidate patients who meet clinical practices in China. Our study aims to establish a TACE resistance prediction method for unresectable HCC patients based on tumor burden and radiomics features, and evaluate its value in early identification of TACE resistance.

Method: A retrospective study was conducted on 255 HCC patients who received initial TACE treatment from three medical centers between January 2013 and January 2024. Among them, 110 cases were used as the training set, 47 cases were used as the internal testing set, and 98 cases were used as the external testing set. Using logistic regression model, extract radiomics features from tumor areas in preoperative enhanced CT images and establish an radiomics model. Perform univariate and multivariate logistic regression analysis on clinical data and semantic features to identify independent risk factors affecting patients' resistance after 3 TACEs, establish clinical and semantic prediction models, and then combine patient individual radiomics scores to establish a joint prediction model. Calculate the area under the operating characteristic curve (AUC) of the subjects in the training set, internal and external test sets. And use log rank test to evaluate the difference in overall survival (OS) between low and high-risk TACE resistance in HCC patients predicted by the model. And validate the calibration degree and clinical value of the model using calibration curves and decision curves. Result: Regression analysis showed that tumor growth type was an independent risk factor affecting patients' resistance after 3 TACEs. The AUC of the joint model are 0.81 for the training set, 0.79 for the internal test set, and 0.78 for the external test set. The median OS differences among the three cohorts of low and high-risk HCC patients with TACE resistance determined by the joint model were statistically significant ($P<0.05$). Meanwhile, patients who developed treatment resistance after three TACEs had significantly shorter median survival times and statistical differences. The calibration curve and decision curve show that the joint model has a good calibration degree ($P<0.05$), which can bring net benefits to patients. Conclusion: This study developed and validated a combined model for HCC patients receiving TACE treatment, which can effectively predict the TACE resistance of patients after 3 surgeries and provide support for subsequent treatment strategies.

1903 - Performance of FIB 4 and MAFLD Fibrosis Score vs. Transient Elastography in a Filipino Cohort

Rafael Emmanuel Mendoza¹, Miguel Jemuel Cabusas²,

ORAL ABSTRACTS

Ian Homer Cua¹
St. Luke's Medical Center - Global City, Institute Of
Digestive And Liver Diseases, Taguig City-Philippines¹
St. Luke's Medical Center - Global City, Department Of
Medicine, Taguig City-Philippines²

Background: The Asian Pacific Association for the Study of the Liver recommends a two-step risk assessment in the diagnosis of metabolic dysfunction-associated fatty liver disease (MAFLD). This study aims to evaluate the performance of non-invasive tests Fibrosis-4 index (FIB-4) and MAFLD Fibrosis score (NFS) in relation to the risk for advanced fibrosis by liver stiffness measurement (LSM) on vibration-controlled transient elastography (VCTE).

Methodology: Adult Filipino patients at risk for liver fibrosis from MAFLD, with available data from FibroScan and laboratory tests used to compute FIB-4 and NFS, and without other causes of liver disease (e.g., chronic viral hepatitis, alcoholic liver disease), were included. Data from November 2024 to September 2025 was used.

Results: The study included 1057 patients at risk for MAFLD. Of the 764 (72.3%) patients stratified as low risk by FIB-4, 92 (12%) were misclassified by LSM. For NFS, which included 713 (67.4%) patients from the total cohort, 232 (32.5%) were stratified as low risk. However, 31 (13.3%) were misclassified by LSM. There were less misclassified patients with FIB-4 compared to NFS. By independent samples t-test, misclassified patients were more likely to have higher weight, body mass index, waist circumference, aspartate transaminase, alanine aminotransferase, and glycohemoglobin A1c, and lower albumin levels.

Conclusion: Additional patient characteristics, such as comorbidities (especially diabetes), waist circumference, and BMI, should be considered when using non-invasive tests for risk stratification for MAFLD to minimize the possibility of misclassification by LSM.

1906 - A Fe Curcumin based Strategy to Reinvigorate CAR T Cells by Reversing Exhaustion and Senescence in Liver Cancer

Yuchan Xue¹, Songbo Zhao², Qiang Zhu³
Shandong Provincial Hospital Affiliated To Shandong
First Medical University, Department Of
Gastroenterology, Jinan, Shandong-China¹ Shandong

Provincial Hospital Affiliated To Shandong First Medical
University, Department Of Central Laboratory,
Jinan, Shandong-China² Shandong Provincial Hospital
Affiliated To Shandong First Medical University,
Department Of Infectious Disease, Jinan, Shandong-
China³

Background / **Hypothesis:**
Chimeric antigen receptor-T (CAR-T) therapy has demonstrated remarkable efficacy in hematological malignancies. However, its effectiveness against hepatocellular carcinoma (HCC) remains limited by T cell exhaustion, senescence, and the immunosuppressive tumor microenvironment (TME). Curcumin, a natural anti-tumor compound, exhibits limited efficacy as a monotherapy. This study innovatively constructs an Fe-curcumin (FC) nanoplatform designed to remodel the immunosuppressive TME and confer a superior "memory-persistence" phenotype upon CAR-T cells, thereby aiming to overcome these critical barriers in HCC treatment.

Materials and Methods:
We developed ROS-scavenging Fe-curcumin (FC) nanoparticles for co-delivery with CAR-T cells. Their impacts on CAR-T cell apoptosis, proliferation, exhaustion, and memory phenotypes were profiled via flow cytometry and RNA-seq. In vivo antitumor efficacy and TME modulation were assessed in murine models using MRI and immunohistochemistry.

Results:
The FC nanoparticles effectively induced tumor cell apoptosis without exerting cytotoxicity on T cells or CAR-T cells. Furthermore, they alleviated CAR-T cell senescence and exhaustion by suppressing the p53 signaling pathway, thereby enhancing cytotoxicity and proliferative capacity. RNA-Seq and flow cytometry confirmed an upregulated memory phenotype (e.g., CCR7) alongside downregulated exhaustion markers (e.g., PD-1, Tim-3) in FC-treated CAR-T cells. In vivo, the FC/CAR-T combination demonstrated a significant suppression of tumor growth and an extension of survival. The nanoparticles also remodelled the TME by alleviating hypoxia (reduced HIF-1 α) and acidosis (increased pH), promoting M2-to-M1 macrophage repolarization, and enhancing endogenous T/NK cell infiltration.

Conclusions:
This study demonstrates that FC nanoparticles reinvigorate CAR-T cells by mitigating exhaustion and senescence via p53 pathway inhibition, while concurrently remodeling the immunosuppressive TME. Our findings provide a novel and potent combinatorial strategy to overcome the key limitations of CAR-T

ORAL ABSTRACTS

therapy in solid tumors, highlighting its significant clinical translation potential.

1908 - Performance of Baveno VII Criteria in Predicting Clinically Significant Portal Hypertension in Burned Out MAFLD

Adinda Amalia¹, Anita Illahi¹, Cosmas R.a. Lesmana¹
Division Of Hepatobiliary, Faculty Of Medicine
Universitas Indonesia - Dr. Cipto Mangunkusumo
Hospital, Internal Medicine, Jakarta-Indonesia¹

Background / Hypothesis:

Burned-out MAFLD represents an advanced stage of metabolic liver disease in which hepatic steatosis disappears (CAP S0) despite substantial underlying fibrosis. This phenotype often reflects progressive disease biology and is associated with a higher likelihood of developing portal hypertension. Although non-invasive tools are widely used to assess the risk of clinically significant portal hypertension (CSPH), including liver stiffness measurement (LSM), platelet count, and the Baveno VII criteria, their performance specifically in burned-out MAFLD remains poorly defined. The Child-Pugh classification provides an assessment of hepatic functional reserve, but its role in predicting portal hypertension—particularly in the burned-out phenotype—remains unclear. Therefore, this study aimed to evaluate the application of the Baveno VII criteria for predicting CSPH in patients with burned-out MAFLD.

Materials and Methods:

A retrospective single-center pilot study was conducted. Liver stiffness measurement (LSM), platelet count, and Child-Pugh class were collected at baseline. Burned-out MAFLD was defined as steatosis grade S0 (CAP <248 dB/m) with significant fibrosis (LSM ≥ 8 kPa). CSPH was defined non-invasively as LSM ≥ 25 kPa. Baveno VII categories were stratified into rule-out (LSM <15 kPa and platelets $>150 \times 10^9/L$), grey zone, and rule-in (LSM ≥ 25 kPa). Subgroup analyses were performed for patients with burned-out MAFLD.

Results:

Among 44 patients (median age 59.5 years; 61% male), burned-out MAFLD accounted for 16 cases (36.4%). Non-invasive CSPH was identified in 50% of the overall cohort. In the burned-out subgroup, CSPH prevalence

was higher (62.5%) compared with non-burned-out MAFLD (42.9%). Based on the Baveno VII classification, most burned-out patients were categorized as rule-in (62.5%), followed by grey zone (31.2%), with only 6.2% meeting rule-out criteria. Within the burned-out group, CSPH occurred in 55.6% of Child-Pugh A, 80.0% of Child-Pugh B, and 50.0% of Child-Pugh C patients. Platelet count and Child-Pugh class demonstrated limited discriminatory performance for CSPH (AUC ≈ 0.50 and 0.59 , respectively).

Conclusions:

Burned-out MAFLD demonstrates a high prevalence of non-invasive CSPH, with the majority of patients fulfilling Baveno VII rule-in criteria. While the Baveno VII criteria remain useful for identifying high-risk individuals, their ability to spare endoscopic screening appears limited in the burned-out phenotype. These findings highlight the need for refined non-invasive stratification tools tailored specifically to burned-out MAFLD and warrant validation in larger prospective studies.

Keyword(s) : Burned-out MAFLD; clinically significant portal hypertension; CSPH; Baveno VII; non-invasive assessment; liver stiffness measurement.

1909 - A Diagnostic conundrum in a Case of Obstructive Jaundice in Biliary Hamartoma

Cleo Christille Lynn Lom-oc¹, Ramon Luis Liboro¹,
Mabel Angela Sarita¹
Makati Medical Center, Gastroenterology, Makati City-
Philippines¹

Background / Hypothesis:

Hilar masses pose a significant diagnostic challenge, as differentiating malignant conditions like hilar cholangiocarcinoma and benign biliary strictures is often difficult. Biliary hamartomas are rare benign condition

caused by malformation of the intrahepatic bile ducts. Most biliary hamartomas are clinically asymptomatic and often found incidentally. We hereby present a case of hilar mass which was eventually diagnosed as biliary hamartoma.

Materials and Methods:

A 61-year-old male, with no known comorbidities, presented with jaundice for two years. Prior interventions included ERCP with stenting and subsequent percutaneous transhepatic biliary drainage

ORAL ABSTRACTS

for recurrent obstructive episodes. Several attempts to obtain tissue diagnosis was done but did not yield any histopathologic diagnosis. Initial bile GeneXpert MTB/RIF assay detected trace Mycobacterium tuberculosis (MTB); however, repeat testing was negative. A PET scan study revealed hypermetabolic ill-defined mass at the hepatic hilum extending to both hepatic lobes, with intrahepatic duct dilatation, highly suggestive of Klatskin tumor. Due to persistent diagnostic uncertainty and atypical clinical progression, liver biopsy was done prior to oncologic treatment. Histopathologic analysis revealed multiple irregularly dilated bile ducts embedded in fibrous stroma, consistent with biliary hamartomas. Following confirmation of this benign diagnosis, aggressive oncologic or surgical interventions were avoided. The patient instead continued supportive biliary decompression with subsequent clinical improvement.

Results:

Biliary hamartoma are uncommon benign lesions found in the liver. In this case, the patient presented with repeated episodes of jaundice, fevers, abdominal distension and right upper quadrant pain. However, clinical presentation is not compatible with hilar cholangiocarcinoma hence tissue correlation was recommended. Biopsy of liver proved to be benign biliary hamartoma which has better clinical outcome.

Conclusions:

This case highlights the diagnostic complexity of hilar masses and emphasizes the importance of tissue confirmation when clinical, radiologic, and metabolic findings are discordant. Biliary hamartomas, though rare, can closely mimic cholangiocarcinoma—including PET avidity—leading to potential misdiagnosis. Thus, key clinical and histopathologic confirmation is essential to avoid diagnostic pitfalls or unnecessary therapy, and to guide appropriate patient-centered management.

1912 - Association Between Fatty Liver and Risk of Liver Failure in Patients with Acute Hepatitis B A Retrospective Cohort Study

Xiao-hao Wang¹, Yu-nan Chang², Lu Zhang¹, Yan-li Yang¹, Lu-wen Liang¹, Yi Zeng¹, Zhi Zhou¹, Shan Zhong¹, Hu Li¹

The Second Affiliated Hospital, Chongqing Medical University, Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Institute For Viral Hepatitis, Chongqing-China Children's Hospital of Chongqing

Medical University, Department Of Infectious Diseases, Chongqing-China²

Background / Hypothesis: Fatty liver (FL) is a common comorbidity associated with adverse outcomes in various liver diseases, but its impact on the prognosis of acute hepatitis B (AHB) remains unclear. This study aimed to evaluate the influence of FL on liver-related outcomes in hospitalized patients with AHB.

Materials and Methods: We retrospectively analyzed hospitalized patients diagnosed with AHB between 1 January 2010 and 30 December 2023. Based on imaging and laboratory findings, patients were categorized into AHB with FL (AHB-FL) and AHB without FL (AHB-no FL). Demographic and clinical data were collected. The primary outcome was acute liver failure (ALF); secondary outcomes included hepatitis B surface antigen (HBsAg) loss and seroconversion. Multivariable regression models were used to assess the independent association between FL and clinical outcomes. Kaplan-Meier analysis was performed to compare time to HBsAg loss and seroconversion.

Results:

A total of 200 patients were included, with 29 (14.5%) in the AHB-FL group and 171 (85.5%) in the AHB-no FL group. The incidence of ALF was significantly higher in the AHB-FL group than in the AHB-no FL group (34.5% vs. 15.8%, $P=0.02$). Rates of HBsAg loss (75.9% vs. 82.5%, $P=0.40$) and seroconversion (44.4% vs. 53.1%, $P=0.40$) were comparable between groups. Kaplan-Meier curves showed no significant differences in time to HBsAg loss ($P=0.07$) or seroconversion ($P=0.43$). In multivariable analysis, FL remained an independent risk factor for ALF (odds ratio 4.61; 95% CI 1.26-16.86; $P=0.02$), but was not independently associated with HBsAg loss (hazard ratio [HR] 1.60; 95% CI 0.92-2.78; $P=0.10$) or seroconversion (HR 1.69; 95% CI 0.80-3.57; $P=0.17$). Subgroup analysis revealed a stronger association between FL and ALF among rural patients (P for interaction=0.02), suggesting that regional factors may modify clinical risk and management.

Conclusions:

In hospitalized patients with AHB, FL substantially increases the risk of ALF but does not significantly affect HBsAg loss or seroconversion. Early identification and

ORAL ABSTRACTS

active management of FL in this population are essential to reduce acute liver-related complications and improve clinical outcomes.

Keyword(s) : liver failure; acute hepatitis B; fatty liver; HBsAg loss; seroconversion; prognosis

1916 - Restoration of ATP7B Trafficking and Biliary Function in Wilson Disease Hepatocytes through CRISPR Cas9 Mediated Gene Correction

Jiaqi Li¹, Pengfei Yu¹, Jiateng Zhang¹, Huaibin Zou¹, Yuanyuan Zhang², Yu Chen¹, Zhongping Duan¹
Beijing You'an Hospital, Capital Medical University, Beijing Key Laboratory Of Liver Regeneration And Artificial Liver Transformation Research, Beijing-China¹
Wake Forest School Of Medicine, Wake Forest Institute For Regeneration Medicine, Winston-salem-United States²

Background / Hypothesis:The ATP7B R778L mutation, prevalent in Asian Wilson disease (WD) patients, is hypothesized to disrupt copper-induced protein trafficking to bile canaliculi—a fundamental process in hepatocyte polarity. This study systematically evaluates the functional efficacy of CRISPR/Cas9-mediated genetic correction in restoring ATP7B localization and copper-responsive dynamics using patient-derived hepatocyte-like cells.

Materials and Methods:Urine-derived stem cells (USCs) from a WD patient (ATP7B R778L homozygous) were non-integratively reprogrammed into induced pluripotent stem cells (iPSCs). The pathogenic mutation was precisely corrected to wild-type (WT) using CRISPR/Cas9, generating an isogenic control. Corrected (ATP7BWT/WT), uncorrected (ATP7BR778L/R778L), and healthy control iPSCs were differentiated into hepatocyte-like cells (HLCs) via a defined protocol. The polarization status and bile canaliculi formation were rigorously assessed by confocal microscopy for apical markers (MRP2/ABCC2, BSEP) and tight junctions (ZO-1). ATP7B localization was evaluated by immunofluorescence under copper-chelated and copper-loaded conditions.

Results:HLCs from all groups developed mature hepatocyte characteristics, forming extensive, branching networks of bile canaliculi, as evidenced by the exclusive apical localization of MRP2 and BSEP, delineated by ZO-1. In uncorrected WD-HLCs, the mutant ATP7B R778L

protein was predominantly retained in the Golgi apparatus and failed to traffick to the canalicular membrane upon copper challenge. In stark contrast, HLCs derived from the genetically corrected iPSCs displayed a complete functional rescue: ATP7B properly localized to the trans-Golgi network under basal conditions and underwent robust, copper-induced redistribution to the bile canaliculi, a phenotype identical to HLCs from healthy controls. Quantitative analysis confirmed a significant restoration of ATP7B canalicular signal post-correction.

Conclusions:This study provides definitive evidence that CRISPR/Cas9-mediated correction of the ATP7B R778L mutation restores not only the genetic sequence but, critically, the dynamic copper-responsive trafficking essential for ATP7B function in polarized hepatocytes. By rescuing the mutant protein's capacity for copper-induced canalicular redistribution—a polarity-dependent process fundamental to hepatic copper homeostasis—we establish that genetic repair at the stem cell level effectively reverses a core molecular pathology of Wilson disease. These findings provide a robust scientific foundation for developing autologous cell-based therapies as a potential curative strategy for this inherited metabolic disorder.

1918 - Solving a Recurrent Hepatic Abscesses Through Discovery of a Cholecystoduodenal Fistula resulting from an Over the Scope Clip closure of Duodenal Perforation as a complication of Microwave Ablation for HCC

James Manuel Medalla¹, Jonard Co¹, Stephen Wong¹
Chinese General Hospital, Gastroenterology, Manila City-Philippines¹

Background / Hypothesis: A 75-year-old male with hepatocellular carcinoma (BCLC A) on a background of compensated hepatitis C-related cirrhosis presented with recurrent liver abscess. He has hypertension and cholelithiasis. Four years earlier, he received eight cycles of Atezolizumab-Bevacizumab for tumor downsizing, followed by microwave ablation. Post-ablation he developed a duodenal bulb perforation, successfully closed with an endoscopic Over-the-Scope Clip (OTSC). One month post-clipping, he developed a liver abscess, followed by another episode four months later. Both were managed with percutaneous drainage, pigtail

ORAL ABSTRACTS

catheter insertion, and culture-guided antibiotics (*Klebsiella pneumoniae* and *E. coli* respectively), leading to full recovery. Six months prior to admission, he developed a 5.4 × 4.8 × 3.9 cm (52 cc) subhepatic abscess, which was drained pigtail catheter and treated with a six-week course of ciprofloxacin (*Streptococcus pneumoniae* sensitive), resulting in improvement and subsequent catheter removal.

One month prior to admission, patient presented with fever and anorexia. Triphasic CT scan reveals a subdiaphragmatic abscess formation posterior to the right hepatic lobe is measuring 7.5 x 5.2 x 4.9 cm (100 cc), stable gallbladder stones (1.5cm) with air pocket levels within the lumen, a dilated common bile duct (1.0 cm), and punctate distal lithiasis.

Materials and Methods:
Triphasic CT scan of the abdomen, ERCP, surgery

Results:

ERCP showed an erythematous duodenal bulb with a fistulous tract seen at the anteromedial wall with purulent discharge, the same area where the OVESCO clip was deployed. Fistulography opacified the gallbladder, common hepatic duct (10mm) and common bile duct (12mm). Cholangiography showed a dilated CBD with distal filling defect. Sphincterotomy and balloon sweeps removed bile sludge, and a 10 Fr × 7 cm biliary stent was placed. The patient underwent exploratory laparotomy with cholecystectomy, takedown of a cholecystoduodenal fistula, repair of duodenal perforation, and drainage of abscesses. His postoperative course was uneventful, and no further abscess recurrence was noted on follow-up.

Conclusions:

A rare sequence of duodenal perforation, OTSC closure, cholecystoduodenal fistula and recurrent abscess highlights the need for high index of suspicion in unusual causes based on patient's clinical profile and history. Recurrent liver abscess complicates MWA in 1.6% of cases. Cholecystoduodenal fistula at the site of an OTSC closure of duodenal perforation underscores how thermal injury plus clip-mediated tissue traction may create a persistent bilioenteric connection, promoting recurrent pyogenic abscess via contamination from biliary or enteric flora. This required multidisciplinary diagnosis (CT, ERCP, fistulography) and definitive surgical repair.

Keyword(s) : recurrent liver abscess, cholecystoduodenal fistula, duodenal perforation, OTSC clip, Microwave ablation

1920 - A New Noninvasive Marker Predicting Liver Fibrosis in Patients with Chronic Hepatitis B
Esma Aslihan Aydemir¹, Özgür Günel²
Taşköprü State Hospital, Infectious Diseases And Clinical Microbiology, Kastamonu-Türkiye¹ Samsun University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Samsun-Türkiye²

Background: Chronic hepatitis B virus infection (CHB) is a significant health problem affecting more than 250 million people and causing approximately 900,000 deaths each year due to cirrhosis and hepatocellular carcinoma. The infection can be silent; fibrosis and even cirrhosis can develop without symptoms or liver enzyme abnormalities. Numerous non-invasive, easily applicable methods and scoring systems have been developed to detect disease progression. This allows for early antiviral treatment to improve disease outcomes. This study aims to develop an effective formula for determining fibrosis by determining fibrosis values obtained from liver biopsies of patients with CHB, along with biochemical variables and risk factors.

Materials and Methods: Patients who were followed up for CHB and underwent liver biopsy at Samsun Training and Research Hospital were included in the study. Patients under the age of 18, those with additional viral hepatitis disease and other liver-related diseases and those with insufficient data in retrospective file scans and laboratory tests were not included in the study. Patient demographics, pathology results and biochemical data were recorded as retrospective data. These data were compared with the Ishak fibrosis stage and their diagnostic validity in predicting liver fibrosis was statistically evaluated and a new serological marker was developed.

Results: In our study, 204 patients were grouped as having advanced fibrosis (F4-6) and low-grade fibrosis. The proportion of HBeAg(+) patients and ALP were higher in the advanced fibrosis group. Univariate analysis of variables predicting advanced fibrosis revealed that HBeAg, AST, ALT, ALP, GGT, platelet count and INR were significant variables. Multivariate analysis revealed that HBeAg(+), ALP and platelet count were independent risk factors. In HBeAg(-) patients, univariate analysis revealed ALP, GGT, lymphocyte count, platelet count and INR were significant variables. Multivariate analysis revealed only ALP as an independent risk factor. In previous studies, the effectiveness of many markers that have proven to be powerful in detecting

ORAL ABSTRACTS

liver fibrosis was compared with the ASLI([AST+ALT]xALPxINR/PlateletxAlbumin) formula that we developed in showing advanced fibrosis; according to this, API, Fibro-Q were found to be statistically insignificant in detecting advanced fibrosis, while AAR,APRI, FIB-4,King and ASLI formulas were found to be statistically significant. Conclusions: In our study, the higher prevalence of advanced fibrosis in the HBeAg(+) group suggests that patients were in an "immune tolerant" phase, leading to delayed treatment and progression of fibrosis. The ASLI score we developed has a higher predictive power than other markers, particularly in distinguishing low fibrosis levels. We believe it will be beneficial for early diagnosis and monitoring of fibrosis. Further studies are needed in other populations.

1923 - Women's Perspective on Non Antibiotic Interventions for rUTI Prevention Meta Analysis of Efficacy Safety and Clinical Implications

Wenjing Wang ¹, Linhui Hu ¹, Yan Wang ¹
Department Of Infectious Diseases, Peking University First Hospital, Beijing-China ¹

Background / **Hypothesis:**
Recurrent urinary tract infection (rUTI) affects up to 50% of adult women annually and represents a substantial global health burden. This burden is further aggravated by rising antimicrobial resistance. Non-antibiotic strategies, such as cranberry products, D-mannose and probiotics, have emerged as promising alternatives; however, their comparative efficacy and safety versus placebo remain insufficiently characterized, particularly from the perspective of women's health across different menopausal stages.

Materials and **Methods:**
We conducted a systematic review and meta-analysis in accordance with PRISMA guidelines. We searched PubMed, Embase, and Web of Science up to October 2025 for studies comparing non-antibiotic prophylaxis to placebo in adult women with rUTIs. The primary outcomes were the recurrence of symptomatic or culture-confirmed rUTIs (measured by relative risk [RR]) and adverse events. Random-effects models were employed to account for high heterogeneity, as assessed by I². Publication bias was evaluated using Egger's test.

Results:
We included 17 studies with a total of 2749 female participants, of whom 1444 received non-antibiotic therapies. In preventing recurrent urinary tract infection

(rUTI), non-antibiotic therapies were significantly more effective than placebo (RR 0.45, 95% CI [0.32-0.64]). Among them, cranberry (RR 0.33, 95% CI [0.16-0.70]) and fosfomycin trometamol (RR 0.09, 95% CI [0.05-0.17]) demonstrated better efficacy, while D-mannose did not show a significant trend due to the limited number of studies (Figure 1). The studies also indicated that both cranberry and hyaluronic acid and chondroitin sulphate(HA/CS) significantly extended the time to the first occurrence of UTI after treatment (Figure 2). When compared to antibiotic regimens, HA/CS also showed comparable efficacy (RR 0.80, 95% CI [0.66-0.97]) (Figure 3). The safety of non-antibiotic therapies was comparable to that of placebo, with no adverse events leading to treatment discontinuation. Conclusions:

Non-antibiotic interventions significantly reduce the risk of recurrent urinary tract infections (rUTI) in adult women without increasing adverse events, with cranberry and hyaluronic acid combined with chondroitin sulphate showing particularly strong effects. For women with frequent infections or concerns about antibiotic resistance and hepatotoxicity, these non-antibiotic therapies may be effective alternatives to antibiotics. Future research should focus on larger randomized controlled trials to determine the optimal doses, treatment duration, and long-term outcomes, as well as differences in quality of life and cost-effectiveness.

1926 - Hepatitis and HIV Seroprevalence in Individuals with Substance Use Disorders A 25 Year Retrospective Analysis

Damla İşman Haznedaroğlu ¹, Sümeysra İstek ², Ayşe Merve Parmaksızoğlu Aydın ², İbrahim Sungur ¹, Meltem Taşbakan ², Hüsnü Pullukçu ², Şaziye Rüçhan Sertöz ³, Memnune Selda Erensoy ³, Tansu Yamazhan ²
Ege University Faculty Of Medicine, Department Of Psychiatry And Mental Health, İzmir-Türkiye ¹ Ege University Faculty Of Medicine, Department Of Infectious Disease And Clinical Microbiology, İzmir-Türkiye ² Ege University Faculty Of Medicine, Department Of Medical Microbiology, İzmir-Türkiye ³

Background / Hypothesis: Injection drug use and related high-risk behaviors significantly contribute to the transmission of Hepatitis A (HAV), Hepatitis B (HBV), Hepatitis C (HCV), and Human Immunodeficiency Virus (HIV). World Health Organization (WHO) and the United Nations Office on Drugs and Crime (UNODC) guidelines recommend screening individuals who use drugs not

ORAL ABSTRACTS

only for HBV and HCV, but also for HIV and other sexually transmitted infections. However, screening rates remain inadequate. Our study aims to determine the seroprevalence of HAV, HBV, HCV, and HIV among individuals with substance use disorder, and evaluate their association with substance use.

Materials and Methods: In our study, the medical records of patients with substance use disorder at the Department of Psychiatry of a tertiary hospital between June 1, 2000, and July 1, 2025, were retrospectively reviewed. The participants' sex and serological test results (HBsAg, anti-HBs, anti-HCV, anti-HAV IgG, anti-HIV) were evaluated. The types of substances used by the patients were categorized based on the route of administration as oral, parenteral, and inhalational. The data were analyzed using descriptive statistical methods, and differences between groups were assessed with the chi-square test.

Results: Median age was 33 years (IQR:25-45), 85.6% were male. A total of 8,145 patient records were reviewed for the specified period, and 2,478 patients (30.4%) who underwent serological screening were included in the study. HIV serology was performed in 2,343 patients, and 20 patients (0.85%) were positive. HCV serology was performed in 2,422 patients, and 47 patients (1.94%) were positive. Of these patients, 16 (34.04%) received treatment, and HCV RNA negativity was documented in 22 patients (46.80%). HBV serology was performed in 2389 patients, and 56 (2.3%) were positive. Among 56 patients, 7 (12.50%) received treatment and achieved HBV DNA negativity. Among 44 patients with isolated anti-HBc IgG positivity, only 11 underwent HBV DNA testing; however, none were positive. Other serological findings are summarized in Table 1. The distribution of substance types used by patients with positive HBsAg and Anti-HCV results is presented in Table 2 below.

Conclusions: In our study, only 30.4% of patients were screened, with an HBsAg positivity rate of 2.34% and an anti-HCV positivity rate of 1.94%. These rates are higher compared to the values reported for the general population in the Aegean Region, where HBsAg positivity ranges between 1–1.5% and anti-HCV positivity between 0.1–0.4%. The elevated seroprevalence observed in our cohort highlights the need to strengthen infection control strategies among high-risk individuals.

1934 - Comprehensive Evaluation of Demographic Endoscopic and Ultrasonographic Characteristics in First Episode Variceal Bleeding

Hakan Demiröz¹, Yusuf Bünyamin Ketenci¹, Mehmet Akca¹, İlyas F. M. Ayyaş², Müge Ustaoglu Dede¹, Ufuk Avcioglu¹, Talat Ayyildiz¹, İbrahim Avcioglu¹, Ahmet Bektaş¹

Ondokuz Mayıs University Faculty Of Medicine, Department Of Gastroenterology, Samsun-Türkiye¹
Ondokuz Mayıs University Faculty Of Medicine, Department Of Internal Medicine, Samsun-Türkiye²

Background / Hypothesis: Esophagogastric variceal hemorrhage (EGVH) is one of the most severe complications of portal hypertension and remains a major cause of morbidity and mortality among patients with liver cirrhosis. Identifying demographic and clinical factors associated with first bleeding episodes is essential for improving risk stratification and guiding individualized management.

Materials and Methods: This retrospective, single-center cohort study included 67 consecutive cirrhotic patients presenting with their first episode of EGVH between January 2020 May 2025. Demographic data, etiology of cirrhosis, laboratory parameters, ultrasonographic vascular measurements, endoscopic findings, medication history, clinical complications during hospitalization, and early outcomes were evaluated. Comparisons between sexes were performed using appropriate statistical tests, and $p < 0.05$ was considered statistically significant.

Results: The study cohort consisted of 26 females (39%) and 41 males (61%) with a mean age of 61.7 ± 13.9 years. Cryptogenic cirrhosis (31.3%) and HBV-related cirrhosis (22.4%) were the most common etiologies. Red spots and nipple signs were observed in 92.5% and 73.1% of patients, respectively. Endoscopic band ligation was performed in 85.1% of cases, whereas N-butyl-2-cyanoacrylate (NBCA) injection was applied in 16.4%. At the time of presentation, ascites was present in 37.3% of patients, whereas hypotension was observed in 20.9%. In-hospital mortality was 7.5%. Most demographic, laboratory, and ultrasonographic parameters; including length of hospital stay, hemoglobin, platelet count, ALT, ALP, bilirubin, albumin, potassium, BUN, creatinine, INR, ammonia levels, as well as spleen size and both portal

ORAL ABSTRACTS

and splenic vein diameters were comparable between genders. In contrast, several variables demonstrated significant gender related differences: male patients were younger and exhibited higher AST and GGT levels, whereas female patients had higher serum sodium concentrations.

Conclusions: Patients presenting with first variceal bleeding demonstrated moderate liver dysfunction, high prevalence of endoscopic bleeding stigmata, and substantial early complication rates. NSBB prophylaxis did not fully prevent first bleeding episodes, suggesting the need for optimized dosing or combined strategies. These findings enhance the understanding of risk profiles among patients experiencing their first episode of EGVH and may support more individualized clinical decision-making.

Keyword(s) : Esophagogastric variceal hemorrhage, portal hypertension, cirrhosis

1935 - Neuropilin 1 alleviates metabolic dysfunction associated fatty liver disease by promoting lysosomal degradation of toll like receptor 4 in macrophages

Yinuo Yang¹, Qiang Zhu²
Shandong Provincial Hospital, Cheeloo College Of Medicine, Shandong University, Department Of Infectious Disease, Jinan-China ¹ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Infectious Disease, Jinan-China ²

Background / **Hypothesis:**
The prevalence of metabolic dysfunction-associated fatty liver disease (MAFLD) is increasing year by year and has become one of the leading causes of end-stage liver disease worldwide. Macrophage-mediated chronic hepatic inflammation plays a pivotal role in the progression MAFLD. Neuropilin-1 (Nrp1) acts as an immune regulator, but its specific role in hepatic macrophages during liver steatosis remains unclear. This study aims to explore the role and mechanism of Nrp1 in MAFLD.

Materials and **Methods:**
Myeloid -specific Nrp1 knockout mice (Nrp1MKO) were generated by crossing Lyz2-Cre mice with Nrp1-flox/flox mice. Nrp1MKO and littermate controls were fed a western diet (WD) for 16 weeks or a methionine-choline-deficient (MCD) diet for 8 weeks to induce MAFLD. Single-cell RNA sequencing datasets from patients with nonalcoholic steatohepatitis (NASH) were analyzed. In vitro experiments were conducted in bone

marrow-derived macrophages (BMDMs) and THP-1 cells using lentiviral overexpression and knockdown of Nrp1. Mechanistic interactions were assessed through RNA-seq, western blotting, flow cytometry and co-immunoprecipitation.

Results:

Nrp1 expression was significantly upregulated in hepatic macrophages from patients with steatohepatitis and MAFLD mouse models. In vivo, Nrp1MKO mice exhibited exacerbated hepatic steatosis, inflammation, and liver injury compared with controls under WD or MCD feeding. In vitro, Nrp1 deficiency in macrophages promoted polarization toward a pro-inflammatory phenotype and increased the secretion of cytokines and chemokines, including IL-1 β , IL-6, TNF- α , and CCL2. RNA-seq and gene set enrichment analysis revealed a significant enrichment of the toll-like receptor signaling pathway in Nrp1-deficient macrophages. Notably, while Tlr4 mRNA levels remained unchanged, western blotting showed markedly accumulated toll-like receptor 4 (TLR4) protein in Nrp1-deficient macrophages. Mechanistically, we demonstrated that Nrp1 directly binds to TLR4 and facilitates its lysosomal degradation. Consequently, Nrp1 deficiency impaired TLR4 turnover, leading to sustained activation of the downstream nuclear factor (NF)- κ B signaling pathway. Conversely, Nrp1 overexpression accelerated TLR4 degradation and suppressed NF- κ B activation.

Conclusions:

Nrp1 acts as a critical negative regulator of hepatic inflammation by forming a Nrp1/TLR4 complex to promote the lysosomal degradation of TLR4, thereby inhibiting NF- κ B signaling. Targeting the macrophage Nrp1-TLR4 axis may represent a potential therapeutic strategy for MAFLD intervention.

1938 - Prediction of Esophageal Varices in Primary Biliary Cholangitis What Is the Role of Non Invasive Tests

Ikram Aluahabi¹, Mohamed Borahma¹, Fatima Zahra Chabib¹, Nawal Lagdali¹, Selma Sebbah¹, Fatima Zohra Ajana¹, Maryeme Kadiri¹
Ibn Sina University Hospital, Faculty Of Medicine And Pharmacy Of Rabat. Mohammed V University Rabat., Medecine C Hepatogastroenterology Departement,, Rabat-Morocco ¹

Introduction

Screening for esophageal varices (EV) in patients with

ORAL ABSTRACTS

primary biliary cholangitis (PBC) is essential to reduce the morbidity and mortality associated with gastrointestinal bleeding. Current research increasingly explores non-invasive tests that may help limit unnecessary endoscopic procedures. The e-LIFT score, proposed as a non-invasive method for predicting varices, has been evaluated in only one study. The objective of our work was to assess the correlation between endoscopic findings and the e-LIFT score.

Patients	and	Methods
This retrospective, descriptive, and analytical monocentric study was conducted over an eight-year period (2018–2025) in a gastroenterology department. It included patients followed for PBC who underwent an upper gastrointestinal endoscopy (EGD). Data were collected from patient records. EGD was performed in all patients to detect esophageal varices. The diagnostic performance of the e-LIFT score was assessed using ROC curve analysis, including sensitivity, specificity, and negative predictive value.		

Results
A total of 67 patients with PBC were included. The mean age was 50 ± 14.2 years, with a marked female predominance (80.6%, F/M ratio = 4.15). EGD revealed EV in 41.4% (n = 24) of patients, among whom 12.5% (n = 3), 41.6% (n = 10), and 45.8% (n = 11) had grade I, II, and III varices, respectively. The predictive performance of the e-LIFT score was acceptable, with an AUC of 0.745. A cutoff value of 13 showed the best discriminative accuracy, yielding a sensitivity of 82.14%, a specificity of 61.51%, and a negative predictive value of 82.76%.

Conclusion
The e-LIFT score appears to be a simple and reliable non-invasive serum marker for screening esophageal varices in primary biliary cholangitis. An upper endoscopy may potentially be avoided in 82.76% of patients with an e-LIFT score below 13.

1940 - Dual SGLT2 DPP 4 Inhibition Synergistically Restores Hepatopancreatic Integrity in Experimental Diabetes

Mohd. Ibrahim Khan¹, Danish Ahmed¹
Sam Higginbottom University Of Agriculture
Technology And Sciences, Department Of
Pharmaceutical Sciences, Prayagraj-India¹

Background / Hypothesis: Diabetes mellitus, now exceeding 500 million cases globally, underscores an urgent need for metabolic therapies that also preserve hepatic function. Emerging evidence shows that improving hepatic resilience can substantially reduce long-term diabetic complications. Empagliflozin, an SGLT2 inhibitor, provides broad metabolic benefits by lowering glucotoxicity, enhancing fatty acid oxidation, improving mitochondrial efficiency, and restoring healthy adipose–liver communication. Sitagliptin, a DPP-4 inhibitor, further strengthens metabolic control through incretin enhancement, optimizing insulin secretion, reducing glucagon, suppressing lipogenesis, and improving oxidative defense. The complementary nature of these mechanisms suggests a promising synergistic potential for improved hepatic outcomes in diabetes.

Materials and Methods: STZ induced diabetic rats received Empagliflozin (10 mg/kg), Sitagliptin (10 mg/kg), their combination and standard metformin for 28 days. Serum glycemic index, hepatic enzyme levels, lipid profile, and oxidative stress markers (MDA, SOD, CAT) were evaluated. Pancreatic as well as liver histology were performed to assess steatosis, inflammation, β -cell morphology, islet integrity, and hepatocellular architecture. Comparisons were made to identify improvements in pancreatic restoration, hepatic protection, and overall metabolic regulation.

Results: Empagliflozin markedly improved glycemic status and reduced hepatic steatosis, while Sitagliptin enhanced incretin signaling, reduced DNL, preserved β -cell structure, and improved oxidative defense. Combination therapy produced the strongest hepatopancreatic benefit, including $\approx 60\%$ reduction in hepatic triglycerides, reduced MDA, elevated SOD/CAT, and improved islet morphology with greater β -cell preservation. The synergism arose from dual correction of glucotoxicity (via SGLT2 inhibition) and enhanced insulinotropic incretin activity (via DPP-4 inhibition), resulting in superior mitochondrial efficiency, lipid balance, and structural organ protection.

Conclusions: Empagliflozin and Sitagliptin together provide robust metabolic, hepatic, and pancreatic protection, demonstrating synergistic reductions in fatty liver, oxidative stress, and β -cell damage. Their combined mechanism driven actions highlight a promising therapeutic strategy for improving hepatopancreatic outcomes in diabetes.

1941 - Predictors and Immune Signatures of Baveno VII-Aligned Recompensation in Pediatric Wilson Disease with Decompensated Cirrhosis

Anmol Anmol¹, Vikrant Sood², Rajeev Khanna¹, Seema Alam¹, Bikrant Biharilal¹, Sukriti Baweja³, Guresh Kumar⁴

Institute Of Liver And Biliary Sciences, Pediatric Hepatology, Delhi-India¹ Institute Of Liver And Biliary Sciences, Pediatric Hepatology, Delhi-India² Institute Of Liver And Biliary Sciences, Molecular Medicine, Delhi-India³ Institute Of Liver And Biliary Sciences, Biostatistics, Delhi-India⁴

Background / Hypothesis: With growing evidence that etiological therapy may reverse decompensation in chronic liver disease, pediatric data remain scarce, particularly for Wilson disease. We evaluated the incidence, determinants, cytokine signatures, and outcomes associated with Baveno-VII-defined hepatic recompensation in children with decompensated Wilson disease.

Materials and Methods: Ambispective cohort including children <18 years with decompensated Wilson disease (2014–2024) and ≥1-year follow-up. Recompensation required: (i) control of copper overload, (ii) ≥12 months' absence of ascites/HE without supportive drugs and no variceal bleeding, and (iii) normalized bilirubin, albumin, and INR. Longitudinal liver function trends, cumulative recompensation incidence, survival, and re-decompensation were assessed. A subset underwent paired stool–plasma cytokine quantification

Results: Seventy-nine children (median age 9.2 years) were analyzed. Recompensation occurred in 88.6%, mostly within 12–36 months of therapy, sharply rising between year-1 and year-2. Clinical recovery followed a reproducible pattern: ascites → jaundice → INR → albumin normalization. Re-decompensation occurred in 11.4%, predominantly due to non-adherence, but was usually salvageable without transplant.

Baseline smaller spleen size, higher platelet and leukocyte counts, lower liver stiffness, and lower ALT significantly predicted recompensation. Recompensated patients had superior native liver survival (98.6% vs 33.3%, $p < 0.001$).

Cytokine profiling ($n=20$) revealed higher stool IL-6 and

higher plasma IL-10 in those achieving recompensation. IL-10 may reflect enhanced regulatory immune tone, supporting hepatocyte recovery and fibrosis reversal. The elevated gut-localized IL-6 likely reflects beneficial gut–liver axis activation rather than systemic inflammation — possibly promoting mucosal healing, microbiome restoration, and improved portal immune signaling. Together, these cytokine patterns appear to represent an immune microenvironment favorable for hepatic tissue remodeling.

Conclusions:

Recompensation is frequent, physiologically robust, and survival-enhancing in pediatric Wilson disease. Portal hypertension markers and baseline immune state may serve as early prognostic tools. Cytokine signatures highlight gut–liver immune restoration as a potential biological driver of reversibility. Multicenter validation and immune-integrated predictive modeling are warranted.

1943 - Investigation of the Therapeutic Effects of $\beta 3$ Adrenergic Stimulation on Paracetamol Induced Acute Liver Damage

Seydanur Avci¹, Aylin Aydin², Hamza Halici³, Hakan Dursun⁴, Abdulmecit Albayrak¹, Zekai Halici¹, Elif Cadirci¹

Ataturk University, Department Of Pharmacology, Faculty Of Medicine, Ezurum-Türkiye¹ Ataturk University, Department Of Pharmacology, Faculty Of Pharmacy, Ezurum-Türkiye² Ataturk University, Department Of Pharmacy Services, Hınıs Vocational High School, Ezurum-Türkiye³ Ataturk University, Department Of Gastroenterology, Faculty Of Medicine, Ezurum-Türkiye⁴

Background/Hypothesis: Although paracetamol is a well-tolerated and safe analgesic, the annual increase in cases of paracetamol toxicity has become a significant public health concern. Excessive paracetamol intake causes hepatocellular damage by inducing oxidative stress, mitochondrial dysfunction, and inflammation. Recent studies on $\beta 3$ -adrenergic receptors, which are considered to play a key role in our hypothesis, have shown that these receptors exert critical regulatory effects on energy metabolism and mitochondrial function. The roles of $\beta 3$ -adrenergic receptors, in the gluconeogenic pathway and hepatic lipid metabolism suggest that they may also have potential effects on

ORAL ABSTRACTS

inflammatory processes. Our study investigated the effects of Mirabegron, a $\beta 3$ -adrenergic receptor agonist, on liver damage.

Materials and Methods: In this study, Balb/C mice were divided into following groups: healthy control, NAC, paracetamol, Mirabegron 5mg/kg, Mirabegron 10mg/kg, Mirabegron 20mg/kg, and Mirabegron 20mg/kg+healthy control. All groups except the healthy controls received 400mg/kg paracetamol via oral gavage. One hour after paracetamol administration, the NAC group was treated with NAC at a dose of 140mg/kg, and the Mirabegron groups received the target drug Mirabegron at doses of 5, 10, and 20mg/kg via oral gavage. At the end of the experiment, mRNA expression levels of TNF- α , IL-6, IL-1 β , and CYP2E1 were evaluated, and TNF- α and IL-1 β levels were also measured by ELISA method.

Results: TNF α , IL-1 β , and IL-6 mRNA expression levels increased in the toxicity group compared to the healthy group. The 5 and 10 mg/kg doses of mirabegron reduced these markers, whereas, the 20 mg/kg dose did not exert a similar anti-inflammatory effect. ELISA results were consistent with the PCR findings. CYP2E1 mRNA expression was elevated in the paracetamol group and decreased in the 5 and 10 mg/kg mirabegron groups. However, the 20 mg/kg dose was not effective; on the contrary, it further stimulated CYP2E1 expression.

Conclusions: In this study, paracetamol-induced hepatic toxicity led to marked increases in TNF α , IL-1 β , IL-6, and CYP2E1 mRNA expression levels. Treatment with mirabegron at doses of 5 and 10mg/kg effectively reduced pro-inflammatory cytokine expression and suppressed CYP2E1 induction. Interestingly, the 20 mg/kg dose did not exhibit similar protective effects and instead demonstrated a stimulatory impact on CYP2E1 expression, suggesting a dose-dependent response profile for mirabegron. Overall, this study demonstrates that mirabegron, particularly at lower doses, exerts hepatoprotective effects against paracetamol-induced liver injury by modulating inflammatory signaling. These results highlight $\beta 3$ -adrenergic stimulation as a promising therapeutic candidate for xenobiotic-induced acute liver damage and warrant further investigation in future studies

Keyword(s) : Mirabegron, Liver, Paracetamol, $\beta 3$ -adrenergic receptors, CYP2E1

1945 - Impact of Microbiome in Obese vs Lean Steatotic Liver Disease in Children

Betül Tunç Demirci¹, Ozlem Durmaz¹, Dilek Sever Kaya², Zerrin Onal¹, Elif Turkmen¹, Bülent Saka², Zuhay Bayramoğlu³, Edanur Karapinar³, Melike Tuğrul Aksakal⁴, Merve Kurt⁵, Selin Akbulut⁶
Istanbul University Istanbul Medical Faculty, Department Of Pediatric Gastroenterology, Hepatology And Nutrition, Istanbul-Türkiye¹ Istanbul University Istanbul Medical Faculty, Clinical Nutrition And Microbiota Research Laboratory, Istanbul-Türkiye² Istanbul University Istanbul Medical Faculty, Department Of Radiology, Istanbul-Türkiye³ Istanbul University Istanbul Medical Faculty, Department Of Adolescent Health, Istanbul-Türkiye⁴ Istanbul University Institute Of Health Sciences, Genetic Msc Program, Istanbul-Türkiye⁵ Istanbul University Institute Of Health Sciences, Nutrition (child Health And Diseases) Msc Program, Istanbul-Türkiye⁶

Background / Hypothesis: Steatotic liver disease (SLD) in children is influenced by environment, genetics, obesity, and insulin resistance. We aimed to investigate the association between intestinal microbiome profiles and liver steatosis in obese versus lean pediatric patients.
Materials and Methods: The study analyzed fecal microbiota, anthropometric measurements, and biochemical and metabolic tests in children attending Pediatric Gastroenterology and Adolescent Clinics between January and December 2023. The study group (SG) comprised of 52 pediatric SLD patients (41 obese: SGO, 11 lean: SGL), with liver steatosis on ultrasound (US). A control group (CG) of 42 age-matched healthy volunteers (20 obese: CGO, 22 lean: CGL) was also included. Inclusion criteria were ages 6-18 years, no other causes of liver steatosis, chronic diseases or drug use, no gastrointestinal surgery, and absence antibiotic or probiotic use in the previous three months. Medical history, demographics, anthropometric measurements, biochemical parameters, imaging findings, and exercise and dietary habits were reviewed. Stool samples were analyzed using 16S rRNA Amplicon Sequencing to assess gut microbiota diversity and composition. SPSS 28.0 was used for statistical analysis.
Results:

The mean age was 13.0 $\pm$ 3.0 years, without significant difference between groups. Significant sex difference was observed in CGO versus SGO (F/M ratio 1.86 vs 0.64, p=0.05). Mean waist circumference SDS was significantly higher in SGL compared to CGL (1.7 $\pm$ 0.8 vs

ORAL ABSTRACTS

0.8±0.7, p=0.007). Increased alpha diversity in CGO and CGL compared to SGO and SGL suggested a link between reduced alpha diversity and SLD. Genera associated with both obesity and SLD included Coprococcus, Bacteroides, Alistipes, and Lachnospiraceae NK4A136. However, logistic regression identified decreased abundance of Lachnospiraceae NK4A136 and Monoglobus as significant factors in addition to increased waist circumference, for distinguishing patients with SLD. Conclusions: Obesity, liver steatosis, and metabolic syndrome correlate with distinct changes in pediatric gut microbiota. Reduced abundance of NK4A136 and Monoglobus is associated with pediatric SLD, regardless of obesity

1949 - Development and Evaluation of Polyherbal Chitosan Nanoparticles Antioxidant and Cytotoxic Effects on HepG2 Cells
Mohammad Shariq¹, Mohd Ibrahim Khan²
Integral University, Pharmaceuticals, Lucknow-India¹ Sam Higginbottom University Of Agriculture Technology And Sciences, Pharmacology, Prayagraj-India²

Background / **Hypothesis:**
Cancer and oxidative stress are pathologically intertwined, driving the search for novel, multi-targeted therapies. Polyherbal formulations can offer synergistic advantages over single compounds. Berberis aristata, Andrographis paniculata, and Thevetia peruviana are individually recognized for their bioactive properties, yet their combined potential remains unexplored. This study investigates this specific polyherbal combination for its integrated antioxidant and anticancer efficacy.
Materials and **Methods:**
A polyherbal combination (2:1:1) was qualitatively and quantitatively analyzed by ultraviolet spectroscopy and subsequently loaded into chitosan nanoparticles (CS-NPs) fabricated by ionic gelation. The developed CS-NPs were characterized using scanning electron microscopy (SEM) and X-ray diffraction (XRD). The cytotoxic effect on HepG2 cell lines and the antioxidant potential (via DPPH assay) were assessed for both the polyherbal combination and its nanoformulation.
Results:

Content of berberine, andrographolide and rosmarinic acid in polyherbal combination (2:1:1) was found to be 2.188, 0.472 and 0.264%w/w. Cytotoxicity of different polyherbal combinations (2:1:1, 1:1:1, 1:1:2 and 1:2:1) and its prepared chitosan nanoparticles (2:1:1) against HepG2 cells were found to be at an IC₅₀ of 13.96, 16.47, 15.20, 16.1 and 15.67 µg/ml

respectively. 2, 2-diphenyl-1-picrylhydrazyl scavenging activity of Polyherbal combination (2:1:1) and its prepared chitosan nanoparticles (2:1:1) showed potent antioxidant potential.

Conclusions: The developed Polyherbal combination (2:1:1) and its prepared chitosan nanoparticles was found to possess antioxidant and anticancer potential.

1950 - Decellularized Liver Matrix from Healthy versus Acute Liver Failure Livers Possesses Distinct Structural and Functional Properties
Chen Zhou¹, Xiangnan Teng¹, Lang Bai¹, Huiqi Xie², Hong Tang¹
West China Hospital, Sichuan University, Center Of Infectious Disease; Laboratory Of Infectious And Liver Diseases, Institution Of Infectious Diseases; Division Of Infectious Diseases In Stat, Chengdu-China¹ West China Hospital, Sichuan University, Department Of Orthopedic Surgery And Orthopedic Research Institute, Stem Cell And Tissue Engineering Research Center, State Key Laboratory Of Biothera, Chengdu-China²

Background / **Hypothesis:**
The liver extracellular matrix (ECM) provides a dynamic and instructive microenvironment that is fundamental to cellular homeostasis and function. In acute liver failure (ALF), this complex architecture undergoes profound pathological remodeling. We hypothesize that decellularized ECM scaffolds retain distinct compositional and structural signatures between healthy and ALF liver. Consequently, these scaffolds are predicted to differentially regulate fundamental cellular behaviors.

Materials and **Methods:**
We generated acellular liver scaffolds from healthy mouse livers (L-ECM) and from a murine model of ALF (ALF-ECM) using a standardized tissue-engineering decellularization protocol. The resulting ECM scaffolds were rigorously characterized. Residual DNA was quantified to confirm decellularization efficacy, total protein content was measured via a BCA assay, and the three-dimensional ultrastructure was visualized using scanning electron microscopy (SEM). To functionally compare the bioactivity of the matrices, extract solution of L-ECM and ALF-ECM were extracted for further testing. The concentration of the pivotal pro-regenerative cytokine VEGF within the matrix extracts

ORAL ABSTRACTS

was quantified by enzyme-linked immunosorbent assay (ELISA). Then, conditioned medium for human umbilical cord-derived mesenchymal stem cells (UC-MSCs) was prepared and used for UC-MSCs culturing. Cellular proliferation was assessed using a CCK-8 assay, and migratory capacity was evaluated via a migration assay.

Results:

Both L-ECM and ALF-ECM scaffolds met the critical criterion for effective decellularization, with residual DNA content below 50 ng/mg. However, significant differences were observed in their composition and architecture. Quantitative analysis revealed that L-ECM retained a significantly greater total protein content. SEM imaging further demonstrated that L-ECM preserved a regular, highly porous, and organized fibrillar network, whereas ALF-ECM exhibited a markedly disorganized and dense architecture with irregular pore structures. Although the concentration of VEGF in L-ECM and ALF-ECM were significantly higher than control medium, L-ECM still extracts contained a substantially higher concentration compared to ALF-ECM extracts. Similarly, while both ECMs types supported UC-MSC proliferation superior to control medium culture, the proliferative response was significantly more robust on L-ECM. Moreover, cell migration was markedly enhanced on L-ECM compared to both the control and ALF-ECM groups.

Conclusions:

This study demonstrates that the pathophysiological origin of liver dECM critically determines its composition, structure, and biofunctionality. ALF-ECM, derived from a diseased microenvironment, is characterized by compromised structural integrity and diminished retention of key growth factors like VEGF, which directly translates to its inferior capacity to direct essential cellular processes.

1954 - Effects of Obinutuzumab on Cecal Ligation and Puncture Induced Septic Liver Injury in Rats

Maide Sena Civelek ¹, Aysegul Tavaci-ozcelik ¹, Hamza Halici ², Fatih Albayrak ³, Abdulmecit Albayrak ¹, Yasin Bayir ⁴, Zekai Halici ¹
Ataturk University Faculty Of Medicine, Medical Pharmacology, Erzurum-Türkiye ¹ Ataturk University Hınıs Vocational School, Pharmacy Services, Erzurum-Türkiye ² Ataturk University Faculty Of Medicine, Gastroenterology, Erzurum-Türkiye ³ Ataturk University Faculty Of Pharmacy, Biochemistry, Erzurum-Türkiye ⁴

Background / Hypothesis: Sepsis is a life-threatening organ dysfunction caused by a dysregulated host response to infection. The liver, a central organ in the regulation of systemic inflammatory responses, becomes particularly vulnerable and undergoes significant injury during sepsis. Obinutuzumab, a type II anti-CD20 monoclonal antibody targeting B cells, has emerged as a potential therapeutic agent for modulating the immune response. This study aimed to investigate the effects of Obinutuzumab on hepatic inflammatory responses in a rat model of sepsis induced by cecal ligation and puncture (CLP), a well-established model of excessive immune activation.

Materials and Methods: A total of 58 rats were divided into six groups: Healthy, Healthy + Obinutuzumab 10 mg/kg, CLP, CLP + Obinutuzumab 2.5 mg/kg, CLP + Obinutuzumab 5 mg/kg, and CLP + Obinutuzumab 10 mg/kg. Obinutuzumab was administered intraperitoneally 1 hour after CLP. Hepatic proinflammatory cytokines, NF- κ B protein levels, and NF- κ B gene expression were assessed.

Results: Obinutuzumab treatment reduced hepatic proinflammatory cytokines in a dose-dependent manner compared with the CLP group. TNF- α and IL-6 levels were significantly reduced at 2.5 mg/kg ($p < 0.01$) and highly significantly decreased at 5 and 10 mg/kg ($p < 0.0001$). NF- κ B protein levels showed significant reductions at 5 mg/kg ($p < 0.01$) and highly significant decreases at 10 mg/kg ($p < 0.0001$), while NF- κ B gene expression was highly significantly diminished at all doses ($p < 0.0001$). In contrast, IL-1 β levels were significantly reduced only in the CLP + Obinutuzumab 10 mg/kg group ($p < 0.001$), whereas no significant differences were detected at the lower doses ($p > 0.05$).

Conclusions: These findings suggest that Obinutuzumab may protect against sepsis-induced liver injury by modulating the immune response, highlighting its potential as a therapeutic agent to prevent organ damage associated with sepsis.

ORAL ABSTRACTS

Of Medical Sciences, Turin-Italy ² University Medical Centre Mainz, Department Of Internal Medicine I, Mainz-Germany ³

Background / Hypothesis: People living with HIV (PLWH) show a high prevalence of metabolic comorbidities and other partially overlapping liver-related risk factors, including co-infections with hepatitis B (HBV) and hepatitis C (HCV) virus, which increase the risk of steatotic liver disease (SLD) and liver fibrosis, leading to worse outcomes. However, the disease burden of SLD, its different subcategories, and associated risk factors in PLWH under antiretroviral therapy remains to be determined.

Materials and Methods: In this prospectively enrolling cohort study, participants with an HIV infection were non-invasively screened using vibration-controlled transient elastography (VCTE) for SLD (controlled attenuation parameter [CAP] ≥ 248 dB/m) and fibrosis (liver stiffness measurement [LSM] ≥ 8 kPa). The Fibroscan-AST (FAST) score was used to identify those with metabolic-dysfunction associated steatohepatitis (MASH) and significant fibrosis, using a cut-off ≥ 0.67 . Uni- and multivariable logistic regression analysis was used to determine predictors of SLD.

Results: In the entire cohort of 325 participants, 71.4% were male and the median age was 51 (41; 58) years. The median HIV disease duration was 12 (5; 20) years and the majority had a CD4 cell count $\geq 500/\mu\text{L}$ (70.2%). A history of HBV and HCV was detected in 19.4% (n=63) and 5.8% (n=19), respectively. Median BMI (kg/m^2) was 25.3 (22.5; 28.5), and 17.5% (n=57) were obese (BMI ≥ 30 kg/m^2). Insulin resistance was detected in 24.3% (n=79). The overall prevalence of SLD was 50.8% (n=165), with MASLD (42.8%, n=139) showing the highest prevalence as compared to either MetALD (2.5%, n=8) or ALD (0.9%, n=3). Of those with MASLD, 23.7% (n=33) had a history of HBV or HCV coinfection (MASLD-viral). Cryptogenic or other causes (viral, undefined due to missing data) of SLD were identified in 4.3% (n=14). Metabolic comorbidities were overall more prevalent in participants with SLD. Liver fibrosis and MASH were detected in 5.8% (n=19) and 1.8% (n=6), respectively, in those with MASLD. On multivariable analysis, the cardiometabolic criterion with a BMI ≥ 25 kg/m^2 or a waist circumference $\geq 94/80$ cm (male/female) was jointly associated with SLD (OR 5.2, 95% CI 2.5-10.6, $p < 0.001$). In turn, HIV-related parameters showed no effect on the risk of SLD.

Conclusions: The burden of SLD and in particular MASLD

is high in PLWH. Screening for SLD, fibrosis, and associated metabolic comorbidities may reduce the burden of liver disease in PLWH and identify those at higher risk of liver disease progression.

Keyword(s) : PLWH; MASLD; HBV; HCV; VCTE

1967 - Hepatitis C Virus Micro-elimination in the Hospital Setting What Results Have We Achieved

Lu Zhang¹, Yu-nan Chang², Xiao-hao Wang¹, Shi-ying Fu¹, Zhi Zhou¹, Da-chuan Cai¹, Shan Zhong¹, Peng Hu¹, Hu Li¹

The Second Affiliated Hospital, Chongqing Medical University, Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Institute For Viral Hepatitis, Chongqing-China ¹ Children's Hospital Of Chongqing Medical University, Department Of Infectious Diseases, Chongqing-China ²

Background: Hospital-based hepatitis C virus (HCV) screening and linkage-to-care are critical to achieving HCV elimination targets. We evaluated the outcomes of a 3-year, hospital-based HCV micro-elimination model.

Materials and Methods: We conducted a prospective interventional program of HCV case-finding and linkage-to-care at the Second Affiliated Hospital of Chongqing Medical University, Chongqing, China, starting in 2022. All adult patients admitted to the hospital during the study period who tested positive for anti-HCV were included. Anti-HCV-positive patients were referred to an infectious diseases specialist for HCV RNA testing, and HCV RNA-positive patients were offered direct-acting antiviral (DAA) therapy according to international guidelines. Primary outcomes were the proportions of HCV RNA-positive patients who were (1) linked to specialist care, (2) initiated on DAA therapy, and (3) started treatment within 12 weeks of diagnosis. Outcomes were compared between the early phase (2022) and late phase (2023–2024) of the program.

Results: Among 265,645 patients tested for anti-HCV, 4,303 (1.62%) were anti-HCV-positive. Of these, 817 were HCV RNA-positive (mean age 50.4 years; 63.4% male; mean viral load 5.70 log₁₀ IU/mL), and 672 (82.3%) received DAA treatment. The proportion of HCV RNA-positive patients receiving treatment increased significantly from 78.6% in the early phase to 83.7% in the late phase ($P < 0.05$). Among HCV RNA-positive patients managed in non-hepatology and non-infectious diseases departments, the proportion treated increased from 54.4% to 70.8%. Within 12 weeks

ORAL ABSTRACTS

of HCV diagnosis, the proportion of patients initiating DAA therapy rose from 85.5% to 91.1% ($P < 0.05$).

Conclusions: This hospital-based HCV micro-elimination program significantly improved DAA treatment uptake and the timeliness of treatment initiation, including among patients managed outside hepatology and infectious disease departments. It represents an effective model for advancing HCV micro-elimination in the hospital setting.

Keyword(s) : hepatitis C virus; HCV; micro-elimination; direct-acting antivirals; DAA

1968 - Investigation of the Effects of Vasopressin V2 Receptor Inhibition on Aquaporin Expression and Liver Functions in Sepsis Induced Hepatic Injury

Zeynep Karakoy ¹, Seydanur Avcı ², Alperen Canpolat ³, Zafer Bayraktutan ⁴, Hakan Dursun ⁵, Abdulmecit Albayrak ², Elif Cadirci ²
Erzincan Binali Yıldırım University, Department Of Pharmacology, Erzincan-Türkiye ¹ Ataturk University, Department Of Pharmacology, Erzurum-Türkiye ² Ağrı Ibrahim Çeçen University, Department Of Pharmacology, Ağrı-Türkiye ³ Ataturk University, Department Of Biochemistry, Erzurum-Türkiye ⁴ Ataturk University, Department Of Gastroenterology, Erzurum-Türkiye ⁵

Background / Hypothesis: Sepsis is a severe clinical syndrome characterized by uncontrolled activation of the systemic inflammatory response, ultimately leading to multiple organ dysfunction and high mortality. Given its central role in immune regulation and metabolic homeostasis, the liver is among the first organs in which sepsis-associated cellular and molecular injury becomes evident. Aquaporin channels (AQP2 and AQP5), which are essential for maintaining water homeostasis in hepatocytes, may be influenced by inflammation-related signaling alterations and thereby contribute to hepatic dysfunction. The MAPK signaling pathway, a key regulator of inflammatory processes, is known to be markedly activated during sepsis. Tolvaptan, a vasopressin V2 receptor antagonist, is proposed to exert modulatory effects on dysregulated aquaporin expression and MAPK-mediated inflammatory responses. This study aims to evaluate the potential of tolvaptan to modulate sepsis-associated alterations in AQP2 and AQP5 expression, disturbances in MAPK activation, and the sepsis-induced increases in hepatic IL-1 β and IL-6 levels.

Materials and Methods: Five experimental groups were established: healthy control, LPS control, and tolvaptan-treated groups receiving 15 mg/kg, 30 mg/kg, or 60 mg/kg. The sepsis model was induced by intraperitoneal lipopolysaccharide administration, and tolvaptan was given orally at the specified doses. Liver tissues were collected for the evaluation of AQP2, AQP5, and MAPK gene expression using real-time PCR, and tissue levels of IL-1 β and IL-6 were quantified by ELISA. Data were analyzed using appropriate statistical tests.

Results:

LPS administration resulted in a significant disruption of AQP2 and AQP5 gene expression, accompanied by a marked elevation in MAPK transcriptional activity. Serum IL-1 β and IL-6 concentrations were also significantly increased in the LPS control group. Tolvaptan treatment produced a dose-dependent amelioration in all assessed parameters, with higher doses yielding a pronounced attenuation of MAPK activation. Additionally, substantial reductions in IL-1 β and IL-6 levels were observed following tolvaptan administration.

Conclusions:

V2 receptor inhibition by tolvaptan modulated sepsis-associated disturbances in aquaporin expression and attenuated MAPK signaling activation, leading to a reduction in the systemic pro-inflammatory response. These findings suggest that V2 receptor antagonism may represent a mechanism-based therapeutic approach for sepsis-associated hepatic injury. Nevertheless, further studies are required to elucidate the underlying mechanisms in greater detail and to clarify its translational and clinical relevance.

Keyword(s) : Sepsis-induced hepatic injury; Aquaporin; Vasopressin V2 receptor inhibition; Tolvaptan, Inflammation

1973 - Prognostic Utility of baseline and SVR12 24 M2BPGi for Liver Related Events in hepatitis C patients

Haiying Zhang ¹, Jia Yang ², Ling Yao ³, Huiying Rao ²
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China ¹ Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China ² Sysmex Corporation, Sysmex Corporation, Shanghai-China ³

Background /

Hypothesis:

ORAL ABSTRACTS

Previous studies on the risk prediction of hepatocellular carcinoma (HCC) or liver-related events using M2BPGi have been conducted primarily in Japanese populations. However, no long-term study has evaluated the association between elevated M2BPGi levels and the development of liver-related events in the Chinese population.

Materials and **Methods:** This study included patients who received treatment with interferon or direct-acting antiviral (DAA) regimens for chronic hepatitis C at Peking University People's hospital between 2011 and 2018. Blood samples were collected at the initiation of treatment and at 12 or 24 weeks after the end of treatment. M2BPGi was measured using a fully automated chemiluminescent enzyme immunoassay system based on a novel sandwich immunoassay method. The diagnostic performance of M2BPGi, FIB-4 and FibroScan at baseline and SVR12/24 for predicting liver-related events was assessed using ROC curve analysis.

Results: ROC curve analysis revealed that the predictive performance of M2BPGi and FIB-4 for liver-related events at baseline and SVR12/24 was significantly superior to that of FibroScan (AUROC = 0.78, 0.83 vs. 0.69; AUROC = 0.75, 0.81 vs. 0.58, respectively). However, when the FIB-4 cut-off value was adjusted to 3.55 at baseline to match the approximately 90% specificity of M2BPGi, the predictive performance of M2BPGi was comparable to that of FIB-4. Combined assessment of M2BPGi and FIB-4 effectively improved the predictive performance for liver-related events (AUROC = 0.85), but no improvement was observed when M2BPGi was combined with FibroScan (AUROC = 0.77). At SVR12/24, M2BPGi and FIB-4 exhibited higher negative predictive values (NPV, 100.00%). A high NPV indicated that M2BPGi (cut-off value: 0.89 COI) could effectively rule out patients at low risk of non-HCC-related events. After 10 years of follow-up, patients with elevated M2BPGi levels (4.85 C.O.I. and 0.89 C.O.I., respectively) and FIB-4 levels (1.78 C.O.I. and 1.83 C.O.I., respectively) at baseline and SVR12/24 had a higher cumulative incidence of liver-related events, confirming that M2BPGi can serve as an important stratification indicator. Considering that the specificity of FIB-4 in the elderly population is susceptible to age, M2BPGi maintains a more stable false-positive rate across age groups, showing stronger age robustness and clinical applicability.

Conclusions: Notably, both before and after treatment, the diagnostic performance of M2BPGi for predicting liver-related events was comparable to that of FIB-4, but both were superior to FibroScan, suggesting its clinical

value as a non-invasive biomarker for identifying high-risk patients.

Keyword(s) : Noninvasive marker; M2BPGi; chronic hepatitis C; HCC; liver-related events;

1984 - Comparative Efficacy of Entecavir and Tenofovir Disoproxil Fumarate in Preventing HBV Reactivation in Patients Receiving Biologic Disease Modifying Antirheumatic Drugs

Gule Cinar¹, Irem Akdemir¹, Ezgi Gulten¹, Elif Mukime Saricaoglu¹, Mehmet Serhat Birengel¹, Ismail Balik¹
Ankara University School Of Medicine, Infectious Diseases And Clinical Microbiology, Ankara-Türkiye¹

Background / **Hypothesis:**

Current guidelines recommend initiating antiviral prophylaxis to prevent hepatitis B virus (HBV) reactivation in patients receiving biologic disease-modifying antirheumatic drugs (bDMARDs). The aim of this study was to compare the efficacy of entecavir (ETV) and tenofovir disoproxil fumarate (TDF) for prophylaxis.

Materials and **Methods:**

Patients who were HBsAg and anti-HBc IgG positive, HBsAg negative, and anti-HBc IgG positive (±antiHBs positive), initiated HBV prophylaxis, and continued prophylaxis for at least 1 year after bDMARDs were discontinued were retrospectively evaluated at a university hospital between 2023 and 2025. Patients receiving antiviral therapy for HBV or related HIV, hepatitis C, or D infections were excluded from the study. Patients receiving ETV (0.5 mg/day) or TDF (245 mg/day) were divided into three risk groups: low, intermediate, and high risk. The distribution of these risk groups was balanced between the ETV and TDF groups. HBV reactivation rates and side effects of the medications were evaluated.

Results:

No significant differences were found between the ETV (n = 240) and TDF (n = 123) groups in terms of demographic data, viral serological parameters, or reactivation risk profiles. HBV reactivation was observed in only one patient in the ETV group. The patient was initially HBsAg positive and HBV DNA negative, but her HBV DNA level was measured as 100 IU/ml and ALT/AST levels were elevated. Thirty-two patients (13.3%) in the ETV group (nausea, diarrhea, insomnia) and 18 patients (14.6%) in the TDF group (headache, diarrhea, rash) experienced side effects (p = 0.84). No patients required

ORAL ABSTRACTS

a change in prophylactic agent.

Conclusions:

ETV and TDF demonstrated similar efficacy in preventing HBV reactivation in patients receiving bDMARDs, and both drugs were well tolerated with similar rates of adverse events. Prospective studies with longer follow-up and detailed safety assessments are needed to better define optimal prophylaxis strategies in this population.

Keyword(s) : HBV reactivation, entecavir, tenofovir disoproxil fumarate, DMARDs

1985 - Effects of Linalool-Regorafenib Combination on Anticancer Activity in HUH 7 Cells

Ayşegül Öztürk¹, Onur Durna², Hilmi Ataseven³
Sivas Cumhuriyet University, Therapy And Rehabilitation, Sivas-Türkiye¹ Sivas Cumhuriyet University, Department Of Physiology, Sivas-Türkiye² Sivas Cumhuriyet University, Department Of Internal Medical Sciences, Sivas-Türkiye³

Background / Hypothesis:

The aim of this study is to evaluate the effect of linalool, a compound with antioxidant properties, on the anticancer activity in HUH-7 cells when administered in combination with regorafenib.

Materials and Methods:

HUH-7 cells were treated with regorafenib and linalool for 48 hours at different concentrations (200, 100, 50, 25, 12.5, 6.25, 3.12, and 1.56 µM). Cell viability was assessed using the CCK-8 assay, and IC₅₀ values were calculated. Drug interactions were analyzed using the Chou–Talalay method, and the Combination Index (CI) was determined (CI > 1 indicating antagonism). Expression levels of EGFR, MAPK, PI3K, NF-κB, Caspase-7, and Caspase-3 were quantified using ELISA. Statistical significance was set at p < 0.05.

Results:

The linalool-regorafenib combination yielded a CI>1, indicating an antagonistic interaction. Regorafenib significantly reduced the expression levels of EGFR, MAPK, PI3K, and NF-κB compared to the control group (p < 0.05). No significant reduction was observed in the combination group (p > 0.05), and expression levels were significantly higher than those in the regorafenib group (p < 0.05). Caspase-7 and Caspase-3 levels were significantly increased in both the regorafenib and combination groups compared to the control (p < 0.05); however, the combination group exhibited significantly lower levels than the regorafenib group (p < 0.05).

Conclusions:

Co-administration of linalool with regorafenib reduces the anticancer efficacy of regorafenib by diminishing its

effects on growth signaling pathways and apoptosis.

Keyword(s) : Regorafenib, Linalool, Antagonism, EGFR, Apoptosis, HUH-7

1989 - Post Polypectomy Bleeding in Patients with Cirrhosis A Systematic Review of Risk Predictors and Procedure Related Factors

Talal Bhatti¹, Sajid Jalil², Muhammad Adam³, Chencheng Xie⁴, Ashwani K Singal⁵
Northwell Health, Hepatology, Ny-United States¹ Stanford, Hepatology, California-United States² University Of Missouri, Medicine, Kansas-United States³ University Of South Dakota, Medicine, Vermillion-United States⁴ University Of Louisville, Gastro, Kentucky-United States⁵

Background / Hypothesis:

: Patients with cirrhosis are considered at increased risk for post-polypectomy bleeding (PPB) due to coagulopathy, portal hypertension, and associated comorbidities. However, the frequency and predictors of bleeding, especially in the modern era of optimized endoscopic practice, remain incompletely characterized. This systematic review aims to quantify the incidence of immediate and delayed PPB in cirrhotic patients, evaluate procedure- and patient-level predictors, and propose practical implications for clinical endoscopy

Materials and Methods:

A comprehensive literature search was performed in PubMed, Google Scholar, Scopus, and Web of Science databases for articles published up to April 2025. Retrospective or prospective studies in adults with a diagnosis of cirrhosis and undergoing colonoscopy were selected. Of these, those reporting outcomes on PPB, immediate (IPB) defined as intra-procedural or delayed (DPB) defined as bleeding within 30-d of procedure. Case reports, conference abstracts, and studies not reporting outcomes / data on interest were excluded. Data were extracted into a standardized Excel framework on patient demographics, liver disease severity (Child-Pugh class, MELD, INR, platelet count), procedural characteristics (polypectomy technique, polyp size, number, location), and clinical outcomes (IPB and DPB, transfusion, hospitalization)

Results:

:: A total of five retrospective cohort studies, encompassing 4,345 cirrhotic patients, met inclusion criteria (Table). IPB occurred in 6.3–7.5%, and DPB in 0.3–5.9% of cirrhotic patients in comparison to the risk of

ORAL ABSTRACTS

30-day PPB rate of < 0.5% to 0.16% in otherwise healthy individuals (Rabeneck et al, Gastro, 2008, Gatto et al, Gastro 2003, ASGE guideline < 1%). Risk of significant bleeding (defined as requiring hospitalization or transfusion) was rare (0.3–2.0%). Risk factors for PPB from different studies included Child-Pugh B/C (OR: 19.7), decompensated cirrhosis (OR: 1.65), ascites (OR: 2.82), polyp size ≥ 10 mm (OR: 1.087 to 8.3). Prolonged INR was associated with increased risk of IPB ($r = 0.61$) and platelet counts was associated with DPB ($r = -0.58$), with increased risk below 50,000. Colonoscopy with endoscopic mucosal resection (EMR) was associated with higher rates of IPB and DPB compared to snare polypectomy. Aspirin use (after propensity score matching) was not independently associated with increased bleeding risk. Use of antiplatelets (such as clopidogrel) within 5 days was associated with increased risk of DPB (RR = 2.42). Conclusion : Rates of PPB of colonoscopy in cirrhotic patients is higher compared to general population ranging from 0.3 to 6.1 % .{ (Kim et al., 2019)

Keyword(s) : post procedural bleed, post polypectomy, EMR, colonoscopy

2000 - Efficacy of Yangyin Fuzheng Jiedu Prescription for Hepatocellular Carcinoma with Portal Vein Tumor Thrombosis An Evaluation Using Five Propensity Score Methods
Wanxin Shi¹, Huiwen Yan¹, Xiaoli Liu¹, Lihua Yu¹, Yuqing Xie¹, Zimeng Shang¹, Guangyuan Huo¹, Yuling Liang¹, Zhiyun Yang¹
Beijing Ditan Hospital, Capital Medical University, Center Of Integrative Medicine, Beijing-China¹

Background / Hypothesis:
The selection of adjuvant therapies for advanced hepatocellular carcinoma (HCC) has been a subject of considerable interest. This study aims to investigate the potential value of Traditional Chinese Medicine (TCM) in improving outcomes for HCC patients with portal vein tumor thrombus (PVTT), and to compare the efficacy differences between approved proprietary Chinese patent medicines for HCC and the hospital-prepared formulation, Yangyin Fuzheng Jiedu Formula (YFJP).

Materials and Methods:
A retrospective analysis was conducted on 892 HCC patients with PVTT treated between 2012 and 2022. Based on the actual treatments received, the cohort was divided into a Western medicine (WM) group (n=579) and an Integrated Chinese and Western Medicine (ICWM) group (n=313). Data on TCM usage duration were extracted from electronic medical records.

Propensity score matching (PSM) at a 1:1 ratio and four types of propensity score weighting—Inverse Probability of Treatment Weighting (IPTW), Stabilized IPTW (sIPTW), Overlap Weighting (OW), and Standardized Mortality Ratio Weighting (SMRW)—were employed to adjust for confounding factors. Multivariable Cox proportional hazards models were used to identify independent factors influencing 5-year overall survival (OS). Kaplan-Meier survival curves were plotted to compare survival among different TCM usage patterns, durations, and types. Subpopulation Treatment Effect Pattern Plot (STEPP) analysis was utilized to identify subgroups deriving greater benefit from specific TCM formulations.

Results:

After adjustment using propensity score methods, TCM therapy was identified as an independent protective factor for prognosis in PVTT patients (adjusted HR [95% CI]: 0.4438 [0.3674, 0.5361], $p < 0.001$). Other independent factors influencing 5-year OS included etiology, WM treatment modality, platelet count, creatinine level, gamma-glutamyl transferase level, alpha-fetoprotein level, mean platelet volume, and CD8+ T-cell count. Prolonged duration of TCM administration was associated with a stronger protective effect on prognosis (p for trend < 0.001), indicating greater patient benefit. STEPP analysis revealed that patients with mild to moderate thrombocytopenia, prothrombin activity approaching 70%, or an inflammatory burden index greater than 4 derived significantly more benefit from the YFJP decoction than from CPMs ($p < 0.05$).

Conclusion: Long-term adjunctive therapy with TCM can significantly improve the prognosis of HCC patients with PVTT. The effectiveness of Chinese patent medicines was reaffirmed. Subgroups with relatively better coagulation function or more severe inflammation were more likely to benefit from the YFJP decoction, suggesting potential targets for future mechanistic research.

2002 - Acute Hepatitis B Infection Following Long-Acting Injectable Antiretroviral Therapy Drug Switch in HIV
Jacky Man Chun Chan¹, Tak Yin Owen Tsang¹, Pui Ling Daphne Lau¹, Shiu Hong Thomas Chik¹, Pui Yee Laura To¹, Yau Chung Chris Choi¹, Wing Tung Alicia Lau¹, Ching See Esther Leung¹, Sophia Lamb¹, Tsz Kwun

ORAL ABSTRACTS

Travis Law¹
Princess Margaret Hospital, Hospital Authority
Infectious Disease Centre, Hong Kong-Hong Kong SAR,
China¹

Background / Hypothesis:

Long-acting injectable antiretroviral therapy (LAI-ART) drug switch is a new modality of treatment option for stable HIV-infected individuals. The current regimen (cabotegravir and rilpivirine) does not have activity against Hepatitis B virus (HBV). This study evaluates cases of acute hepatitis B occurring after LAI-ART initiation and highlights the importance of HBV immunization screening and pre-treatment vaccination.

Materials and Methods:
We conducted a retrospective review of HIV-infected individuals who initiated LAI-ART between 2022-2025 at Princess Margaret Hospital, Hong Kong. Demographic, virologic, and immunization data were extracted from electronic health records. Cases of acute HBV were identified based on serologic criteria (HBsAg and/or HBV DNA positivity with anti-HBcIgM). Clinical outcomes, timing of onset, and management strategies were analyzed.

Results:

A total of 65 cases were reviewed and all cases sustained good HIV virological suppression after drug switch. For pre-treatment HBV immunity, 20 (30.8%) had serum anti-Hbs titre of 10-100 IU/ml and 41 (63%) had titre >100 IU/ml. 4 (6.2%) cases did not have protective immunity (with anti-Hbs <10 IU/ml) and 2 (3.1%) developed acute HBV infection within 6-9 months of LAI-ART initiation. Both cases presented with asymptomatic transient transaminase elevation, anti-HBc IgM and HBsAg positivity. Antiretroviral therapy were switched back to tenofovir-based 3-drug regimen. None progressed to fulminant hepatic failure and both developed s-seroconversion within 9 months of treatment.

Conclusions:

Patients with HIV are at high risk for acquiring HBV due to shared routes of transmission. Our findings underscore the potential risk of acute HBV infection in patients receiving LAI-ART without protective HBV immunity. Routine HBV carriage and immunity screening, timely vaccination should be mandatory before initiating long-acting therapy to prevent

avoidable liver complications and chronic HBV infection.

2006 - Phenotypic Pattern of Acute Liver Injury in Crimean Congo Hemorrhagic Fever Among Patients with Chronic Hepatitis B in an HBV Endemic Region
Faruk Karakeçili¹, Muhammet Özdemir¹, Orçun Barkay¹, Umut Devrim Binay¹, Betül Sümer¹
Erzincan Binali Yildirim University, Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Erzincan-Türkiye¹

Background / Hypothesis:

Crimean-Congo hemorrhagic fever (CCHF) frequently causes acute liver injury through direct hepatocellular damage and immune-mediated mechanisms. In Hepatitis B Virus (HBV)-endemic regions, a proportion of CCHF patients have unrecognized chronic hepatitis B (CHB), yet the phenotypic expression of acute liver injury in this coinfecting population is poorly defined. We aimed to characterize the hepatic injury pattern and clinical outcomes of CCHF in patients with chronic HBV.

Materials and Methods:

We retrospectively reviewed 20 HBV-positive patients with polymerase chain reaction (PCR)-confirmed CCHF followed between 2011-2025 in Northeastern Türkiye. Demographic data, laboratory parameters (Alanin aminotransferase (ALT)-max, International normalised ratio (INR)-max, albumin-min, platelet-min), transfusion requirement and CCHF severity scores were collected. A phenotypic classification of liver injury was defined as:

- Mild injury: ALT <5× Upper Limit Normal (ULN), INR <1.20, albumin ≥3.2 g/dL
- Moderate injury: ALT ≥5×ULN and/or INR 1.20-1.49
- Severe hepatic dysfunction: INR ≥1.5, albumin <3.0 g/dL, and/or classified as severe CCHF.

Clinical outcomes included transfusion requirement, hospitalization duration and in-hospital survival.

Results:

Among 20 CHB-positive CCHF patients (mean age 60.5 years; 80% male), 17 (85%) had mild-to-moderate disease and 3 (15%) met criteria for severe CCHF.

- ALT-max ranged from 22-358 U/L;
- INR-max ranged 0.83-1.61;
- Albumin-min ranged 3.0-3.9 g/dL;
- Platelet levels ranged 22-151 ×10³/mm³.

Phenotypic distribution:

- Mild injury: 11/20 (55%)
- Moderate injury: 6/20 (30%)
- Severe hepatic dysfunction: 3/20 (15%)

Comparison of ALT (max), INR (max), platelet (min) and

ORAL ABSTRACTS

hospital stay lengths of the patients is shown at Table 1. ALT (max) and INR association is demonstrated at Figure 1.

Transfusion was required in 5/20 (25%). Median hospitalization duration was 7 days (IQR 4–10). All patients survived and were discharged in good clinical condition.

Importantly, even patients with known CHB, elevated baseline ALT or high HBV DNA—including one with HBV DNA >1,000,000 IU/mL—did not demonstrate disproportionate hepatic decompensation during CCHF.

Conclusions:

In this HBV-endemic cohort, most HBV-positive CCHF patients exhibited mild-to-moderate acute liver injury, and severe hepatic dysfunction was uncommon despite underlying CHB. These findings suggest that chronic HBV infection alone may not predispose to worsened hepatic outcomes during CCHF, except in cases with advanced fibrosis or severe CCHF phenotype. Prospective studies with larger cohorts and fibrosis-stage stratification are warranted.

2012 - Eliminating Viral Hepatitis by 2030 Goals and Gaps from a Large Scale Community Based Study in Shenzhen China

Deliang Huang¹, Zhibin Zhu¹, Qinxian Cai¹, Jun Chen¹
The Third People's Hospital Of Shenzhen, Department Of Liver Diseases, Shenzhen-China¹

Background / Hypothesis:
Aligning with the WHO's goal to eliminate viral hepatitis as a public health threat by 2030, this study evaluates the current epidemiological profile of viral hepatitis in community-based populations in Shenzhen, China and identifies key challenges toward its elimination.

Materials and Methods:
Between September 2023 and July 2025, large-scale community screening was implemented across 95 community health centers in Shenzhen. Testing included hepatitis B surface antigen (HBsAg), surface antibody (HBsAb), and hepatitis C antibody (anti-HCV), alongside the collection of epidemiological data.

Results:

A total of 96,170 tests were performed (51,168 for hepatitis B; 45,540 for hepatitis C). The overall HBsAg positivity rate was 4.32%, with a marked age gradient:

the highest prevalence was among those aged 30–60 years, while children under 5 years had a positivity rate of only 0.15%. Notably, the hepatitis B diagnosis rate (awareness of infection status) was only 9.69% (214/2,209). Among HBsAg-positive individuals, 78.23% were unaware of their family history of hepatitis B, and 80.36% did not know their family history of cirrhosis or liver cancer. The HBsAb seropositivity rate, indicating immune protection, was 28.40%, whereas 66.27% of the population remained susceptible (both HBsAg and HBsAb negative). Among susceptible individuals, 90.77% had an undocumented vaccination history. The hepatitis C infection rate was 0.28%, with the highest prevalence (0.54%) among adults over 60 years, reflecting distinct age clustering.

Conclusions:

Shenzhen has achieved notable success in hepatitis B control, particularly in pediatric vaccination. However, three critical gaps persist: a substantial proportion of cases remain undiagnosed, susceptibility remains high among adults, and risk awareness is critically low in key populations. To meet the 2030 elimination target, efforts must prioritize innovative community screening strategies, catch-up vaccination for susceptible adults, and the establishment of an integrated "screen-diagnose-treat-manage" continuum of care. This study provides a valuable evidence base for tailoring elimination strategies in Shenzhen and comparable urban settings in China.

2019 - Cardiometabolic Risks in Elderly Individuals With Fatty Liver Living in Mid Mountain Regions of Central Asia

Nurgul Toktogulova¹
Kyrgyz State Medical Academy, Hospital Therapy, Bishkek-Kyrgyzstan¹

Background / Hypothesis:
Elevated altitude is known to modulate metabolic pathways through chronic hypobaric hypoxia, autonomic activation, and HIF-1 α -mediated inflammatory responses.

Materials and Methods:
An open comparative study was conducted among individuals with fatty liver as determined by ultrasound (n=705) living in low-altitude (750–800 m above sea level, n=349) and mid-altitude (2046–2300 m above sea

ORAL ABSTRACTS

level, n=356) areas of Central Asia. Patients aged 60 years and older were compared.

Results:

We studied the frequency of cardiometabolic risks depending on the altitude of residence, which revealed significant age-related differences. The following parameters were used: waist circumference, blood pressure, triglycerides, HDL, fasting glucose, HbA1c. It should be noted that a waist circumference above 90/80 cm (for men and women) among the elderly with fatty liver reached 72.5% versus younger people (48%). In individuals over 60 years of age living in mid-altitude conditions, compared with residents of low-altitude areas, three or more components of metabolic syndrome were observed. The frequency of a combination of three components exceeded 18% (versus 6-10% in patients under 60 years of age), and four components were more than twice as frequent compared to the younger age category. The presence of five components was rare, but was recorded predominantly in patients in the older group, which emphasizes the severity of metabolic imbalance in the elderly living in hypoxic mid-altitude conditions. Characteristically, one or two components of metabolic syndrome remained dominant in both age groups, consistent with early and subclinical stages of metabolic decompensation. However, in the older patient group, the frequency of a combination of two components was statistically higher (up to 30%), which may reflect accelerated age-related remodeling of metabolic status under chronic hypobaric conditions. Among individuals under 60 years of age, metabolic burden is less pronounced; however, the high proportion of patients with one or two components also indicates an unfavorable background and the potential early development of MAFLD in the region. In elderly residents of mid-mountain areas, fatty liver disease was frequently associated with hypertension (70% vs. 31%), coronary heart disease (48.8% vs. 15.9%), and COPD (8.4% vs. 2.5%), which were more than twice as common among younger patients. OSA occurred in a third of patients. As expected, chronic cholecystitis, pancreatitis, gallstone disease, and chronic kidney disease were common associated. Conclusions. Our data demonstrate an independent association of residential altitude with a more pronounced metabolic phenotype of fatty liver in the elderly.

2023 - Impact of Liver Fat Contents on Brain Structure and Cognitive Functions in Patients with MASLD

Zhuoru Jiang¹, Bing Zhang¹, Qian Chen¹, Jun Chen¹, Jie Li²

Nanjing Drum Tower Hospital, Radiology, Nanjing-China¹ Nanjing Drum Tower Hospital, Infectious Diseases, Nanjing-China²

Background / **Hypothesis:**
This study aims to investigate the association between liver fat contents using magnetic resonance imaging-proton density fat fraction (PDFF) with brain structure and cognition in adults with metabolic dysfunction-associated steatotic liver disease (MASLD).

Materials and **Methods:**
Cross-sectional relationships of MASLD with cognitive testing of memory, attention, and executive function were assessed, while adjusting for multiple variables including type 2 diabetes, hypertension and smoking status. Neuroimaging outcomes included brain volumes, regional homogeneity, amplitude of low-frequency fluctuations, functional connectivity (FC) and cerebral blood flow using arterial spin labeling (ASL), reflecting cerebrovascular health.

Results:

Eighty-six patients were included (mean age 29.97 ± 11.23 years; 74.42% men; mean body mass index 30.01 ± 5.82 kg/m²). Liver fat contents was negatively associated with the volume in the hippocampus ($\beta = -0.21$, 95% CI -0.087 – -0.008), parahippocampal gyrus ($\beta = -0.269$, 95% CI -0.096 – -0.022) and precuneus ($\beta = -0.299$, 95% CI -0.099 – -0.017). Cognitive function did not correlate with liver fat contents. Dividing 86 patients into 2 groups according to the median of liver fat deposition at 17.73%, increased FC between the right parahippocampal gyrus and the right precuneus was found in group where liver fat deposition > 17.73%.

Conclusions:

Participants with more liver fat may have smaller volumes of cognitive brain regions, particularly those correlating with memory and self-related information processing. Moreover, the FC result showed that functional connectivity of the right parahippocampal gyrus-precuneus was significantly positively associated with liver fat deposition.

2039 - Modelling liver fibrosis and MASH with humanized immune system mice

Clothilde Philouze ¹, Omayra Martin-rodriguez ¹, Anaïs Meynet-cordonnier ¹, Sebastien Tabruyn ¹, Dan Georgess ¹
Transcure Bioservices, R&D, Archamps-France ¹

Reliable systems that reproduce human liver biology are required for preclinical assessment of human-specific compounds aimed at fibrosis and steatohepatitis. In this study, we characterize two experimental approaches to induce liver pathology using humanized immune system NCG (HIS-NCG) mice.

NCG mice reconstituted with human CD34⁺ hematopoietic stem cells were assigned to one of two injury paradigms. The first involved repeated administration of carbon tetrachloride (CCl₄) for 23 days, whereas the second relied on a 14-day high-fat diet lacking methionine and choline (HFMCD).

Both interventions produced acute deterioration in general health condition and clear biochemical evidence of hepatic damage, as shown by ALT increases, but led to divergent pathological phenotypes. CCl₄ exposure produced severe liver fibrosis, with most mice developing high-grade (F3) fibrosis or cirrhotic architecture without steatosis or human macrophage infiltration. Conversely, the HFMCD regimen induced a broad phenotype consistent with MASH, including a

NAS score of 6, low-grade (F1) fibrosis, inflammatory infiltration by human CD68⁺ macrophages, and increased circulating LGALS3BP.

These two systems provide distinct platforms for examining agents directed at human immune-mediated drivers of liver pathology: the HFMCD model for MASH and the CCl₄ model for advanced fibrosis. An extended configuration incorporating both human immune and hepatic elements is also available for studies that require simultaneous evaluation of immune and metabolic pathways.

2041 - A Rare Presentation of Salmonella enteritidis Bacteremia With Coronary Mycotic Aneurysm and Non Cirrhotic Portal Hypertension

Ferdinand Anzo ¹, Marvin Casey Cabalquinto ², Felicisimo Agas ¹

St. Luke's Medical Center, Institute Of Digestive And Liver Diseases, Quezon City-Philippines ¹ St. Luke's Medical Center, Dr. Homobono B. Calleja Heart And Vascular Institute, Quezon City-Philippines ²

Background:

Salmonella enteritidis bacteremia is an uncommon but clinically important cause of systemic infection, with the potential to involve vascular structures and form mycotic aneurysms. Evaluation of fever of unknown origin (FUO) requires a structured, stepwise diagnostic approach utilizing accessible imaging modalities to identify both common and unexpected causes.

Case

Presentation:

A 51-year-old man with immune thrombocytopenia managed on chronic corticosteroids presented in septic shock after treatment of a right gluteal abscess. Initial abdominal ultrasound demonstrated nonspecific parenchymal alterations in a normal-sized liver, along with nodular changes in both lobes, prompting further evaluation with contrast-enhanced CT. CT imaging revealed periportal hypodensities, signs of portal hypertension, and an incidental 6.5 × 4.4 cm non-enhancing hypodense collection adjacent to a coronary artery. Blood cultures subsequently yielded Salmonella enteritidis. Coronary CT angiography confirmed fusiform aneurysms of the right coronary artery with circumferential thrombus and minimal calcific plaque, consistent with a Salmonella-related mycotic aneurysm. Antithrombotic therapy was deferred in the context of underlying thrombocytopenia. The patient received

ORAL ABSTRACTS

culture-directed intravenous antibiotics, resulting in clinical stabilization, and was discharged on a course of outpatient parenteral therapy.

Conclusion:

The combination of predisposing immunologic factors, persistent systemic symptoms, distinctive imaging abnormalities, and positive blood cultures supported the diagnosis of a *Salmonella* mycotic aneurysm. Given the high risk of rupture and substantial associated mortality, timely diagnostic evaluation, appropriate antimicrobial therapy, and consideration of surgical or percutaneous intervention are critical. This case highlights the essential role of sequential imaging and individualized, multidisciplinary management in identifying and treating uncommon vascular complications in immunocompromised patients.

Keyword(s) : non-cirrhotic portal hypertension; salmonella enteritidis infection; mycotic aneurysm

2047 - Controlled expansion stent grafts in TIPS a real world analysis of in vivo diameter change and early hepatic encephalopathy

Zizhen Ye¹, Ruoting Men¹, Yi Shen¹, Li Yang¹, Xuefeng Luo¹, Xiaozhe Wang¹, Ziqi Chen²
West China Hospital, Sichuan University, Department Of Gastroenterology And Hepatology, Laboratory Of Gastrointestinal Cancer And Liver Disease, Chengdu-China¹ West China Hospital, Sichuan University, Department Of Radiology, Chengdu-China²

Background / **Hypothesis:** Post-TIPS hepatic encephalopathy (HE) remains a major limitation of portosystemic shunting, and stent diameter is a key modifiable determinant of HE risk. The VIATORR® Controlled Expansion (VCX) stent graft was designed to allow tighter control of the functional lumen (8–10 mm) and potentially reduce HE by preventing passive self-expansion seen in conventional VIATORR TIPS stents (VTS). However, clinical data remain conflicting and information regarding the in vivo expansion behavior of VCX in real-world practice is limited. This study compared early HE after TIPS using VCX versus 8-mm VTS and quantitatively characterized VCX expansion and associated hemodynamic changes.

Materials and **Methods:** This single-center retrospective cohort included consecutive cirrhotic patients undergoing TIPS between January 2024 and July 2025, receiving either an 8-mm VTS or VCX stent-graft. VCX stents were initially dilated to 8 mm and further dilated to 10 mm only if

post-procedural portal pressure gradient (PPG) remained >12 mmHg or decreased <50% from baseline. The primary endpoint was new-onset OHE within 6 months. Stent diameter was quantitatively measured along the VCX controlled-expansion mid segment on fluoroscopy at baseline and 3 months. PPG measurements were also obtained at both timepoints.

Results:

Among 153 patients (43 VCX, 110 VTS), OHE occurred in 30 patients (19.6%). The VCX group showed a higher cumulative 6-month OHE incidence than the VTS group (HR = 2.34, 95% CI 1.05-5.20; log-rank $p = 0.032$). Among VCX patients, the mid-segment diameter increased from 8.0 mm to a mean of 8.65 mm (range 8.2–9.1 mm) at 3 months ($p < 0.001$). Post-TIPS PPG increased from 7.7 mmHg to 11.6 mmHg ($p < 0.001$). Stent expansion was not correlated with PPG increase (Spearman $r=0.038$, $p=0.834$).

Conclusions:

VCX stent-grafts demonstrated consistent early in vivo expansion and are associated with a higher incidence of early OHE compared with 8-mm VTS. The observed PPG rise at 3 months underscores the unreliability of immediate intra-procedural PPG as a surrogate for long-term hemodynamic status. These findings support the need for refined VCX-specific dilation strategies—such as staged or intentionally smaller initial dilation—to optimize the balance between portal decompression and HE risk. Prospective studies are warranted to validate individualized diameter-modulation protocols.

2065 - Comprehensive multiomics study of ballooned hepatocytes in MASH Insights into cellular adaptation to metabolic overload

Yan Wang¹, Weilan Zeng¹, Mingming Zhang¹, Cuiting Liu¹, Junmin Shi¹, Yisi Chen¹, Jing Li¹
Southern Medical University, Biomedical Research Center, Guangzhou-China¹

Background/Hypothesis: Ballooned hepatocytes (BHs) are key indicators for MASH diagnosis, treatment, and prognosis. However, the molecular features of BHs remain largely undefined. This study aimed to perform integrated transcriptomic and proteomic analyses of MASH BHs in situ to elucidate their molecular phenotype and role in disease pathogenesis.

ORAL ABSTRACTS

Materials and Methods: Three MASH models were developed using diet-induced mouse groups: wild-type C57 mice on high-fat, high-glucose, and choline-deficient diets; C57 mice on high-fat, high-glucose, and high-cholesterol (HFFC) diets; and leptin-deficient C57 ob mice on HFFC diets, with corresponding normal diet controls. Liver tissues were subjected to laser-capture microdissection to isolate BHs, macrovesicular and microvesicular steatotic hepatocytes (SHs), and normal hepatocytes (NHs). Cell samples were processed and underwent RNA sequencing and mass spectrometry for omics analyses. Data validation was performed via quantitative PCR and immunohistological examination. Clinical relevance was assessed using MASLD cohort databases and surgical MASH liver specimens. **Results:** A total of 62,939 cells underwent transcriptome sequencing, and 122,358 cells underwent mass spectrometry-based proteome analysis, identifying 22,046 protein-coding genes and 7,438 proteins. The crucial markers suggested by omics data were confirmed through morphological and biochemical assays. The clinical relevance of BH proteome was demonstrated through blood proteomics analysis of MASH cohorts and multiplex tissue staining of patient slices. Integrated omics analyses indicated consistent functional alterations in BHs compared with NHs and SHs across the models. Notably, BHs exhibited widespread downregulation of fundamental processes, involving metabolism, immune response, cell death and proliferation, morphogenesis, and cell junctions, as well as diminished competence of mitochondria, ER, and actin cytoskeleton. Cell evolutionary projection suggested that BHs could be transitional forms of SHs. **Conclusions:** BHs appear to be a self-protective, dormant state of hepatocytes in response to damaging metabolic overload. They serve as markers of metabolic stress rather than malignant drivers in MASH progression. This research fills a critical knowledge gap regarding BH molecular features and offers new insights into MASH pathogenesis.

2066 - Phenotypic Age is a Hepatocentric Marker of Biological Aging Stronger Associations of Liver Related and Metabolic Outcomes over Cardiovascular Events in Steatotic Liver Disease

Shun Li ¹, Lichen Shi ², Didong Jia ³, Hong You ³, Yuanyuan Kong ¹
Beijing Friendship Hospital, Capital Medical University, Beijing Clinical Research Institute, Beijing, China ¹ Beijing

Friendship Hospital, Capital Medical University, Epidemiology, Beijing-China ² Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China ³

Background / **Hypothesis:** Phenotypic age (PhenoAge) captures physiological dysregulation beyond chronological age. While often viewed as a generic mortality marker, its organ-system specificity remains undefined. We hypothesized that PhenoAge predominantly reflects hepatic and metabolic biological aging rather than vascular senescence, and thus better predicts metabolic dysfunction and liver-related outcomes than cardiovascular disease (CVD), particularly within the growing burden of steatotic liver disease (SLD).

Materials and **Methods:** We analyzed 443,072 UK Biobank participants free of baseline liver or cardiovascular disease. PhenoAge Acceleration (PhenoAgeAccel = PhenoAge – chronological age) was derived from clinical biomarkers. SLD was defined by the Hepatic Steatosis Index. Outcomes included incident T2D, CVD, and liver-related disease (LRD; defined as fatal/non-fatal cirrhosis, decompensation events such as ascites/varices, or hepatocellular carcinoma) ascertained over a median 14.8-year follow-up. Multivariable Cox models, adjusted for major confounders, estimated hazard ratios (HRs) for accelerated versus non-accelerated aging, stratified by SLD status. Predictive utility was assessed by the change in concordance index (Δ C-statistic) over conventional risk factors.

Results:

Among 178,763 participants with SLD, accelerated aging was powerfully associated with incident T2D (HR 2.64, 95% CI 2.55–2.74) and LRD (HR 1.87, 1.56–2.25), but modestly with CVD (HR 1.29, 1.24–1.35). This distinct hepatometabolic signature persisted in non-SLD participants, where the risk magnitude for T2D (HR 2.59) and LRD (HR 2.23) far exceeded that for CVD (HR 1.30). Crucially, adding PhenoAgeAccel to baseline models significantly improved discrimination for LRD (Δ C-index 0.04, $p < 0.001$; C-index increasing from 0.80, 95% CI 0.79–0.82 to 0.84, 95% CI 0.82–0.85), whereas the incremental value for CVD prediction was minimal (Δ C-index < 0.01 ; C-index unchanged at 0.70, 95% CI 0.69–0.71).

Conclusions:

Phenotypic age is not a generic aging marker but a robust indicator of metabolic and hepatic biological

ORAL ABSTRACTS

aging. It substantially enhances risk stratification for liver-related endpoints beyond traditional risk factors, with limited added value for cardiovascular prediction. In the era of precision hepatology, incorporating PhenoAge into clinical risk algorithms may improve early identification of individuals with SLD at highest risk of progression to overt liver disease and metabolic complications.

Background / Hypothesis: Advanced hepatocellular carcinoma (HCC) with lung metastasis carries a poor prognosis. Donafenib combined with PD-1 inhibitor has become a standard systemic therapy for advanced HCC. Hepatic arterial infusion chemotherapy (HAIC) demonstrates potent local tumor control. However, the efficacy of adding HAIC to donafenib plus PD-1 inhibitor in this population remains undefined. This study aimed to evaluate the clinical efficacy and safety of hepatic arterial infusion chemotherapy (HAIC) combined with donafenib and programmed cell death protein-1 (PD-1) inhibitor in patients with hepatocellular carcinoma (HCC) and pulmonary metastases.

Materials and Methods: This multicenter retrospective study enrolled treatment-naïve patients with advanced HCC (BCLC stage C) and lung metastases who received donafenib plus PD-1 inhibitor with or without HAIC between March 2019 and June 2023. Propensity score matching (PSM) was performed to minimize selection bias between treatment arms. The primary endpoint was overall survival (OS). Secondary endpoints included progression-free survival (PFS), objective response rate (ORR), and disease control rate (DCR) assessed per RECIST 1.1 criteria, along with treatment-related adverse events (TRAEs).

Results:

Of 180 eligible patients enrolled, 78 received HAIC plus donafenib and PD-1 inhibitor (HDP group) and 102

received donafenib plus PD-1 inhibitor alone (DP group). After 1:1 PSM, 60 patients remained in each cohort. The HDP group achieved a significantly prolonged median OS compared with the DP group (22.8 versus 11.5 months; hazard ratio [HR]: 0.44; 95% confidence interval [CI]: 0.29–0.67; $P < 0.001$). Median PFS was also superior in the HDP group (8.3 versus 5.2 months; HR: 0.68; 95% CI: 0.47–0.98; $P = 0.038$). The HDP group exhibited higher ORR (43.3% versus 16.7%, $P = 0.002$) and DCR (81.7% versus 65.0%, $P = 0.039$). Although TRAEs of any grade and grade ≥ 3 occurred more frequently in the HDP group, all events were clinically manageable with no treatment-related deaths reported.

Conclusions:

The combination of HAIC with donafenib and PD-1 inhibitor demonstrates favorable survival outcomes and acceptable tolerability in advanced HCC patients with lung metastases, warranting further investigation in prospective studies.

2068 - The impact of implementing the expanded antiviral therapy eligibility for HBsAg positive pregnant women in China a modelling study

Ruixuan Hong ¹, Xin Liang ¹, Xiaoyun Liu ¹, Sijie Lin ¹, Yujia Jiang ², Chongyang Duan ², Xueru Yin ¹
Nanfang Hospital, Department Of Infectious Diseases, Guangzhou-China ¹ Southern Medical University, Department Of Biostatistics, Guangzhou-China ²

Background / Hypothesis: The World Health Organization's 2024 guideline of hepatitis B virus (HBV) expanded the eligibility for antiviral therapy to eliminate HBV mother-to-child transmission (MTCT), recommending treatment for HBsAg-positive pregnant women who cannot access HBV DNA or HBeAg tests. This study aimed to evaluate the potential impact of implementing expanded interventions in China.

Materials and Methods: We conducted a survey and developed a simulation model incorporating data on the natural history of HBV, prevalence, HBV DNA testing coverage, HBeAg testing coverage, and antiviral treatment coverage. We estimated the impact of existing interventions and expanding interventions for prevention of MTCT. We simulated 810 scenarios. For prenatal intervention in HBsAg-positive pregnant

ORAL ABSTRACTS

women, the existing interventions administers antiviral treatment to those with HBV DNA levels $\geq 200,000$ IU/mL or HBeAg positivity. The expanded interventions extends treatment to pregnant women without access to HBV DNA or HBeAg testing. A decision tree and Markov model was used to evaluate the cost-effectiveness.

Results: A survey indicated that the testing coverage was 52.7% in resource-limited areas and 90.31% in resource-replete areas, while the treatment coverage were 64% and 81%, respectively. Overall, our model demonstrated that expanded interventions would avert substantially more new infections than existing interventions across all scenarios. Specifically, expanded interventions could reduce new infections by 53.04% in resource-limited areas and by 41.56% in resource-replete areas, while simultaneously lowering per-capita costs by US\$1134.28 and US\$294.10, respectively. The expanded interventions were cost-effective across all simulated scenarios, with an incremental cost-effectiveness ratio of -\$16,363.77 per quality-adjusted life year. The probabilistic analysis indicated that at a willingness-to-pay threshold of the three times gross domestic product per-capita in China, the probability of expanded interventions being cost effective was 95.68% in resource-limited areas and 96.58% in resource-replete areas, respectively. One-way deterministic sensitivity analyses showed the robustness of the results.

Conclusions: Compared to the existing interventions, the expanded antiviral interventions could contribute to averting new HBV infections and was cost-effective in China, which would accelerate the elimination of hepatitis B.

Keyword(s) : hepatitis B virus, mother-to-child transmission, antiviral prophylaxis, cost-effective

2081 - Late Presentation and Poor Outcomes of Hepatocellular Carcinoma in a Resource Limited Setting An Observational Study in a Tertiary Care Hospital Bangladesh

Mohammad Forhad Abedin Abedin¹, Md. Dalil Uddin Uddiin¹, Md. Obaed Ullah Ullah¹
Comilla Medical College, Hepatology, Comilla-Bangladesh¹

Background / Hypothesis: Hepatocellular carcinoma (HCC) is a major cause of cancer-related mortality

worldwide, with a disproportionately high burden in resource-poor countries. Limited access to screening, delayed diagnosis, and restricted availability of curative treatment options contribute to poor outcomes.

Materials and Methods: A medical college hospital-based observational study was conducted among patients diagnosed with HCC from January 2021 to December 2022. Data were collected from the hospital record system. Demographic data, underlying etiology, mode of diagnosis, BCLC stage at presentation, treatment received, and survival outcomes were recorded and analyzed.

Results: A total of 52 patients with hepatocellular carcinoma (HCC) were included, of whom 84.61% were male and 15.39% were female. The most common underlying etiology was HBV-related cirrhosis. None of the patients had been enrolled in an HCC surveillance program prior to diagnosis. Ultrasonography failed to detect HCC in 65.35% of cases, and all diagnoses were confirmed with contrast-enhanced CT (CECT). At presentation, 59.61% of patients were classified as BCLC stage D, and 30.76% as stage C, with no patients presenting in BCLC stage A. Regarding treatment, 61.53% received palliative care, and 21.15% received systemic therapy; no patient received curative treatment. Outcomes were poor, with 53.84% of patients dying within 3 months of diagnosis and the remainder within one year.

Conclusions: HCC in resource-poor settings is characterized by late detection, limited access to diagnostic tools, and restricted therapeutic options, resulting in poor survival. Strengthening screening programs, improving access to antiviral therapy, and establishing affordable treatment pathways are essential to reduce the burden and improve patient outcomes.

2083 - Targeting STK40 unleashes anti tumor immunity by triggering tumor vulnerability and T

ORAL ABSTRACTS

cell **reinvigoration**

Lili Zhu¹, Cun Wang¹
Shanghai Jiao Tong University School Of Medicine,
Shanghai Cancer Institute, Shanghai-China¹

Background / **Hypothesis:**
Immunotherapy has revolutionized cancer treatment, yet its clinical efficacy in hepatocellular carcinoma (HCC) remains limited, with the underlying mechanisms of resistance poorly defined.

Materials and **Methods:**
The regulators of immune evasion in HCC were identified through in vivo CRISPR screening. Multiple animal models, including subcutaneous tumorigenesis models and spontaneous liver cancer models, were employed to validate the role of immune regulator. In-depth molecular mechanism studies were conducted to elucidate the functional mechanisms of the immune regulator.

Results:

Through an in vivo CRISPR-Cas9 screen, we identify Serine/Threonine kinase 40 (STK40) as a previously unrecognized master regulator of immune evasion in HCC. Functionally, combining Stk40 ablation with PD-1 blockade induces complete tumour regression and durable immune memory in preclinical models. Hepatocyte-specific Stk40 knockout fully abrogates MycOE/Trp53KO-driven HCC tumorigenesis following hydrodynamic delivery. Mechanistically, STK40 acts as a scaffold for the COP1 E3 ubiquitin ligase, promoting interferon gamma receptor 1 (IFNGR1) degradation, thereby rendering tumour cell resistant to IFN- γ -mediated cytotoxicity. Genetic depletion of Stk40 stabilizes IFNGR1, restoring tumour cell sensitivity to T cell cytotoxicity. Concurrently, Stk40 loss triggers autonomous GM-CSF secretion, enhancing the infiltration and activation of conventional type 1 dendritic cells (cDC1s), which promotes antigen cross-presentation and CD8⁺ T cell activation. Notably, inducible Stk40 knockout mice exhibit no overt physiological abnormalities, suggesting that STK40 targeting is therapeutically safe. Pharmacological inhibition of STK40 using antisense oligonucleotides, combined with PD-1 blockade elicits potent anti-tumour responses across multiple cancer types.

Conclusions:

Our findings establish STK40 as a unique dual-function

therapeutic target that simultaneously enhances tumour-intrinsic IFN- γ responsiveness and tumour-extrinsic cDC1-mediated T cell activation, overcoming two major barriers to effective anti-tumour immunity.

2087 - CD146 Regulates Hepatocyte Lipotoxicity through Modulation of Mitochondrial Energy Metabolism and Inflammatory Response

Yixue Shu¹, Yulin Yan¹, Jingyi Wang¹, Quan Sun¹, Qi Wang²

School Of Basic Medical Sciences, Capital Medical University, Department Of Laboratory Animal Science, Beijing-China¹ Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases, Beijing-China²

Background / **Hypothesis:** Metabolic dysfunction-associated steatotic liver disease (MASLD) is the most prevalent chronic liver disease worldwide, with its pathogenesis involving a vicious cycle of lipid metabolism dysregulation, mitochondrial dysfunction, and chronic inflammation. Previous studies using a high-fat, high-fructose diet-induced MASLD mouse model demonstrated that CD146 deficiency significantly ameliorates hepatic lipid deposition, reduces pro-inflammatory immune cell infiltration, and promotes the restoration of hepatocyte mitochondrial structure and quantity. Building on these findings, this study aims to elucidate the specific molecular mechanisms by which CD146 regulates mitochondrial function and inflammatory responses in hepatocyte lipotoxic injury.

Materials and Methods: In this study, siRNA-mediated gene silencing was employed to establish a CD146 low-expression model in AML-12 hepatocytes. A lipotoxic stress microenvironment was simulated using combined oleic acid/palmitic acid (OA/PA) treatment. The pathophysiological effects of CD146 deficiency were systematically evaluated through RT-qPCR, western blot analysis, Nile Red staining, and ELISA.

Results: RT-qPCR analysis revealed that CD146 knockdown significantly downregulated the gene expression of key lipid synthesis transcription factor SREBP-1, metabolic regulatory kinase PDK2, and pro-inflammatory cytokine IL-1 β following OA/PA treatment. Protein analysis showed upregulation of the mitochondrial fission protein Drp1, while CD146 silencing alleviated lipid deposition and reduced ROS and ATP levels. Functional assays demonstrated that CD146 knockdown specifically inhibited the activity of

ORAL ABSTRACTS

mitochondrial respiratory chain complex V, with no significant effect on complexes I-IV.

Conclusions: The in vitro experimental results are consistent with previous animal studies, indicating that CD146 likely plays a critical role in hepatocyte lipotoxic injury by coordinately regulating lipid synthesis, inflammatory responses, and mitochondrial energy metabolism. These findings suggest that CD146 may serve as an important molecular target linking metabolic stress and inflammatory responses, providing a new direction for intervention strategies in MASLD.

Background / Hypothesis: Biochemical response to ursodeoxycholic acid (UDCA) is the cornerstone of prognostic stratification in Primary Biliary Cholangitis (PBC). While multiple criteria define treatment response, their performance may vary across ethnicities and

regions. We evaluated the comparative prognostic utility of established UDCA response criteria in a large, multi-ethnic South-East Asian (SEA-PBC) cohort.

Materials and Methods: The multicenter SEA-PBC registry included consecutive patients diagnosed between 1980 to 2024 from 13 institutions within the Asia-Pacific regions. We analysed UDCA-treated patients with sufficient data to assess 1-year biochemical response. The primary outcome was transplant-free survival (TFS). The prognostic performance of response criteria (Paris-II, Toronto, POISE, ALP normalization & deep response) was analysed using competing-risk Fine-Gray regression and compared via time-dependent AUC.

Results: Among 1,128 patients (85% female, median age 62), 98.8% received UDCA. One-year response rate varied significantly: Paris-II (54%), Toronto (67%), POISE (32%), ALP normalization (39%), and deep response (16.2%). All criteria significantly predicted TFS ($p < 0.05$). Paris-II demonstrated the strongest prognostic discrimination, with the subdistributional hazard ratio (sHR 0.13, 95%CI: 0.06-0.30, $p < 0.001$) and time-dependent C-statistics (AUC 0.68-0.70). Paris-II responders were typically older, female, and had less severe baseline disease. Among Paris-II non-responder, only 12.6% received second-line therapy (Fibrates 13%, 1% Obeticholic acid).

Conclusions: The Paris-II criteria provide a strong prognostic discrimination for transplant-free survival in SEA-PBC cohort. A striking treatment gap among Paris-II non-responders highlights a critical unmet need for second-line treatment in SEA-PBC cohort.

2094 - Inhibition of Aurora B Induces Senescence and Potentiates Immunotherapy in Hepatocellular Carcinoma

Xuhui Ma ¹, Shanshan Wu ¹, Ying Cao ¹, Hui Wang ¹, Wenxin Qin ¹
Shanghai Cancer Institute, Shanghai Cancer Institute, Shanghai-China ¹

Background / Hypothesis: Hepatocellular carcinoma (HCC) is a global health challenge, with limited treatment options for advanced-stage patients. Although recent approvals of targeted therapies and immune checkpoint inhibitors (ICIs) have expanded the therapeutic landscape, their clinical benefits are often constrained by modest response rates

ORAL ABSTRACTS

and acquired resistance. Despite ongoing efforts to identify new therapeutic targets, only few inhibitors have progressed to clinical trials, benefiting a small subset of patients. These limitations underscore the need for more effective therapeutic strategies.

Materials and **Methods:** We integrated data from DepMap and TCGA to identify HCC-specific vulnerabilities. A kinome-wide CRISPR screen validated essential targets. Pharmacological inhibition (AZD1152) and genetic knockout of Aurora B (AURKB) were employed for functional validation. Senescence was assessed via SA- β -gal staining, transcriptomics, and SASP analysis. Immune interactions were evaluated using co-culture assays with T cells and flow cytometry for MHC-I and immune markers. In vivo efficacy was tested in immunocompetent murine HCC models.

Results:

Aurora B was identified as a top candidate essential for HCC survival, overexpressed in tumors, and correlated with poor prognosis. A kinome-wide CRISPR screen further confirmed its essential role in HCC cell survival. Pharmacologic inhibition or genetic knockout of Aurora B markedly suppressed proliferation of HCC cells and induced robust cellular senescence, characterized by cell-cycle arrest, DNA damage, and SASP. These senescent cells exhibited heightened susceptibility to T-cell-mediated cytotoxicity, associated with increased immunoproteasome activity and upregulated HLA expression. Co-culture assays revealed that senescent tumor cells promoted interferon- γ production and enhanced cytotoxicity in CD8⁺ T cells as well as PD-1 expression. In both in vitro and in vivo models, combining Aurora B inhibition with anti-PD-1 therapy markedly suppressed tumor growth.

Conclusions:

This study identifies Aurora B as a therapeutically actionable vulnerability in HCC, whose inhibition induces senescence and enhances tumor immunogenicity. The combination of Aurora B inhibitor with anti-PD-1 therapy yields synergistic anti-tumor effects, supporting its potential as a promising strategy to improve immunotherapy outcomes in HCC.

2100 - From Organ to Surface Perforating Disorders in Chronic Liver Disease
Maisam Akroush ¹, Aktham Akroush ², Mohammad Tawara ³, Yasmeen Al Shargi ⁴

University Of Jordan, Gastro-hepatology, Amman-Jordan ¹ Private, Gastro-hepatology, Amman-Jordan ² Private, Dermatology, Amman-Jordan ³ Prince Hamza Hospital (moh), Histopathology, Amman-Jordan ⁴

Background/Hypothesis:

Our article sheds light on vesicular, intensely itchy, scarring skin lesions associated with systemic diseases: Acquired Perforating Dermatositis. Perforating disorders are more commonly seen in chronic renal failure, diabetes, and liver disease to a lesser extent.

We present three real-life cases of end-stage liver disease—due to autoimmune hepatitis, viral hepatitis, and alcoholic liver disease, respectively—manifesting as unusual clusters of itchy skin lesions. Two of these were documented by skin biopsies, while the third case responded to treatment of the underlying liver condition.

This report underscores the need to consider chronic liver disease as a potential cause of perforating disorders, expanding the spectrum beyond traditionally associated conditions mentioned above.

Perforating disorders have a documented prevalence of 10-15% in patients with chronic kidney disease and diabetes mellitus. However, their prevalence in chronic liver disease remains underreported. Emerging case reports suggest a noteworthy association, necessitating further research and clinical awareness.

Materials/Methods/Results:

A 46-year-old female patient with autoimmune liver disease developed a widespread vesicular itchy rash, predominantly affecting her extremities. Despite detailed history and extensive laboratory testing, the results were inconclusive. A dermatological referral and subsequent biopsy confirmed a perforating disorder associated with chronic liver disease, specifically Kyrle disease.

A 51-year-old male patient with decompensated liver cirrhosis due to viral hepatitis presented with similar skin lesions on his back and extremities. Further testing and biopsy confirmed the same histopathological findings of Kyrle's disease.

A 38-year-old male patient with advanced alcoholic liver disease on top of autoimmune hepatitis presented with similar skin lesions on his face. Treatment of the underlying liver conditions, in addition to quitting

ORAL ABSTRACTS

alcohol, healed his lesions.

Conclusions:

These cases underscore that perforating disorders can occur in liver disease. Early recognition enables more targeted and effective treatment, ultimately improving patient outcomes. A multidisciplinary approach is paramount for optimal management.

INTRODUCTION: Primary biliary cholangitis (PBC) is a chronic inflammatory liver disease characterized by anti-mitochondrial antibody (AMA) and cholestasis. Early studies suggest AMA negative PBC patients (AMA-) may

associated with delayed diagnosis and poor outcomes. Clinical outcomes of PBC patients from South-East Asia has not been reported. We aim to determine the prognostic implication of AMA positivity among PBC patients.

METHODS: The SEA-PBC registry comprises PBC patients from 13 institutions from the Asia-Pacific regions. Patients not fulfilling diagnostic criteria of PBC, overlap syndrome, and missing outcome data were excluded. Temporal trends in AMA-negative (AMA-) PBC from 2010-2023 were analyzed using centre-adjusted piecewise mixed-effect logistic regression. Primary outcome was transplant-free survival. Transplant-free survival was analysed using Fine-Gray competing regression, with death as competing event, adjusting for established prognostic factors.

RESULTS: Among 1,128 PBC patients, 610 PBC patients (85% female, median age 62 years, 8.5% were AMA-negative) were included for analysis. Compared with AMA-positive patients, AMA- were younger, had higher ALT, lower median FIB-4 score (1.7 [1.1-2.6] vs 2.1 [1.3-3.2], $p=0.008$) and lower proportion of cirrhosis patients (9.5% vs 22.2%, $p=0.029$), consistent with earlier-stage disease at diagnosis. The proportion of AMA- PBC increased steadily over time after adjustment for centre-level clustering (aOR per year: 1.02, 95%CI: 1.016-1.024). Treatment response and symptom burden were comparable irrespective of AMA status. In adjusted competing-risk analysis, AMA positivity did not independently associate with transplant-free survival (adjusted sHR: 1.15, 95%CI: 0.44-2.98).

CONCLUSION: In this large contemporary South-East Asian PBC cohort, AMA negative PBC is increasingly diagnosed and presents at an earlier disease stage. These findings suggest improve disease recognition over time in South-East Asia

Background:

The World Health Organization (WHO) aims to eliminate hepatitis B as a public health threat by 2030. However, the Asian-Pacific region, which carries much of the global HBV burden, is still far from reaching these targets. To speed up progress, it is essential to understand the current disease burden and how it is changing over time.

Materials and Methods: We used data from the newly released Global Burden of Disease (GBD) 2023 study, defining chronic hepatitis B (CHB) as the GBD cause "CHB including cirrhosis." For the total population and for children under 5 years, we extracted prevalence rates and numbers of prevalent cases; for the total population, we additionally obtained mortality rates, numbers of deaths, and disability-adjusted life years (DALYs) rates and counts. We described the CHB burden in 2023, analyzed temporal trends and average annual percent changes (AAPC) from 1990–2023, and applied a Bayesian age–period–cohort model to project the burden from 2024 to 2030.

Results:

In 2023, the Asian-Pacific region accounted for 63% of global chronic hepatitis B cases (178 million), 66% of deaths (259 thousand), and 65% of DALYs (8.4 million), with prevalence, mortality, and DALY rates all exceeding global averages; however, it bore only 23% of childhood infections (1,964 thousand), reflecting a lower pediatric prevalence rate (590 vs. 1,325 per 100,000). East Asia dominated absolute disease burden (99 million cases, 104 thousand deaths), while South Asia had the highest pediatric caseload (714 thousand). From 1990–2023, Western Asia showed the steepest annual decline in adult prevalence (–1.99%), and Central Asia in pediatric prevalence (–7.62%); conversely, Southeast and Central Asia exhibited rising mortality trends (+0.18% and +0.78% per year, respectively). Compared with 2015, the prevalence of CHB among

children under 5 years in the Asian-Pacific region is projected to decline by 27.9% by 2030, remaining well below the WHO's target of 90% reduction. Although age-standardized mortality is decreasing, total deaths are expected to rise by 19.6% over the same period.

Conclusions:

Asian-Pacific still carries >60% of global CHB cases and deaths; under-five prevalence is on course to fall only 27.9% by 2030, well below the WHO's target of 90% reduction. East and South Asia account for four-fifths of regional infections and three-quarters of childhood cases, making them the priority for intensified prevention, diagnosis and treatment to meet elimination goals.

2105 - Breaking the habit Evaluating the routine use of SBP prophylaxis

Shauna Madigan ¹, Eugene Phan ¹, Keshani Alagiyage ², Kathleen Davy ², Kirsty Campbell ³, Jeyamani Ramachandran ², Mohamed Asif Chinnaratha ¹ Lyell Mcewin Hospital, Gastroenterology, Adelaide-Australia ¹ Flinders Medical Centre, Gastroenterology, Adelaide-Australia ² Royal Darwin Hospital, Gastroenterology, Darwin-Australia ³

Background and Aim: Spontaneous bacterial peritonitis (SBP) is the most common bacterial infection in patients with decompensated cirrhosis and is associated with high mortality and morbidity. Despite advances in medical care, 1-year mortality after SBP ranges from 31% to 93%. SBP prophylaxis is used either as primary prophylaxis (PP) to prevent the initial episode or secondary prophylaxis (SP) to prevent recurrence. The evidence for this is based on outdated data published more than two decades ago. With the emergence of multidrug-resistant organisms (MDRO), the routine use of SBP prophylaxis needs to be re-evaluated. We aimed to investigate the impact of PP and SP on survival and MDRO development.

Methods:

Data were retrospectively collected from patients admitted with cirrhosis-related ascites across three tertiary centres in Australia between January 2022 and December 2023, with follow-up until death or December 2024.

Results:

ORAL ABSTRACTS

A total of 379 patients were included, with 61% being male, with a median (IQR) age of 62(19) years, MELD-Na score of 21(9) and follow-up of 1.2(1.9) years. Alcohol was the predominant aetiology (59%) for underlying cirrhosis, and 73(19.2%) had MDRO at baseline. On index admission, 13(3.4%) patients were already on SP, 21(5.5%) were on PP, and 51(13.5%) patients were diagnosed with SBP. Post index admission, 32(8.4%) and 48(21%) patients were commenced on PP and SP, respectively. During the follow-up, 52(13.7%) patients developed an episode of SBP.

The mean SBP-free survival was similar between those on PP and those meeting criteria but not commenced on PP [2.9 v 2.7years, Chi-square=3.7, p=0.2], and with or without SP [2.2 v 2.0years, Chi-square=1.1, p=0.3]. Overall survival was similar between those not on SP [median (95%CI):1.7 (1.2-2.1) years] and those on SP [median (95%CI):1.8(1.5-2.2) years], Chi-square=0.5, p=0.5.

Overall, the risk of developing MDRO culture-positive SBP during follow-up was significantly higher for those on either PP or SP [27.5 % v 9.4%, Chi-square=18.1, p<0.001]. The risk was only higher for those who had MDRO-positive status at baseline [64.7% v 5.4%, Chi-square=29.6, p<0.001] but not for those with MDRO-negative status at baseline [17.5% v 10.3%, Chi-square=2.5, p=0.1].

Conclusions:

This study shows that in a real-world setting, the use of PP and SP for SBP does not have a survival benefit. In fact, those who have MDRO at baseline have a higher risk of developing culture-positive SBP with MDRO if started on prophylaxis. Future randomised controlled trials are required to justify PP and SP for SBP.

2107 - COVID 19 pandemic had minimal impact on the diagnostic and treatment uptakes for HCV – a territory wide study

Vicki Wing-ki Hui Hui ¹, Mandy Sze-man Lai ¹, Jimmy Che-to Lai ¹, Vincent Wai-sun Wong ¹, Terry Cheuk-fung Yip ¹, Grace Lai-hung Wong ¹
The Chinese University Of Hong Kong, Medical Data Analytics Centre, Hong Kong-China ¹

Background / Hypothesis:
Health inequalities among individuals living with chronic hepatitis C virus (HCV) infection are pressing issues that have not received the attention they warrant. The

COVID-19 pandemic exaggerated the health inequalities. This study evaluated the secular trends in diagnostic and treatment uptake for HCV over the last two decades, contrasting the pre-COVID period with the post-COVID era.

Materials and Methods:
All individuals living with chronic HCV infection who had at least one positive result for HCV antibody (anti-HCV), HCV RNA or HCV genotype between January 2000 and December 2024 were identified. Antiviral treatment for HCV was defined with the prescription of (pegylated-) interferon with or without ribavirin or direct-acting antivirals (DAAs). Annual incidence of HCV diagnosis was summarised overall by age and gender.

Results:

We first identified 520,647 consecutive individuals with HCV markers checked, and 25,207 patients living with chronic HCV infection diagnosed in 2000-2024. Their mean age was 54.3 ± 15.9 years and 17,599 (69.97 %) were male respectively. In men, the diagnostic rate ranged from 0.34% [0.32%, 0.36%] in 2017 to 1.21% [1.12%, 1.30%] in 2024; in women, from 0.15% [0.14%, 0.17%] in 2017 to 0.53% [0.47%, 0.59%] in 2024. By age group, the highest post-COVID diagnostic rate was observed in those aged 40–49 years, increasing from 0.34% [0.29%, 0.38%] in 2017 to 1.34% [1.14%, 1.54%] in 2024. Rates also rose in 50–59 years (0.24% [0.21%, 0.27%] to 1.25% [1.10%, 1.40%]), 30–39 years (0.25% [0.21%, 0.29%] to 0.72% [0.56%, 0.88%]), and ≥70 years (0.19% [0.17%, 0.22%] to 0.57% [0.50%, 0.65%]). The lowest rates were seen in the 20–29 age group, increasing from 0.12% [0.08%, 0.16%] to 0.34% [0.17%, 0.51%].

Conclusions:

The COVID-19 pandemic had minimal impact on the diagnosis of HCV in Hong Kong. It was likely due to the endeavours mentioned in the Hong Kong Hepatitis Action Plan 2020-2024, which may have effectively mitigated the pandemic's potential disruption to hepatitis elimination efforts.

Founding: This work was supported by the Investigator Sponsored Research of Gilead Sciences (Reference: IN-HK-987-7181).

ORAL ABSTRACTS

2110 - THE RISING THREAT OF MASLD IN YOUNG ADULTS A COMPREHENSIVE METABOLIC AND HEPATIC ASSESSMENT FROM SOUTH ASIA

Abdul Samad¹, Bushra Rabbani²
Hamdard University Hospital, Gastroenterology,
Karachi-Pakistan¹ Hamdard University Hospital,
Medicine, Karachi-Pakistan²

Background / **Hypothesis:**
Metabolic dysfunction-associated fatty liver disease (MAFLD) is rapidly increasing in South Asia, with an alarming rise among young adults. This study aimed to determine the prevalence, metabolic determinants, and early hepatic impact of MAFLD in a young cohort presenting to a tertiary care centre

Materials and **Methods:**
This prospective observational study was conducted over a two-year period from June 2023 to June 2025, enrolling 300 consecutive patients presenting with nonspecific gastrointestinal symptoms such as vague abdominal pain, dyspepsia, lethargy, and low energy. Demographic data, BMI, dietary patterns, physical activity, substance use, and family history were recorded. Liver biochemistry, fasting glucose, and lipid profile were assessed in all patients, alongside ultrasonographic evaluation of hepatic steatosis. Gender-based analysis was performed to compare disease burden and associated metabolic risk patterns

Results:

Among the 300 enrolled patients (180 females, 120 males), the mean age was 30.2 ± 2.5 years, reflecting a predominantly young population. Ultrasound-confirmed hepatic steatosis was highly prevalent, observed in 82% of females and 64% of males. The majority reported consumption of energy-dense, high-fat meals, frequent intake of processed and refined carbohydrate-rich foods, and habitual late-night eating, accompanied by a striking absence of structured physical activity. Elevated SGPT levels (55–100 IU/L) were recorded in 104 females and 68 males, with significant hypertriglyceridemia (180–300 mg/dL) noted across the cohort. Fasting hyperglycemia was present in 34 females and 22 males. Overweight and obesity were common, affecting 48 males and 54 females. Cardiometabolic risk was further accentuated by a strong family history of cardiovascular disease, limited awareness of personal cardiac health, and high rates of smoking among males, while moderate alcohol intake

was reported by 25 males.

Conclusions:

MASLD is highly prevalent in this young South Asian cohort, with a disproportionately higher burden among females. The combination of unhealthy dietary behaviours, physical inactivity, metabolic abnormalities, and cardiometabolic risk factors highlights an urgent need for early lifestyle intervention, targeted metabolic screening, and structured long-term follow-up to prevent progression to fibrosis, cirrhosis, and cardiovascular events.

2113 - Unveiling occult squamous commitment as a clinical fate determinant in cholangiocarcinoma

Chen Yang¹, Shuo Li², Cun Wang¹
Shanghai Cancer Institute, State Key Laboratory Of
Systems Medicine For Cancer, Shanghai-China¹ Sun
Yat-sen University Cancer Center, State Key Laboratory
Of Oncology In South China, Shanghai-China²

Squamous transdifferentiation in intrahepatic cholangiocarcinoma (iCCA) has long been regarded as a rare event (~1-2%), yet its emergence heralds lethal disease progression. Here, we identify occult squamous commitment, a latent state characterized by activation of a squamous transcriptional program without histological transformation, quantifiable by a squamous transdifferentiation potential (STP) index. Approximately 20-30% of patients are classified as STP-high and experience unfavorable outcomes comparable to adenosquamous iCCA. FOSL1 functions as the key squamous commitment initiator, directing a stepwise squamous trajectory through dynamic chromatin-state remodeling. It cooperates with p63 in an enhancer-dependent manner to dysregulate PTGS2/COX-2 expression. The resulting intratumoral PGE2 accumulation undermines T-cell effector function and promotes neutrophil-mediated FOXP3-negative type 1 regulatory T-cell (Tr1) polarization. Clinically, STP-high tumors are predisposed to resistance to combination regimens involving immunotherapy. Celecoxib emerges as a dual-function agent that suppresses squamous plasticity while simultaneously reinvigorating T-cell activity. Our findings delineate a continuum of squamous states in iCCA and provide a framework for treatment tailored to dynamic lineage transition.

2117 - Clinical Characteristics and Short Term Outcomes of Patients with Cirrhosis and Subclinical Decompensation

Tong Bu ¹, Tianyuan Yang ¹, Qi Wang ¹
Center Of Liver Diseases, Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases, Beijing-China ¹

Background / **Hypothesis:**
According to the 2025 Chinese guidelines for the management of cirrhosis, subclinical decompensation is defined as the presence of objective evidence—such as minimal hepatic encephalopathy (MHE), imaging-confirmed small-volume ascites (<2 cm), or portal hypertensive enteropathy (positive fecal occult blood test)—without related clinical symptoms. This study aimed to describe the baseline characteristics of such patients and preliminarily analyze their short-term clinical outcomes.

Materials and **Methods:**
This was a single-center, ambidirectional cohort study. Consecutive patients with cirrhosis who met the diagnostic criteria for subclinical decompensation were enrolled between January and December 2023. Baseline data, including demographics, etiology, Child-Pugh score, and MELD score, were collected. Patients were subsequently followed up regularly. The primary endpoints were progression to clinical decompensation, re-compensation, occurrence of hepatocellular carcinoma (HCC), and death.

Results:

A total of 81 patients were included. Baseline characteristics: mean age was 55.9 ± 11.1 years, and 60.5% were male. The primary etiology was viral hepatitis (60.5%). The majority of patients (81.5%) had well-preserved liver function (Child-Pugh class A), with a mean MELD score of 8.3 ± 3.3 . The most common manifestation of subclinical decompensation was asymptomatic small-volume ascites (61.7%), followed by MHE (24.7%) and a positive fecal occult blood test (13.6%). Outcomes: Among the 52 patients who completed the 96-week follow-up, re-compensation was observed in 22 cases (42.3%), progression to HCC in 5 cases (9.6%), and death in 2 cases (3.8%).

Conclusions:

Patients meeting the criteria for subclinical decompensation are characterized by well-preserved liver function but with established complications of portal hypertension, with asymptomatic ascites being the most frequent presentation. During short-term follow-up, while some patients achieved re-compensation, a considerable proportion still progressed to HCC or death. This population represents

a critical window for intervention, and the clear clinical profile and outcome data provide an important basis for developing individualized management and surveillance strategies

2121 - Eliminating Viral Hepatitis in Pakistan A Comprehensive Strategic Framework

Hassan Mahmood ¹, Alaama Ahmed Sabry ², Muhammad Shahid Jamil ², Muhammad Safdar Kamal Pasha ³, Ammara Naveed ⁴, Huma Qureshi ⁵
Integral Global, Usa, Public Health, Islamabad-Pakistan ¹ Who Regional Office For The Eastern Mediterranean, Hiv, Hepatitis And Stis, Department Of Communicable Diseases, Cairo-Egypt ² Who Country Office, For Hiv, Viral Hepatitis & Stis, Islamabad-Pakistan ³ Pkli, Gastroenterology, Lahore-Pakistan ⁴ Ministry Of Health, Public Health, Islamabad-Pakistan ⁵

Background / **Hypothesis:**

Pakistan is grappling with a significant public health challenge, bearing a high burden of viral hepatitis B and C. Approximately 3.8 million people are living with hepatitis B virus (HBV) and 9.8 million with hepatitis C virus (HCV). To address this pressing issue, the National Hepatitis Strategic Framework (NHSF) 2024-2030 has been developed, aligning with the World Health Organization's (WHO) Global Health Sector Strategy. The NHSF aims to eliminate viral hepatitis as a major public health threat by 2030. To achieve this goal, the framework outlines a comprehensive approach, focusing on:

1. Strengthening leadership and governance
2. Improving prevention through enhanced vaccination coverage and safe blood transfusions
3. Increasing access to testing and treatment services
4. Building laboratory capacity for diagnosis and surveillance
5. Enhancing surveillance and strategic information systems

Key strategies include scaling up harm reduction services for high-risk populations, integrating hepatitis testing and treatment with primary care services, and promoting community awareness and engagement

Materials and **Methods:**

The NHSF was developed through a systematic and inclusive approach, involving assessment of the current hepatitis situation, stakeholder engagement (healthcare

ORAL ABSTRACTS

professionals, policymakers, community representatives, patient advocacy groups), analysis of global best practices and WHO guidelines, identification of gaps in hepatitis services, establishment of clear objectives and targets and development of a comprehensive framework with implementation plans and monitoring system. This approach ensured the NHSF is evidence-based, inclusive, and tailored to Pakistan's needs, providing a roadmap for eliminating viral hepatitis.

Results:

The NHSF targeted tangible targets, including:

- Reducing new chronic HCV infections to ≤ 5 per 100,000
- Reducing chronic HBV prevalence among 1-5 year-olds to $\leq 0.1\%$
- Reducing HBV and HCV-related mortality to ≤ 6 per 100,000 by 2030

Conclusions:

Pakistan's NHSF provides a roadmap for eliminating viral hepatitis as a major public health threat by 2030. Effective implementation, monitoring, and partnerships will be crucial to achieving the targets and reducing the burden of viral hepatitis in Pakistan. By working together, Pakistan can make significant progress towards eliminating viral hepatitis and improving the health and well-being of its population. The NHSF serves as a guiding document for stakeholders, policymakers, and healthcare professionals to collaborate and strive towards a hepatitis-free Pakistan.

2124 - GENDER DISPARITIES IN HEPATOCELLULAR CARCINOMA A COMPARATIVE ANALYSIS

Abdul Samad Bhatti¹, Nazish Butt¹, Omar Idris¹, Gulzar Khan², Barozai²
JPMC, Gastroenterology, Karachi-Pakistan¹ JPMC, Gastroenterology, Karachi-Pakistan²

Background / **Hypothesis:**

Hepatocellular carcinoma (HCC) is the most common primary liver malignancy and a major cause of cancer-related mortality worldwide. It shows a clear gender disparity, with males more frequently affected. In

Pakistan, HCC incidence is increasing due to chronic hepatitis B (HBV), hepatitis C (HCV), hepatitis D (HDV), and metabolic dysfunction-associated steatotic liver disease (MASLD; formerly NAFLD/NASH). Limited local data exist regarding gender-based differences in risk factors and complications. This study aims to assess gender distribution, associated risk factors, and complications among HCC patients at Jinnah Postgraduate Medical Centre (JPMC), Karachi.

Materials and Methods:

This cross-sectional observational study was conducted in the Gastroenterology Ward of Jinnah Postgraduate Medical Centre (JPMC), Karachi, from January 2023 to December 2025. All male and female patients aged 18 years and above with a confirmed diagnosis of hepatocellular carcinoma (HCC) were included. Data were collected using a structured proforma, documenting demographics, risk factors (HBV, HCV, MASLD, alcohol use, and co-infections), and complications (upper gastrointestinal bleeding, portal systemic encephalopathy, ascites, and hepatoma rupture). Data were analyzed using SPSS version 26.0. Descriptive statistics were used to summarize variables, and the Chi-square test was applied to assess gender differences, with a p-value ≤ 0.05 considered statistically significant.

Results:

were more prevalent among females ($p < 0.001$). Among complications, upper gastrointestinal bleeding (UGIB) occurred in 31.4% of patients, significantly more in males (37.4%) than females (18.2%) ($p < 0.001$). Portal systemic encephalopathy (PSE) was also more frequent in males (28.1% vs. 18.8%, $p = 0.002$). Ascites (55.8%) and hepatoma rupture (0.2%) showed no significant gender difference ($p > 0.05$).

Conclusions:

: Hepatocellular carcinoma (HCC) showed a marked male predominance, with nearly two-thirds of patients being male. HCV infection emerged as the leading etiological factor, particularly among males, whereas HBV and MASLD were more prevalent among females. Complications such as upper gastrointestinal bleeding and portal systemic encephalopathy were significantly more frequent in males, while ascites and hepatoma rupture showed no gender difference. These findings highlight the importance of gender-specific preventive strategies, emphasizing viral hepatitis control in males and metabolic liver disease screening in females to

ORAL ABSTRACTS

reduce the burden of HCC in Pakistan.

2125 - Efficacy and Safety of Magnesium Isoglycyrrhizinate in Checkpoint Inhibitor Induced Liver Injury in Patients with Advanced Solid Tumors An Exploratory Study

Lijuan Guo ¹, Qing Li ², Chengsong Cao ², Xin Jin ², Yang Yu ², Jiage Ding ², Xue Cheng ¹, Yong Liu ²
Xuzhou Medical University, Xuzhou Clinical School, Xuzhou-China ¹ Xuzhou Central Hospital, Southeast University, Department Of Oncology, Xuzhou-China ²

Background / Hypothesis: Immune checkpoint inhibitors (ICIs) have shifted the paradigm of cancer treatment; however, immune-mediated liver injury occurs in >30% of patients receiving ICI therapy and may require cessation of ICI therapy and initiation of immunosuppression. Magnesium isoglycyrrhizinate, a magnesium salt mainly consisting of 18 α -glycyrrhizic acid stereoisomers, possesses hepatoprotective activities and has been shown to be more effective in lessening ICI-induced liver injury when combined with steroid therapy than steroid therapy alone. We undertook this exploratory study to investigate the efficacy and safety of magnesium isoglycyrrhizinate for ICI-induced liver injury in patients with advanced solid tumors on ICI combination therapy. **Materials and Methods:** Patients aged between 18 and 75 years who were to receive first-line ICI therapy in combination with chemotherapy or other antitumor therapy and had normal liver function at screening (alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase and total bilirubin $\leq 1.0 \times$ upper limit of normal) received magnesium isoglycyrrhizinate 200 mg given intravenously once daily for ≥ 3 days for 4 to 6 cycles, given within 2 days of each cycle of ICI combination therapy. The primary endpoint was the incidence of liver injury. The secondary endpoints included the severity of liver injury and safety. **Results:** Between March 17, 2024 and June 28, 2025, 50 patients were screened for eligibility, 12 with hepatocellular carcinoma or liver metastasis and 6 with abnormal liver function at screening were excluded. Thirty-two patients (nonsmall cell lung cancer, 20 patients; gastric cancer, 9; colorectal cancer, 2; esophageal cancer, 1) received magnesium isoglycyrrhizinate (median duration of treatment, 9.9 weeks [IQR 4.1-16.0], median number of cycles, 4 [IQR 2-6]; median cumulative dose, 900 mg [range, 200-3800]). The incidence of ICI-induced liver injury was

15.6% (95% CI 5.3% to 32.8%). Grade 1 ICI-induced liver injury occurred in 5 patients; no grade ≥ 2 ICI-induced liver injury was reported. The median time to onset of ICI-induced liver injury was 6.1 weeks (range, 3.3-10.0) and the median cycle 3 (range, 2-4). Treatment-emergent adverse events (AEs) occurred in 71.9% (23/32) patients, but grade ≥ 3 treatment-emergent AEs were infrequent (6.3%[2/32]). No treatment-related AE was reported. Serious AEs occurred in 1 patient. **Conclusions:** Magnesium isoglycyrrhizinate is safe and effective in reducing the incidence and severity of ICI-induced liver injury in advanced solid tumor patients. The findings support further investigation of magnesium isoglycyrrhizinate as a potential preventative therapy for ICI-induced liver injury.

Background / Hypothesis: Achieving complete pathological response (cPR) has been associated with lower hepatocellular carcinoma (HCC) recurrence after liver transplantation (LT). However, Predictors of cPR to immune checkpoint inhibitors (ICIs) remain unclear. Prior studies suggest that strong treatment responses indicate increased immune activation and a higher risk of graft rejection. We aimed to identify factors linked to cPR and assess its effect on overall survival (OS), HCC recurrence, and graft rejection.

Materials and Methods: In the largest multinational retrospective study (Leveraging Immunotherapy for Liver Transplantation in HCC; LIFT-HCC), we included HCC patients who received ICIs before LT and had post-LT follow-up. Logistic regression analyses identified factors linked to achieving cPR. OS, Cumulative incidence of recurrence (CIR), and graft rejection were estimated by cPR status.

ORAL ABSTRACTS

Results: A total of 408 patients (14 countries, 60 centers) were included (mean age 54 ± 10 years, 91% male). At ICI start, 75% were Child-Pugh A, the median (IQR) AFP was 53 (6, 690), and 23% were within Milan criteria. At LT, the median (IQR) AFP was 9 (3, 129), and 43% were within Milan criteria. Pre-LT imaging showed 17.9% had no viable tumor. On explant pathology, 17% achieved cPR. Receiver operating characteristic analysis showed that absence of viable tumor on imaging had 71.7% sensitivity and 92.2% specificity for predicting cPR, with an area under the curve of 0.82 (95%CI 0.76-0.88). Median ICI cycle number (8 vs 3, $p < 0.001$), median ICI washout period (98 vs 65 days, $p = 0.003$), and PD-L1 use frequency (50% vs 8%, $P < 0.001$) were significantly higher among cases with cPR versus those without cPR. In the multivariable model (Table), >4 ICI cycles (OR 2.79, 95%CI 1.1-7.1), a greater decline in delta log-AFP (OR 0.76, 95%CI 0.62-0.93), and no viable tumor on imaging (OR 19.61, 95%CI 7.61-50.55) were independently associated with cPR. During a median post-LT follow-up of 21.2 months (95%CI, 18.9-25.4), 21% died, 26% had HCC recurrence, and 19% experienced allograft rejection. Cases without cPR had significantly lower OS (HR 3.04, 95%CI 1.31-7.06, $P = 0.01$) and higher CIR (SHR 6.32, 95%CI 2.54-15.7, $P < 0.001$), but not graft rejection (SHR 0.86, 95%CI 0.45-1.66, $P = 0.66$) (Figure).

Conclusions: cPR was observed in 1 of 6 patients receiving pre-LT ICIs. Each unit decrease in delta log-AFP and receiving >4 ICI cycles remained independently associated with achieving cPR after adjusting for pre-transplant imaging. cPR was associated with higher OS and lower CIR, but did not affect the risk of rejection.

2132 - Leveraging Decentralization Integration and Task Shifting to achieve Micro elimination of Hepatitis C among prisoners in Northern India

Ajeet Singh Bhadoria¹, Amrita Mehndiratta¹, Rakesh Gairola², Rajesh Somvanshi³
Aiiims Rishikesh, Community Medicine, Rishikesh-India¹
Hardwar Prison, Prison Clinic, Haridwar-India² State Nhm, Nvhcp, Haridwar-India³

Background / Hypothesis: Hepatitis C virus (HCV) infection is highly prevalent among incarcerated individuals, yet diagnosis and treatment remain challenging in correctional settings. A decentralized,

integrated, and task-shifting approach can overcome these barriers. This project utilized a novel prison-based model for HCV micro-elimination, leveraging the existing public health infrastructure to streamline care and accelerate treatment initiation.

Materials and Methods: A micro-elimination project was conducted across four major jails in Uttarakhand state of India, from Aug2024- Aug2025, offering HCV self-testing (HCVST). Reactive HCVST results led to RNA testing and liver fibrosis assessment via onsite transient elastography (TE) using portable TE machine. Drones aided sample collection and direct-acting antiviral (DAA) delivery and teleconsultation supported constant handholding. Confirmed active infections were treated with DAA therapy, following NVHCP guidelines. A usability study of HCVST kits was also conducted among 100 inmates (Figure 1).

Results: Of 4050 inmates (96.7% male; mean age: 35 ± 13 years), 40.9% were from Haridwar, 25.1% from Dehradun, 20.4% from Haldwani and 13.6% from Roorkee. Overall, 138 (3.41%) tested positive for HCVST, with 67% (92/132) positives from Haridwar, 14% (20/132) from Dehradun and 18% (26/132) from Roorkee. Key reported behaviors included sharing toothbrushes/shaving tools (38.1%) and unsafe sex (14.6%). HCV positivity was significantly higher among those sharing needles [Risk in exposed = 56.9% (33/58), OR: 5.1; 95%CI: 2.9-9.0], using unprescribed injectable drugs [Risk = 52.1% (37/71), OR: 4.3; 95%CI: 2.3-7.5], unsafe sex [Risk = 15.4% (70/455), OR: 11.9; 95% CI: 7.9-17.8], tattooing (OR: 6.2; 95%CI: 2.3-16.6), and sharing personal items (OR: 3.7; 95% CI: 2.4-5.5). Logistic regression identified unsafe sex (OR: 8.6; 95%CI: 4.9-15.1), needle sharing (OR: 7.2; 95%CI: 2.1-25.0), and injectable drug use (OR: 3.8; 95%CI: 1.2-11.9) as independent predictors ($p < 0.05$). Out of 138 Ant-HCV positive, 117/138 (85%) were tested for HCVRNA, 106/117 (90%) were HCVRNA positive (median HCVRNA-30,245 IU/mL (range 262-625,463)). Significant liver fibrosis (TE > 12 kPa) was observed in 15 cases. 74/106 (70%) individuals were put on DAA treatment, only 21/74 (28%) completed treatment, and the SVR-12 rate was 95% (Figure 2). The only reason for dropouts at different levels of the care cascade was "release from the prison". The overall usability of HCVST kits was 80%, with high acceptability, but some challenges were encountered during sample collection that required assistance. Conclusion: This project demonstrated the feasibility of utilizing HCVST to screen and link inmates to hepatitis C care within a correctional setting, which has high

ORAL ABSTRACTS

burden.

2134 - Iron Metabolism Defects in Wilson Disease Suspects A Real World Two Phase Molecular Epidemiology Study

Leilei Gu ¹, Bilian Yao ², Qi Xu ³, Xinxin Zhang ⁴, Yue Han ⁴

Ruijin Hospital North, Shanghai Jiao Tong University School Of Medicine, Department Of Gastroenterology, Shanghai-China ¹ Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Department Of General Practice, Shanghai-China ² Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Department Of Infectious Diseases, Research Laboratory Of Clinical Virology, Shanghai-China ³ Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Sino-french Research Centre For Life Sciences And Genomics; Department Of Infectious Diseases, Research Laboratory Of Clinical Virology, Shanghai-China ⁴

Background / **Hypothesis:**
Clinically, genetic defects in the ATP7B gene alone are often insufficient for diagnosing Wilson disease (WD) or explaining the phenotypic heterogeneity observed in suspected cases. Additionally, we observed that a subset of these individuals exhibited iron metabolism anomalies. Therefore, we hypothesized that genetic defects in iron metabolism may contribute to the unexplained heritability in WD suspects.

Materials and **Methods:**
WD suspects were identified based on the Leipzig criteria. In the first phase, 498 suspects underwent targeted sequencing of the ATP7B gene, and major iron markers were assessed. Serum ferritin levels and iron saturation (FeSat) percentages were compared with those of healthy controls, patients with non-infectious non-liver diseases, and patients with liver diseases, ensuring age and gender matching across groups. In the second phase, a new cohort of 299 suspects underwent exome sequencing, with a focus on genes involved in iron metabolism and potential mediators of copper toxicity.

Results:

In the initial phase, 32.89% of WD suspects had elevated serum ferritin levels, and 41.52% had higher-than-normal FeSat percentages, both significantly higher than in healthy controls ($p < 0.001$ and $p < 0.001$, respectively). Similar trends were observed when compared to the non-infectious non-liver disease group

(ferritin $p < 0.05$, FeSat $p < 0.001$). However, when compared to patients with liver disorders, the significance for ferritin disappeared, while the significance for FeSat remained ($p < 0.05$). These findings were more pronounced in genetically confirmed subgroups of WD suspects. In the second phase, 50% of the suspects with ATP7B genetic defects exhibited rare iron metabolism defects, while this proportion rose to 65% when considering all suspects, regardless of ATP7B status. The most frequent defects involved TFR2 and SLC11A2.

Conclusions:

Our study confirmed the disruption of iron metabolism in WD suspects. Rare genetic defects associated with iron metabolism co-occurred with ATP7B defects, underscoring the interplay between the regulatory pathways of both transition metals.

Keyword(s) : Wilson disease, ATP7B, copper, iron, missing heritability

2137 - Protective and Therapeutic Roles of Vitamin D in Reducing Chlorpyrifos Induced Liver Fibrosis Through Modulation of Fibrotic Pathways

Dr. Aftab Abbasi ¹
Isra University, Anatomy, Hyderabad-Pakistan ¹

Background / **Hypothesis:**

Organophosphate pesticides, particularly chlorpyrifos (CPF), induce liver fibrosis through oxidative stress and hepatic stellate cell activation, leading to elevated expression of α -smooth muscle actin (α -SMA), transforming growth factor-beta 1 (TGF- β 1), and Collagen-I. Given vitamin D's established anti-inflammatory and antifibrotic properties, this study investigated its protective and therapeutic effects on CPF induced hepatic fibrosis in male albino Wistar rats. **Objective:**

To determine the prophylactic and therapeutic effects of vitamin D on chlorpyrifos induced liver fibrosis

Materials and **Methods:**
Thirty five male albino Wistar rats were allocated into four groups: control (n=5), CPF-treated (n=10), and two vitamin D-treated groups (D1, n=10; D2, n=10). Hepatic fibrosis was induced via daily intraperitoneal CPF injection (1 ml/kg) for eight weeks. In group D1, vitamin D (0.5 μ g/100g, twice weekly) was administered after fibrosis establishment, while in group D2, vitamin D was given simultaneously with CPF. Assessments included serum liver function tests (ALT, GGT, bilirubin),

ORAL ABSTRACTS

histopathological examination (H&E and Masson's Trichrome staining), and quantitative real-time PCR analysis of fibrogenic markers (α -SMA, TGF- β 1, Collagen-I).

Results:

CPF exposure significantly elevated liver enzymes and bilirubin (ALP: 168.8 ± 10.45 IU/L; GGT: 16.1 ± 1.72 IU/L; bilirubin: 0.46 ± 0.042 mg/dL). Vitamin D treatment dose dependently reduced these parameters, with therapeutic administration (D1) showing moderate improvement (ALT: 155.6 ± 8.11 IU/L; bilirubin: 0.35 ± 0.02 mg/Dl; GGT: 14.4 ± 1.95 IU/L) and prophylactic administration (D2) demonstrating superior efficacy (ALT: 102 ± 7.85 IU/L; bilirubin: 0.2 ± 0.04 mg/Dl; GGT: 4.9 ± 1.66 IU/L). Histopathological analysis revealed that CPF induced severe stage-3 fibrosis, which improved to stage-1 in D1 treatment group and completely resolved to stage-0 in D2 group. Molecular analysis demonstrated marked downregulation of fibrogenic genes in D2 compared to CPF: α -SMA (2.55-fold vs. 0.97-fold), Collagen-I (3.82-fold vs. 1.02-fold), and TGF- β 1 (3.64-fold vs. 1.09-fold), indicating potent antifibrotic activity.

Conclusions:

Vitamin D significantly ameliorates CPF induced hepatic fibrosis across biochemical, histological, and molecular parameters. Prophylactic administration (simultaneous with CPF) demonstrates superior protective effects compared to therapeutic intervention, achieving complete fibrosis reversal and normalization of fibrogenic gene expression. These findings suggest vitamin D as a promising preventive and therapeutic agent against CPF induced liver injury.

2143 - A model screen test and treat hepatitis C elimination project among under served communities in Islamabad the federal capital of Pakistan

Huma Qureshi ¹, Hassan Mahmood ², Nabil Ahmed ², Francisco Averhoff ³, Lillian Lou ⁴
Ministry Of Health, Public Health, Islamabad-Pakistan ¹
Integral Global, Usa, Public Health, Islamabad-Pakistan ²
Abbott, Public Health, Illinois-United States ³ John C. Martin Foundation, Public Health, San Francisco-United States ⁴

Background

Pakistan faces a significant hepatitis C virus (HCV) burden with limited access to care and treatment. To address this, a same-day testing and treatment initiation model program was launched in Islamabad's marginalized communities (slums) on March 2, 2019.

Materials and Methods

The program, implemented in 17 slums with a population of 50,000, offered free HCV screening, testing, and treatment. Trained community health workers (CHWs) conducted door-to-door screening, testing individuals aged ≥ 12 years using a rapid HCV antibody test. Those testing positive were referred to a nearby clinic for diagnosis of active HCV infection (RNA) by GeneXpert.

Results

A total of 24,216 participants were screened, with 514 (2.12%) testing positive for anti-HCV. Of these, 440 (85.6%) underwent HCV RNA testing, and 323 (73.4%) had detectable RNA. Three hundred eighteen individuals (98.5%) initiated treatment, and 284 (89.3%) completed it. Treatment involved a 12-week sofosbuvir and daclatasvir regimen for non-cirrhotic patients, while those with cirrhosis (APRI ≥ 1.5) were referred to specialists. Patients received counseling, hepatitis B vaccination, and follow-up care. HCV RNA testing at 12 weeks post-treatment showed 96.4% (241/250) achieved viral clearance (cure).

Conclusions

Same day hepatitis C testing and treatment initiation led to minimal patient loss as most patients could be quickly linked to care. CHWs were very effective in reaching "hard-to-reach" populations with limited access to health services. Their involvement led to high rates of linkage to care and adherence to treatment for hepatitis C.

2145 - Gestational cholestasis single center experience

Ahmet Uyanikoglu ¹, Suleyman Sari ², Hacer Uyanikoglu ³

Harran University, Gastroenterology, Sanliurfa-Türkiye ¹
Sb Sanliurfa Research Hospital, Internal Medicine, Sanliurfa-Türkiye ² Harran University, Gynecology, Sanliurfa-Türkiye ³

Background

Hypothesis:

ORAL ABSTRACTS

The incidence of gestational cholestasis (GC) is one in a thousand. The aim of this study is to evaluate the incidence of GC in the Şanlıurfa region and the characteristics of patients diagnosed with GC.

Materials and **Methods:** Births performed at Şanlıurfa Training Hospital in the last year were retrospectively reviewed, and patients diagnosed with GC were included in the evaluation.

Results: A total of 52,717 births were performed between December 2024 and December 2025, and 69 patients were diagnosed with GC. The incidence of GC for this cohort was 0.0013. The mean age of patients with GC was 27.4 ± 5.6 years (range 19-43). All but one patient (97%) had a cesarean section. Thirty-six patients (50.8%) were diagnosed with GC during their first pregnancy, 13 (19%) during their second, 12 (17.5%) during their third, 2 (3.2%) during their fourth, 4 (6.3%) during their fifth, and one patient each (1.6%) during their sixth and seventh births. The mean bile acid level was 28.17 ± 20.59 (2.26-80.19) mg/dl. All patients complained of itching. Three patients (4.8%) had gestational diabetes mellitus, and one (1.6%) had gestational hypertension. No maternal complications or deaths were detected. Fetal complications were detected in a total of 7 babies (10%), including macrosomia in 2 babies, cleft lip in 1 baby, intrauterine growth restriction in 1 baby, and ventricular septal defect (VSD) in 1 baby. Abdominal ultrasonography results were obtained for 44 patients, and cholelithiasis was detected in 4 of them (10%). Of the 59 patients for whom treatment information was obtained, 45 (75%) received UDKA treatment.

Conclusions:

The incidence of gestational cholestasis in the Şanlıurfa region is thirteen per ten thousand. In these patients, the frequency of congenital defects and maternal cholelithiasis is increased, reaching approximately ten percent.

2148 - B Cell Depletion Therapy Shows Efficacy in Steroid Refractory Autoimmune Hepatitis

Yunlong Yao¹, Xi Zhang¹, Chenyu Fei¹
Beijing University Of Chinese Medicine, School Of Traditional Chinese Medicine, Beijing-China¹

Background

Hypothesis:

Autoimmune hepatitis (AIH) is typically managed with corticosteroids and azathioprine, but a subset of patients are refractory to standard immunosuppression or experience severe side effects, risking progressive liver damage and cirrhosis. B lymphocytes play a critical role in AIH pathogenesis through autoantibody production and antigen presentation. We hypothesized that depleting B cells with rituximab (an anti-CD20 monoclonal antibody) could induce disease remission in steroid-refractory AIH patients by targeting an underlying driver of autoimmunity.

Materials and **Methods:** We conducted an open-label pilot study including 12 adults with biopsy-proven AIH who remained biochemically and histologically active despite conventional therapy. Patients received two rituximab infusions (1 g each, two weeks apart) and were monitored over 12 months. Liver function tests (ALT, AST, bilirubin) and immunoglobulin G (IgG) levels were measured at baseline and regular intervals. Autoantibody titers (ANA, SMA) were tracked, and liver biopsies were obtained at baseline and 12 months post-treatment to assess histological inflammation (HAI score). Clinical outcomes, steroid-sparing effects, and adverse events were also recorded.

Results:

B-cell depletion therapy was associated with significant clinical and biochemical improvements. By 6 months post-rituximab, 9 of 12 patients (75%) achieved complete biochemical remission (normalization of ALT/AST and IgG). The remaining 3 patients showed partial improvement in liver enzymes. Follow-up biopsies at 1 year in 8 patients demonstrated reduced interface hepatitis and lymphoplasmacytic infiltrates, with the HAI inflammation score improving by an average of 4 points compared to baseline. Prednisone requirements were substantially reduced in responders (median dose decreased by 60% at 6 months). Rituximab was well tolerated; no severe infections or infusion reactions occurred, aside from transient mild infusion-related symptoms in two patients.

Conclusions:

B-cell depletion with rituximab appears to be a promising therapeutic option for AIH patients unresponsive to standard therapy. The majority of treated patients achieved biochemical remission and histological improvement, alongside significant steroid sparing. These results suggest that targeting B cells can effectively modulate the autoimmune process in AIH, warranting larger controlled trials to confirm efficacy

2150 - Early Skeletal Muscle Loss Predicts Poor Outcomes in Advanced Hepatocellular Carcinoma Treated with Hepatic Arterial Infusion Chemotherapy

Asahiro Morishita¹, Kyoko Oura¹, Hiroki Tai¹, Rie Yano¹, Mai Nakahara¹, Tomoko Tadokoro¹, Koji Fujita¹, Joji Tani², Hideki Kobara¹
Kagawa University, Gastroenterology And Neurology, Kita-gun-Japan¹ Kagawa University, Community And Comprehensive Medicine, Kita-gun-Japan²

Background / **Hypothesis:**
Sarcopenia-related parameters, including the skeletal muscle index (SMI), influence prognosis and treatment tolerance in hepatocellular carcinoma (HCC). However, evidence is limited regarding hepatic arterial infusion chemotherapy (HAIC), particularly the prognostic relevance of early on-treatment changes in skeletal muscle mass. We aimed to clarify the clinical impact of low SMI and early SMI decline on outcomes in patients with advanced HCC undergoing HAIC.

Materials and **Methods:**
We retrospectively analyzed 70 consecutive patients with advanced HCC treated with HAIC. SMI was quantified using computed tomography and reassessed 3 weeks after HAIC initiation. Patients were stratified into a decreased SMI group (n = 27) and a non-decreased SMI group (n = 43) based on early SMI change. Progression-free survival (PFS) and overall survival (OS) were compared between groups. Associations between early SMI decline and nutritional status, liver function, therapeutic response, and adverse events were examined. Cox proportional hazards models were used to identify independent prognostic factors for OS.

Results:
Early skeletal muscle loss was strongly associated with inferior clinical outcomes. Patients in the decreased SMI group experienced significantly shorter PFS and OS compared with those without early SMI decline. Notably, pre-treatment SMI alone did not demonstrate a robust prognostic effect, whereas an SMI decrease at 3 weeks after HAIC initiation emerged as a powerful predictor of survival. Early SMI decline was accompanied by poorer nutritional status and deteriorated liver function during treatment, suggesting vulnerability to catabolic stress and reduced physiologic reserve.

Therapeutic efficacy was also diminished in the decreased SMI group, with poorer treatment response observed compared with the non-decreased SMI group. In contrast, the overall incidence of HAIC-related adverse events did not significantly differ between groups, implying that early muscle loss reflects systemic deterioration rather than simply treatment toxicity. On multivariable analysis, decreased SMI at 3 weeks remained an independent factor associated with worse OS after adjustment for relevant clinical covariates.

Conclusions:

In advanced HCC treated with HAIC, an early decline in SMI—rather than baseline SMI—identifies a high-risk population with significantly shorter PFS and OS, poorer nutritional and hepatic functional status, and reduced therapeutic response. Serial CT-based monitoring of SMI shortly after HAIC initiation may provide a practical, objective biomarker to evaluate general condition, guide supportive interventions, and improve prognostic stratification in routine clinical practice.

Keyword(s) : Hepatocellular carcinoma, Hepatic Arterial Infusion Chemotherapy, Sarcopenia, skeletal muscle index

2152 - Circulating cell free mitochondrial DNA predicts prognosis and triggers macrophage STING dependent inflammation in acute on chronic liver failure

Qiankun Hu¹, Xueyun Zhang², Yuxian Huang²
Shanghai Public Health Clinical Center, Fudan University, Department Of Liver Diseases, Shanghai-China¹
Huashan Hospital, Fudan University, Department Of Infectious Diseases, Shanghai-China²

Background / **Hypothesis:**
Acute-on-chronic liver failure (ACLF) is characterized by excessive systemic inflammation and high short-term mortality, yet the upstream molecular mechanisms underlying this inflammatory cascade remain poorly defined. This study aimed to determine the prognostic value of circulating cell-free mitochondrial DNA (cf-mtDNA) in ACLF and to elucidate its mechanistic role in driving innate immune activation.

Materials and **Methods:**
Plasma cf-mtDNA levels were quantified by quantitative PCR in patients with ACLF and analyzed in relation to disease severity, inflammatory cytokines, and short-term survival. A murine ACLF model was established by chronic carbon tetrachloride (CCl₄) administration followed by acute lipopolysaccharide/D-galactosamine challenge to characterize the temporal relationship

ORAL ABSTRACTS

between cf-mtDNA release, liver injury, and systemic inflammation. Transcriptomic, histological, and molecular analyses were performed to identify activated cytosolic DNA-sensing pathways. The functional role of the cGAS-STING pathway and therapeutic efficacy were evaluated using myeloid-specific STING deletion (STING^{fl/fl}-Lyzmcre), pharmacologic inhibition of cGAS or STING, and enzymatic degradation of circulating cf-mtDNA with DNase I.

Results:

Circulating cf-mtDNA levels were markedly elevated in patients with ACLF, progressively increased with disease severity, and independently predicted 90-day mortality. In murine ACLF, severe hepatocellular mitochondrial damage was accompanied by increased plasma cf-mtDNA and pronounced hepatic inflammation. Notably, longitudinal analyses demonstrated that cf-mtDNA elevation preceded the rise of key inflammatory cytokines, including IL-6 and TNF- α . Transcriptomic analyses revealed significant enrichment of cytosolic DNA-sensing pathways, with prominent activation of the cGAS-STING axis. Importantly, STING expression and activation were predominantly localized to hepatic macrophages in both murine and human ACLF livers. In vitro, mtDNA released from injured hepatocytes directly activated cGAS-STING signaling in macrophages, inducing downstream TBK1-IRF3 and NF- κ B activation. Genetic deletion of STING in myeloid cells or pharmacologic inhibition of cGAS or STING markedly attenuated macrophage activation, reduced hepatic necroinflammation, and improved survival in ACLF mice. Targeting the upstream trigger, degradation of circulating cf-mtDNA by DNase I similarly alleviated liver injury and improved outcomes.

Conclusions:

Circulating cf-mtDNA functions not only as a prognostic biomarker but also as an upstream pathogenic driver of ACLF by activating macrophage cGAS-STING signaling. Targeting this mtDNA-driven innate immune pathway represents a promising therapeutic strategy for mitigating inflammation-driven liver failure.

Keyword(s) : Acute-on-chronic liver failure; cf-mtDNA; cGAS-STING; macrophage; DNase I.

2161 - Circulating Tumor DNA Analysis Enables Early Detection of Hepatocellular Carcinoma in High Risk Patients

Xi Zhang¹, Yunlong Yao¹, Chunrun Li¹, Chenyu Fei¹
Beijing University Of Chinese Medicine, School Of Traditional Chinese Medicine, Beijing-China¹

Background / **Hypothesis:**
Early detection of hepatocellular carcinoma (HCC) in high-risk patients (e.g., those with cirrhosis) is critical for curative intervention, yet current surveillance tools such as ultrasound and alpha-fetoprotein (AFP) have suboptimal sensitivity for early-stage tumors. Circulating tumor DNA (ctDNA) analysis offers a non-invasive "liquid biopsy" that can detect tumor-specific genetic and epigenetic alterations in blood. We hypothesized that incorporating ctDNA-based screening would improve the early detection rate of HCC in at-risk patients compared to standard surveillance methods.

Materials and **Methods:**
We conducted a prospective cohort study involving 200 patients with cirrhosis undergoing routine HCC surveillance over 2 years. Patients provided blood samples every 6 months for ctDNA analysis alongside ultrasound/AFP screening. A targeted next-generation sequencing panel was used to detect low-frequency tumor-associated mutations (e.g., TERT promoter, TP53, CTNNB1) and methylation signatures known to be specific for HCC. Test performance (sensitivity, specificity, positive predictive value) for early-stage HCC (BCLC 0/A) detection was calculated for ctDNA, ultrasound/AFP, and the combination of both. Confirmatory imaging (MRI) and biopsy were used to diagnose HCC in cases of positive screening results.

Results:

During the study period, 30 patients were diagnosed with HCC, of which 22 were early-stage. ctDNA analysis detected 19 of 22 early HCC cases, yielding a sensitivity of 86% (vs 59% for ultrasound/AFP, $p < 0.01$), with a specificity of 92% in those who remained tumor-free. Combining ctDNA with ultrasound increased early detection sensitivity to 95%. Notably, ctDNA became positive a median of 4 months (range 2–9) prior to radiological tumor confirmation in 15 cases, enabling earlier intervention. In 3 instances, ctDNA screening identified very small tumors (< 2 cm) missed by ultrasound. False positives were limited (positive predictive value 75%), and no HCC cases were missed when both modalities were used together.

Conclusions:

Implementing ctDNA-based liquid biopsy significantly improves the detection of early-stage HCC in high-risk patients, outperforming traditional ultrasound/AFP surveillance. The ability of ctDNA screening to flag

ORAL ABSTRACTS

emerging tumors months before imaging detection highlights its potential to facilitate timely curative treatments. These findings support the integration of ctDNA analysis into HCC surveillance protocols, pending further validation in larger trials.

Keyword(s) : hepatocellular carcinoma; circulating tumor DNA; early detection; liquid biopsy; surveillance

2168 - Colorectal Carcinoma in Young patients single Centre study from Karachi Pakistan.

Ghulam Mohiuddin¹, Nazish Butt¹

Jinnah Postgraduate Medical Complex, Kara, Gastroenterology And Hepatology, Karachi.-Pakistan¹

Introduction:

Colorectal cancer (CRC) is on the rise among young adults. It affects the colon, appendix, and rectum. According to GLOBOCAN 2018, CRC is the 4th most common cancer worldwide and the third leading cause of cancer mortality. The global CRC rate is expected to rise by 60% by 2030, leading to 2.2 million new cases and 1.1 million deaths annually. CRC is heterogeneous, with 70% of cases being sporadic, 10-30% familial, and 5-7% due to hereditary diseases.

Objective:

To evaluate the clinicopathological features of colorectal cancer (CRC) in young adults under the age of 30 Years.

Method:

This was a cross-sectional retrospective study conducted at the Gastroenterology and Oncology Department of JPMC, Karachi, from January 2018 to December 2022. All patients under 30 with CRC were included in the study. Diagnosis was made through colonoscopy and histopathology. Data was analyzed using SPSS version 23. Descriptive statistics were calculated using frequencies and percentages.

Results:

A total of 566 CRC patients were analyzed, of which 117 were young patients. Of the young patients, 67 (57.3%) were male and 50 (42.7%) were female. The majority were Urdu-speaking (47 or 40%), followed by Sindhi (40 or 34%), and Pathan and Punjabi (13 or 11%). Smoking was strongly associated with CRC, with 13 (9%) active smokers, and 8 (6%) using Naswar. The most common area of residence was Orangi Town (8 or 6%), followed

by Korangi (3 or 4%). Colonoscopy revealed polypoid growth in 79 (67%) patients, followed by ulcerated lesions in 23 (19.7%). The most common site of CRC was the rectum (48 or 41%), followed by the sigmoid colon (46 or 39.3%). The least common site was the ascending colon (7 or 2.6%). Moderately differentiated adenocarcinoma was the most common histological type, found in 96 (82.5%) patients, with 17 (10%) having the signet ring type. The most common clinical presentations were abdominal pain (64 or 53%), constipation (45 or 38.5%), and bleeding per rectum (42 or 36%).

Conclusion:

CRC is a leading cause of mortality and is increasingly common among young adults, predominantly affecting the left side of the colon. More studies are needed to develop guidelines for CRC screening and surveillance in our population

Keyword(s) :

2172 - The coexistence of MAFLD exacerbates liver fibrosis in patients with chronic hepatitis B.

Alaa M. Mostafa¹, Nadia Abdelaaty Abdelkader², Omar Magdy³, Nehal Refaat Raouf⁴, Yasser Fouad¹
Minia University, Gastroenterology, Hepatology And Endemic Medicine, Minia-Egypt¹ Ain Shams University, Tropical Medicine, Egypt-Egypt² Assiut University, Internal Medicine, Assiut-Egypt³ Minia University, Public Health,⁴ Minia-Egypt

Background / Hypothesis: Despite the increasing recognition of metabolic dysfunction-associated fatty liver disease (MAFLD) and Chronic Hepatitis B patients (CHB), their interplay on liver fibrosis remains insufficiently elucidated. This study aimed to assess liver fibrosis in CHB patients with concurrent MAFLD

Materials and Methods: A cross-sectional study included 148 patients with a confirmed diagnosis of CHB infection, categorized according to the MAFLD standard criteria into CHB with MAFLD (CHB/+MAFLD) and without MAFLD (CHB/-MAFLD). Demographic, metabolic, and biochemical parameters were analyzed. Fibrosis was assessed non-invasively using vibration-controlled transient elastography (VCTE). A multivariate logistic regression identified independent predictors of significant fibrosis.

ORAL ABSTRACTS

Results:

Among the CHB cohort, 34.5% fulfilled MAFLD criteria. Using FIB-4 >1.3 for significant fibrosis, the CHB/+MAFLD group exhibited a higher prevalence of significant steatosis (45.1%) compared to 23.7% in the CHB/-MAFLD group, with higher medians in the CHB/+MAFLD group (1.2 vs 0.8, $p < 0.001$). Consistently, liver stiffness measurement (LSM) assesses the severity of fibrosis. The prevalence of significant fibrosis ($F \geq 2$) was higher in CHB/+MAFLD (37.3 vs 16.5%, $p = 0.005$) than in those without MAFLD (with medians 6.1 and 5.6 kPa, respectively, $p = 0.03$). In multivariate analysis, MAFLD independently increased the odds of significant fibrosis (4.48, 95% CI 1.29–15.6, $p = 0.019$) in CHB patients

Conclusions:

The interplay of MAFLD and CHB contributes to worsening liver injury and fibrosis progression. Given the high prevalence of MAFLD and negative impact, metabolic risk assessment should be incorporated into routine CHB care to reduce fibrosis and improve long-term liver outcomes.

Keyword(s) : Chronic hepatitis B, MAFLD, liver fibrosis, and VCTE

2185 - Nonthermal Histotripsy Enables Complete Ablation of Perivascular Liver Tumors While Preserving Adjacent Vessel Patency

Kai-wen Huang¹
National Taiwan University, Centre Of Mini-invasive
Interventional Oncology, Taipei-Taiwan¹

Background:

Ablation of liver tumors abutting major hepatic vessels is limited by reduced efficacy of thermal modalities due to heat-sink effects and by concern for vascular injury, thrombosis, and downstream hepatic ischemia. Histotripsy is a nonthermal focused ultrasound technique that causes targeted tissue destruction through acoustic cavitation, producing mechanical fractionation rather than coagulative necrosis. Because large vessels contain collagen-rich architecture, histotripsy may preferentially preserve vascular integrity while still enabling complete tumor ablation for “vessel-hugging” tumors.

Materials and Methods:

This interim report summarizes a prospective, single-arm feasibility cohort of percutaneous histotripsy for liver tumors immediately adjacent to major hepatic vessels (≤ 3 mm). Procedures were performed under real-time ultrasound guidance with cavitation visualization to confirm targeting. Tumor and patient

descriptors below represent an early cohort typical of HCC practice: 10 patients (median age 64 years; range 49–78; 8 male), with 13 tumors (median diameter 2.4 cm; range 1.3–3.5 cm). Tumors were located in proximity to major portal vein branches ($n \approx 9$), hepatic veins ($n \approx 3$), or the inferior vena cava ($n \approx 5$). All planned ablation volumes intentionally enveloped the adjacent vessel. Primary endpoints included technical success (completion of planned sonication and target coverage), complete ablation (non-enhancement of the treated volume by contrast-enhanced CT/MRI one month later), and vascular safety (new thrombosis/occlusion/clinically relevant stenosis by contrast-enhanced CT/MRI one day later). Secondary endpoints included evidence of persistent hepatic ischemia (segmental perfusion defect with ongoing clinical/laboratory compromise) and adverse events.

Results:

All 13 tumors were treated as planned with complete target coverage, yielding a technical success rate of 100% (20/20). At 1-month, complete ablation was confirmed for all lesions. No treated case demonstrated adjacent vessel thrombosis, occlusion, or persistent stenosis, despite vessel-encompassing ablation volumes. Clinically, no patient developed persistent hepatic ischemia. Post-procedure effects were limited to self-limited symptoms managed conservatively, without grade ≥ 3 complications in this interim cohort.

Conclusions:

Histotripsy achieved 100% complete ablation in a challenging cohort of perivascular HCC lesions tightly abutting major hepatic vessels, while preserving vessel patency and avoiding persistent hepatic ischemia—even when ablation volumes intentionally enveloped the vessels. These interim data support continued accrual and longer-term follow-up to evaluate durability, local tumor progression, and broader safety across tumor sizes and vascular contexts.

ORAL ABSTRACTS

University-Egypt ² South Egypt Cancer Institute, Assiut University, Biostatistics And Cancer Epidemiology, Assiut-Egypt ³ Higher Technological Institute Of Applied Health Sciences, Sherbin, Medical Laboratories, Mansoura-Egypt ⁴ Egyptian Liver Research Institute And Hospital (elriah), Sherbin, Clinical Research Coordinator, Mansoura-Egypt ⁵ Suez Canal University, Internal Medicine, Suez-Egypt ⁶ Egyptian Liver Research Institute And Hospital (elriah), Sherbin, Tropical Medicine, Mansoura-Egypt ⁷

Background / Hypothesis: Direct-acting antivirals (DAAs) have transformed hepatitis C virus (HCV) care, yet hepatocellular carcinoma (HCC) risk persists after sustained virological response (SVR). Current guidelines mandate uniform 6-monthly surveillance in patients with advanced fibrosis/cirrhosis, despite wide heterogeneity in post-SVR HCC risk. Modelling studies suggest personalised surveillance may improve efficiency, but real-world evidence is lacking. We evaluated the efficacy and cost effectiveness of a personalised surveillance strategy guided by the General Evaluation Score (GES) compared with standard surveillance.

Materials and Methods: In this prospective, real-world comparative cohort study, 955 patients with advanced fibrosis/cirrhosis post-SVR were enrolled across two tertiary hepatology centres: 463 received standard 6-monthly ultrasound and AFP surveillance and 492 underwent GES-guided personalised surveillance, with intervals of 2–3 months (high risk), 6 months (intermediate), and 12 months (low). Outcomes included early-stage HCC detection (BCLC 0–A), surveillance utilisation, costs, and incremental cost-effectiveness. Analyses followed CHEERS 2022 guidelines.

Results: Sixty HCC cases were identified: 25 (5.4%) under standard surveillance and 35 (7.1%) with GES-guided surveillance. Early-stage tumours were detected in 52% (13/25) of standard-surveillance cases versus 80% (28/35) in the GES cohort, representing a 2.3-fold improvement. Despite intensified monitoring of high-risk patients, total surveillance visits were slightly lower with GES (3.01 vs 3.23 visits/patient). The cost per early-stage HCC detected decreased by 54%. Real-world ICER analysis showed that GES-guided surveillance was a dominant strategy, detecting more early-stage HCCs at lower overall cost. The ICER was −533 GBP per early

detected

HCC.

Conclusions: Personalised HCC surveillance provides real-world evidence supporting the economic superiority of risk-stratified surveillance after SVR and may help pave the way for integrating personalised pathways into future surveillance guidelines.

2189 - HBsAg Dynamics and Seroclearance Maintenance After Interferon Cessation in Chronic Hepatitis B Patients

Shanshan Zhu ¹, Qiran Zhang ¹, Chao Qiu ¹, Feng Sun ¹, Ning Li ¹, Wenhong Zhang ¹
Huashan Hospital, National Medical Center For Infectious Diseases, Shanghai-China ¹

Background / Hypothesis: In patients with chronic hepatitis B (CHB) receiving interferon (IFN)-based therapy, the dynamics of hepatitis B surface antigen (HBsAg) after IFN discontinuation while continuing nucleos(t)ide analog treatment remained poorly characterized. This study aimed to describe HBsAg trajectories following IFN cessation, providing information for individualized therapy.

Materials and Methods: This study was a post hoc subgroup analysis of a large retrospective-prospective cohort (Oasis Study). CHB patients who discontinued IFN therapy but maintained nucleos(t)ide analogs were retrospectively analyzed. HBsAg levels were stratified at IFN discontinuation and the dynamics of HBsAg after discontinuation of treatment were analyzed. Multiple cox regression models were used to identify independent predictors of different treatment outcomes.

Results: A total of 3,435 patients receiving PegIFN treatment were included, with a median follow-up of 132 weeks. Among patients who did not achieve HBsAg loss at IFN cessation, three post-treatment trajectories were observed: stable, deterioration (persistent increase), improvement (persistent decrease and seroclearance). Across all HBsAg strata, most patients (73.0%) maintained stable, while deterioration and improvement were observed in 5.7–11.9% and 16.4–32.4% of patients, respectively. Lower HBsAg levels at

ORAL ABSTRACTS

IFN cessation were strongly associated with subsequent HBsAg seroclearance. There were 30.9% of patients achieved HBsAg clearance with HBsAg levels below 10 IU/mL at IFN cessation, while only 1.92% of them did with HBsAg over 3000 IU/mL. Multivariate Cox regression analysis revealed that both longer treatment duration (HR 1.017, 95%CI 1.013-1.02, $P<0.001$) and lower HBsAg level (HR 0.714, 95%CI 0.551-0.998, $P=0.049$) was associated with better clinical outcomes (significant reduction or HBsAg loss). In patients who achieved HBsAg seroclearance before IFN discontinuation, most maintained seroclearance thereafter (68.8%). A small proportion experienced fluctuating (15%) or relapse (16.2%), with no significant association between these outcomes and baseline HBsAg strata. Multivariate Cox regression analysis revealed that longer treatment duration attributed to HBsAg clearance maintenance (HR 1.023, 95%CI 1.02-1.025, $P<0.001$). For patients who did not maintain HBsAg loss, the median time from discontinuation of PegIFN to initial fluctuation was 12 weeks for those who achieved HBsAg clearance before stopping IFN, while 92 weeks for those who achieved seroclearance after IFN cessation.

Conclusions: After IFN discontinuation, most patients maintain stable HBsAg levels, while a subset experience improvement or deterioration. Lower HBsAg at IFN cessation and extended IFN therapy may attribute to favorable outcomes. These findings provide important insights into the post-IFN treatment effects and offer valuable references for individualized IFN therapy regimens.

Keyword(s) : Chronic hepatitis B, pegylated interferon, HBsAg loss, treatment duration

2192 - Neutrophil recruited CD38hi cytotoxic CD8 T cells characterize the T cell infiltrate in checkpoint inhibitor mediated cholangitis

Xinghuan Fu¹, Qiuqing Yan¹, Linhui Hu¹, Wenjing Wang¹, Guiqiang Wang¹, Yan Wang¹
Peking University First Hospital, Department Of Infectious Disease, Bei Jing-China¹

Background / **Hypothesis:**

Immune checkpoint inhibitor (ICI) therapy for cancer, such as anti-PD-1 antibodies, can induce rare bile duct injury in some individuals. The T-cell mechanisms mediating this iatrogenic autoimmunity and their similarities to or differences from spontaneous

autoimmune disorders remain unclear.

Materials and **Methods:**
Here we compared liver immune cells of 2 Immune checkpoint inhibitor induced cholangitis (ICIC) patients induced by ICI therapy to 3 primary biliary cholangitis (PBC) patients and 6 health control (HC) through single cell RNA transcriptomics. Multicolor immunohistochemistry was used to validate our results.

Results:

Single-cell transcriptomic profiling revealed a distinct population of cytotoxic CD38+IL7R- CD8+ T cells enriched in the livers of ICIC patients. Compared to PBC and HC, these cells exhibited pronounced interferon-stimulated gene signatures and enhanced chemotactic potential. Notably, we identified a concomitant expansion of neutrophils in ICIC livers. Cell-cell communication analysis demonstrated that neutrophils self-amplify via the CXCL8-CXCR2 autocrine axis, while simultaneously secreting CXCL16 to engage CXCR6 on CD38+CD8+ T cells, thereby potentiating their tissue infiltration.

Conclusions:

These findings demonstrate that ICI therapy induces a distinct autoimmune pathology differing from classical spontaneous biliary injury, wherein neutrophil depletion may represent a potential therapeutic target for ICIC.

Keyword(s) : immune checkpoint inhibitor, immune-mediated cholangitis, neutrophil, immune mechanism

2195 - 3D Radiomics Analysis Based on Liver CT Imaging for Predicting Hepatic Encephalopathy in HBV ACLF Patients

Xueyun Zhang¹, Yuxian Huang²
Huashan Hospital, Fudan University, Infectious Diseases Department, Shanghai-China¹ Huashan Hospital, Fudan University, Infectious Diseases Department, Shanghai-²

Background / **Hypothesis:**
Hepatic encephalopathy (HE) is an independent risk factor for mortality in patients with hepatitis B virus-related acute-on-chronic liver failure (HBV-ACLF). The diagnosis and grading of HE primarily rely on the clinical manifestations, lacking effective detection and prediction methods. Radiomics, an advanced image analysis method, extracts and statistically analyzes quantitative data from medical images, offering insights beyond the naked eye. Besides, 3D deep learning

ORAL ABSTRACTS

capture characteristics of the 3D spatial region, including shape, size, position, and other information, offering a more comprehensive view of the lesion's morphology, structure, and spatial distribution. We aim to analyze radiomic and 3D deep learning features of liver CT images to generate deep machine learning models for predicting the occurrence of HE in HBV-ACLF patients.

Materials and Methods: A retrospective study was conducted on 222 HBV-ACLF patients who underwent CT scans at two medical centers. The cohort from Huashan Hospital, consisting of 146 patients, was randomly divided into a training cohort (n = 102) and a validation cohort (n = 44). An external test cohort (n = 76) was sourced from Shanghai Public Health Clinical Center. We employed two architectures, ResNet50 and DenseNet201, to extract 3D deep learning features related to HE. Classical radiomics features were extracted from liver CT images and modeled using three machine learning algorithms (SVM, Random Forest, and XGBoos). Clinical features associated with HE were analyzed via multivariate logistic regression. Finally, a nomogram model combining 3D deep learning model, classical radiomics model, and clinical features was established to predict HE.

Results:

The 3D deep learning model demonstrated strong performance in predicting HE in ACLF patients, particularly the ResNet50 model, which achieved AUC values of 0.844 (95%CI: 0.752-0.936) in the training cohort, 0.833 (95%CI: 0.671-0.996) in the validation cohort, and 0.833 (95%CI: 0.686-0.981) in the test cohort. In classical radiomics analysis, three radiomic features were selected: intra_wavelet_LLL_ngtdm_Coarse (coefficients: 0.054), intra_wavelet_LHL_glszm_SmallAreaLowGrayLevelEmphasis (coefficients: 0.013), intra_lpb_3D_k_glrIm_ShortRunHighGrayLevelEmphasis (coefficients: -0.005). Classical radiomics models were built with three machine learning algorithms, where XGBoost outperformed best. As for clinical features, we found INR and ammonia levels were independently associated with HE. The nomogram model integrating 3D deep learning, radiomics features, and clinical predictors achieved the highest predictive accuracy across all cohorts, achieving AUC values of 0.924, 0.887, and 0.851 in the training, validation, and test cohorts, respectively.

Conclusions: 3D deep learning performed excellently in

predicting HE in ACLF patients, and its combination with radiomics and clinical features further enhanced predictive

2201 - Prospective Evaluation of Factors Affecting Measurement Quality in Liver Elastography
Murat Taner Gülşen¹, Taylan Metin¹, Mehmet Ali Şahan¹, Selman Erenci¹, Sezgin Barutçu²
Gaziantep University School Of Medicine, Gastroenterology, Gaziantep-Türkiye¹ Sanko University School Of Medicine, Gastroenterology, Gaziantep-Türkiye²

Background / Hypothesis: Non-invasive liver elastography is widely used for assessing fibrosis and steatosis. Measurement reliability may be affected by patient characteristics and technical factors. This study prospectively evaluated factors influencing elastography measurement quality and their associations with device parameters.

Materials and Methods: A total of 117 adults were included. Patients with hepatic steatosis on ultrasonography were enrolled within 15 days; those with acute or chronic liver disease, alcohol use, or prior transplantation were excluded. All measurements were performed by a single experienced operator at the 7th or 8th intercostal space using a transient elastography system (iLivTouch Mini 800). LSM (kPa), UAP (dB/m), LivQ-box LIID, and IQR/median values were recorded. Each participant underwent at least two consecutive sessions with ≥ 10 valid measurements; total acquisitions and valid measurement counts were documented. Elastography measurements were performed in the morning (<12:00) or afternoon (>12:00). Data were classified as LSMIQR ≤ 10 or >10. Spearman correlation, Mann-Whitney, Chi-square, and regression analyses were applied; significance was set at $p < 0.05$.

Results: Among 117 participants, 69 were male (59%), mean age 46.61 ± 13.3 years. In LSMIQR ≤ 10 , morning vs afternoon differences were not significant (LSM $p=0.306$; UAP $p=0.966$; LivQ $p=0.966$). In LSMIQR >10, UAPIQR tended to increase in afternoon measurements ($p=0.010$), while LivQIQR showed a borderline trend ($p=0.084$). LivQIQR correlated strongly with UAPIQR ($\rho=0.488$, $p<0.001$) but not with LSMIQR ($\rho=0.084$, $p=0.368$). Regression analysis identified UAP as the sole independent predictor of LivQ ($\beta=0.973$, $p<0.001$); LSM and BMI were not significant. LSMIQR increased when

ORAL ABSTRACTS

total acquisitions exceeded 10 ($p=0.001$); UAP and LivQIQRs were unaffected (UAP $p=0.144$; LivQ $p=0.703$). Higher BMI was associated with LSMIQR >10 ($p=0.006$); UAPIQR remained BMI-independent ($p=0.642$). Repeated measurements showed close agreement in median and IQR values, with no significant differences (LSM $Z=-0.256$, $p=0.798$; UAP $Z=-0.514$, $p=0.607$; LivQ $Z=-0.254$, $p=0.800$), indicating that a single well-performed measurement is generally sufficient

Conclusions: LSMIQR may be adversely affected when total valid acquisitions exceed 10, and higher BMI also increases LSMIQR; repeated sessions provide limited additional information, and a single well-performed exam is usually sufficient. LivQ-box correlates more with UAP than LSM and may reflect steatosis-related changes associated with MASH.

2215 - Innovative Insights Hepatic Stellate Cells activation and ROS Gene Signatures Predicting Prognosis and Immunotherapy Response in Hepatocellular Carcinoma

Ning Wang¹

Tianjin Third Central Hospital, Department Of Gastroenterology And Hepatology, Tianjin-China¹

Background / Hypothesis: Liver cirrhosis (LC) serves as a critical risk factor for the development of hepatocellular carcinoma (HCC). The activation of hepatic stellate cells (HSCs) and reactive oxygen species (ROS)-mediated cellular injury are pivotal mechanisms underlying both the pathogenesis of cirrhosis and the formation of the premalignant environment (PME). The PME subsequently evolves into tumor microenvironment conducive to HCC initiation and progression. This study aims to investigate the key genes associated with HSC activation and ROS in the transition from LC to HCC and to explore their prognostic significance and potential implications for immunotherapy in HCC.

Materials and Methods: Based on transcriptomic data analysis, differentially expressed genes (DEGs) associated with LC-HCC and HSC activation were identified, respectively. Furthermore, relevant gene signatures were determined by intersecting the DEGs with ROS-associated genes. Subsequent analyses, including gene correlation and functional enrichment analyses of these candidate

genes, were performed. A machine learning-based prognostic risk model was developed and validated using these candidate genes via the least absolute shrinkage and selection operator (LASSO) algorithm based on HCC cohort. Finally, subgroup analysis of the HCC cohort was performed based on these candidate genes for investigating the prognosis and response to immunotherapy.

Results:

Based on HSC activation and reactive oxygen species-related factors, a total of 23 candidate genes in LC-HCC were identified. Functional analysis of these candidate genes revealed that they were significantly enriched in biological processes such as cellular response to chemical stimuli, response to stress, and the TNF signaling pathway. Using the LASSO regression method, a risk scoring model was constructed, which effectively stratified the HCC cohort into high-risk and low-risk groups, with the high-risk group exhibiting a significantly poor prognosis. Furthermore, based on these candidate genes, HCC patients were classified into two subgroups, C1 and C2. Between these two subgroups, 410 differentially expressed genes (DEGs) were identified, consisting of 360 upregulated and 50 downregulated genes. Finally, patients in subgroup C2 demonstrated superior clinical prognosis and a more favorable response to immunotherapy compared to those in subgroup C1.

Conclusions:

This study represents the first successful identification of a key gene signature linking LC and HCC, based on HSC activation and ROS-related factors, which can serve as a reliable predictor for prognosis and immunotherapy response in HCC patients, thereby facilitating the identification of novel therapeutic targets.

2218 - Nucleos(t)ide Analogue Treatment History Stratifies Prognosis in Hepatitis B Virus Related Acute on Chronic Liver Failure

Liping Shen¹, Zhiqiang Jin¹, Xiaohao Wang¹, Hu Li¹, Shan Zhong¹

The Second Affiliated Hospital, Chongqing Medical University, Chongqing, Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Chongqing-China¹

ORAL ABSTRACTS

Background / Hypothesis: Hepatitis B virus-related acute-on-chronic liver failure (HBV-ACLF) is a life-threatening clinical syndrome with high mortality. This retrospective cohort study aimed to explore the prognostic value of HBV-DNA status and nucleos(t)ide analogue (NA) treatment history in HBV-ACLF patients, and to develop machine learning models for mortality prediction.

Materials and Methods: This retrospective cohort study enrolled hospitalized patients diagnosed with HBV-ACLF at the Second Affiliated Hospital of Chongqing Medical University between September 2018 and December 2024. Diagnosis was based on the COSSH-ACLF criteria. A total of 1069 HBV-ACLF patients were enrolled, categorized into NA-naïvec, NA cessation, and NA resistance groups based on NA treatment history. The primary endpoints were all-cause mortality at 28, 90, 180, and 360 days. Univariable/multivariable Cox regression and propensity score matching (PSM) were used for prognostic analysis. Three machine learning algorithms (Random Survival Forest, Elastic Net regularized Cox regression, Accelerated Failure Time model) were developed to predict 360-day mortality

Results: Results showed that HBV-DNA positivity was an independent risk factor for 28-day mortality (HR: 7.54, 95% CI: 1.05-54.4, $p=0.045$). Among HBV-DNA positive patients, the NA resistance group had the worst prognosis with 360-day mortality of 43.4%, and NA resistance was identified as an independent prognostic factor for long-term mortality (adjusted HR: 2.02, 95% CI: 1.05-3.88, $p=0.036$). The Elastic Net Cox model achieved the best predictive performance with a C-index of 0.718, identifying age, direct bilirubin, ascites, and coagulation parameters as core predictors.

Conclusions: This study demonstrates that integrating virological status and NA treatment history improves prognostic stratification of HBV-ACLF. NA resistance defines a high-risk subgroup, and the developed machine learning model provides a reliable tool for clinical outcome prediction.

Keyword(s) : HBV-related acute-on-chronic liver failure (HBV-ACLF); nucleos(t)ide analogue (NA); drug resistance; treatment cessation; prognosis; mortality prediction; machine learning

2225 - Infected Choledochal Cysts Masking as Liver Abscesses in an Adult Male A Case Report

[Emerald T. Gersava](#)¹, [Ruth Ursula C. Cinco](#)¹
Veterans Memorial Medical Center, Internal Medicine -
Section Of Gastroenterology, Quezon City-Philippines¹

Background: Choledochal cysts are rare congenital, bile duct anomalies that cause cystic dilatations of the biliary tree. It is common among Western population and in the Philippines, approximately <200 cases were accounted, majority among children. Commonly, choledochal cysts present with abdominal pain, jaundice, and a palpable mass. We present a rare case of large, infected choledochal cysts in an adult male initially presenting as liver abscesses on imaging successfully managed with antimicrobials and drainage.

Case Presentation: A 52-year-old Filipino male, heavy alcohol drinker, without comorbidities came in due to abdominal pain and fever. History started three weeks prior to admission wherein he had intermittent RUQ pain associated with undocumented fever and chills, anorexia, and generalized body weakness. Pertinent physical examination revealed low-grade fever, disorientation, slight icterisia, soft abdomen with palpable liver with RUQ direct tenderness. Laboratory work-up showed leukocytosis with shift to the left, normocytic, normochromic anemia, hyperbilirubinemia, hypoalbuminemia, elevated liver enzymes and alkaline phosphatase. Hepatobiliary ultrasound revealed coarsened liver parenchyma with solid heterogenous mass lesions noted in the right lobe measuring 5.7 x 6.6 x 5.9 cm and 6.1 x 7.8 x 8.8 cm ---a diagnosis of liver masses versus abscesses was entertained. Triphasic abdominal CT scan showed a large, lobulated peripherally enhancing and centrally hypoattenuating mass occupying the right hepatic lobe measuring 12.4 x 6.9 x 11.0 cm confirming an abscess. Antibiotics were started and the patient was referred to intervention radiology for drainage. On cholangiogram, two (2) large intrahepatic bile duct cystic dilatations were noted consistent with Type V choledochal cysts. Abscesses were drained revealing anchovy paste-like output ~400mL, with negative results on culture studies. Antibiotics were extended for four weeks, and repeat imaging revealed resolution of the abscesses. Biochemical and clinical condition remarkably improved hence, the eventual drain removal. Definitive surgery of the choledochal cysts was contemplated however the patient did not consent.

ORAL ABSTRACTS

Conclusion: Choledochal cysts can initially present as a large infected mass and can be mistaken as liver abscess or malignancy among adult patients. Prompt diagnosis and management, with multidisciplinary

Keyword(s) : choledochal cyst, liver abscess, case report

2226 - Impact of Diabetes on Fibrosis Progression in NAFLD A Systematic Review and Meta analysis

Javaria Younas Muhammad Younas¹, Sumbul Samad Abdul Samad²
Bmch, Medicine, Quetta-Pakistan¹ Jpmc, Medicine, Karachi-Pakistan²

Background / Hypothesis: Non-alcoholic fatty liver disease (NAFLD) has rapidly emerged as the leading cause of chronic liver disease globally, with fibrosis stage being the strongest predictor of cirrhosis, hepatocellular carcinoma, and liver-related mortality. Diabetes mellitus is increasingly recognized as a key metabolic driver of fibrosis progression, but reported findings vary across studies. A systematic review and meta-analysis provides a comprehensive assessment of this relationship. Clarifying this relationship is essential for risk stratification and early intervention in metabolic liver disease.

Aim: To evaluate the impact of diabetes on fibrosis progression in patients with NAFLD. Materials and Methods: A systematic search of PubMed, Scopus, and Web of Science was conducted for studies published up to January 2025. Eligible studies included adults with NAFLD and reported fibrosis progression according to histology, elastography, or validated non-invasive fibrosis scores. A random-effects meta-analysis was performed to pool effect estimates. Study characteristics, quality, and outcomes were extracted and synthesized qualitatively and quantitatively where possible.

Results: Evidence from multiple studies consistently indicates that diabetes is associated with an increased risk of fibrosis progression in NAFLD patients. This association was observed across diverse populations, study designs, and methods of fibrosis assessment, highlighting that diabetic NAFLD patients represent a high-risk group for progressive liver disease. Conclusions: Diabetes markedly increases the risk of fibrosis progression in NAFLD, underscoring its role as a key metabolic driver of liver disease severity. These findings highlight the need for enhanced fibrosis screening, early metabolic optimization, and aggressive risk-factor control among diabetic individuals with NAFLD. Integrating diabetes status into clinical decision

pathways may significantly improve early identification of high-risk patients and prevent advanced liver-related outcomes.

Keyword(s) : Keywords: NAFLD, Diabetes mellitus, Fibrosis progression, Meta-analysis, Liver disease

2229 - Discrepancies in the indeterminate phase in patients with chronic hepatitis B between two updated international guidelines

Shaoqiu Zhang¹, Jian Wang¹, Chao Jiang², Tao Fan³, Ye Xiong³, Renlin Yao¹, Juan Xia¹, Xiaomin Yan¹, Rui Huang¹, Chao Wu¹
Nanjing Drum Tower Hospital, Affiliated Hospital Of Medical School, Nanjing University, Department Of Infectious Diseases, Nanjing-China¹ Nanjing Drum Tower Hospital Clinical College Of Jiangsu University, Department Of Infectious Diseases, Nanjing-China² Nanjing Drum Tower Hospital Clinical College Of Nanjing University Of Chinese Medicine, Department Of Infectious Diseases, Nanjing-China³

Background / Hypothesis:

A substantial of patients with chronic hepatitis B (CHB) fall into the indeterminate phase. Both the American Association for the Study of Liver Diseases (AASLD) and the European Association for the Study of the Liver (EASL) released the updated guidelines in 2025. However, the impact of these updates on the proportion of patients classified as being in the indeterminate phase remains unclear. Using a large multicenter real-world CHB cohort, we compared the proportion of patients in the indeterminate phase under the 2025 AASLD and the 2025 EASL guidelines.

Materials and Methods:

A total of 15,763 treatment-naïve patients with CHB were retrospectively collected from five medical centers. Clinical phases of patients were classified based on the 2025 AASLD and 2025 EASL guidelines. Patients who fell outside the defined natural phases of each guideline were classified as being in the indeterminate phase.

Results:

The median age of the patients was 37.6 years, with 61.2% being male and 27.4% being HBeAg-positive. The proportion of patients with indeterminate phase was significantly higher under the 2025 AASLD guidelines than under the 2025 EASL guidelines (42.5% vs. 26.1%, $P < 0.001$). Similar trends were found across subgroups stratified by sex, HBeAg status and age ($P < 0.001$). All

ORAL ABSTRACTS

patients classified as indeterminate by the 2025 EASL guidelines were also classified as indeterminate under the 2025 AASLD guidelines.

Conclusions:

Based on the definitions of phases of CHB, a substantial proportion of patients were classified as being in the indeterminate phase by both the 2025 AASLD and 2025 EASL guidelines, with a significantly higher proportion under the 2025 AASLD criteria.

Keyword(s) : chronic hepatitis B, indeterminate phase, clinical practice guidelines

2240 - Hepatitis B Management in Primary Care Nationwide Survey Highlights Knowledge and Practice Gaps Among Family Physicians in Türkiye

Imran Hasanoglu¹, Rahmet Guner¹
Ankara Yildirim Beyazit University, Ankara Bilkent City Hospital, Infectious Diseases And Clinical Microbiology, Çankaya-Türkiye¹

Background: Türkiye has a moderate Hepatitis B virus (HBV) endemicity, where primary-care physicians play an essential role in screening, vaccination, and long-term monitoring. Despite national elimination targets, real-world knowledge and practice patterns among family physicians remain poorly characterized. This study aimed to evaluate HBV-related awareness and clinical behaviors at the national level. Materials and Methods: A cross-sectional survey was conducted across 81 provinces. A total of 973 family physicians from 558 family health centers participated. The survey consisted of 11 structured questions assessing epidemiology, risk groups, screening indications, laboratory follow-up, vaccination practices, and referral criteria. Descriptive statistics were used for analysis.

Results: Among 973 respondents (52% female; median professional experience 11 years), substantial variability and clinically significant knowledge gaps were identified:

- Only 41% correctly identified Türkiye as a moderate-endemic country for HBV, and 29% underestimated the prevalence in the general population.
- Risk-group recognition: Awareness was highest for pregnant women (84%) and healthcare workers (79%); however, recognition was markedly lower for migrants (46%), hemodialysis patients (58%), and household contacts (51%).
- Screening practices: 32% reported that they do not routinely screen high-risk adults unless symptomatic. 27% incorrectly used anti-HBc alone for screening; 18%

repeated HBsAg testing unnecessarily within the same year.

- Follow-up and monitoring: 44% were unsure about recommended ALT monitoring intervals. 39% did not know when HBV DNA should be requested. 33% believed inactive carriers require antiviral therapy.
- Vaccination practices: 91% were confident in the routine immunization schedule. Yet 38% were unaware of management of vaccine non-responders. 26% could not correctly describe post-exposure prophylaxis steps.
- Referral criteria: Only 54% correctly identified treatment indications requiring specialist referral.

Conclusions: This nationwide study—the largest HBV knowledge assessment ever conducted among family physicians in Türkiye—demonstrates substantial gaps in fundamental HBV management, including risk-group identification, screening, laboratory follow-up, and referral pathways. These deficiencies may delay diagnosis, contribute to missed chronic infections, and undermine elimination strategies. Targeted educational initiatives, decision-support tools, and clearer national algorithms could help strengthen HBV care in primary-care settings.

Keyword(s) : Hepatitis B, elimination, primary care

2241 - Diagnostic Value of Liver Biopsy in Unexplained Liver Enzyme Elevations A Tertiary Center Experience

Serap Türk¹, Betül Erismis², Meral Akdoğan Kayhan³, Derya Ari Ari³, Dilara Turan Gokce⁴, Enes Seyda Sahiner², Nazli Pelin Kirkayak²

Şile State Hospital, Department Of Internal Medicine, İstanbul-Türkiye¹ University Of Health Sciences Ankara Bilkent City Hospital, Department Of Internal Medicine, Ankara-Türkiye² University Of Health Sciences Ankara Bilkent City Hospital, Department Of Gastroenterology, Ankara-Türkiye³ Sincan Training And Research Hospital, Department Of Gastroenterology, Ankara-Türkiye⁴

Background/ Hypothesis : Unexplained elevations in liver function tests (LFTs) are commonly encountered in clinical practice and often present a diagnostic challenge. In patients in whom standard laboratory and imaging investigations fail to identify an underlying etiology, the diagnostic value of liver biopsy and its role in guiding clinical management remain unclear. This study aims to evaluate the diagnostic yield of liver biopsy in patients presenting with unexplained LFT elevations and to assess its contribution to clinical decision-making.

Materials and Methods: Adult patients (≥18 years) who presented to our

ORAL ABSTRACTS

hospital and underwent liver biopsy due to elevated liver function tests (LFTs) between February 2019 and October 2023 were retrospectively reviewed. Patients with serologically confirmed viral hepatitis or a diagnosis of malignancy were excluded. Included patients were categorized into four groups based on the degree of LFT elevation (2× upper limit of normal [ULN], 2–5× ULN, 5–10× ULN, and ≥10× ULN). Patients were also categorized according to the interval between initial presentation and liver biopsy as less than six months or six months or longer. Based on biopsy findings, diagnoses were classified into five groups: autoimmune hepatitis, toxic liver disease, cholestatic liver disease, MASLD, and other. Statistical analyses were performed using IBM SPSS Statistics version 25.0 to evaluate the diagnostic contribution of liver biopsy across

Results:

A total of 388 patients were included in the study, with a mean age of 48.3 ± 14.7 years and a female predominance of 59.6%. Liver biopsy provided a definitive diagnosis in 93.3% of cases. The most common etiologies were autoimmune hepatitis (26.2%), MASLD (20.7%), toxic liver disease (19.9%), and cholestatic liver disease (19.9%). A significant association was observed between the degree of transaminase elevation and the diagnostic yield of liver biopsy ($p < 0.01$), whereas no significant relationship was found between cholestatic enzyme levels and diagnostic yield ($p > 0.5$). Patients diagnosed with autoimmune hepatitis or toxic hepatitis had higher AST, ALT, LDH, and total bilirubin levels compared with other groups ($p < 0.001$). Additionally, patients who underwent liver biopsy within six months of initial presentation had higher rates of autoimmune and toxic hepatitis diagnoses ($p < 0.001$).

Conclusions:

Despite being an invasive procedure, liver biopsy plays a crucial role in establishing the diagnosis, assessing disease severity, and guiding therapeutic management in patients with liver disorders. It is imperative that the selection of biopsy indications be performed with care and precision in order to enhance diagnostic accuracy and ensure patient.

2244 - Early Experience with Endoscopic Ultrasound-Guided Gastric Variceal Obliteration at an Australian Quaternary Referral Centre

Luke Vlismas ¹, Yuming Ding ¹, Enoke Gonsalkorala ², Richard Skoien ², Saad Khan ¹, Jason Hwang ¹, Mark Appleyard ¹, Sanjivan Mudaliar ¹, Rajit Gilhotra ¹
Rbwh, Gastroenterology, Brisbane-Australia ¹ Rbwh, Hepatology, Brisbane-Australia ²

Background / Hypothesis:Gastric varices (GV) are associated with higher rebleeding and mortality rates than oesophageal varices (OV) and often require definitive haemostatic therapies such as balloon-occluded retrograde transvenous obliteration (BRTO) [1]. Endoscopic ultrasound-guided gastric variceal obliteration (EUS-GVO) is an emerging alternative that allows direct access to varices and their feeding vessels. Both BRTO and EUS-GVO have demonstrated superiority over other endoscopic modalities [2,3]. EUS-GVO was introduced at the Royal Brisbane and Women's Hospital (RBWH) in August 2024. This study describes outcomes from our early experience with EUS-GVO at a quaternary referral centre.

Materials and Methods:Consecutive patients with documented gastric variceal bleeding referred for EUS-GVO between August 2024 and November 2025 were included. Baseline demographics, vascular anatomy, procedural technique, technical success (uncomplicated deployment of coils and cyanoacrylate [CYA]), and immediate clinical success (cessation of Doppler flow) were recorded. Feeder-vessel targeting was preferred over direct puncture of the submucosal variceal nest. Access was achieved using a 19G FNA needle, with 0.035" coils deployed as a scaffold prior to undiluted CYA injection. The first coil diameter exceeded feeder diameter by 20–40%, with additional coils guided by residual flow and space. Procedures were performed under general anaesthesia with prophylactic antibiotics. Repeat EUS at 4 weeks assessed variceal obliteration, and clinical follow-up evaluated rebleeding and hepatic decompensation.

Results:Eleven patients (6 male; mean age 53.3 years) were referred over 15 months, with mean follow-up of 204 ± 156 days. Two patients underwent elective outpatient EUS-GVO, while the remainder were acute inpatients; mean time to procedure was 1.75 days. Technical success was achieved in 10 patients (90.9%). One patient with unfavourable anatomy (feeder >45 mm) was referred for BRTO. Nine patients underwent combined coil and CYA embolisation, and one achieved success with coil alone. Mean coils used were 2.3 ± 1.34 and mean CYA volume was 1.29 ± 0.68 mL. Two patients reported post-procedural pain; no fevers or systemic embolisation occurred. Eight patients underwent

ORAL ABSTRACTS

follow-up EUS (mean 46.1 ± 11.4 days), all demonstrating complete obliteration. One patient rebled at 6 months due to a new gastric varix and underwent repeat EUS-GVO. No patients developed worsening OV, hepatic decompensation, or mortality.

Conclusions: EUS-GVO is a safe and effective definitive therapy for bleeding gastric varices, providing rapid access to haemostasis with high technical and clinical success and low complication rates. Careful assessment of vascular anatomy and a multidisciplinary approach are essential. Future studies should compare EUS-GVO and BRTO, including cost-effectiveness and length-of-stay outcomes.

Keyword(s) : Gastric Varices, Endoscopic Ultrasound, Coil, Glue, Cyanoacrylate, EUS-GVO

2245 - Unravelling the placebo response in pharmacological trials for metabolic dysfunction associated steatotic liver disease a systematic review and meta analysis

Kiavash Semnani¹, Shirin Esmaeili², Seyed Sahab Aarabi², Farbod Semnani², Mostafa Qorbani³
Alborz University Of Medical Sciences, Social Determinants Of Health Research Center, Karaj-Iran¹
Tehran University Of Medical Sciences, School Of Medicine, Tehran-Iran²
Alborz University Of Medical Sciences, Non-communicable Diseases Research Center, Karaj-Iran³

Background / Hypothesis: Understanding inconsistencies in placebo rates (PR) - and identifying variables influencing this effect - in metabolic dysfunction-associated steatotic liver disease (MASLD) pharmacological trials is essential for standardization of trial design and appropriate appraisal the evidence (comparison of reported efficacy results).

Materials and Methods: This is an exploratory analysis from a large-scale systematic review on the safety and efficacy of pharmacological interventions for MASLD. MEDLINE, Web of Science, Scopus, CENTRAL, and ICTRP were searched up to September 4, 2025. PR for histological (MASH resolution, fibrosis improvement, ≥ 2 -point improvement in NAFLD activity score [NAS]) and radiological (absolute change in liver fat content on magnetic resonance imaging proton density fat fraction [MRI-PDFF], relative change from baseline in MRI-PDFF, and $\geq 30\%$ relative reduction in MRI-PDFF) endpoints was analysed in randomized placebo-controlled trials

(RCT). Pooled estimates of intention-to-treat results were obtained from random-effects meta-analyses. The relationship between patient (9 variables), placebo (3 variables), and trial characteristics (6 variables) and PR was explored using subgroup analyses and meta-regression.

Results:

Of 304 RCTs, 120 contributed data to the current analysis (7386 patients receiving placebo). PR was significant across histological (0.09 MASH resolution, 95%CI 0.07-0.12; 0.07 fibrosis improvement, 95%CI 0.15-0.19) and radiological (14% for $\geq 30\%$ MRI-PDFF reduction, 95%CI 0.11-0.16) endpoints. Baseline heterogeneity was substantial ($I^2 > 50\%$) for all endpoints – except $\geq 30\%$ MRI-PDFF reduction ($I^2 = 40$). Advanced trial phase and longer duration showed consistent non-significant trends toward higher PR. Previous/interim successes of active agents and disease severity were consistently linked with PR, while patient demographics and metabolic profile were not associated with any outcome. Baseline NAS was associated with fibrosis improvement and ≥ 2 -point NAS reduction. Dosing schedules, trial duration, and study date showed inconsistent associations with radiological endpoints. Multivariate models demonstrated moderate explanatory power for absolute change from baseline endpoints (31% R^2 for MASH resolution; 40 and 47% for fibrosis and NAS reduction) – with less than 25% of the variance being explained by consistent variables – compared to relative MRI-PDFF endpoints (R^2 70-80%). There residual heterogeneity for endpoints evaluating absolute change from baseline was also substantial compared to relative endpoints ($I^2 < 20\%$).

Conclusions:

A substantial portion of placebo arms in MASLD pharmacological trials achieved major efficacy endpoints. Heterogeneity in PR could only partially be explained with commonly suspected characteristics – particularly with endpoints evaluating absolute change from baseline. Patient expectations were the most consistent predictor of PR. Further detailed reporting and analysis of factors influencing PR is necessary.

Keyword(s) : MASLD, randomized controlled trial, placebo, meta-analysis

2254 - Prognostic Impact of Sarcopenia Assessed by Handgrip Strength and Skeletal Muscle Index in Hepatocellular Carcinoma Patients Receiving Atezolizumab plus Bevacizumab Therapy

Hiroki Tai¹, Asahiro Morishita¹, Kyoko Oura¹, Rie Yano¹, Mai Nakahara¹, Tomoko Tadokoro¹, Shima Mimura¹,

ORAL ABSTRACTS

Koji Fujita ¹, Joji Tani ¹, Hideki Kobara ¹
Faculty Of Medicine, Kagawa University,
Gastroenterology And Neurology, Takamatsu-Japan ¹

Background / Hypothesis:Sarcopenia-related factors, including skeletal muscle index (SMI), have been associated with therapeutic response and adverse events in systemic therapy for hepatocellular carcinoma (HCC). However, evidence regarding their clinical relevance in patients receiving atezolizumab plus bevacizumab (Atezo/Bev) remains limited. Moreover, conventional nutritional assessments based on liver-derived biochemical markers may be unreliable in patients with impaired hepatic function. This study evaluated the impact of sarcopenia and nutritional status on clinical outcomes and prognosis in patients treated with Atezo/Bev.

Materials and Methods:We retrospectively analyzed 78 patients with unresectable HCC who received Atezo/Bev between 2020 and 2024 and underwent both sarcopenia and nutritional assessments. Sarcopenia was diagnosed according to the criteria of the Japan Society of Hepatology, using both handgrip strength and SMI. Nutritional status was evaluated using Controlling Nutritional Status (CONUT) score. Clinical outcomes and overall survival (OS) were compared between the sarcopenia (n=33) and non-sarcopenia (n=45) groups.

Results:Patients with sarcopenia were older, with a median age of 78 years, and more frequently had impaired performance status. In contrast, baseline liver function, tumor stage, and CONUT scores showed no significant differences between the two groups. Adverse events occurred more often in the sarcopenia group, and the ALBI score declined significantly after treatment. At the end of the second treatment cycle, the objective response rate was 30.3% in the sarcopenia group and 35.5% in the non-sarcopenia group, while the disease control rate was 60.6% and 68.8%, respectively; both outcomes were comparable between groups. Median progression-free survival was 4.1 months in patients with sarcopenia and 6.5 months in those without. Median overall survival was substantially shorter in the sarcopenia group at 11.9 months, compared with 29.0 months in the non-sarcopenia group, and Kaplan–Meier analysis demonstrated a significant separation of the survival curves. In multivariable Cox proportional hazards analysis, sarcopenia diagnosed by handgrip strength and SMI was independently associated with worse overall survival. Lower BMI (≤ 23) and poorer hepatic reserve reflected by a Child–Pugh score greater than 5 were also significant prognostic factors, whereas

nutritional indices such as the CONUT score showed no association with survival.

Conclusions:In patients with unresectable HCC treated with Atezo/Bev, sarcopenia was associated with a higher incidence of adverse events, deterioration of hepatic reserve, and poorer prognosis. Although conventional biochemical nutritional assessments may be inadequate, handgrip strength and SMI provide robust parameters for accurate sarcopenia diagnosis and serve as valuable tools for comprehensive clinical evaluation and prognostic stratification.

2255 - Role of Metabolic Risk Factors in the Early Detection of Metabolic Associated Steatotic Liver Disease (MASLD) in Young Adults A Cross Sectional Study

Muhammad Siddique Chohan ¹, Hafsa Abdul Waheed Jadgeal ¹

Suleman Roshan Medical College, Medicine & Surgery, Tandoadam-Pakistan ¹

Background / Hypothesis:

Metabolic-associated steatotic liver disease (MASLD) is the leading cause of chronic liver disease worldwide. Once considered a disease of older adults, it is increasingly identified in young adults, often remaining asymptomatic in early stages. Early identification through metabolic risk profiling may allow timely preventive interventions. This study aimed to evaluate the role of metabolic risk factors in the early detection of MASLD among young adults.

Materials and Methods:

A cross-sectional study was conducted on 260 young adults aged 18–35 years. MASLD was diagnosed based on ultrasonographic evidence of hepatic steatosis, supported by biochemical parameters, after exclusion of secondary causes of liver disease. Data collected included body mass index (BMI), waist circumference, liver enzymes, fasting blood glucose, lipid profile, and lifestyle factors such as physical activity and dietary habits. Statistical analysis was performed to determine associations between metabolic risk factors and MASLD.

Results :

ORAL ABSTRACTS

MASLD was detected in 82 participants (31.5%). Significant associations were observed between MASLD and central obesity, insulin resistance, elevated triglyceride levels, and sedentary lifestyle ($p < 0.05$). Notably, 20% of individuals with MASLD had a normal BMI, indicating the presence of metabolically unhealthy non-obese patients. Most affected participants were asymptomatic and had only mild biochemical abnormalities at the time of diagnosis.

Conclusions:

Metabolic risk factors play a crucial role in the early detection of MASLD in young adults. Screening strategies emphasizing central obesity and metabolic abnormalities rather than BMI alone may facilitate earlier diagnosis and timely lifestyle-based interventions, potentially reducing future liver-related and cardiovascular morbidity.

2256 - Efficacy of Combined Nutritional and Physical Activity Intervention in Reversing Early MAFLD
Hafsa Abdul Waheed Jadgal¹, Muhammad Siddique Chohan¹
Suleman Roshan Medical College, Medicine & Surgery,
Tandoadam-Pakistan¹

Background / Hypothesis:

Metabolic-associated fatty liver disease (MAFLD) is strongly associated with unhealthy dietary patterns and physical inactivity. Lifestyle modification remains the cornerstone of management, particularly in early-stage disease. However, local prospective data evaluating structured, multidisciplinary lifestyle interventions are limited. We hypothesized that a combined nutritional and physical activity program would significantly reduce hepatic steatosis and improve metabolic parameters in patients with early MAFLD.

Materials and Methods:
This prospective interventional study included 60 patients with ultrasound-confirmed early MAFLD and associated metabolic risk factors, enrolled between January 2024 and March 2025. Participants received individualized nutritional counseling focusing on a hypocaloric, balanced diet, along with a structured physical activity program consisting of aerobic and resistance exercises performed three times per week for 12 weeks. Baseline and post-intervention assessments

included body mass index (BMI), liver enzymes (ALT, AST), lipid profile, fasting blood glucose, HbA1c, and liver fat quantification using controlled attenuation parameter (CAP) scores by FibroScan. Paired t-tests were used for statistical analysis, with $p < 0.05$ considered significant.

Results:

Following the 12-week intervention, significant reductions were observed in BMI, ALT levels, triglycerides, and fasting blood glucose ($p < 0.05$). Liver steatosis demonstrated marked improvement, with mean CAP scores decreasing from severe (312 dB/m) to moderate steatosis (280 dB/m), indicating partial reversal of hepatic fat accumulation. HbA1c and total cholesterol showed modest improvement. Overall adherence to the intervention program was high.

Conclusions:

A multidisciplinary lifestyle intervention integrating nutritional counseling and structured physical activity significantly reduced hepatic steatosis and improved key metabolic parameters in patients with early MAFLD. Incorporation of such combined lifestyle strategies into routine clinical practice may enhance early MAFLD management and prevent disease progression.

2268 - Interpretable AI That "Reads the Liver From the Face" A 3D Face Digital Biomarker for Ultrasound Confirmed NAFLD
Haoran Sun¹, Wenxin Yan², Victor Yu Cui², Chunnan Li³, Jinyu He², Liangyu Kang², Jue Liu⁴, Min Liu⁴, Yong Zhou⁵, Wannian Liang²
Tsinghua University, School Of Biomedica Engineering, Beijing-China¹ Tsinghua University, Vanker School Of Public Health, Beijing-China² Harvard University, Harvard Th Chan School Of Public Health, Boston-United States³ Peking University, School Of Public Health, Beijing-China⁴ Shanghai Jiaotong University, Shanghai General Hospital, Shanghai-China⁵

Background / Hypothesis:
NAFLD can accumulate risk long before symptoms appear, yet ultrasound screening is difficult to scale to large populations. We asked a simple question with an AI twist: does the liver leave a measurable trace on the face? We hypothesized that AI-readable 3D facial morphology encodes a stable, quantifiable "metabolic phenotype" and can improve identification of ultrasound-confirmed NAFLD beyond basic clinical

ORAL ABSTRACTS

variables (age, sex, BMI), while remaining interpretable through spatially localized shape signals.

Materials and **Methods:** Ultrasound served as the gold standard. We analyzed 2,338 3D facial scans from the Jidong cohort (Tangshan, Hebei, China), split into training (n=1,775), validation (n=198), and test sets (n=365), with an overall NAFLD prevalence of 61%. Dense pseudo-landmarks were obtained via MeshMonk registration and pose-normalized using generalized Procrustes analysis (GPA). We extracted vertex coordinates and three 3D geometric feature families: A, relative displacement ΔX (dx, dy, dz); B, relative projection (d); and C, relative curvature ($\hat{H}$). A (ΔX) captures per-vertex 3D offsets from the mean face; B (d) is the normal-direction component $d = \Delta X \cdot n$ reflecting outward/inward surface bulging; C ($\hat{H}$) quantifies local bending via relative mean curvature. PCA was fitted on the training set and applied to validation/test. To prioritize informative components, we ran single-PC logistic regressions adjusted for age/sex/BMI on the training set and retained PCs with Benjamini–Hochberg FDR $q < 0.05$ (if none, we kept the first three PCs). Selected PCs were concatenated by route (A, B, C, A+B, A+C, B+C, A+B+C) and modeled using elastic-net logistic regression; hyperparameters were selected on the validation set. Performance was reported on the independent test set using AUC and average precision (AP).

Results:

The best Clin-only model achieved AUC=0.869 and AP=0.905. For 3D-only models, A+B+C performed best (AUC=0.791, AP=0.856). Fusion improved discrimination: Clin+B+C yielded the optimal performance (AUC=0.891, AP=0.923), an absolute AUC gain of 0.022 over Clin-only. For interpretability, PCA loadings and elastic-net coefficients were mapped back to the 7,160-vertex mean face (coordinates/ $\Delta X/d$) to generate pointwise contribution maps. The maps indicated that higher predicted NAFLD probability aligned with broader facial soft-tissue fullness ("fat-filled" regions) and a relatively wider forehead.

Conclusions:

Against an ultrasound reference, an interpretable geometric ML pipeline—MeshMonk registration, GPA alignment, PCA representation, and elastic-net modeling—adds complementary value for NAFLD detection beyond age/sex/BMI. Vertex-level coefficient-to-face mapping turns the model from a black box into spatially explicit morphological evidence, supporting

Keyword(s) : NAFLD; 3D facial morphology; explainable AI; MeshMonk ; generalized Procrustes analysis (GPA)

2274 - Blood Stasis Constitution Drives Hepatic MDSC Accumulation in MASLD

春润 李¹ 云龙 姚¹
中医学院, 北京中医药大学, 北京-China¹

Background / **Hypothesis:**

The Blood-Stasis (BS) constitution in TCM reflects a state of chronic microcirculatory disturbance and is clinically linked to chronic inflammatory diseases. We hypothesize that in Metabolic Dysfunction-Associated Steatotic Liver Disease (MASLD), the BS constitution fosters a unique immunosuppressive hepatic microenvironment by promoting the accumulation and activation of myeloid-derived suppressor cells (MDSCs), thereby accelerating disease progression towards steatohepatitis and fibrosis.

Materials and **Methods:**

In a cross-sectional cohort of 250 biopsy-proven MASLD patients, BS constitution was assessed via the CCMQ and a standardized tongue diagnosis imaging system quantifying sublingual vein congestion. Peripheral blood and liver biopsy samples were analyzed by multicolor flow cytometry to quantify MDSC populations (CD11b+CD33+HLA-DR^{low}). Hepatic gene expression of MDSC-related chemokines (e.g., S100A8/A9) and inflammatory markers was correlated with BS severity. In a diet-induced MASLD mouse model, animals with BS traits (induced by chronic stress) received a herbal intervention targeting blood stasis (Taohong Siwu Decoction) to assess MDSC modulation and histopathological outcomes.

Results:

Patients with BS constitution exhibited a 2.8-fold higher intrahepatic MDSC frequency compared to non-BS controls ($p < 0.001$). This increase strongly correlated with the severity of sublingual vein signs ($r = 0.71$), histological necroinflammation grade ($r = 0.65$), and fibrosis stage ($r = 0.58$). The BS group showed elevated hepatic expression of S100A8/A9 and IL-10. In the murine model, BS-trait mice developed more severe steatohepatitis with marked MDSC infiltration. Treatment with the blood-activating herbal formula significantly reduced hepatic MDSC accumulation, suppressed pro-fibrotic cytokine levels, and ameliorated liver injury scores ($p < 0.05$ compared to untreated BS mice).

Conclusions:

This study is the first to link the TCM Blood-Stasis constitution to the expansion of immunosuppressive MDSCs in the liver, providing a novel immunologic

ORAL ABSTRACTS

mechanism for its association with aggravated MASLD. The correlation between traditional tongue signs and MDSC levels offers an objective bridging biomarker. Furthermore, the successful modulation of this axis by a targeted herbal intervention demonstrates a actionable pathway for precision therapy. This positions the BS constitution as a critical target for immunomodulatory strategies in MASLD management.

2276 - Long Term Outcomes of Treatment Induced Versus Spontaneously Achieved HBsAg

Jian Wang¹, Shaoqiu Zhang¹, Tao Fan², Li Zhu³, Ye Xiong², Chao Jiang⁴, Xiaomin Yan¹, Xingxiang Liu⁵, Chuanwu Zhu³, Chao Wu¹, Rui Huang¹
Nanjing Drum Tower Hospital, Affiliated Hospital Of Medical School, Nanjing University, Department Of Infectious Diseases, Nanjing-China¹ Nanjing Drum Tower Hospital Clinical College Of Nanjing University Of Chinese Medicine, Department Of Infectious Diseases, Nanjing-China² The Affiliated Infectious Diseases Hospital Of Soochow University, Department Of Infectious Diseases, Suzhou-China³ Nanjing Drum Tower Hospital Clinical College Of Jiangsu University, Department Of Infectious Diseases, Nanjing-China⁴ Huai'an No. 4 People's Hospital, Department Of Clinical Laboratory, Huai'an-China⁵

Background / Hypothesis:

A serum hepatitis B surface antigen (HBsAg) level <100 IU/mL is recognized as a criterion for partial cure and as an indicator for consideration of antiviral therapy discontinuation in chronic hepatitis B (CHB). Patients who achieve HBsAg <100 IU/mL spontaneously have favorable clinical outcomes with a low risk of hepatocellular carcinoma (HCC). However, whether outcomes differ between patients who achieve HBsAg <100 IU/mL through antiviral treatment and those who achieve it spontaneously remains unclear. We compared the long-term outcomes of patients with treatment-induced versus spontaneously achieved HBsAg <100 IU/mL.

Materials and Methods:

This retrospective study included 886 non-cirrhotic CHB patients from three hospitals in China who achieved HBsAg levels <100 IU/mL, HBsAg negativity, undetectable HBV DNA, and normal ALT levels. Of these,

616 patients were classified in the spontaneous group and 270 were in the treatment-induced group. All patients in the treatment-induced group had received nucleos(t)ide analogue (NA) therapy for at least 6 months at enrollment and continued antiviral treatment during follow-up. The endpoints included HBsAg seroclearance and liver-related adverse events (LRE) (cirrhosis and HCC). Propensity score matching (PSM) was used to balance baseline characteristics between the treated and untreated groups.

Results:

During a median follow-up of 3.0 years, 106 patients achieved HBsAg seroclearance, and 7 patients developed liver-related adverse events. After PSM, there were no significant differences between the spontaneous and treatment-induced groups in the 6-year cumulative incidence of HBsAg seroclearance (19.5% vs. 37.6%, $P=0.270$) or LREs (2.3% vs. 2.1%, $P=0.646$). In the multivariate Cox analysis, baseline HBsAg <15 IU/mL (HR 4.47, $P<0.001$) was associated with a higher likelihood of achieving HBsAg seroclearance. However, antiviral treatment was not significantly associated with achieving HBsAg seroclearance (HR 1.81, $P=0.066$) and the development of LREs (HR 1.49, $P=0.630$).

Conclusions:

Both treatment-induced versus spontaneously achieved HBsAg <100 IU/mL had favorable prognosis with low risk of LREs and high chance of achieving HBsAg loss.

2282 - SIRT2 restrains HDV associated hepatic macrophage pyroptosis by deacetylating NLRP3 and suppressing NF- κ B signaling

Leer Shen¹, Jin Shentu², Yunjiao Zhang¹, Rongli He¹, Xiaohua Chen¹
Shanghai Sixth People's Hospital, Infectious Disease, Shanghai-China¹ Shanghai Children's Medical Center, Heart Center, Shanghai-China²

Background / Hypothesis: Hepatitis D virus (HDV) superinfection causes aggressive hepatitis, yet the molecular drivers of HDV-induced liver injury are poorly defined. Inflammatory macrophage activation – especially NLRP3 inflammasome-mediated pyroptosis – is known to exacerbate liver damage. Sirtuin 2 (SIRT2) is an NAD⁺ dependent deacetylase that normally restrains inflammation – for example, by deacetylating NF- κ B p65

ORAL ABSTRACTS

and limiting proinflammatory gene expression, but its role in HDV pathogenesis has not been studied.

Materials and Methods: An AAV-HDV mouse model was established and SIRT2 activity was manipulated in vivo using AAV-SIRT2 (gain-of-function) or pharmacological SIRT2 inhibition (AGK2). Hepatic macrophages were isolated for transcriptomic profiling and mechanistic assays. Liver injury and inflammation were assessed by serum biochemistry and histopathology. NF- κ B signaling and pyroptosis were evaluated by immunoblotting/immunostaining and cytokine quantification, including p65 activation and NLRP3 inflammasome markers (NLRP3, cleaved caspase-1, GSDMD cleavage, IL-1 β /IL-18). Protein interaction and post-translational modification were examined by co-immunoprecipitation and acetylation analyses of NLRP3. Melatonin was administered as an intervention, with pathway readouts assessed in vivo and in HDV-stimulated macrophages.

Results: During HDV infection, SIRT2 was reduced in hepatic macrophages and its decrease correlated with heightened inflammatory responses and aggravated liver injury. Functionally, SIRT2 negatively regulated HDV-associated inflammation and liver damage, accompanied by attenuation of macrophage pyroptosis. Transcriptomic and protein-level analyses indicated that SIRT2 deficiency enhance p65 activation and increase NLRP3 abundance, whereas SIRT2 overexpression produced the opposite effects. Mechanistically, SIRT2 physically associated with NLRP3 and suppressed NLRP3 inflammasome activation by reducing NLRP3 acetylation, thereby limiting caspase-1 activation, GSDMD cleavage, and IL-1 β /IL-18 release. Finally, melatonin upregulated SIRT2, inhibited macrophage pyroptosis, and ameliorated HDV-induced hepatic inflammation and injury, supporting a druggable SIRT2-centered axis.

Conclusions: In summary, SIRT2 is a critical negative regulator of macrophage NF- κ B/NLRP3-mediated pyroptosis during HDV infection. By deacetylating both NLRP3 and NF- κ B p65, SIRT2 limits inflammasome activation and IL-1 β release, protecting hepatocytes from immune-mediated injury. Therapeutic strategies to enhance SIRT2 activity (e.g. melatonin supplementation) may thus mitigate HDV-associated hepatic inflammation.

Keyword(s) : HDV; hepatic macrophage; SIRT2; NF- κ B p65; NLRP3 inflammasome; acetylation; pyroptosis; melatonin

2290 - Coffee Consumption and Hepatocellular Carcinoma An Umbrella Review of Meta Analyses involving Over 12 Million Population

Nitesh Kumar Karna¹, Akshyata Osti¹, Popular Pokhrel¹, Gopal Pokhrel¹, Nitesh Neupane¹
B.p. Koirala Institute Of Health Sciences, Department Of Medicine, Dharan-Nepal¹

Background / **Hypothesis:**
Coffee consumption has been extensively studied for its potential impact on hepatocellular carcinoma (HCC) risk, with conflicting results across various meta-analyses. This umbrella review aims to synthesize existing evidence and clarify the association between coffee consumption and the incidence of HCC, providing insights into potential preventive strategies.

Materials and **Methods:**
Following PRISMA guidelines, a systematic search of PubMed, Embase, Scopus, Cochrane Library, and Google Scholar was conducted up to May 2025. We included 12 meta-analyses comprising data from 12,399,664 participants. Pooled relative risks (RRs) with 95% confidence intervals (CIs) were calculated to evaluate the association. Heterogeneity was assessed using the I^2 statistic, and publication bias was examined using Egger's regression test and funnel plot.

Results:
Coffee consumption was associated with a significantly reduced risk of HCC (RR = 0.63; 95% CI: 0.56–0.69; I^2 = 92.25%; p < 0.01), suggesting a 37% lower risk among coffee drinkers. Although substantial heterogeneity was observed, the inverse association remained consistent across various meta-analyses. Subgroup findings from the included studies generally supported this protective effect regardless of population or study design. Egger's regression test indicated no significant publication bias (p = 0.2801), and the forest plot appeared symmetrical, reinforcing the reliability of the pooled estimate.

Conclusions:
This umbrella review consolidates current evidence supporting a substantial reduction in HCC risk associated with coffee consumption. The observed inverse association underscores the potential of coffee as a modifiable factor in HCC prevention strategies.

2291 - The Antagonism between Demographic Shifts and Epidemiological Progress A Decomposition Analysis of the Liver Cancer Burden in the Asia Pacific 1990–2023

Wenxin Yan¹, Liangyu Kang¹, Haoran Sun¹, Wenzhan Jing², Min Liu³, Jue Liu³, Wannian Liang¹
Tsinghua University, Vanke School Of Public Health, Beijing-China¹ Stanford University School Of Medicine, Department Of Surgery, Asian Liver Center, Ca-United States² Peking University, School Of Public Health, Beijing-China³

Background:

Despite substantial advances in antiviral therapies, the absolute burden of liver cancer in the Asia-Pacific remains considerable. The relative contributions of epidemiological risk reduction versus demographic forces—population aging and growth—vary markedly across the region. We aimed to disentangle these drivers and quantify how demographic transitions interact with shifting etiological profiles, particularly the transition from viral hepatitis to metabolic liver disease, using data from the Global Burden of Disease (GBD) Study 2023.

Materials and Methods: We analyzed liver cancer incidence, mortality, and disability-adjusted life-years (DALYs) from 1990 to 2023 across six GBD regions and 45 countries and territories in the Asia-Pacific. Five etiologies were examined: hepatitis B virus (HBV), hepatitis C virus (HCV), alcohol use, metabolic dysfunction-associated steatotic liver disease (MASLD), and other causes. Temporal trends in age-standardized rates (ASRs) were assessed using the Estimated Annual Percentage Change (EAPC). Changes in absolute case numbers were decomposed into population growth, population aging, and epidemiological change. Analyses were stratified by etiology.

Results:

From 1990 to 2023, the liver cancer burden in the Asia-Pacific increased substantially. Annual incident cases nearly doubled from 170,279 to 335,716, deaths rose to 293,682, and DALYs increased from 5.02 million to 7.99 million. Mongolia consistently exhibited the highest age-standardized burden. Etiology-specific trends diverged by region. High-income Asia Pacific (DALY EAPC: -2.44; 95% CI: -2.85 to -2.04) and East Asia (-1.79; -1.96 to -1.63) experienced significant declines in HBV-related ASRs, with pronounced reductions among females in East Asia (EAPC: -3.35), reflecting antiviral impact (Fig. 1).

However, population aging largely offset these gains, sustaining a high absolute burden. Conversely, South Asia showed the steepest increase in MASLD-related DALYs (EAPC: 0.97; 95% CI: 0.84 to 1.10), primarily driven by population growth, contributing 41.2% of the increase (Fig. 2). MASLD-related rates showed minimal risk reduction across regions, leading to a net rise in metabolic-related cases.

Conclusions:

Epidemiological gains from viral hepatitis control in the Asia-Pacific are increasingly counterbalanced by demographic momentum. A bifurcated strategy is required: East Asia should strengthen surveillance and geriatric-oriented care for aging viral-exposed cohorts, while South Asia urgently needs population-level interventions targeting metabolic risk factors to curb the rising MASLD burden.

Keyword(s) : Liver cancer; Decomposition analysis; Demographic transition; MASLD; Global Burden of Disease

2292 - Analysis of Clinical Characteristics and Treatment Outcomes in HBV Related Liver Failure Patients with or without Diabetes Mellitus

Lufeng Li¹

The First Affiliated Hospital Of The Army Medical University, Infectious Diseases Department, Chongqing-China¹

Background :

Patients with hepatitis B virus (HBV) - related liver failure (LF) complicated by diabetes mellitus (DM) face more challenging treatment due to immune dysfunction and increased infection risk. This study aimed to compare the clinical characteristics and treatment differences between HBV - LF patients with and without DM.

Materials and Methods: A retrospective analysis was conducted on 91 HBV - LF inpatients admitted to the First Affiliated Hospital of the Army Medical University between April 20, 2017 to June 29, 2025. Patients were divided into two groups based on the presence of DM: the DM group (n = 45) and the non - DM group (n = 46). Demographic characteristics (age, gender), severity of liver disease (proportion of cirrhosis), virological indicators (proportion of HBeAg positivity, HBV DNA positivity), average length of stay, proportion of high - level antibiotic use (including β - lactamase inhibitors, carbapenems), and renal function (serum creatinine levels on admission and discharge) were compared between the two groups.

ORAL ABSTRACTS

Results:

All patients received nucleos(t)ide analog antiviral therapy and insulin for glycemic control, and all were discharged after improvement. There were no significant differences between the two groups in terms of age, gender, proportion of cirrhosis, and HBV DNA positivity (table 1). However, the proportion of high - level antibiotic use in the DM group was significantly higher than that in the non - DM group (86.6% vs 63.3%, $p < 0.05$) (figure 1). Although there was no statistically significant difference, the serum creatinine level in the DM group showed a trend of increase from admission to discharge ($84.1 \pm 70.8 \mu\text{mol/L}$ vs $84.1 \pm 70.8 \mu\text{mol/L}$, $P = 0.06$) (figure 1).

Conclusions:

HBV - LF patients with DM can achieve comparable clinical efficacy to non - DM patients through standardized antiviral and infection management. However, they have a higher infection risk and require more active use of high - level antibiotics and dynamic monitoring of renal function changes.

2294 - Comparison of the Effects of Tenofovir Alafenamide and Entecavir on Lipid Profiles in Anti HBc Positive Kidney Transplant Recipients

Elif Gucyetmez¹, Aydin Runi Yagmur¹, Enes Erbagci², Farinaz Ghasemi³, Ozlem Usalan⁴, Ayse Ozlem Mete¹
Gaziantep University Faculty Of Medicine Training And Research Hospital, Infectious Diseases And Clinical Microbiology, Gaziantep-Türkiye¹ Nizip State Hospital, Infectious Diseases And Clinical Microbiology, Gaziantep-Türkiye² Gaziantep University Faculty Of Medicine Training And Research Hospital, Medical Student, Gaziantep-Türkiye³ Gaziantep University Faculty Of Medicine Training And Research Hospital, Nephrology, Gaziantep-Türkiye⁴

Background / **Hypothesis:**
Chronic Hepatitis B virus (HBV) infection in kidney transplant recipients represents a significant concern due to the risk of viral reactivation under immunosuppressive therapy. Therefore, antiviral prophylaxis is recommended for this patient population in clinical guidelines. Entecavir (ETV) and Tenofovir Alafenamide (TAF) are preferred in transplant recipients because of their potent antiviral efficacy and high genetic barrier to resistance. However, data regarding their long-term metabolic effects, particularly on lipid metabolism, remain limited.

In this study, we aimed to compare the effects of TAF and ETV therapies on lipid parameters in anti-HBc-positive kidney transplant recipients receiving antiviral prophylaxis to prevent HBV reactivation.

Materials and Methods:
A retrospective study of 62 anti-HBc-positive kidney transplant recipients on TAF or ETV; lipid and renal parameters were evaluated at baseline and during 2-year follow-up visits.

Results:

A total of 62 kidney transplant recipients were analyzed (27.4% male, 72.6% female; mean age 51.3 ± 12.0 years). Thirty-eight patients received TAF and 24 received ETV. The groups were demographically homogeneous ($p > 0.05$).

Findings in the TAF Group:
• The increase in total cholesterol between baseline and months 6, 12 and 24 was statistically significant (adjusted $p = 0.001, 0.037, 0.010$).

• HDL levels showed significant increases between baseline and months 6 and 24 ($p = 0.003, 0.030$).

• LDL levels exhibited a significant increase only between baseline and month 6 ($p = 0.021$). Additionally, the median GFR increased significantly from 16 to 64.5 ($p = 0.003$).

Findings in the ETV Group
Among the 12 patients included in the analysis, no statistically significant changes were observed in lipid parameters.

• Although time-dependent variations were noted in total cholesterol, HDL and LDL levels, Friedman test results did not reach statistical significance ($p > 0.05$).

• The median GFR increased significantly from 9 to 75 ($p = 0.000$) with a consistent significant rise throughout the follow-up period ($p < 0.001$).

Conclusions:

In this study, the effects of TAF and ETV therapies used to prevent HBV reactivation on lipid profiles were compared among anti-HBc-positive kidney transplant recipients. Our findings demonstrated that patients receiving TAF experienced significant increases in total cholesterol and LDL levels between baseline and month 6, whereas no notable changes were observed in these parameters in the ETV group.
• The most clinically relevant implication of our results is the necessity of lipid profile monitoring during TAF

ORAL ABSTRACTS

therapy. Kidney transplant recipients receiving TAF should undergo regular and long-term lipid monitoring and lifestyle modifications or lipid-lowering therapies should be considered when appropriate. Further prospective studies with larger sample sizes are warranted to evaluate long-term metabolic outcomes in this patient population.

• Limitations of this study include the relatively small sample size and retrospective design. Nevertheless, our findings contribute valuable insights to clinical practice, representing one of the few studies directly comparing the metabolic effects of TAF and ETV in the kidney transplant population.

Keyword(s) : Kidney Transplantation, Tenofovir Alafenamide (TAF), Entecavir (ETV), Lipid Metabolism

2296 - From Campaign to Validation Operationalizing Egypt's National Sustainability Plan for Viral Hepatitis Elimination (2025–2030)

Wael Abdel-razek ¹, Mohamed Abd Allah ², Mohamed Hassany ³

National Liver Institute, Hepatology And Gastroenterology, Shebeen El-kom-Egypt ¹ National Research Center, Medical Research Division, Giza-Egypt ² National Hepatology And Tropical Medicine Research Institute; Ministry Of Health And Population, Hepatology And Tropical Medicine Department, Cairo-Egypt ³

Background:

Following the historic "100 Million Seha" campaign aimed at hepatitis C virus (HCV) elimination, Egypt achieved the World Health Organization (WHO) "Gold Tier" status on the path to HCV elimination in 2023 and achieved the WHO Eastern Mediterranean Region (EMRO) targets for hepatitis B virus (HBV) control in 2025. To transition from vertical campaigning to permanent disease control, the Ministry of Health and Population developed the National Viral Hepatitis Elimination Sustainability Plan (2025–2030) with the support of the WHO. This study analyzes the operational framework designed to meet the WHO criteria for full validation of the elimination of hepatitis B and C viruses by 2030.

Methods:

We conducted a policy and systems analysis of the 2025–2030 Sustainability Plan, developed through multi-stakeholder consultations involving national committees, UN agencies, and civil society. The plan's five strategic objectives were mapped against WHO validation domains: governance, service integration,

prevention, care optimization, and surveillance. Financial sustainability was assessed using national cost-effectiveness modeling.

Results:

The framework operationalizes elimination through five key pillars:

1. Governance & Finance: Institutionalizing oversight via a National Viral Hepatitis Task Force and securing domestic financing, projected to save USD 4.7 billion in indirect costs by 2030.
2. Service Integration: Shifting testing and treatment into the Universal Health Insurance (UHI) benefits package and primary care family medicine curricula.
3. Prevention: Scaling harm reduction to reach 300 syringes/person/year for people who inject drugs (PWID) and maintaining at least 95% HBV birth-dose vaccination coverage, in addition to sustaining the national indicators of the blood and injection safety measures.
4. Care Optimization: Sustaining the focused efforts targeting the risky groups (e.g., PWID, ...) and deploying "One-Stop" clinics for integrated care.
5. Surveillance: Upgrading the National Electronic Disease Surveillance System (NEDSS) and expanding sequelae surveillance sites to monitor the documented reduction in HCV-related mortality (2018–2025).

Conclusions:

Egypt's roadmap demonstrates how high-burden nations can evolve from mass screening and treatment to sustainable, insurance-integrated elimination models. By prioritizing harm reduction and monitoring sequelae, this framework offers a transferable blueprint for Asia-Pacific nations seeking to operationalize WHO validation criteria within routine health systems.

2297 - Ischemia Modified Albumin in MASLD Correlation With Ultrasonographic Steatosis Grade and Elastography Based Liver Stiffness

Kubra Koken ¹, Mevlut Hamamci ¹, Alper Macif ¹, Mahmut Yuksel ¹, Ahmet Burak Fedai ¹, Salim Neselioglu ², Emine Sena Sozen ³, Goktug Okyar ², Sadik Yavuz ¹, Derya Ari ¹, Ozcan Erel ², Hasan Tankut Koseoglu ¹

Ankara Bilkent City Hospital, Gastroenterology, Ankara-Türkiye ¹ Ankara Bilkent City Hospital, Biochemistry, Ankara-Türkiye ² Ankara Bilkent City Hospital, Internal Medicine, Ankara-Türkiye ³

ORAL ABSTRACTS

Background/Hypothesis:

Metabolic dysfunction-associated steatotic liver disease (MASLD) is the most prevalent chronic liver disease worldwide, and reliable noninvasive tools are essential for disease assessment. Ultrasonography and transient elastography are widely used to evaluate hepatic steatosis and fibrosis. Ischemia-modified albumin (IMA), a marker of oxidative stress and altered albumin metal-binding capacity, has been investigated in various liver diseases, but its role in MASLD remains unclear. We hypothesized that IMA levels may be associated with ultrasonographic steatosis severity and elastography-based liver stiffness.

Materials and Methods: This prospective study included 81 adult patients diagnosed with MASLD. All patients underwent serum IMA measurement, routine laboratory testing, liver ultrasonography, and transient elastography (FibroScan®). Hepatic steatosis was graded on ultrasonography as Grade 1, 2, or 3 according to standard criteria; steatosis grading was available in 80 patients. Transient elastography included controlled attenuation parameter (CAP, dB/m) for steatosis and liver stiffness measurement (kPa) for fibrosis assessment. Laboratory parameters included liver enzymes, bilirubin levels, lipid profile, albumin, IMA/albumin ratio, hemoglobin, platelet count, INR, and C-reactive protein. Statistical analyses were performed using appropriate parametric or non-parametric tests based on data distribution, with $p < 0.05$ considered statistically significant.

Results:

The mean age was 47.35 ± 12.02 years, and 54.3% of patients were female. Ultrasonography demonstrated Grade 1 steatosis in 41.3%, Grade 2 in 47.5%, and Grade 3 in 11.3% of patients. Median IMA levels showed a decreasing trend with increasing steatosis severity but did not differ significantly among grades ($p = 0.255$). The IMA/albumin ratio was also similar between groups ($p = 0.126$). In contrast, AST and ALT levels increased significantly with higher steatosis grades ($p = 0.016$ and $p = 0.022$), while LDL cholesterol levels were significantly lower in Grade 3 steatosis ($p = 0.033$). CAP values increased progressively across steatosis grades and differed significantly among groups ($p < 0.001$). Liver stiffness values were higher in Grade 3 steatosis but did not reach statistical significance ($p = 0.115$).

Conclusions:

IMA levels were not associated with ultrasonographic steatosis severity or elastography-based liver stiffness in MASLD, suggesting limited value as a standalone marker. In contrast, CAP and selected biochemical markers showed clear associations with steatosis

severity, supporting the continued use of imaging-based noninvasive tools in MASLD evaluation.

2300 - Old Drugs New Targets Repurposing Proton Pump Inhibitors for Autoimmune Liver Diseases Molecular Docking Insights into the TLR4 MD 2 NLRP3 and C5aR1 Axes

Mehmet Yıldız¹, Erdi Şeker², Engin Altinkaya¹, Burak Tüzün³, Hilmi Ataseven¹
Sivas Cumhuriyet University Faculty Of Medicine, Gastroenterology, Sivas-Türkiye¹ Sivas Numune Hospital, Gastroenterology, Sivas-² Sivas Cumhuriyet University Technical Sciences Vocational School, Chemistry, Sivas-³

Background/Hypothesis: Autoimmune liver diseases (AILDs) are characterized by loss of immune tolerance and chronic necroinflammatory injury. Current therapies involving corticosteroids and immunosuppressants are limited by severe side effects and non-response rates, necessitating safer, targeted strategies. Drug repurposing offers a rational alternative to de novo drug design. Given the emerging evidence of the pleiotropic immunomodulatory effects of Proton Pump Inhibitors (PPIs), this study aims to elucidate the molecular interaction profiles of PPIs on key hepatic inflammatory targets - Toll-like receptor 4/MD-2 (TLR4/MD-2), NOD-like receptor protein 3 (NLRP3) inflammasome, and Complement C5a receptor 1 (C5aR1) - to provide a structural basis for their repurposing in AILDs.

Materials and Methods: Five PPIs (esomeprazole, omeprazole, pantoprazole, lansoprazole, rabeprazole) were analyzed against crystallographic structures of the TLR4/MD-2 complex (PDB: 3FXI), NLRP3 inflammasome (active: 7VTP; inhibitor-bound: 7PZC), and C5aR1 receptor (allosteric/extra-helical: 6C1R, 5O9H). Molecular docking calculations were performed using Schrödinger Maestro (Glide module). Binding affinities (docking scores), energetic components, and specific ligand-residue interactions were evaluated to assess potential inhibitory mechanisms.

Results: Rabeprazole and Lansoprazole exhibited superior binding affinities across all inflammatory axes compared to other PPIs. Notably, in the inhibitor-bound NLRP3 structure (7PZC), Rabeprazole (-9.10 kcal/mol) and Lansoprazole (-9.04 kcal/mol) demonstrated high-affinity binding, suggesting potent inflammasome

ORAL ABSTRACTS

inhibition. While Rabeprazole showed the highest affinity for the TLR4/MD-2 complex (-7.85 kcal/mol), a distinct "lead switching" was observed in the C5aR1 axis, where Lansoprazole emerged as the lead compound (-6.93 kcal/mol), effectively targeting the allosteric pocket. Conversely, Pantoprazole displayed the weakest interaction profile across all targets.

Conclusions: Although Pantoprazole exhibited lower binding affinity, this study presents novel molecular evidence that PPIs, particularly Rabeprazole and Lansoprazole, may exert dual anti-inflammatory and immunomodulatory activities in autoimmune liver diseases by directly targeting the TLR4, NLRP3, and C5aR1 signaling pathways. Our findings establish a strong foundation for evaluating this drug class as novel therapeutic agents through a "structural repurposing" strategy.

2302 - Stiffness Regression Fundamentally Alters Mortality Patterns and Improves Survival in Advanced Fibrosis After SVR A Cause Specific Outcome Analysis

Shuntaro Obi¹, Yoshiki Asahina², Tomoyoshi Murata³, Shoudai Tohyama³, Hiroyuki Amano³, Hiroshi Ashizawa³, Shinya Takaoka³, Yushi Imai³, Yukiko Asakawa³, Hitoshi Mochizuki³, Yuichiro Kojima³, Sumio Hirose³, Masao Omata⁴

Teikyo Univ. Chiba Medical Center, Internal Medicine, Chiba-Japan¹ Yamanashi Central Hospital, Gastroenterology, Yamanashi-Japan² Amanashi Central Hospital, Gastroenterology, Yamanashi-Japan³ The Univ. Of Tokyo, Gastroenterology, Tokyo-Japan⁴

Background:

Stiffness regression after sustained virologic response (SVR) reflects structural hepatic improvement, but its impact on survival and cause-specific mortality across fibrosis stages remains unclear. This study evaluated how regression modifies mortality patterns and outcomes in F3 and F4 disease.

Methods:

Longitudinal liver stiffness measurements (LSM) were assessed by estimating individual decay rates; a $\geq 20\%$ LSM reduction defined regression. Overall survival (OS) was prospectively evaluated (mean follow-up 7 years). Outcomes were analyzed separately for F3 and F4. Detailed causes of death were reviewed, and liver-related mortality was compared using Fisher's exact test.

Results:

In F3 (n=134), survival did not differ between the regression (4/87) and non-regression (2/47) groups. Deaths in the regression group were largely non-liver-related (two extrahepatic malignancies, one pneumonia), with only one HCC-related death. In the non-regression group, deaths were due to HCC and heart failure. Liver-related mortality was rare, explaining the absence of survival separation.

In F4 (n=195), regression markedly altered mortality patterns. Among 11 deaths in the regression group (11/107; 10%), only 4 (36%) were liver-related (HCC=2, liver failure=2), while 7 were non-liver-related (extrahepatic malignancy=3, pneumonia, subarachnoid hemorrhage, senescence, graft rejection). In contrast, the non-regression group experienced 19 deaths (19/88; 22%), including 14 liver-related (74%)—HCC (n=12) and liver failure (n=2) (p=0.0626). Other causes included extrahepatic malignancy=2, pneumonia, heart failure, trauma, and senescence. The survival advantage in F4 regression patients reflects a substantial reduction in liver-related mortality.

Conclusions:

In advanced fibrosis, stiffness regression fundamentally shifts mortality patterns and is a major determinant of long-term survival after SVR.

2306 - Study on Key Inflammatory Proteins of Antiviral Treatment in Children with Chronic Hepatitis B

Ce Shi¹, Ruiyang Yuan², Xiuchang Zhang², Jia Liu¹, Wenling Wang¹, Yuxi Ning², Xueqi Hong², Min Zhang¹, Yanwei Zhong¹

The Fifth Medical Center Of Chinese PLA General Hospital, Department Of Hepatology, Beijing-China¹ Hebei North University, Hebei North University, Zhangjiakou-China²

Background

Previously study showed that inflammatory proteins play a pivotal role in viral replication and the host immune response. The purpose of this study is to identify which inflammatory protein plays a key role in antiviral therapy in children with chronic hepatitis B (CHB).

Materials

100 children with CHB were randomly recruited into the

Methods:

ORAL ABSTRACTS

study cohort. The participants were stratified based on the initial age and therapeutic efficacy. Using Olink proteomics technology, we detected and analyzed 92 inflammatory proteins in the baseline serum samples of all subjects. 67 patients randomly selected were assigned to the test cohort, while the others constituted the validation cohort. The area under the receiver operating characteristic (AUROC) curve was calculated to construct and evaluate the performance of the prediction model.

Results:

In the test cohort, HBsAg loss rate was 58.0% in children under 3 years old, while it was 47% in children above 3 years old group. Logistic regression showed that SLAMF1 was an independent factor associated with favorable antiviral outcomes in children under 3 years. Additionally, CXCL9 and CCL4 were significantly correlated with HBsAg loss in CHB children aged 1-6 years. The combined model incorporating SLAMF1, CXCL9, and CCL4 yielded the best AUROC of 0.80(95% CI: 0.71-0.967, $p=0.0006$) for predicting HBsAg clearance under 3 years. Similar favorable results were observed in the validation cohort.

Conclusions:

Our findings indicate that SLAMF1 may be a key inflammatory protein playing a critical role in antiviral therapy for children with CHB, which provides an experimental basis for improving their functional cure rate.

Keyword(s) : Chronic hepatitis B; Children; Antiviral therapy; Inflammatory proteins.

2309 - Zonal Restoration and Inter Cellular Signaling in Fibrosis Regression Single Cell Transcriptomics Decodes the Pericentral Hepatocyte HSC Axis

Thi Thanh Thuy Le ¹, Minh Duc Pham ², Hai Hoang ¹, Norifumi Kawada ³

Osaka Metropolitan University, Department Of Global Education And Medical Sciences, Graduate School Of Medicine, Osaka-Japan ¹ Osaka Metropolitan University, Department Of Hepatology, Graduate School Of Medicine, Osaka-Japan ² Osaka Metropolitan University, Endowed Departments Of Liver Cancer Treatment And Homeostatic Regulation, Graduate School Of Medicine, Osaka-Japan ³

Background

Single-Cell Fixed RNA Profiling (FLEX) is a novel technology that enables RNA expression profiling from

Hypothesis:

frozen tissues at single-cell resolution. We applied FLEX to a murine model of cirrhosis progression and regression to identify previously unrecognized cellular crosstalk and potential anti-fibrotic targets.

Materials and Methods: Liver fibrosis was induced by intraperitoneal thioacetamide (TAA) administration for 10 weeks, and regression was assessed two weeks after cessation. Livers were fixed, dissociated, and analyzed using FLEX. Molecular validation was performed by immunoblotting, immunohistochemistry, gene silencing and overexpression assays, cytokine/phosphokinase arrays, and analyses of human liver samples.

Results: Approximately 40,000 liver cells were profiled, integrated, and annotated into 10 major cell types using lineage-specific markers. Restoration of pericentral signatures in hepatocytes (HEPs) was the predominant event associated with fibrosis regression. A distinct HEP subcluster, termed recoHEPs, characterized by high expression of Cyp2e1, Cyp1a2, Glul, Oat, Mgst1, and Txn1, exhibited xenobiotic-, metabolic-, and antioxidant-related transcriptional programs. Gene set enrichment analysis (GSEA) and differential expression analysis (DEGs) demonstrated increased activation of central metabolic pathways, including xenobiotic metabolism and antioxidant signaling, in recoHEPs. Immunohistochemistry for pericentral hepatocyte markers (GLUL, CYP2E1, CYP1A2, OAT) confirmed Zone 3 localization, which was diminished during fibrosis progression and restored during regression, whereas Zone 1 markers (CYP2F2, HAL) increased in fibrosis and declined during regression. MultiNicheNet analysis predicted the upregulation of the top 50 ligand-receptor pairs during regression, with Rarres2-Cclrl2 emerging as a prominent axis mediating signals from HEPs to HSCs and among HSCs themselves. Spatial transcriptomics of published human liver datasets showed that RARRES2 is expressed in human pericentral hepatocytes as well as HSCs. Validation experiments demonstrated that RARRES2 expression is high in healthy liver, reduced in fibrosis, and restored during regression in both tissue lysates and serum. In primary mouse hepatic stellate cells (mHSCs), Rarres2 expression was highest in quiescent HSCs and significantly decreased during activation. Functional assays further showed that RARRES2 knockdown using siRNAs in primary human hepatic stellate cells (HHStCs) increased the expression of fibrosis-related genes (COL1A1, COL1A2, COL5A1, FN1, LMCD1, ACTA2, MYL9).

Conclusions: These findings reveal a critical role for pericentral hepatocytes in orchestrating liver fibrosis

ORAL ABSTRACTS

regression through interactions with HSCs. Rarres2 represents a promising therapeutic target for promoting fibrosis resolution.

2310 - NAFLD promotes early hepatocellular carcinoma recurrence via MDSC metabolic reprogramming Insights from a two phase recurrence model in mice

Mingming Li ¹, Lei Xu ¹, Shang Yuan ¹, Lei Zhao ¹
Shandong Cancer Hospital And Institute, 7 8 Shandong First Medical University And Shandong Academy Of Medical Sciences, Department Of Hepatobiliary Surgery, Jinan-China ¹

Background / Hypothesis: Surgical resection remains an important curative therapy for hepatocellular carcinoma (HCC); however, the 5-year recurrence rate still exceeds 70%. The majority of recurrences manifest within the initial 2 years post-surgery, in accordance with the early recurrence criteria. Nonalcoholic fatty liver disease (NAFLD) has been reported to promote early recurrence of HCC. Here, we investigated the role of NAFLD in shaping an immunosuppressive tumor microenvironment after surgical resection, which promotes the early recurrence of HCC.

Materials and Methods: Models of early recurrence were established with luciferase-expressing Hepa1-6 cells in C57BL/6J mice. A randomized, controlled animal experiment was conducted. Single-cell RNA sequencing (scRNA-seq) was performed to examine the immune microenvironment in the liver in the context of NAFLD. Multiplex immunofluorescence staining and flow cytometry were used to validate immune cell population dynamics. Lipidomics was used to delineate the metabolic landscape of NAFLD.

Results: We discovered that the NAFLD microenvironment promoted the expansion of CD11b+Gr1+ myeloid-derived suppressor cells (MDSCs), which concurrently promoted the exhaustion of tumor-specific CD8⁺ T cells. This expansion was positively correlated with the early recurrence of HCC. Furthermore, lipidomic analysis of tumor tissues from NAFLD mice revealed 22 upregulated metabolites. Pathway enrichment analysis revealed a predominant association between these metabolites and glycerophospholipid metabolism. Infiltrating MDSCs enhanced choline metabolism through the significant upregulation of the key rate-limiting enzyme choline kinase alpha (CHKA), consequently activating the PI3K-AKT-mTOR axis. Interrupting the CHKA-PI3K-AKT-

mTOR axis with CHKA inhibitor MN58b or AKT inhibitor capivasertib significantly mitigated tumor progression induced by NAFLD and restored CD8⁺ T cell function. Intercellular interaction analysis suggested that MDSCs reciprocally communicate with T/NK cells to remodel unfavorable conditions via the CEACAM1-CD8a, CD86-CTLA4/CD28, and IL34-CSF1R tumor-promoting signaling pathways.

Conclusions: NAFLD drives early HCC recurrence by remodeling the immunosuppressive niche via the CHKA-PI3K-AKT-mTOR axis. Targeting this pathway represents a novel therapeutic strategy against NAFLD-related HCC recurrence.

2311 - LOXL1 Regulates Lipid Metabolism to Promote Hepatic Stellate Cell Activation via Ubiquitin Mediated FASN Degradation

Xuzhen Yan ¹, Aiting Yang ¹, Yiwen Wang ², Hong You ²
Beijing Friendship Hospital, Experimental And Translational Research Center, Beijing-China ¹ Beijing Friendship Hospital, Liver Research Center, Beijing-China ²

Background / Hypothesis:

Activation of hepatic stellate cells (HSCs) is a central event in liver fibrosis and is accompanied by a marked loss of intracellular lipid droplets. Our previous work showed that deletion of lysyl oxidase-like 1 (LOXL1) in HSCs attenuates stellate cell activation; however, the underlying mechanism remains unclear. Given our observation that LOXL1 deficiency leads to abnormal lipid metabolism in HSCs, we aimed to investigate a novel metabolic mechanism by which LOXL1 regulates HSC activation during liver fibrosis.

Materials and Methods:

LratCreLoxl1^{fl/fl} mice were subjected to CCl₄-induced liver fibrosis. Primary HSCs were isolated for RNA sequencing to delineate metabolic pathway alterations associated with LOXL1 deficiency, and quantitative PCR was performed to analyze lipid metabolism-related gene expression. In vitro, primary HSCs were treated with β -aminopropionitrile (BAPN) to examine intracellular lipid droplet accumulation together with total cholesterol (TC) and triglyceride (TG) levels. Immunoprecipitation followed by mass spectrometry

ORAL ABSTRACTS

(IP-MS) was used to identify LOXL1-interacting proteins. LOXL1 was overexpressed in LX-2 cells to evaluate its effect on fatty acid synthase (FASN) expression. MG132 and cycloheximide (CHX) treatments were applied to assess FASN protein stability, and FASN ubiquitination was analyzed by co-immunoprecipitation.

Results:

In CCl₄-induced fibrotic mice, primary HSCs from LratCreLoxl1^{fl/fl} mice showed significantly reduced expression of fibrogenic genes. RNA-seq identified lipid metabolism as a prominently enriched pathway. Expression of Ppara, Acc, Scd1, and Scd2 increased by 56%, 106%, 134%, and 112%, respectively, with a concomitant increase in intracellular TG levels. In vitro, inhibition of HSC activation was associated with increased lipid droplet accumulation, as shown by BODIPY staining, along with elevated TC and TG contents (89% and 66% increases, respectively). IP-MS identified FASN as the most abundant lipid-related protein interacting with LOXL1. LOXL1 overexpression did not alter FASN mRNA levels but reduced FASN protein abundance by approximately 2-fold. MG132 treatment restored FASN protein levels, while CHX chase assays demonstrated time-dependent accumulation of LOXL1-associated FASN protein. Co-immunoprecipitation confirmed enhanced ubiquitination of FASN in LOXL1-overexpressing LX-2 cells.

Conclusions:

Hepatic stellate cell-derived LOXL1 suppresses stellate cell activation by preserving intracellular lipid metabolic homeostasis. Mechanistically, LOXL1 directly interacts with FASN and promotes its ubiquitin-mediated proteasomal degradation, thereby linking lipid metabolic regulation to HSC activation during liver fibrosis.

Keyword(s) : Liver fibrosis; Hepatic stellate cell; LOXL1; Lipid metabolism;FASN

2314 - Gilbert syndrome increases the risk of gallstone disease a cross sectional study based on health examination data from 338 372 adults

Meihan Li ¹, Haitian Yu ¹, Kaige Sun ², Puhong Zhang ², Sujun Zheng ¹

Beijing Youan Hospital, Capital Medical University, Beijing, China, Department Of Hepatology, Beijing-China ¹ Beijing Physical Examination Center, Department Of Research And Education, Beijing-China ²

Background / Hypothesis:Gilbert syndrome (GS) is characterized by mild unconjugated hyperbilirubinemia and may be associated with an increased prevalence of gallstone disease. This study aimed to investigate the relationship between bilirubin levels and gallstone risk.

Materials and Methods:This retrospective study collected data from 338,372 adults at the Beijing Physical Examination Center between 2015 and 2024. Participants were categorized based on GS diagnostic criteria (at least two examinations over 6-month intervals meeting: $1 \times \text{ULN} < \text{total bilirubin [TB]} < 102.6 \mu\text{mol/L}$, direct bilirubin [DB]/TB < 0.5 , without elevated alanine aminotransferase [ALT] or aspartate aminotransferase [AST], and excluding organic hepatobiliary diseases and hemolysis). The relationships between GS status, TB quartiles, and gallstone prevalence at the last examination were analyzed using multivariable logistic regression. Restricted cubic splines were applied to explore the dose-response relationship between TB levels and gallstones.

Results:The prevalence of gallstones was significantly higher in the GS group than in the non-GS group (8.44% vs. 5.66%, $P < 0.001$). After adjusting for age, sex, and body mass index (BMI), both GS status and the highest TB quartile (Q4) were independent risk factors for gallstones (GS: adjusted odds ratio [OR]=1.20, 95% confidence interval [CI]: 1.11–1.30; TB Q4: adjusted OR=1.16, 95% CI: 1.10–1.23). Sex-stratified analysis using restricted cubic splines revealed a linear dose-response relationship in males (Q4 vs. Q1 OR=1.26, P for trend < 0.001 , P for nonlinear=0.187), while a nonlinear association was observed in females (P for nonlinear < 0.001 , P for trend=0.063), with gallstone risk primarily driven by age and BMI.

Conclusions:Gilbert syndrome and elevated TB levels are associated with gallstone disease. The association between bilirubin and gallstones exhibits significant sexual dimorphism: linear and incremental in males, but nonlinear and largely explained by age and BMI in females.

Keyword(s) : Gilbert syndrome, bilirubin, gallstone disease, cross-sectional study

ORAL ABSTRACTS

2318 - Gut Microbiota Transfer and Integrated Omics Identify Streptococcal Collagen Like (Scl1) Protein as a key fibrogenic driver in Alcohol associated liver disease.

Background / Hypothesis: Alcohol modulated gut microbiota (AGMs) contributes to liver injury. we aimed to investigate how AGMs alters hepatic kinome signaling and mediate inflammation, fibrosis in alcohol-associated liver disease (ALD).

Materials and Methods: Liver kinome and metaproteome changes were studied in rats (n=6/group) colonized with stool of severe alcohol-related hepatitis patients (SAH→healthy-rats) or healthy human-donors (HD→ALD-rats). AGM-associated liver kinome changes were cross-correlated with bacterial genera. A bacterial protein; Streptococcal collagen-like protein 1 (Scl1) was identified with affinity for TGFβR1. Streptococcus pneumonia and pyogenes were screened in stool of SAH patients (n=10). Scl1 was screened in patient stool (n=24) and liver tissue (n=19) samples. Scl1 and streptococcus levels were checked pre and post FMT

Results: Stool metaproteomics showed significant increase in 10 bacterial genera (Streptococcus, Staphylococcus, and Clostridium) in SAH→Healthy-rats, mirroring changes seen in ALD-rats (FC>1.5, p<0.05). Liver kinome profiling showed 85 upregulated kinases in SAH→Healthy-rats, with 34 overlapping with ALD-rats, associated with inflammation (Mapk14, Map3k10 and others), fibrosis (Tgfb1, Igf1r, and others), lipid metabolism (Cdk14, Cdk18) and regeneration (Met, Bmpr1a and others). FMT from healthy human-donors to ALD-rats reversed the expression of Streptococcus (10-fold), Staphylococcus (3-fold), and Clostridium (5-fold), along with 18 kinases associated with inflammation (Btk, Camk4, Nuak1) and fibrosis (Tgfb1, Col4a1, Fgfr2 and others). Strong association ($r^2>0.9$, p<0.05) was seen between Streptococcus abundance

and fibrosis. Level of Scl1 was significantly high in SAH and ALD-rat stool and liver samples (FC>2, p<0.05). It showed strong affinity for TGFβR1, as validated by molecular docking (>86% confidence) and immunoprecipitation assays (>100FC, p<0.05), indicating it as a potential ligand for TGFβR1. Concordantly, expression of Scl1 was highest amongst all the known ligands for TGFβR1 (p<0.05) suggesting Scl1 is a major contributor for TGFβR1 activation and its downstream signalling in these patients. Following fecal microbiota transplantation, expression of Scl1 in plasma and Streptococcus levels in stool were significantly reduced by 2.1-folds and 1.9 folds respectively in SAH patients. Further, Scl1 levels SAH plasma is capable of predicting poor therapeutic response and 30-day mortality with high accuracy (AUC=0.92, cutoff >70 normalized abundance).

Conclusion: Alcohol induced gut dysbiosis alters the liver kinome, promoting fibrosis. Streptococcal Scl1 is identified as a bacterial protein mimicking human collagen and capable of activating fibrotic signalling pathway through TGFβR1 in liver and is capable of predicting poor response in SAH. FMT from healthy donor restores microbial balance and mitigates harmful host-microbe interactions.

2320 - Liver meta proteome and kinome reveal Pseudomonas aeruginosa –pPKCη axis as a driver of steroid resistance in severe alcohol related hepatitis

Manisha Yadav¹, Sanju Yadav¹, Vipul Sharma¹, Yash Magar¹, Deepanshu Deepanshu², Neha Sharma¹, Vasundhra Bindal¹, Babu Mathew¹, Sushmita Pandey¹, Gaurav Tripathi¹, Nupur Sharma¹, Anupama Kumari¹, Shvetank Sharma¹, Shiv Sarin³, Jaswinder Maras¹
Institute Of Liver And Biliary Sciences, Molecular And Cellular Medicine, New Delhi-India¹ National Institute Of Immunology, National Institute Of Immunology, New Delhi-India² Institute Of Liver And Biliary Sciences, Department Of Hepatology, New Delhi-India³

Background / Hypothesis: Severe alcohol-related hepatitis (SAH) is a critical condition where corticosteroids remain the primary therapy, but with limited efficacy (~40%) in many patients. The molecular mechanisms underlying steroid non-response are not fully elucidated. This study investigated these mechanisms using global phosphoproteomics and metaproteomic profiling of liver biopsies, focusing on microbial modulation of glucocorticoid signalling.

ORAL ABSTRACTS

Materials and Methods: Liver biopsies from 19 SAH patients (10-responders, 9-non-responders) on prednisolone therapy (cohort-1) were analyzed via phosphoproteomics and metaproteomics. Findings were validated in 20 patients (cohort-2) via IHC and in 32 patients (cohort-3) using RNA-seq. Pathway and kinase enrichment analyses were conducted to identify molecular drivers of steroid resistance. A key glucocorticoid-modulating kinase was functionally validated in vitro and in vivo.

Results: Metaproteomic analysis identified 9,080 bacterial peptides from 257 species. Non-responders had significantly reduced alpha diversity (Shannon index, $p < 0.01$) and enrichment of *Streptococcus pneumoniae*, *Staphylococcus aureus*, *Mycoplasma pneumoniae*, and *Pseudomonas aeruginosa* ($p < 0.05$). Phosphoproteomics revealed 11,172 phosphoproteins and 372 kinases ($p < 0.05$). Non-responders exhibited significant up-regulation of TH17 signalling, metabolic stress, CREB phosphorylation, JAK-STAT signalling, and glucocorticoid receptor (GR) inhibitors ($p < 0.05$), with down-regulation of HSP90 activity, DUSP3, ERK inhibition, and ECM maintenance ($p < 0.05$). Kinome profiling showed increased activity of CDK7, PRKCH, PRKAA1, and MINK1. PRKCH was the most differentially activated kinase ($p < 0.001$), correlating with *P. aeruginosa* abundance ($r^2 > 0.7, p < 0.01$) already known to induce PRKCH. Plasma pyocyanin levels ($r^2 > 0.7, p < 0.01$) were elevated in non-responders and enzymes involved in pyocyanin production such as PhZS were significantly increased in non-responder's liver. PRKCH inhibition significantly restored prednisolone sensitivity in vitro ($p < 0.01$). In the NIAAA binge model, staurosporine plus prednisolone reduced inflammatory and metabolic pathways more significantly than prednisolone alone documenting benefit of combination therapy ($p < 0.01$).

Conclusions: Bacterial dysbiosis and PRKCH-driven kinase signalling mediate steroid resistance in SAH. Targeting PRKCH restores steroid sensitivity and enhances anti-inflammatory activity this offers a new therapeutic strategy for steroid resistance.

Background/Hypothesis

Hepatocellular carcinoma (HCC) presents a critical global health challenge, with the Asia-Pacific region accounting approximately 72% of the disease burden. Current surveillance standards, primarily ultrasound (US) with or without alpha-fetoprotein (AFP), are limited by suboptimal sensitivity especially for early-stage disease and operator dependence with ultrasound. The biomarker-based GAAD algorithm—incorporating Gender, Age, AFP, and PIVKA-II—has emerged as a standardized surveillance option. This expert consensus aimed to synthesize evidence regarding the diagnostic performance and cost-effectiveness of GAAD to provide

ORAL ABSTRACTS

expert recommendations tailored for clinical practice in the region.

Materials & Methods
A panel of 15 liver cancer experts conducted a literature review focusing on the clinical and economic utility of GAAD. Twelve preliminary statements were drafted and subsequently refined through two consensus meetings held in Beijing and virtually. The panel evaluated statements using a modified Delphi approach with a five-point Likert scale. Consensus was defined as $\geq 75\%$ of respondents selecting "accept completely" or "accept with minor reservations," and evidence was graded according to the 2011 Oxford Centre for Evidence-Based Medicine Levels of Evidence.

Results

The expert panel achieved 100% consensus on 11 final statements, endorsing GAAD as a validated tool for HCC surveillance.

Diagnostic Accuracy: In validation cohorts, GAAD demonstrated high diagnostic accuracy for differentiating early-stage HCC from benign chronic liver disease, achieving a sensitivity of up to 72%, specificity of approximately 90%, and an area under the curve (AUC) of up to 90.7%. Its performance was consistent across diverse regions and viral etiologies, comparable to the more complex GALAD score (AUC 79–86%) without requiring AFP-L3.

Combination Strategy: Combining GAAD with US significantly enhanced surveillance sensitivity. In comparative studies, GAAD plus US increased early-stage detection rates to 69.7%, compared to 57.6% for GAAD alone and significantly outperforming US alone or US plus AFP.

Economic Utility: Health economic modeling identified GAAD as economically advantageous due to its simpler biomarker composition. In high-risk populations, GAAD plus US is a cost-effective strategy, whereas GAAD alone serves as a dominant, cost-efficient strategy in resource-limited settings where US expertise is scarce.

Clinical Application: While GAAD offers a scalable solution for resource-limited settings, the panel noted that results must be interpreted alongside clinical context, specifically screening for confounders such as warfarin use or vitamin K deficiency which affect PIVKA-II levels.

Conclusions

The Asia-Pacific consensus endorses GAAD as a validated, cost-efficient surveillance tool that addresses current diagnostic gaps. Particularly effective for high-risk populations when combined with US and serves as

a viable standalone option in HCC early detection.

2328 - Fatty Liver as a Key Risk Modifier for Adenoma Detection in FIT Positive Young Adults A Systematic Review of the Available Evidence

Desiree Jane Lacuin¹
Makati Medical Center, Section Of Gastroenterology, Makati-Philippines¹

Background / Hypothesis:
Early-onset colorectal neoplasia is increasing, and risk stratification in younger adults (<50 years) remains poorly defined. Fatty liver disease—now highly prevalent in younger populations—has emerged as a potential synergistic risk factor for colorectal adenomas, particularly among individuals with positive fecal immunochemical test (FIT) results.

Materials and Methods:
A systematic search identified studies evaluating the association between FIT status, fatty liver, and adenoma detection in adults younger than 50. Only one eligible study was found and included for narrative synthesis.

Results:

In a retrospective cohort of 3,307 adults aged 30–49 years who underwent FIT and colonoscopy, individuals with both fatty liver and a positive FIT result demonstrated significantly higher adenoma and advanced adenoma detection rates compared with those without fatty liver. Fatty liver conferred an adjusted odds ratio of ~2.69 for adenoma detection, independent of metabolic syndrome and other covariates. FIT-positive individuals with fatty liver represented the highest-risk subgroup for clinically significant neoplasia.

Conclusions:

Evidence—though limited to a single study—suggests that fatty liver substantially amplifies the neoplastic yield of colonoscopy among FIT-positive young adults. Fatty liver may serve as an important triage factor for early colonoscopic evaluation in younger populations.

2329 - Multi omics analyses identify a novel hepatocellular carcinoma subtype with better response to immune checkpoint inhibitor therapies

Junjie Xu¹, Yunkun Lu¹, Xueyi Teng², Shi Jiang³, Xiang Huang¹, Qianqian Wang¹, Zhonglong Wang², Yeling

ORAL ABSTRACTS

Ruan ¹, Kainan Lin ¹, Yangtao Xue ¹, Yiheng Tang ², Xiaomin Chen ², Runsheng Chen ², Shunmin He ², Xiujun Cai ¹

Sir Run-run Shaw Hospita, Zhejiang University School Of Medicine, Department Of General Surgery, Hangzhou-China ¹ Institute Of Biophysics, Chinese Academy Of Sciences, State Key Laboratory Of Epigenetic Regulation And Intervention, Beijing-China ² The First Affiliated Hospital Of Ningbo University, Department Of General Surgery, Ningbo-China ³

Background / Hypothesis: Hepatocellular carcinoma (HCC) present persistent therapeutic challenges due to molecular heterogeneity and unpredictable immune checkpoint inhibitor (ICI) responses.

Materials and Methods: In this study, whole transcriptome sequencing was performed on tumor and adjacent non-tumor tissues across 242 patients with HCC and 51 patients with intrahepatic cholangiocarcinoma (ICC). Whole exome sequencing was performed in selected samples of each cancer subtype. Single-cell RNA sequencing was performed on fresh primary tumor samples from 15 HCC patients and 8 ICC patients. Whole genome sequencing was performed on tumor and adjacent non-tumor tissues across 90 HCC patients.

Results: Through integrative multi-omics analyses, we identified a novel ICI-sensitive HCC subtype (IS-HCC) characterized by a pre-dysfunctional microenvironment and distinct genomic drivers (TP53, CBX3, FBN2, etc.), exhibiting aggressive baseline features but achieved favorable response to ICI therapies. While bulk transcriptomic profiles revealed partial similarity with intrahepatic cholangiocarcinoma (ICC), single-cell RNA sequencing and spatial proteomic resolutions uncovered unique immune dynamics in IS-HCC, marked by enriched transitional CD8⁺ T cells co-expressing exhaustion (PD1, TIM-3) and activation (GZMB, IFNG) markers. By validation in a prospective ICI-treated HCC cohort (n=90), this pre-dysfunctional T cell state, rather than tumor mutational burden, predicted superior ICI response (OR=4.595, 95%CI: 1.725 to 12.022), challenging neoantigen-centric paradigms. Furthermore, whole-genome data suggested that somatic mutations may influence intratumoral metabolic reprogramming in IS-HCC, particularly in pathways related to glycometabolism and hypoxia, potentially driving the formation of a functionally pre-dysfunctional immune microenvironment through tumor-associated macrophage induction, suggesting metabolic-immune crosstalk via glycometabolism and

hypoxia pathways might be actionable targets. Furthermore, we developed and validated a 29-gene signature across major global HCC cohorts that stratified IS-HCC patients. Clinically, this biomarker-driven framework transcends current selection paradigms and addresses a critical unmet need by enabling precise ICI deployment selection.

Conclusions: Our findings bridge molecular discovery to clinical translation, with potential to double ICI efficacy in stratified populations and spare non-responders from futile therapies, advancing precision immuno-oncology in liver cancer.

2336 - Lean MAFLD in Chronic Hepatitis B Clinical Characteristics Fibrosis Risk and antiviral response in a Pakistani Cohort
Farhana Kayani ¹, Jalal Khan ²
Bmch, Gastroenterology, Quetta-Pakistan ¹ Bmch, Medicine, Quetta-Montenegro ²

Background / Hypothesis: The coexistence of metabolic dysfunction-associated fatty liver disease (MAFLD) in chronic hepatitis B (CHB) is increasingly recognized and both are highly prevalent in Pakistan. However, the burden and clinical impact of lean MAFLD in CHB patients remain poorly defined, particularly in Pakistan, where metabolic risk factors are prevalent despite normal body mass index (BMI). Aim of this study is To determine the prevalence, clinical characteristics, fibrosis risk associated with lean MAFLD in patients with chronic hepatitis B.
Materials and Methods: This observational study included adult patients with CHB presenting to a tertiary-care hepatology center in Pakistan between 2014 and 2024. MAFLD was diagnosed based on imaging evidence of hepatic steatosis with metabolic risk factors. Lean MAFLD was defined as BMI <25 kg/m². Liver fibrosis was assessed using transient elastography and the FIB-4 score. Statistical analysis was performed using SPSS version 26. Logistic regression was used to identify predictors of significant fibrosis (≥F2).
Results:

A total of 1080 patients with CHB were included;454 (42.1%) had coexisting MAFLD. Among MAFLD patients, 175 (38.6%) met criteria for lean MAFLD. Lean MAFLD patients had higher rates of insulin resistance (HOMA-IR ≥2.5: 61.8% vs 34.2%, p<0.01) and dyslipidemia

ORAL ABSTRACTS

compared with non-MAFLD patients. Median liver stiffness was significantly higher in lean MAFLD patients (8.2 vs 6.1 kPa, $p=0.003$). Complete virological response at 12 months was lower in lean MAFLD patients (74.6%) compared with non MAFLD patients (86.9%, $p=0.01$). ALT normalization was also less frequent (62.3% vs 81.4%, $p<0.01$). On multivariable logistic regression analysis, lean MAFLD independently predicted significant fibrosis (adjusted OR 2.04, 95% CI 1.21–3.46; $p=0.007$) after adjustment for age, sex, ALT, and HBV DNA levels and incomplete virological response (adjusted OR 1.89, 95% CI 1.03–3.45; $p=0.04$).

Conclusions:

Lean MAFLD is a common and clinically important phenotype among patients with chronic hepatitis B in Pakistan and is independently associated with increased fibrosis risk and suboptimal antiviral response. Normal BMI does not exclude metabolic liver disease in CHB. Routine metabolic screening should be incorporated into hepatitis B management strategies.

2340 - Metabolic Fatty Liver Masks Hepatitis B Activity Implications for ALT Based Treatment Decisions a study from PAKISTAN

Jalal Khan¹, Farhana Kayani²
Bmch, Medicine, Quetta-Pakistan¹ Bmch,
Gastroenterology, Quetta-Pakistan²

Background & Aim: Metabolic dysfunction-associated fatty liver disease (MAFLD) is increasingly recognized in patients with chronic hepatitis B (CHB). Elevated alanine aminotransferase (ALT) is a key marker for initiating antiviral therapy in CHB. However, the presence of MAFLD may independently elevate ALT, potentially masking underlying HBV activity and complicating treatment decisions. This study aimed to evaluate the impact of MAFLD on ALT interpretation and antiviral treatment eligibility in CHB patients.

Methods:

We conducted a cross-sectional analysis of 500 CHB patients. Clinical, biochemical, and imaging data were collected. MAFLD was defined based on the presence of hepatic steatosis plus metabolic risk factors. Patients were categorized by ALT levels and HBV DNA activity. Multivariable logistic regression was used to assess the

independent association of MAFLD with ALT elevation, adjusting for HBV viral load and other confounders.

Results:

Among 500 CHB patients, 200 (40%) had coexisting MAFLD. Patients with MAFLD had significantly higher ALT levels compared to those without MAFLD (median ALT: 48 vs. 32 U/L, $p<0.001$), independent of HBV DNA levels. Notably, 35% of patients with MAFLD and low HBV replication had ALT above the conventional treatment threshold, potentially leading to unnecessary antiviral therapy. In multivariable analysis, MAFLD independently predicted ALT elevation (OR 2.1, 95% CI 1.4–3.2, $p<0.001$).

Conclusion:

MAFLD can independently elevate ALT in CHB patients, masking the true viral activity and potentially leading to misclassification for antiviral treatment. Clinicians should consider metabolic fatty liver when interpreting ALT and assessing treatment eligibility, highlighting the need for HBV DNA-guided treatment strategies rather than ALT-based decisions alone.

ORAL ABSTRACTS

Medical And Science, Søborg-Denmark⁹ Stravitz-sanyal Institute For Liver Disease And Metabolic Health, Virginia Commonwealth University, Vcu School Of Medicine, Richmond, Va-United States¹⁰

Background / Hypothesis: Part 1 of the ESSENCE trial in participants with metabolic dysfunction-associated steatohepatitis (MASH) and stage 2/3 fibrosis (F2/F3) showed positive effects of once-weekly subcutaneous semaglutide 2.4 mg on liver histology and non-invasive tests (NITs). This post hoc analysis evaluated cardiometabolic and liver-related semaglutide treatment effects across Asian and non-Asian participants.

Materials and Methods: In part 1, the first 800 randomized ESSENCE (NCT04822181) participants were stratified by diabetes status, fibrosis stage and Asian/non-Asian race. Endpoints included change from baseline to week 72 in body weight, waist circumference (WC), waist-to-height ratio (WtHR), HbA1c, high-sensitivity C-reactive protein (hsCRP), low-density lipoprotein (LDL), high-density lipoprotein (HDL), and N-terminal propeptide of type III collagen (ProC3); and proportions of participants with NIT responses (VCTE-LSM $\geq 30\%$ and $\geq 25\%$; ELF score ≥ 0.5). Subgroups statistical analysis used the same approach as the main trial. No formal between-race comparisons were performed.

Results: At baseline, in Asian versus non-Asian participants, respectively, median (interquartile range) body mass index (BMI) was 29.7 (25.9–33.4) versus 35.1 (31.4–39.7) kg/m², WC was 101.5 (92.0–109.0) versus 115.0 (105.5–125.0) cm, mean WtHR was 0.63 versus 0.69, and mean (SD) hsCRP was 3.1 (4.7) versus 6.3 (6.2) mg/L. Baseline mean LDL, HDL and HbA1c were similar in both groups. At week 72, semaglutide improved outcomes versus placebo in both groups. WC reduction with semaglutide was lower in Asian versus non-Asian participants (estimated treatment difference [ETD] versus placebo [95% CI]: -3.7 [-6.7; -0.6] vs -6.8 [-8.3; -5.2] cm). ETDs versus placebo (95% CI) in WtHR were -0.022 (-0.041; 0.003) and -0.041 (-0.050; -0.032) in Asian and non-Asian participants, respectively. For body weight, HbA1c, hsCRP, LDL, HDL and ProC3, semaglutide treatment benefits versus placebo were comparable between groups. For Asian versus non-Asian participants, VCTE-LSM responder proportions with semaglutide were similar ($\geq 30\%$: 53.7% and 51.5%; $\geq 25\%$: 58.5% and 59.9%, respectively). For VCTE-LSM $\geq 30\%$, the estimated difference in responder proportions (EDP) versus placebo (95% CI) in Asian and

non-Asian participants were 23.1 (8.1;38.1) and 21.2 (11.3;31.1), respectively. A similar proportion of Asian versus non-Asian participants receiving semaglutide had ELF score reduction ≥ 0.5 (58.2% and 55.0%). The EDP versus placebo (95% CI) was 35.1 (22.3;48.0) and 28.4 (20.0;36.8), in Asian and non-Asian participants, respectively.

Conclusions: Despite differences in baseline characteristics, including BMI, semaglutide demonstrated consistent efficacy across Asian and non-Asian participants in several cardiometabolic and non-invasive liver-related outcomes, reinforcing its utility in people with MASH with F2/F3.

2349 - Study on the Anti Liver Cirrhosis of Luteolin Targeting the PPAR α Axis to Regulate Macrophage Fatty Acid Metabolic Reprogramming
Xuemei Wang¹, Feilin Ge², Xiaoli Ma³, Zujiang Yu⁴, Xiaohe Xiao⁵, Zhigang Ren⁶, Hongxia Liang⁶
The First Affiliated Hospital Of Zhengzhou University, Department Of Infectious Diseases, state Key Laboratory Of Antiviral Drugs, Zhengzhou-China¹ The First Affiliated Hospital Of Zhengzhou University, Department Of Liver Disease, State Key Laboratory Of Antiviral Drugs, Zhengzhou-China² The First Affiliated Hospital Of Zhengzhou University, State Key Laboratory Of Antiviral Drugs, Zhengzhou-China³ The First Affiliated Hospital Of Zhengzhou University, Department Of Infectious Diseases, Zhengzhou-China⁴ Fifth Medical Center Of Chinese PLA General Hospital, Department Of Liver Disease, Beijing-China⁵ The First Affiliated Hospital Of Zhengzhou University, Department Of Infectious Diseases, State Key Laboratory Of Antiviral Drugs, Pingyuan Laboratory, Zhengzhou-China⁶

Background / Hypothesis: At present, there are no first-line small molecule drugs for anti-liver cirrhosis. The development of potentially effective small molecule drugs is extremely urgent. Some studies have reported that the luteolin has anti-fibrotic and anti-inflammatory effects. However, whether it has anti-liver cirrhosis effects and its mechanism remain unclear. This study will evaluate the efficacy of luteolin against liver cirrhosis and explore its mechanism.

Materials and Methods: The pharmacological effects were validated using both in vivo and in vitro models of liver fibrosis. Mechanistic

ORAL ABSTRACTS

exploration was conducted by integrating single cell transcriptomics, metabolomics, 16S rRNA microbial profiling, liquid-phase chip and experimental verification. Furthermore, the potential targets of Luteolin were investigated through molecular docking, molecular dynamics simulation, surface plasmon resonance, small molecule-protein pull down, and small molecule-protein truncation experiments. Finally, mechanistic validation was performed in macrophage-depletion models, PPAR α inhibitor models, and PPAR α knockout cell models.

Results:

Both in vivo and in vitro, Luteolin alleviated liver fibrosis. It was found to modulate the PPAR α pathway, fatty acid oxidation (FAO), and macrophage polarization. Moreover, the interaction target of Luteolin was identified as PPAR α , with its ligand-binding domain (LBD) serving as the binding site. The mechanisms were further corroborated by target- and target-cell-knockout experiments.

Conclusions:

Luteolin has an anti-liver cirrhosis effect. The mechanism may be that it binds to the LBD domain of PPAR α to regulate the PPAR α /PGC-1 α /CPT1A axis and mitochondrial homeostasis, which promotes the FAO to induce M2 polarization in macrophages. Luteolin is a newly discovered PPAR α agonist, which is expected to provide a reference for the development of potential small molecule drugs against liver cirrhosis.

Keyword(s) :

2350 - Generation of Macro Scale Engineered Biliary Trees with P gp Efflux Function and Enhanced Injury Resistance

Shiwen Ma¹, Jiaxian Chen¹, Meiqian Hu¹, Jiaojiao Xin¹, Jing Jiang¹, Dongyan Shi¹, Jun Li¹
The First Affiliated Hospital, Zhejiang University School Of Medicine, State Key Laboratory For Diagnosis And Treatment Of Infectious Diseases, Hangzhou-China¹

Background / Hypothesis:

The reconstruction of functional biliary trees (FBT) is crucial in the development of bioengineered liver. Decellularized liver scaffolds (DLS), a common platform for FBT, suffer from mechanical instability, resulting in luminal collapse and consequent hypoxic stress that severely impairs FBT function. Additionally, current engineered biliary constructs lack the necessary injury resistance to endure the pathological microenvironment associated with end-stage liver disease.

Materials and Methods:

This work aimed to construct macro-scale FBT with enhanced injury resistance using rat DLS optimized by genipin and mouse primary cholangiocytes. The newly developed FBTs were systematically evaluated through functional assays, transcriptomic analysis, and hepatotoxic drug-induced injury testing to validate their structural stability and injury resistance.

Results:

The FBT exhibited an optimized microenvironment with enhanced structural stability and fluid mechanical properties, which facilitated cholangiocyte adhesion and alleviated hypoxic stress, as evidenced by downregulation of the HIF pathway. Morphological characterization showed that the FBT recapitulated key features of native biliary networks as early as day 7, including multi-level branch architecture, proper apical-basal polarity as well as various mature metabolic and transport functions. Scanning electron microscopy identified the elongated primary cilia orienting toward the bile duct lumen. Functionally, the FBT exhibited enhanced bile acid transport, marked by the upregulation of Slc51a/Slc51b (encoding OST- α /OST- β) and Abcc3 (encoding MRP3), along with enhanced retinoic acid synthesis capacity. Compared to 2D monolayers, the FBT exhibited a superior polarity barrier and enhanced efflux capacity for toxic substances, supported by the upregulation of Abcb1a, which encodes the key efflux transporter P-glycoprotein (P-gp). Notably, such FBT maintained homeostasis and exhibited unique resistance to hepatotoxic injury. This toxic resistance was linked to P-gp-mediated efflux function in FBT, as demonstrated by the impairment of this protection following verapamil-mediated activity inhibition of P-gp.

Conclusions:

The efflux transporter P-gp plays a critical role in the injury resistance of FBT. Our macro-scale FBT, with enhanced toxic efflux function and injury resistance, provides a promising strategy for bioengineered liver construction and clinical translation.

Background / **Hypothesis:**
In Mongolia, liver cancer is a major health issue and has a high prevalence due HBV, HCV and alcohol abuse. This study analyzed the age distribution, tumor status, cirrhosis status, treatment modalities, surveillance outcomes, and causes of death among patients under surveillance for liver cancer.

Materials and **Methods:**
The study was conducted retrospectively. A total of 1,108 cases were selected and analyzed from the registries of liver cancer patients at Happy Veritas Hospital, the Mongolian National University of Medical Sciences, NCC, Second General Hospital. Patients were classified by age group, tumor type (primary/recurrent), cirrhosis status, treatment modality, and surveillance outcome (alive, deceased, lost to follow-up), and actual counts and percentages were calculated. Graphs were generated from the actual data for comparison.

Results:

The data of a total of 1,108 patients included in the study were analyzed. The results are presented categorized according to the graphs. The age distribution of patients under surveillance is shown in actual numbers. The majority of patients fall into the 60–85 age group. The presence or absence of liver cirrhosis was compared in actual numbers and percentages. 59.3% of patients with cancer have liver cirrhosis. Tumor types were classified as primary or recurrent.

Conclusion: The majority (61.7%) of patients under surveillance have recurrent cancer. Patients who received treatment and those who did not were compared. The vast majority (97.5%) of patients have received some form of treatment. Patients who survived, died, or were lost to follow-up during the surveillance period are shown in actual numbers and percentages. 83.4% of patients under surveillance are alive. The main cause of death is liver cancer (85.5%). Various treatment modalities were compared in actual numbers and percentages.

Conclusion

From the study of citizens under surveillance for liver cancer in Mongolia, it is evident that the majority of patients belong to older age groups and recurrent cancer cases are numerous. Treatment outcomes are

good (97.5% received treatment), but the primary cause of death remains the cancer itself. Since the risk is high in patients with cirrhosis, there is a need to improve early detection

Sivas Numune Hospital, Gastroenterology, Sivas-Türkiye¹ Sivas Cumhuriyet University Faculty Of Medicine, Gastroenterology, Sivas-Türkiye² Sivas Cumhuriyet University, Faculty Of Economics And Administrative Sciences, Department Of Management Information Systems, Management Information Systems, Sivas-Türkiye³

Background

Hepatocellular carcinoma (HCC) is a biologically heterogeneous malignancy with high mortality largely driven by intrahepatic spread and portal vein invasion. Clinically, solitary tumors, multifocal disease, and HCC with portal vein tumor thrombosis (PVTT) represent distinct yet progressive phenotypes associated with aggressive tumor behavior and poor prognosis. Accurate molecular stratification of these phenotypes is essential for risk assessment and biomarker-driven clinical decision support. However, identifying stable and biologically meaningful gene signatures from high-dimensional transcriptomic data remains challenging. In this study, we applied machine learning and ensemble-based approaches to classify invasive and metastasis-prone HCC phenotypes using a previously established transcriptomic dataset.

Methods

Analyses were conducted on a publicly available gene expression dataset comprising solitary HCC, multifocal intrahepatic HCC, and HCC with portal vein tumor thrombosis. Six machine learning classifiers representing linear, tree-based, and kernel-based approaches, along with two ensemble learning strategies, were systematically evaluated using 10-fold stratified cross-validation. To enhance robustness and biological interpretability, a consensus-driven feature selection strategy was applied based on feature importance scores derived from the three top-performing models. Two reduced gene sets were generated: an intersection set containing genes consistently selected across models and a union set including genes identified as important by at least one

ORAL ABSTRACTS

model. Both sets were independently re-evaluated.
Results

XGBoost (AUC = 0.927) and Random Forest (AUC = 0.919) demonstrated the highest classification performance. Reanalysis using reduced feature sets further improved predictive accuracy, with the Random Forest model trained on the intersection set achieving an AUC of 0.94 and the XGBoost model trained on the union set achieving an AUC of 0.95. Across cross-validation folds, averaged feature importance scores consistently highlighted major histocompatibility complex class I (MHC-I) genes as the most discriminative features among top-performing models.

Conclusion

Our findings demonstrate that ensemble learning combined with consensus-based gene selection enables accurate and biologically interpretable classification of invasive and metastasis-prone HCC phenotypes. This reproducible and extensible framework provides a robust foundation for molecular risk stratification and biomarker-driven modeling in aggressive HCC and has potential applicability in translational hepatology research

hepatocellular carcinoma (HCC) vary substantially across the Asia-Pacific region. These differences may reflect heterogeneity in underlying etiologies and healthcare systems, as well as variation in stage-specific survival. To clarify regional diversity in HCC prognosis, we evaluated Barcelona Clinic Liver Cancer (BCLC) stage-specific overall survival (OS) using data from the Asia-Pacific Association for the Study of the Liver (APASL) Hepatology/Oncology Consortium (A-HOC) registry. Methods: This retrospective study used the A-HOC database, which includes newly diagnosed HCC cases from 25 institutions across seven Asian countries. Among 6,580 patients diagnosed between 2013 and 2024, 5,756 patients with available BCLC stage and follow-up data were analyzed. Baseline characteristics, including age, sex, etiology, Child-Pugh, tumor burden, AFP levels, and BCLC stage, were compared among Japan, Taiwan, Turkey, and China. To adjust for interregional differences in background characteristics, inverse probability weighting (IPW) was applied, and BCLC stage-specific OS was compared across regions. Results: Patients in Japan were older at diagnosis (median 73 vs. 61 years), had a slightly lower proportion of males (73.0% vs. 76.8%), and showed a distinct etiologic profile, with higher hepatitis C virus prevalence (37.3% vs. 16.4%) and lower hepatitis B virus prevalence (11.3% vs. 60.6%) than non-Japanese cohorts. The distribution of BCLC stages 0/A, B, and C was 57.5%, 19.4%, and 19.8% in Japan; 46.7%, 27.6%, and 24.1% in Taiwan; 36.7%, 28.3%, and 25.6% in Turkey; and 28.8%, 23.7%, and 46.1% in China, respectively. In the overall cohort, median OS was 10.1 years for stage 0, 7.6 years for stage A, 3.3 years for stage B, 1.3 years for stage C, and 3.3 months for stage D (log-rank $p < 0.01$). Before adjustment, median OS differed among countries (Japan 5.1 years, Taiwan 6.3 years, Turkey 2.1 years, and China 4.3 years). After IPW adjustment for baseline characteristics, no significant differences in OS were observed among Japan, Taiwan, and Turkey for BCLC stages 0/A, B, or C. In contrast, stage-specific differences were observed between Japan and China, with better survival in Japan than in China for BCLC stage 0/A, and better survival in China than in Japan for BCLC stage B and stage C. Conclusions: Although substantial regional variation in HCC prognosis exists across the Asia-Pacific region, much of this variation can be explained by differences in diagnostic stage and patient characteristics. Standardizing surveillance practices and promoting earlier detection may help reduce interregional disparities in HCC outcomes.

2360 - Amlodipine activates an adaptive endoplasmic reticulum stress response in Huh 7 hepatocellular carcinoma cells

Neslihan Başgöz Karagüç¹, Ahmet Ozan Kaleci², Sebahattin Karabulut³, Hilmi Ataseven⁴
Erciyes University, Department Of Medical Genetics, Sivas-Türkiye¹ Cumhuriyet University, Department Of Medical Pharmacology, Sivas-Türkiye² Cumhuriyet University, Department Of Medical Services And Techniques, Sivas-Türkiye³ Cumhuriyet University, Department Of Gastroenterology, Sivas-Türkiye⁴

Background / Hypothesis: Amlodipine is a widely used calcium channel blocker. Although generally considered safe, rare cases of amlodipine-associated liver injury have been reported, and the underlying mechanisms remain unclear. Endoplasmic reticulum (ER) stress in hepatocytes is characterized by activation of the unfolded protein response, including upregulation of glucose-regulated protein 78 (GRP78) and, under severe conditions, induction of the pro-apoptotic marker C/EBP homologous protein (CHOP). This study aimed to investigate whether amlodipine induces ER stress in Huh-7 hepatocellular carcinoma cells.

Materials and Methods: Huh-7 hepatocellular carcinoma cells were treated with increasing concentrations of amlodipine or control for 24 hours. Cell viability was measured by the CCK-8 assay, and IC₅₀ values were subsequently determined. Protein expression levels of GRP78 and CHOP were evaluated by Western blot analysis, with GAPDH used as a housekeeping protein for normalization.

Results: Amlodipine treatment caused a dose-dependent reduction in cell viability in Huh-7 cells, with an IC₅₀ value of 63.34 µM. Western blot analysis demonstrated a noticeable increase in CHOP protein expression in amlodipine-treated cells compared to control cells. In contrast, GRP78 protein levels showed no significant change following amlodipine exposure. GAPDH-normalized band intensities suggest that amlodipine exposure is associated with activation of CHOP-related pro-apoptotic ER stress-associated signaling rather than an adaptive GRP78-mediated unfolded protein response.

Conclusions: These findings suggest that amlodipine induces endoplasmic reticulum stress in Huh-7 hepatocellular carcinoma cells, characterized by upregulation of the pro-apoptotic ER stress marker

CHOP without a concomitant increase in the adaptive chaperone protein GRP78. This pattern indicates a predominance of maladaptive ER stress and apoptotic signaling rather than a protective unfolded protein response. Such activation of CHOP-dependent pathways may contribute to amlodipine-induced cytotoxicity in hepatocellular carcinoma cells. Further studies are required to elucidate the upstream ER stress pathways involved and to clarify the role of CHOP-mediated apoptosis in amlodipine-associated hepatocellular injury.

2361 - L canavanine selectively inhibits hepatocellular carcinoma cell proliferation and induces apoptosis in vitro

Ahmet Ozan Kaleci¹, Neslihan Başgöz Karagüç², Burcu Şahinbaş¹, Sebahattin Karabulut³, Hilmi Ataseven⁴
Sivas Cumhuriyet University Faculty Of Medicine, Department Of Medical, Merkez-Türkiye¹ Erciyes University Faculty Of Medicine, Department Of Medical Genetics, Kayseri-Türkiye² Sivas Cumhuriyet University Vocational School Of Health Services, Department Of Medical Services And Techniques, Sivas-Türkiye³ Sivas Cumhuriyet University Faculty Of Medicine, Department Of Gastroenterology, Sivas-Türkiye⁴

Background / Hypothesis: Hepatocellular carcinoma is associated with high mortality and limited therapeutic options, highlighting the need for novel antiproliferative agents. L-canavanine, a structural analogue of arginine, has been suggested to interfere with protein synthesis and to preferentially induce cell death in malignant cells. We hypothesised that L-canavanine would decrease cell viability and promote apoptosis in hepatocellular carcinoma cells.

Materials and Methods: Human Huh7 hepatocellular carcinoma cells and murine L929 fibroblast cells were cultured under standard conditions. After 24 hours of attachment, cells were exposed to L-canavanine (12.5–800 µM) for 48 and 72 hours (vehicle control). Cell viability was assessed by XTT assay and expressed as a percentage of control. In Huh7 cells, apoptosis was evaluated by a flow cytometric Annexin V binding assay; the proportion of Annexin V positive cells was taken as a marker of apoptotic cell death. Data were analysed using one-way analysis of variance followed by appropriate post hoc tests; p<0.05 was considered statistically significant.

Results: L-canavanine produced a marked, dose-

ORAL ABSTRACTS

dependent reduction in Huh7 cell viability at both 48 and 72 hours. Concentrations from 25 to 800 μM significantly decreased viability compared with control ($p < 0.05$), with higher doses lowering viability to approximately 20–40% of control, whereas 12.5 μM partially preserved viability. In L929 cells, XTT revealed only modest but statistically significant decreases in viability at the higher concentrations ($p < 0.05$), and overall survival remained substantially higher than in Huh7 cells at equivalent doses. In Huh7 cells, Annexin V flow cytometry showed a clear, dose-dependent increase in Annexin V positive cells, indicating prominent induction of apoptosis; Annexin V positivity was significantly elevated in L-canavanine treated groups compared with control ($p < 0.05$).

Conclusions: L-canavanine exerts pronounced cytotoxic and pro-apoptotic effects in Huh7 hepatocellular carcinoma cells, while causing comparatively limited loss of viability in L929 fibroblast cells. The combination of reduced viability and increased Annexin V positivity supports apoptosis-driven cell death and suggests that L-canavanine may represent a promising candidate for further preclinical evaluation as a selective antitumour agent in hepatocellular carcinoma.

2364 - Hepatic Involvement and Drug Induced Liver Injury in Brucellosis

Meltem Tügdür Ceylan ¹, Oğuzhan Acet ¹, Ahmet Türk ², Esra Erdem Kivrak ³, Melike Yaşar Duman ⁴, Meltem Taşbakan ¹

Ege University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, İzmir-Türkiye ¹ Ege University Faculty Of Medicine, Internal Medicine, İzmir-Türkiye ² Celal Bayar University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Muğla-Türkiye ³ Ege University Faculty Of Medicine, Medical Microbiology, İzmir-Türkiye ⁴

Background / Hypothesis: Brucellosis is a systemic zoonosis with frequent reticuloendothelial involvement. While liver involvement can range from mild transaminase elevation to granulomatous hepatitis, data on the incidence of drug-induced liver injury (DILI) during prolonged antibiotic therapy remains scarce. This study aims to evaluate the incidence of baseline hepatitis and the development of DILI in patients diagnosed with brucellosis during follow up.

Materials and Methods: This retrospective study included patients diagnosed with brucellosis at Ege University and Manisa Celal Bayar University between 2017 and 2025. Diagnosis was confirmed by compatible clinical findings combined with positive serology (Rose Bengal, Wright agglutination test $\geq 1/160$) or blood culture isolation. Baseline hepatic involvement was defined as the elevation of aminotransferases (AST or ALT) above the upper limit of normal, accompanied by clinical findings such as hepatomegaly or splenomegaly, consistent with the literature on brucellar hepatitis. DILI was defined according to international consensus criteria during the follow-up. Normality of distribution was assessed using the Shapiro-Wilk test. Continuous variables were expressed as median (minimum-maximum) for non-normally distributed data and compared using the Mann-Whitney U test. Statistical analysis was performed using the Chi-square test and Fisher's exact test to compare clinical features between groups. A p-value of < 0.05 was considered statistically significant.

Results: A total of 122 patients were included in the study. The median age of the patients was 48 (18-82) years, and 76 (62.3%) were male. Demographic characteristics and baseline clinical findings are presented in Table 1. Based on the strict definition, 25 (20.5%) of the cohort presented with hepatitis. Patients with clinical hepatitis exhibited a higher rate of bacteremia compared to those without clinical hepatitis (Blood culture positivity: 10/17, 58.8% vs. 16/44, 36.4%), although this difference did not reach statistical significance ($p = 0.15$). The detailed comparison of clinical characteristics between groups is presented in Table 2. During the treatment course, 13 (10.7%) of patients developed DILI (Table 3). The incidence of DILI was numerically higher in the clinical hepatitis group compared to the non-hepatitis group (4/25, 16.0% vs. 9/97, 9.3%, $p = 0.46$). No significant association was found between pre-existing liver disease and DILI development (2/15, 13.3% vs. 11/107, 10.3%, $p = 1.00$).

Conclusions: Clinical hepatitis represents a distinct phenotype in brucellosis associated with significant thrombocytopenia and cholestasis. Furthermore, the potential for treatment-related hepatotoxicity underscores the critical necessity for strict and regular liver function monitoring throughout the prolonged antibiotic course, regardless of the patient's baseline hepatic status.

2368 - Dynamic Metabolic Reprogramming Drives Adipose Fibrosis in a High Fat Diet-Induced Obesity in Mice Model

Abhishak Gupta¹, Sunita Giri², Neha Sharma², Jaswinder Maras², Gaurav Tripathy²
Artemis Hospitals, Education And Research, Gurugram-India¹ Ilbs, Molecular And Cellular Medicine, New Delhi-India²

Background / Hypothesis: Adipose tissue undergoes significant metabolic and structural change during high-fat diet (HFD)-induced obesity in mice, resulting in increased fat mass, adipocyte hypertrophy, inflammation, oxidative stress, and metabolic dysfunction. Extracellular matrix (ECM) deposition, inflammation, and eventually fibrosis are the results of this progressive change. Finding the metabolic milestones that propel fibrotic remodeling requires an understanding of the successive metabolomic changes that occur during this transition. The objective is to delineate stage-specific metabolic signatures associated with adipose dysfunction and fibrotic progression. **Materials and Methods:** C57BL/6J mice (6–8 weeks old) were fed a standard chow and a high-fat diet consisting of 10% and 50–60% kcal from fat, respectively, till 24 weeks. We performed a comprehensive time-resolved untargeted metabolomics analysis of visceral adipose tissues of control and HFD mice at weeks 8 and 24, coupled with histology, and fibrotic markers. Metabolites from tissue were extracted and analysed using by ultra-performance liquid chromatography-high resolution mass spectrometry (UPLC-HRMS) and metabolite module specific to pathway analysis correlation. **Results:**

We developed and characterized a model of obese fibrosis mice brought on by a high-fat diet. In both comparison groups, high fat feeding led to a substantial increase in body weight and liver weight as well as other biochemical markers such liver enzymes (serum ALT, AST) and lipid profiles (TC, TG, LDL-C, and HDL) ($p > 0.05$). Steatosis and fibrosis are measured by histology and Sirius Red at a later stage (24 weeks). Sequential integration analysis revealed three primary metabolic nodes that contribute to fibrosis: (1) mitochondrial TCA dysregulation/inadequate β -oxidation; (2) glycolysis; and (3) bile acid dysregulation. Early-stage (8 weeks) metabolomics showed a distinct shift toward mitochondrial stress and decreased β -oxidation, as seen by a lower TCA cycle. Significantly lower levels of

tricarboxylic acid (TCA) cycle intermediates (citrate, α -ketoglutarate, and malate) further suggested early-stage oxidative metabolism suppression. Adipose tissue showed a chronic dysfunction pattern with substantial oxidative stress, ECM stabilization, and decreased metabolic flexibility following 24 weeks of HFD. The levels of DCA, TDCA, and 12 α -hydroxylated BAs (such as taurocholic acid) showed significant changes at 24 ($p > 0.05$). We found significant changes in the TCA cycle, β -oxidation, and mitochondrial stress during the transition period of 8 to 24 weeks, but not in glycolysis. **Conclusions:**

Our results provide a thorough metabolomic study linking obesity and adipose fibrosis. Potential metabolic indicators and therapeutic targets for early intervention of adipose tissue fibrotic remodeling in metabolic disease.

2369 - AGIUS Score Predicts Re bleeding Risk after Endoscopic Variceal Ligation in Cirrhotic Patients Introduction

Fei Wang¹, Zhen Tian¹, Tian-yan Chen²
The First Affiliated Hospital Of Xi'an Jiaotong University, Department Of Ultrasound Medicine, Xi'an City-China¹
The First Affiliated Hospital Of Xi'an Jiaotong University, Department Of Infectious Diseases, Xi'an City-China²

Background / Hypothesis:

Re-bleeding remains a major challenge after endoscopic variceal ligation (EVL) in cirrhotic patients. This study aimed to investigate the predictive value of the Acute Gastrointestinal Injury Ultrasonography (AGIUS) score for both one-year re-bleeding and treatment-resistant re-bleeding (TR-rebleeding, defined as ≥ 3 episodes per year) post-EVL.

Materials and Methods: In this single-center retrospective cohort study, 120 cirrhotic patients who underwent EVL were included. Patients were stratified based on re-bleeding events within one year. Baseline characteristics, AGIUS scores, endoscopic findings, and hemodynamic parameters were analyzed. Multivariate logistic regression was used to identify independent predictors. The predictive performance was evaluated using receiver operating characteristic (ROC) curve analysis.

Results:

Among the 120 patients, 44 (36.7%) experienced re-

ORAL ABSTRACTS

bleeding, with 29 (24.1%) meeting the criteria for TR-rebleeding. Multivariate analysis identified the AGIUS score (adjusted odds ratio [aOR] = 1.558, 95% CI: 1.217–1.996, $p < 0.001$) and high-grade esophagogastric varices (aOR = 13.763, 95% CI: 4.308–43.971, $p < 0.001$) as independent predictors for any re-bleeding. For TR-rebleeding, the AGIUS score (aOR = 1.403, 95% CI: 1.113–1.767, $p = 0.004$) and high-grade varices (aOR = 6.602, 95% CI: 2.391–18.228, $p < 0.001$) remained independent predictors. The combined model (AGIUS score + variceal grading) demonstrated excellent predictive power for any re-bleeding (AUC = 0.853) and for TR-rebleeding (AUC = 0.836).

Conclusions:

The AGIUS score, particularly when combined with endoscopic variceal grading, is a robust and non-invasive predictor for re-bleeding and treatment-resistant re-bleeding within one year after EVL. This novel tool holds significant promise for improving risk stratification and guiding personalized management in cirrhotic patients.

2374 - Non Invasive Assessment of Steatosis and Stiffness in MASLD Links to Body Composition and Dyslipidemia in High Risk Metabolic Groups
Abdulvahap Hohluoğlu¹, Furkan Kirsoy¹, Onur Solmaz², Sedat Çiçek¹, Faruk Kiliç³, Hakan Artaş⁴, Mehmet Yalniz¹, Ibrahim Halil Bahçecioğlu¹
Firat University Faculty Of Medicine, Gastroenterology, Elazığ-Türkiye¹ Batman Training And Research Hospital, Radiology, Batman-Türkiye² Firat University Faculty Of Medicine, Endocrinology, Elazığ-Türkiye³ Firat University Faculty Of Medicine, Radiology, Elazığ-Türkiye⁴

Background

Obesity, prediabetes, and type 2 diabetes are rising globally, with metabolic dysfunction-associated steatotic liver disease (MASLD) as the most prevalent liver disorder. This study investigates the grade of liver steatosis and stiffness in patients with MASLD across these conditions and their associations with metabolic parameters and body composition via bioelectrical impedance analysis (BIA).

Materials

and

Methods:

This prospective cross-sectional study included 40 obese, 40 prediabetic, 40 type 2 diabetic patients with MASLD (diagnosed by ultrasonography and/or shear wave elastography within the past six months), and 40 healthy controls. Body measurements, blood

parameters, elastography, and Tanita BIA assessments were recorded. Statistical analyses used ANOVA with post-hoc tests; $p < 0.05$ was significant

Results:

Body mass index (BMI), fat percentage, fat mass, and visceral fat ratio were significantly lower in non-steatotic individuals compared to grade 1 and 2 steatosis ($p < 0.001$). Liver elastography (kPa), liver size (mm), and pancreatic steatosis grade increased with steatosis severity ($p < 0.001$; Table 1). LDL-cholesterol, triglycerides, and total cholesterol were elevated in steatotic groups versus controls ($p < 0.001$), but not between grades. Diabetes group showed highest elastography values (7.6 ± 2.6 kPa) versus others ($p < 0.001$), with larger liver sizes and higher pancreatic steatosis in all patient groups versus controls ($p < 0.001$).

Conclusions:

Increasing liver steatosis correlates with higher BMI, adiposity, and visceral fat, alongside stiffness suggesting fibrotic progression. Pancreatic steatosis underscores metabolic syndrome's multi-organ impact. Comprehensive metabolic evaluation is crucial for MASLD management.

Keyword(s) : MASLD, obesity, prediabetes, type 2 diabetes, elastography, bioelectrical impedance

2375 - Achieving Recompensation with Low dose Diuretics in HBV related Cirrhosis An Expanded Baveno VII Strategy Yields Similar Long Term Prognosis in A Multicenter Cohort Study
Zhiying He¹, Jimmy Che-to Lai², Bingqiong Wang¹, You Deng¹, Junlong Dai², Xiaoning Wu¹, Shuai Xia³, Wen Xie³, Terry Cheuk-fung Yip², Jidong Jia¹, Hong You¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹ The Chinese University Of Hong Kong, Hong Kong, Li Ka Shing Institute Of Health Sciences, Department Of Medicine And Therapeutics, Hongkong-Hong Kong SAR, China² Beijing Ditan Hospital, Capital Medical University, Center Of Liver Diseases, Beijing-China³

Background

/

Hypothesis:

Baveno VII consensus proposed the definition of recompensation with resolution of decompensation events and discontinuation of respective treatments (except non-selective beta-blockers) for 12 months. However, the impact and necessity of discontinuation of minimal decompensation treatment in the definition of recompensation was unknown.

ORAL ABSTRACTS

Materials and Methods: Patients with hepatitis B virus (HBV)-related decompensated cirrhosis were enrolled at the time of first decompensation from three multicentre cohorts. Recompensation was defined according to Baveno VII criteria. An expanded recompensation criteria were evaluated for patients on low-dose diuretics (anti-aldosteronic drugs ≤ 200 mg/day and/or furosemide ≤ 25 mg/day) and/or lactulose/rifaximin with resolution of decompensated events for 12 months. Propensity score-matching (PSM) was performed in 1:1 or 2:1 matched for sex, age, platelet, albumin and total bilirubin at the time of achieving recompensation between patients meeting Baveno VII criteria or those meeting expanded recompensation criteria. Re-decompensation was defined as the recurrence of ascites, variceal bleeding, hepatic encephalopathy, spontaneous bacterial peritonitis or hepatorenal syndrome after recompensation. The cumulative incidence of re-decompensation, liver-related death/liver transplantation (LT) and hepatocellular carcinoma (HCC) was estimated using Kaplan-Meier curves, with subgroup comparisons performed by the log-rank test.

Results:

A total of 1,008 patients were enrolled for analysis, with a median follow-up of 44.8 (IQR: 21.3-64.2) months. Among them, 368 (36.5%) patients achieved recompensation of Baveno VII criteria, and 100 (9.9%) patients met the expanded recompensation criteria. During follow-up, the 5-year cumulative incidence of re-decompensation was comparable between recompensated patients meeting Baveno VII criteria and expanded criteria (22.8% vs. 26.4%, $P = 0.305$), using the time of achieving recompensation as time zero. Moreover, the 5-year cumulative incidence of liver-related death/ liver transplantation was also similar between patients meeting Baveno VII criteria and expanded criteria (5.4% and 11.1%, $P = 0.111$), respectively. However, the 5-year cumulative incidence of hepatocellular carcinoma (HCC) was higher in patients meeting Baveno VII criteria compared with those achieving expanded recompensation criteria (18.8% vs. 18.0%, $P = 0.021$). After performing propensity score-matching, no significant difference was observed in the cumulative incidence of re-decompensation and liver-related death/ liver transplantation, as well as the occurrence of HCC after recompensation ($P > 0.05$).

Conclusions: The continued use of minimal decompensation treatment in expanded

recompensation criteria identifies recompensated patients with similar prognosis, comparable to those meeting the recompensation criteria proposed in the Baveno VII consensus.

Keyword(s) : Recompensation; Re-decompensation; Anti-HBV therapy; Low-dose Diuretics

2377 - Efficacy Differences of Interferon Combined with Nucleos(t)ide Analogs in Treating HBeAg Positive Chronic Hepatitis B Stratified by Baseline Liver Fibrosis Indicators

Yaqin Zhang¹, Shiyu Wang¹, Ziyu Zhang¹, Yao Xie¹, Minghui Li¹
Beijing Ditan Hospital, Capital Medical University, Department Of Hepatology Division 2, Beijing-China¹

Background / Hypothesis:

The impact of baseline liver fibrosis degree on the efficacy of pegylated interferon (Peg-IFN) combined with nucleos(t)ide analogs (NAs) in treating HBeAg-positive chronic hepatitis B (CHB) has not been fully elucidated. This study aims to evaluate the efficacy differences of this combination regimen in patients with varying degrees of baseline liver fibrosis based on a retrospective clinical cohort.

Materials and Methods:

A total of 172 HBeAg-positive CHB patients treated with Peg-IFN combined with NAs were included in this study. Patients were divided into three groups based on baseline non-invasive fibrosis indicators (APRI and FIB-4): Group 1 (no significant fibrosis, $n=75$), Group 2 (significant fibrosis, $n=70$), and Group 3 (early cirrhosis, $n=27$). The primary endpoint was the HBeAg clearance rate at 24 months of treatment, while secondary endpoints included HBsAg clearance rate, virological response (HBV DNA < 20 IU/mL), and liver fibrosis outcomes.

Results:

After 24 months of treatment, there were no significant differences among the three groups in terms of HBsAg clearance rate and undetectable HBV DNA rate. However, significant differences were observed in HBeAg clearance: the cumulative HBeAg clearance rates for Group 1, Group 2, and Group 3 were 16.00%, 30.00%, and 40.74%, respectively, with Group 3 showing a significantly higher clearance rate compared to Group 1 and Group 2 (Log-rank $P = 0.027$). Multivariate analysis revealed that after adjusting for other variables, the odds ratio for achieving HBeAg clearance in Group 3 (early cirrhosis) was 5.234 times that of Group 1 (95% CI: 1.452-18.871, $P = 0.011$), indicating that baseline liver

ORAL ABSTRACTS

fibrosis degree is an independent predictor of HBeAg clearance.

Conclusions:In HBeAg-positive chronic hepatitis B patients, the degree of baseline liver fibrosis is an important factor influencing the efficacy of Peg-IFN combined with NAs treatment. Compared to patients without significant fibrosis, those with significant fibrosis or early cirrhosis at baseline achieved higher HBeAg clearance rates, suggesting that this combination therapy may provide greater clinical benefits for patients with more advanced fibrosis.

2378 - Metabolic Dysfunction–Associated Liver Disease and Lung Injury A Decade of Progress Toward Mechanistic Integration and Translational Insight

Tong Chen¹, Shaodong Li¹, Junzhe Jiao², Ruijuan Yan², Qian Guan², Rui Zhao¹, Zhanjie Chang², Jingtao Li², Haibo Zhang³

Shaanxi University Of Chinese Medicine, School Of Traditional Chinese Medicine, Xianyang-China¹ Shaanxi University Of Chinese Medicine, Affiliated Hospital Of Shaanxi University Of Chinese Medicine, Xianyang-China² Shaanxi University Of Chinese Medicine, School Of Basic Medical Sciences, Xianyang-China³

Background / Hypothesis:Metabolic dysfunction-associated fatty liver disease (MAFLD) and its progressive form, metabolic dysfunction-associated steatohepatitis (MASH), are increasingly recognized as conditions with prominent systemic immunometabolic features rather than liver-confined disorders. Accumulating evidence suggests that the lung may represent a vulnerable extrahepatic target organ in MAFLD/MASH, with diverse pulmonary abnormalities reported. Here, we propose a conceptual framework in which disease-specific mechanisms—chronic metabolic inflammation, liver-derived mediators, and inter-organ crosstalk—contribute to heightened pulmonary vulnerability, with potential implications for risk stratification and therapy. **Materials and Methods:**We performed a comprehensive narrative, non-systematic review of clinical, epidemiological, and experimental studies retrieved from PubMed and Web of Science between 2010 and 2025. The review focused on the clinical spectrum of pulmonary involvement in MAFLD/MASH, evidence for dose–response and potential causal relationships, key pathophysiological mechanisms (immunometabolic dysregulation, hepatic extracellular vesicles, and the gut–liver–lung axis), and emerging translational

approaches.

Results:MAFLD/MASH is associated with a broad range of pulmonary manifestations, including pulmonary vascular complications (hepatopulmonary syndrome and portopulmonary hypertension), impaired lung function, increased susceptibility to acute lung injury and acute respiratory distress syndrome, and interstitial lung disease or pulmonary fibrosis. These associations persist after adjustment for major shared risk factors and demonstrate dose–response relationships with MAFLD/MASH severity. Emerging Mendelian randomization analyses suggest potential causal links between hepatic metabolic dysfunction and adverse lung outcomes. Three interconnected mechanisms are proposed to contribute to pulmonary vulnerability: neutrophil extracellular trap–mediated amplification of lung injury, hepatic extracellular vesicles as mediators of liver–lung communication, and the gut–liver–lung axis as a chronic immunometabolic modifier. Advances in multi-omics profiling, integrated disease models, and composite biomarkers facilitate refined mechanistic investigation and risk stratification. **Conclusions:**MAFLD/MASH may be conceptualized as a state of heightened pulmonary vulnerability mediated by systemic immunometabolic dysregulation and inter-organ crosstalk. Standardized assessment of MAFLD/MASH severity, particularly fibrosis stage, combined with mechanism-informed biomarkers may improve pulmonary risk stratification. Translational strategies targeting shared metabolic, immunomodulatory, and antifibrotic pathways hold promise for integrated management of liver and lung outcomes in this growing patient population.

2385 - HECTD3 Mediates PRDX4 Stabilization via K63 Linked Ubiquitination to Ameliorate Hepatic Steatosis Inflammation and Fibrosis in MASH

Rui Jin¹, Qianwen Zhao¹, Jie Li¹
Nanjing Drum Tower Hospital, Department Of Infectious Diseases, Nan Jing-China¹

Background / Hypothesis:Metabolic dysfunction-associated steatohepatitis (MASH) poses a significant global public health challenge, involving complex pathogenesis related to metabolic syndrome and systemic inflammation. HECTD3, an E3 ubiquitin ligase, is known to regulate

ORAL ABSTRACTS

various inflammatory and fibrotic signaling pathways. However, its role in MASH progression remains unclear. This study aims to investigate the function of HECTD3 in MASH and its underlying molecular mechanisms.

Materials and Methods: Hepatocellular HECTD3 were over-expressed in mice via the AAV8 system, and male C57BL/6J mice (six weeks old) were fed either a Choline-deficient, L-amino acid-defined, high-fat diet (CDAHFD) for 10 weeks, or a high-fat, high-fructose diet (HFHFD) diet for 16 weeks to induce MASH. THLE-2 and AML12 cell lines were used for in vitro studies. Multi-dimensional mass spectrometry combined with co-immunoprecipitation (co-IP) was employed to identify HECTD3-interacting proteins.

Results: HECTD3 protein expression was significantly downregulated in the livers of CDAHFD- or HFHFD-fed mice and in palmitic acid (PA)-stimulated hepatocytes. Compared with controls, hepatocyte-specific overexpression of HECTD3 markedly alleviated MASH progression, including reduced lipid accumulation and significantly attenuated fibrosis. Consistently, HECTD3 overexpression decreased lipid deposition in PA-treated hepatocytes. Co-IP combined with mass spectrometry analysis suggested PRDX4 as a potential binding partner of HECTD3, which was further confirmed by both endogenous and exogenous co-IP assays. Previous studies indicated PRDX4 protects against MAFLD progression; our in vitro data showed that PRDX4 overexpression significantly reduced PA-induced lipid accumulation and inflammation in AML12 cells. Immunofluorescence and western blot analysis revealed that hepatocyte-specific HECTD3 overexpression increased PRDX4 protein levels in the livers of MASH model mice. Consistent with in vivo findings, in vitro experiments further demonstrated elevated PRDX4 protein levels in HECTD3-overexpressing hepatocytes, and cycloheximide (CHX) chase assays indicated that HECTD3 overexpression prolonged the half-life of PRDX4 protein. We further detected that HECTD3 overexpression significantly increased the total ubiquitination level of PRDX4, particularly the level of K63-linked polyubiquitin chains.

Conclusions: HECTD3 interacts with PRDX4 and stabilizes its protein expression by mediating its ubiquitination, specifically via K63-linked polyubiquitination. As a crucial positive regulator of PRDX4, HECTD3 plays a protective role in the development and progression of MASH and may

represent a novel potential therapeutic target for MASH treatment.

2386 - Immunosuppressive Medication Non adherence in Liver Transplantation Adult Recipients in Vietnam

Anh Nguyen Thi Van¹, Ha Nguyen Thu¹, Hao Dao Thi¹,
Huong Nguyen Thi¹, Trang Le Hong¹, Linh Le Cam¹
108 Military Central Hospital, Hepato - Biliary And
Pancreatic Surgery, Ha Noi-Vietnam¹

Background / Hypothesis:Long-term graft survival after liver transplantation depends heavily on strict adherence to immunosuppressive therapy. Non-adherence remains a major cause of graft dysfunction, rejection, and unplanned hospitalization, yet data from Southeast Asia, particularly Vietnam, are limited.

Materials and Methods:A cross-sectional study was conducted among 136 adult liver transplant recipients followed at the Hepato-Biliary and Pancreatic Surgery Department, 108 Military Central Hospital (2017–2025). Adherence was assessed using the validated BAASIS questionnaire. Clinical, demographic, and psychosocial factors were analyzed for associations with non-adherence.

Results:Mean follow-up after transplantation was 25.7±17.4 months; 83% were male and 98.1% received living-donor grafts. The overall non-adherence rate was 14.6%. Significant determinants of poor adherence included transplant indication (p=0.027), lack of encouragement or feedback from healthcare staff during follow-up (p=0.038), and dissatisfaction with immunosuppressant therapy (p<0.001). Patients with acute liver failure demonstrated the highest adherence rates.

Conclusions:Immunosuppressive adherence among liver transplant recipients in Vietnam is relatively high, though gaps remain. Strengthening post-transplant counseling, structured follow-up communication, and patient-centered medication education could further reduce non-adherence. These findings highlight modifiable behavioral and healthcare-system factors

ORAL ABSTRACTS

and support the need for multidisciplinary interventions in low- and middle-income transplant settings.

Keyword(s) : liver transplantation, adherence, immunosuppression, BAASIS, Vietnam

2389 - Towards Individualized Interferon Therapy in Hepatitis B HBsAg Kinetics and Seroclearance upon Baseline HBsAg Levels and Treatment Duration

Qiran Zhang¹, Yiqi Yu¹, Shulan Sui¹, Chao Qiu¹, Feng Sun¹, Wenhong Zhang¹
Huashan Hospital, Fudan University, National Medical Center For Infectious Diseases, Shanghai-China¹

Background / Hypothesis: A standard 48-week course of pegylated interferon (Peg-IFN) is recommended for chronic hepatitis B (CHB). However, in clinical practice, patients with low baseline HBsAg might achieve seroclearance rapidly, while those with high HBsAg may require extended therapy. Real-world evidence to guide individualized IFN treatment duration based on quantitative HBsAg is lacking.

Materials and Methods: This study was a post hoc subgroup analysis of a large retrospective-prospective cohort (Oasis Study). CHB patients receiving Peg-IFN-based therapy were included in this analysis. Patients were stratified by baseline HBsAg: <100, 100-1000, 1000-3000, and ≥ 3000 IU/mL. We analyzed cumulative HBsAg seroclearance rates, kinetics of HBsAg decline, and the association between actual treatment duration (median 48 weeks, range 24-242 weeks) and outcomes across these strata.

Results: A total of 3623 patients were included in this analysis, with median follow-up duration of 3.0 years. A strong inverse relationship was observed between baseline HBsAg level and cumulative seroclearance, with all inter-stratum differences being statistically significant (Table 1).

We presented the dynamic patterns of median HBsAg levels over time. There was a rapid initial drop across all baseline strata. Among patients with baseline HBsAg <100 IU/mL, median levels plummeted to a low plateau by week 24, and in those with higher baseline levels, the decline was more gradual and required a longer time to stabilize, exceeding 72 weeks in patients with baseline HBsAg >3000 IU/mL. For patients who achieved HBsAg loss, the median time of HBsAg loss was 24 weeks in patients with baseline HBsAg <100 IU/mL, 48 weeks in baseline HBsAg between 100-1000 IU/mL, 84 weeks in 1000-3000 IU/mL, and 96 weeks in baseline HBsAg over 3000 IU/mL (Table 1).

We also examined the relationship between IFN

treatment duration and HBsAg loss in patients. When stratified by baseline HBsAg level, patients with HBsAg <3000 IU/mL who received only 24 weeks of IFN had significantly lower cumulative seroclearance rates than those with longer courses, while in patients with baseline HBsAg over 3000 IU/mL, extending IFN therapy beyond 48 weeks associated with improvement in cumulative seroclearance rates (Figure 1).

Conclusions: This study provides a data-driven framework for individualizing IFN therapy. Among patients with low baseline HBsAg, rapid seroclearance suggests even a shortened course may be highly effective. For those with higher levels, extended therapy beyond 48 weeks could be considered to improve outcomes. The identified time-to-clearance benchmarks offer practical guidance for tailoring IFN treatment duration in real-world practice.

Keyword(s) : Chronic hepatitis B, Pegylated interferon, HBsAg seroclearance, Treatment duration, Individualized therapy

2390 - Ultrasonographic evaluation of gallbladder motor function in the diagnosis and prognosis of intrahepatic cholestasis of pregnancy

Zhen Tian¹, Fei Wang¹, Litao Ruan¹
The First Affiliated Hospital Of Xi'an Jiaotong University, Ultrasound Department-hepatobiliary And Gastrointestinal Ultrasound Section, Xi'an-China¹

Background / Hypothesis: Intrahepatic cholestasis of pregnancy (ICP) is characterized by skin pruritus and impaired liver function. Several previous studies have revealed that the fasting and ejection volumes of the gallbladder in cholestasis of pregnancy were greater than in normal pregnancy. The goal of this study was to explore the specific ultrasonic features of the gallbladder and evaluate the diagnostic and prognostic values of ultrasound in ICP.

Materials and Methods: We induced a retrospective cohort of 60 ICP patients from January 2021 to December 2022, and compared their data with those from healthy pregnant women (n=60). Gallbladder volume was evaluated by real-time ultrasound examination after an overnight fast and 30, 60, 120 and 180 min after a liquid test meal of 200 mL, and ejection fraction was calculated. Diagnostic and prognostic values of volume and ejection function of gallbladder were analyzed by receiver operating characteristic (ROC) curve.

ORAL ABSTRACTS

Results:

Pregnant women in the ICP group had significantly higher gallbladder basal volume ($43.49 \pm 1.34 \text{ cm}^3$ vs $26.66 \pm 0.83 \text{ cm}^3$, $p < 0.01$) and higher ejection fraction compared with the healthy pregnant women. Ejection fraction (120 min) $> 54.55\%$ might be used to predict ICP diagnosis, while Gallbladder volume (60 min) $> 12.52 \text{ cm}^3$ might predict ICP severity.

Conclusions:

Our results indicate abnormal volume and ejection function of gallbladder in patients with ICP. Ejection fraction (120 min) can be used to predict ICP diagnosis, and Gallbladder volume (60 min) can be used to assess ICP severity.

Keyword(s) : Intrahepatic cholestasis of pregnancy, Ultrasound, Gallbladder motor function,

2394 - Demystifying primary hepatic Langerhans Cell Histiocytosis (LCH) From pattern recognition to molecular diagnosis

Deepa Janakiraman¹, Nirmala Dheivamani¹, Sindhuja Tharti Audikesavalu¹, Senthil Kumar R¹, Winston Thomas¹

Institute Of Child Health And Hospital For Children, Madras Medical College, Paediatric Gastroenterology, Chennai-India¹

Background / Hypothesis:

Langerhans Cell Histiocytosis (LCH) is a rare clonal proliferative disorder of dendritic cells. Hepatic involvement, although uncommon, represents a severe and prognostically adverse form of the disease in the pediatric age group. Though liver involvement in multi system LCH is reported, Primary hepatic LCH had been hardly reported in literature. Hence this study aimed to analyze the patterns of clinic pathologic and immunophenotypic characteristics in children diagnosed as Langerhan Cell Histiocytosis based on primary hepatic manifestations. To identify diagnostic pitfalls and propose a pattern-based diagnostic algorithm to improve early recognition and management.

Materials and Methods:

Retrospective review of the records of children diagnosed with primary hepatic LCH managed at ICH, Egmore, from January 2023- October 2025. Children developing hepatic LCH after being diagnosed as systemic LCH were excluded. Clinical profiles, biochemical data, imaging findings (USG/MRI),

histopathology (H&E, special stains), immunohistochemistry (CD1a, Langerin, S100), and molecular studies (if available) were analysed.

Results:

We present here seven children diagnosed with primary hepatic LCH. The median age at initial presentation was 20 months (IQR 12-24 months). All cases 100% (n=7) presented initially with short duration fever, cholestatic jaundice, pale stools, abdominal distension, hard hepatomegaly with predominant left-lobe enlargement. GGT (Gamma-glutamyl-transferase) elevation (> 10 times) and serum-alkaline-phosphatase (SAP > 4 times) was seen in all cases (n=7) (sensitivity-100%). MRCP showed Sclerosing cholangitis pattern in one child (n=1). ANA, ASMA was positive in 28.5% (n=2). Bone marrow was normal and Mantoux, CBNAAT was negative in all cases. IHC from liver biopsy was negative for LCH in 6/7 (85.7%) cases. Median period of decompensation was 6 months from initial presentation (IQR 3-10 months). Diagnosis was confirmed by immunohistochemistry of nail-matrix biopsy, skin biopsy and liver explant in the initial 3 cases. Average time from initial presentation to diagnosis was three months, diagnosed only after decompensation. Cases 4-7: Skeletal survey and X-ray-skull were normal. Considering institutional experience where similar presentation of hard hepatomegaly with high SAP, GGT which turned out to be LCH, PET-CT was done to find metabolically active area. Showed multiple metabolically active hypodense hepatic lesions. Last two cases none of the investigations were conclusive, diagnosed with BRAF V600E mutation, and MAP Kinase pathway defects.

Conclusions:

Primary Hepatic LCH does exist in children. Suspect early, do not miss window period for definitive chemotherapy. Since liver biopsy often have poor yield in establishing the diagnosis due to the patchy involvement and later stages at diagnosis, further investigations like PET scan and molecular tests for BRAF V600 mutations would help in arriving at the diagnosis early before other system involvement

Keyword(s) : Primary Hepatic Langerhans Cell Histiocytosis, BRAF V600 mutation, early recognition

2395 - Multicohort fecal metagenomes analysis contributes to non invasive diagnosis for cholangiocarcinoma

Zhigang Ren¹, Benchen Rao¹, Zujiang Yu¹
The First Affiliated Hospital Of Zhengzhou University,

ORAL ABSTRACTS

Department Of Infectious Diseases, Zhengzhou-China ¹

Background / **Hypothesis:** Cholangiocarcinoma (CCA) is a highly lethal malignancy with limited early diagnostic options. While emerging evidence implicates the gut microbiome in CCA tumorigenesis, its potential as a non-invasive diagnostic biomarker remains unexplored. This study aimed to characterize CCA-associated gut microbial alterations and evaluate their diagnostic utility across diverse Chinese populations.

Materials and **Methods:** Metagenomic sequencing was performed on fecal samples collected from 643 individuals across three geographically distinct regions in China (East, Central, and Northwest). We analyzed microbial community composition and functional pathways to identify CCA-specific dysbiosis patterns. Diagnostic models were constructed using both species-level taxonomic markers and functional pathway-based features. Model performance was evaluated in the discovery cohort and validated in two independent cross-regional cohorts. Additionally, we assessed the model's ability to differentiate CCA from hepatocellular carcinoma (HCC) and examined disease specificity using 6,847 samples from 31 published studies spanning 11 disease conditions.

Results: CCA patients exhibited distinct gut microbial dysbiosis characterized by significant enrichment of lipopolysaccharide-producing bacteria (*Klebsiella aerogenes*, *Citrobacter koseri*) and depletion of butyrate-synthesizing organisms (*Faecalibacterium prausnitzii*, *Roseburia intestinalis*). Species-level diagnostic models demonstrated superior discriminatory capacity compared to pathway-based approaches, achieving area under the curve (AUC) values of 98.63% and 99.42% in the East China discovery cohort. Importantly, robust cross-regional validation yielded AUCs of 80.89% in Central China and 80.43% in Northwest China, confirming model generalizability. The model effectively distinguished CCA from HCC (AUC=95.58%), addressing a critical clinical differential diagnosis challenge. Meta-analysis of public datasets revealed moderate disease specificity for the CCA microbiome signature, with performance influenced by biomarker overlap across different pathological conditions.

Conclusions:

This study establishes gut microbiome metagenomic profiling as a promising non-invasive diagnostic tool for cholangiocarcinoma, demonstrating robust performance across geographically diverse populations and effective discrimination from other hepatobiliary malignancies.

Keyword(s) : cholangiocarcinoma, gut microbiome, metagenome, diagnostic model, liver cancer

2398 - Etiology Specific Patterns of Liver Stiffness and Steatosis Assessed by Transient Elastography in a Tertiary Referral Center in Southern Philippines

Mark Siñagan¹, Guinevere Ang¹, Miguelito Lasala¹, Karl Paolo Dillera¹
Southern Philippines Medical Center, Gastroenterology, Davao City-Philippines¹

Background:

Chronic liver disease (CLD) in the Philippines represents a heterogeneous etiologic spectrum shaped by the coexistence of metabolic dysfunction, alcohol use, chronic viral hepatitis, and parasitic infections. In Southern Philippines Medical Center, a tertiary referral center, schistosomal hepatopathy remains a clinically relevant but under-characterized contributor to portal hypertension and advanced fibrosis. Vibration-controlled transient elastography (VCTE) enables non-invasive, simultaneous assessment of hepatic steatosis via the controlled attenuation parameter (CAP) and fibrosis via liver stiffness measurement (LSM). However, comparative real-world data describing etiology-specific CAP–LSM patterns in mixed-disease populations remain limited.

Materials and **Methods:** We conducted a retrospective cross-sectional study of adult patients who underwent clinically indicated VCTE at a tertiary referral hospital in Southern Philippines between May 2023 and November 2025. Demographic variables (age, sex, body mass index) and VCTE-derived parameters (CAP, LSM, steatosis grade, fibrosis stage) were extracted. Liver disease etiologies were categorized as metabolic dysfunction–associated steatotic liver disease (MASLD), viral hepatitis, alcohol-related liver disease, schistosomiasis-related liver disease, or drug-induced liver injury. Non-parametric tests were used to compare CAP and LSM across etiologies. Multivariable logistic regression identified independent predictors of significant steatosis (S2–S3) and advanced fibrosis (F3–F4), while linear regression and cluster analysis explored continuous stiffness

ORAL ABSTRACTS

patterns and phenotypic groupings.

Results:

A total of 482 patients were included. CAP and LSM values differed significantly across etiologies (both $p < 0.001$). MASLD demonstrated the highest steatosis burden, with elevated CAP values and relatively lower median LSM, consistent with early to intermediate fibrotic disease. In contrast, schistosomiasis-related liver disease exhibited a distinctive phenotype characterized by low CAP but markedly elevated LSM, reflecting fibrosis and portal hypertension disproportionate to steatosis. Alcohol-related liver disease showed high and widely variable LSM values, suggesting heterogeneous fibrotic trajectories. On multivariable analysis, significant steatosis was independently associated with BMI, CAP, and MASLD etiology, whereas viral hepatitis and schistosomiasis were inversely associated with steatosis severity. Advanced fibrosis was most strongly predicted by viral hepatitis and schistosomiasis, with age and CAP also contributing, while BMI was not independently associated after etiology adjustment. Cluster analysis revealed clinically interpretable CAP–LSM phenotypes aligning with underlying disease mechanisms.

Conclusions:

VCTE reveals distinct, etiology-specific steatosis and fibrosis patterns in a mixed CLD population from Southern Philippines. Schistosomiasis-related liver disease is characterized by high liver stiffness despite minimal steatosis, underscoring the importance of etiology-aware interpretation of VCTE parameters. These findings support the role of VCTE as a valuable, non-invasive tool for risk stratification and clinical decision-making in regions with diverse and overlapping liver disease etiologies.

Keyword(s) : VCTE; Transient Elastography; CAP; liver stiffness; steatosis; MASLD; viral hepatitis; alcohol-related liver disease; schistosomiasis; Philippines.

2404 - Development and validation of a dynamic nomogram for predicting significant liver injury in chronic hepatitis B patients with indeterminate phase

Chao Jiang¹, Shaoqiu Zhang², Jian Wang², Li Zhu³, Tao Fan⁴, Ye Xiong⁴, Juan Xia², Yuanwang Qiu⁵, Xingxiang Liu⁶, Chuanwu Zhu³, Qun Zhang⁷, Chao Wu¹, Rui Huang¹

Nanjing Drum Tower Hospital Clinical College Of Jiangsu University, Department Of Infectious Diseases, Nanjing-China¹ Nanjing Drum Tower Hospital, Affiliated Hospital Of Medical School, Nanjing University, Department Of Infectious Diseases, Nanjing-China² The

Affiliated Infectious Diseases Hospital Of Soochow University, Department Of Infectious Diseases, Suzhou-China³ Nanjing Drum Tower Hospital Clinical College Of Nanjing University Of Chinese Medicine, Department Of Infectious Diseases, Nanjing-China⁴ The Fifth People's Hospital Of Wuxi, Department Of Infectious Diseases, Wuxi-China⁵ Huai'an No. 4 People's Hospital, Department Of Clinical Laboratory, Huai'an-China⁶ Zhongda Hospital, School Of Medicine, Southeast University, Department Of Infectious Diseases, Nanjing-China⁷

Background

/

Hypothesis:

A large number of patients with chronic hepatitis B (CHB) are classified into the indeterminate phase, yet a substantial proportion may have significant liver injury and require antiviral treatment. However, few practical non-invasive tools are available for accurately identifying the presence of liver injury in this population. Using a multicenter cohort of CHB patients who received liver biopsy, we developed and validated a dynamic nomogram to predict significant liver injury in CHB patients with indeterminate phase.

Materials

and

Methods:

Patients with CHB in the indeterminate phase based on the AASLD 2018 guideline who underwent liver biopsy were retrospectively collected from five hospitals in China and randomly divided into a training cohort ($n=248$) and a validation cohort ($n=123$) with the ratio of 2:1. Significant liver injury was defined as liver inflammation of grade $\geq G2$ and/or liver fibrosis of stage $\geq S2$ according to the Scheuer scoring system. Variables associated with significant liver injury were selected using least absolute shrinkage and selection operator (LASSO) regression, and a dynamic nomogram was developed. The performance of the nomogram was evaluated using area under the receiver operating characteristic (AUC), calibration curves, decision curve analysis (DCA).

Results:

A total of 371 CHB patients were included, with a median age of 41.0 years and 17.8% were HBeAg positive. 70.2% and 69.9% of patients had significant liver injury in the training cohort and validation cohort, respectively. Hepatitis B e antigen (HBeAg), gamma-glutamyl transpeptidase (GGT), prothrombin time (PT), and alkaline phosphatase (ALP) were identified as independent predictors of significant liver injury in the

ORAL ABSTRACTS

training cohort, and a web-based nomogram was constructed accordingly based on these variables. The nomogram demonstrated good discriminatory capacity and calibration, with AUCs of 0.745 (IQR: 0.679-0.811, $P < 0.001$) and 0.728 (IQR: 0.630-0.827, $P < 0.001$) in the training and validation cohort, respectively; both were significantly higher than that of alanine aminotransferase (ALT). Decision curve analysis indicated superior net clinical benefit of the nomogram.

Conclusions:

We proposed a novel non-invasive dynamic nomogram based on routine clinical parameters with good performance in predicting significant liver injury in CHB patients with indeterminate phase. This tool may assist risk stratification and clinical management of CHB patients with indeterminate phase.

Keyword(s) : chronic hepatitis B, indeterminate phase, significant liver injury, predictive model, dynamic nomogram

2406 - Benefit of treatment expansion A Comparative Analysis of EASL 2025 AASLD 2025 and APASL 2026 Clinical Practice Guidelines for Management of Chronic Hepatitis B

Jing Chen ¹, Hong You ², Rakhi Maiwall ³, Dong Ji ⁴, Jidong Jia ², George Lau ⁵

The Chinese University Of Hong Kong, Jc School Of Public Health And Primary Care, Hong Kong-Hong Kong SAR, China ¹ Capital Medical University, Beijing Friendship Hospital, Beijing-China ² Institute Of Liver And Biliary Sciences, Institute Of Liver And Biliary Sciences, New Delhi-India ³ Fifth Medical Center Of Chinese PLA General Hospital, Senior Department Of Hepatology, Beijing-China ⁴ Humanity And Health Medical Group, Humanity And Health Clinical Trial Center, Hong Kong-Hong Kong SAR, China ⁵

Background / **Hypothesis:** Thresholds for initiating antiviral therapy for chronic hepatitis B (CHB) vary substantially across major regional guidelines, resulting in substantial variation in treatment coverage. The APASL 2026 CHB clinical practice guidelines (CPGs) introduce a simplified, more inclusive "treat-all" strategy, yet its population-level impact has not been quantified. This study intended to estimate the eligibility, HCC and mortality outcomes under recently updated CHB CPGs.

Materials and **Methods:** Three guideline-specific treatment algorithms were constructed according to APASL 2026, EASL 2025, and

AASLD 2025 CPGs. A synthetic cohort of 100,000 treatment-naïve adults with CHB was generated using publicly available epidemiological datasets. Treatment eligibility under each guideline was assessed deterministically. A state-transition Markov model projected HCC incidence, liver-related mortality, and direct medical costs from 2025–2050. Transition probabilities were derived from large prospective Asian cohorts and meta-analyses evaluating antiviral effectiveness across fibrosis stages in both treated and untreated populations. Model uncertainty was assessed using probabilistic sensitivity analysis (1,000 iterations).

Results:

Treatment eligibility was highest under APASL (85%, range 77–99.99%), followed by EASL (62%, 59–97.9%) and AASLD (47%, 46–58%). Compared with EASL and AASLD, the APASL "treat-all" approach prevented 5,843 (95% UI: 216–22,660) and 9,534 (373–33,322) additional HCC cases, and 4,875 (151–18,337) and 7,955 (220–26,804) liver-related deaths by 2050, respectively. Long-term healthcare costs were also lower under APASL, saving USD 231 million (95% UI: 2.1–1,740 million) versus EASL and USD 377 million (3.1–2,630 million) versus AASLD over 25 years.

Conclusions:

A treat-all approach markedly expands treatment eligibility and yields significant reductions in HCC and liver-related mortality. These findings support APASL's simplified treatment strategy as a practical and impactful pathway toward HBV elimination.

Keyword(s) : Chronic Hepatitis B; Guidelines; Treat-all; APASL; AASLD; EASL

2410 - Hepatitis B Virus Core Antibody Seroconversion and Risk of Hepatitis B Reactivation after Allogeneic Hematopoietic Stem Cell Transplantation

Ruirui You ¹, Qiran Zhang ¹, Yiqi Yu ¹, Jianming Zheng ¹, Tianling Ding ², Chao Qiu ¹, Wenhong Zhang ¹
Huashan Hospital, Fudan University, Department Of Infectious Diseases, Shanghai-China ¹ Huashan Hospital, Fudan University, Department Of Hematology, Shanghai-China ²

Background: Anti-HBc positivity is a serological marker of previous HBV infection. Patients with positive anti-HBc are at risk of HBV reactivation during immunosuppressive therapy, chemotherapy, or monoclonal antibody therapy. This study aimed to compare the effects of different immune clearance and reconstitution therapies—including allogeneic

ORAL ABSTRACTS

hematopoietic stem cell transplantation (allo-HSCT), autologous hematopoietic stem cell transplantation (auto-HSCT), and anti-CD20 monoclonal antibody therapy (represented by Rituximab, RTX)—on anti-HBc seroconversion and HBV reactivation risk in patients with previous HBV infection, providing evidence for clinical monitoring and management strategies. **Methods:** This was a single-center, retrospective nested case-control study. Patients who received allo-HSCT/auto-HSCT/RTX treatment at Huashan Hospital, Fudan University from 2020 to 2023, with positive anti-HBc and negative HBsAg before treatment, were enrolled. 10 patients who underwent allo-HSCT served as the observation group, and 10 patients each in the auto-HSCT and RTX groups were selected as control groups based on the follow-up time of anti-HBc after transplantation or RTX initiation. Kaplan-Meier curve and Log-rank test were used to compare cumulative anti-HBc seroconversion rates at 24 months post transplantation of RTX initiation between groups. **Results:** Within 24 months, 7 patients in allo-HSCT group achieved anti-HBc seroconversion, with a median seroconversion time of 11 months post-transplantation. Only 1 patient in auto-HSCT group had anti-HBc seroconversion at 18 months, while no patients in RTX group showed seroconversion. There was a significant difference in the cumulative 24-month anti-HBc seroconversion rates among three groups ($P = 0.035$). In allo-HSCT group, 1 patient experienced HBV reactivation after anti-HBc seroconversion: a 41-year-old male did not receive preventive anti-HBV treatment after allo-HSCT. His anti-HBc disappeared at 9 months. HBV DNA load of 2.45×10^2 IU/mL was detected at 12 months. Then he developed positive HBsAg, HBeAg and anti-HBc, with ALT/AST rose to above ULN at 13 months post-transplantation, indicating HBV reactivation. HBV DNA load dropped below the detection limit after 3 months of entecavir treatment. **Conclusions:** This study observed that allo-HSCT significantly promotes anti-HBc seroconversion, which may be related to the clearance of HBV-specific immune memory by immune reconstitution after allo-HSCT. The low anti-HBc seroconversion might be due to the presence of B cells that secrete anti-HBc during the autologous hematopoietic stem cell isolation process. It is recommended that anti-HBc-positive patients receive preventive antiviral therapy after allo-HSCT; close monitoring for HBV reactivation is needed even after anti-HBc seroconversion. For patients who become anti-HBc-negative after allo-HSCT and require subsequent immunosuppressive therapy, a detailed history of pre-transplant anti-HBc positivity should be obtained.

Keyword(s) : Hepatitis B; HBV Reactivation; Anti-HBc; Allogeneic Hematopoietic Stem Cell Transplantation

2418 - AFP trajectories in HCC after ablation treatment a 15 year retrospective study

Maria Fleurdeliz Goco-siatan¹, Stephen Wong¹
University Of Santo Tomas Hospital, Gastroenterology, Manila-Philippines¹

Background / **Hypothesis:**
As a potential curative treatment for HCC, Ablation treatment for HCC as part of the locoregional therapy is becoming more accepted by patients and specialists in various centers and is now being recognized as a potential curative treatment. There is a need to understand whether the prognostic value of AFP applies to patients receiving ablation treatment and its relationship to tumor recurrence and patient's survival.

Materials and **Methods:**
Data of 250 newly diagnosed HCC patients who underwent ablation treatment (RFA/MWA) were analyzed. A total of 717 ablation procedures were included. AFP response were categorized to 4 groups: >20% increase from the baseline with tumor recurrence in imaging, <20% increase with HCC recurrence, >20% with no recurrence in imaging and <20% with no recurrence. The independent risk factors of relapse and mortality were determined by Cox proportional hazard model. The cumulative 1-, 3-, 5-year RFS, OS and RDS rates were computed by Kaplan-Meier method and were compared between groups using the log-rank test. P value <0.05 was considered to be statistically significant. IBM SPSS version 27.0 (SPSS Inc., Chicago, IL, USA) was used to process the data involved.

Results:
AFP elevation $\geq 20\%$ at 3 months post-ablation significantly predicted worse RFS ($p=0.001$) and OS ($p=0.006$) but not RDS ($p=0.288$). Multivariate Cox regression analysis showed that compared to the reference group (i.e., patients with AFP increase <20% and no recurrence), patients with AFP increase $\geq 20\%$ and recurrence had 2.48 times the risk of recurrence (HR=2.477, 95% CI: 1.16-5.28, $p=0.018$) and 2.60 times the risk of death (HR=2.596, 95% CI: 1.14-5.89, $p=0.022$). Patients with AFP increase <20% and recurrence also demonstrated elevated risks with HR=2.866 ($p<0.001$) for recurrence and HR=2.013 ($p=0.004$) for mortality. Kaplan-Meier survival analysis demonstrated

ORAL ABSTRACTS

significantly divergent survival curves between AFP trajectory groups for both RFS and OS (log-rank $p < 0.001$ and $p = 0.004$, respectively). However, AFP trajectories did not significantly predict post-recurrence survival.

Conclusion:

An AFP increase of $\geq 20\%$ at 3 months following ablation is a strong independent predictor of both recurrence and overall mortality in patients with HCC. The lack of association with post-recurrence survival suggests that AFP dynamics primarily reflect initial treatment response. However, AFP trajectories did not significantly predict post-recurrence survival.

Keyword(s) : AFP, post ablation

2422 - Diagnostic Accuracy of Portal System Duplex Sonography Findings Among Filipinos with and Without Liver Cirrhosis; The DupLiCs Study

Yrah Damiene Fernandez¹, Patrick Vera Cruz²
Institute Of Digestive And Liver Diseases, St. Luke's Medical Center, Medicine, Quezon City-Philippines¹ Dr. Hb Calleja Heart And Vascular Institute, St. Luke's Medical Center, Medicine, Quezon City-²

Background / Hypothesis: Portomesenteric duplex ultrasonography (PDUS) provides hemodynamic information not captured by liver elastography. Despite its accessibility and safety, its diagnostic role in cirrhosis remains underexplored in Filipino populations. This study aimed to determine the diagnostic accuracy of PDUS parameters in detecting liver cirrhosis among Filipinos.

Materials and Methods: We conducted an analytical cross-sectional study at a tertiary center in Quezon City. Adult Filipinos with elastography-confirmed cirrhosis were recruited as cases and matched 1:1 with controls without liver injury. All participants underwent standardized PDUS. Diagnostic performance was evaluated through sensitivity, specificity, predictive values, likelihood ratios, and overall accuracy. ROC analysis was used for multivariate models.

Results:

The portal vein congestion index emerged as the

strongest single predictor, demonstrating 82.4% diagnostic accuracy (95% CI: 71.2–93.5) and a significant association with cirrhosis. A multivariate model integrating the portal vein congestion index, hepatic vein damping index, and hepatic artery resistivity index achieved an AUC of 0.858 (95% CI: 0.763–0.952), indicating good discriminatory ability.

Conclusions:

PDUS offers reliable hemodynamic markers for cirrhosis detection. The portal vein congestion index shows the highest diagnostic accuracy, while a composite model of portal, hepatic vein, and arterial parameters provides robust discriminatory performance in Filipinos. PDUS may complement elastography in cirrhosis assessment, especially in resource-limited settings.

Keyword(s) : #PDUS #Liver Cirrhosis

2426 - Association of Immune Nutritional Status with Histological Stage and Mortality in Patients with Metabolic Dysfunction Associated Steatotic Liver Disease A Population Based Cohort Study

Yixuan Zhu¹, Jie Li¹
Nanjing Drum Tower Hospital, Affiliated Hospital Of Medical School, Nanjing University, Infectious Diseases, Nanjing-Germany¹

Background / Hypothesis: Nutritional-metabolic dysregulation and chronic inflammation are central mechanisms in the progression of metabolic dysfunction-associated steatotic liver disease (MASLD). The Prognostic Nutritional Index (PNI) reflects both the nutritional status and immune function. This study aimed to investigate the associations of PNI with histological severity and mortality in patients with MASLD.

Materials and Methods: The cross-sectional cohort included 969 individuals with MASLD who underwent liver biopsy, from 7 medical centers across China from 2004 to 2024. Logistic regression and restricted cubic splines were used to investigate the association between PNI levels and significant steatosis, moderate-to-severe inflammation and advanced fibrosis. The relationship between PNI and all-cause and cardiovascular-related mortality were subsequently assessed by Cox regression analysis in the NHANES III follow-up cohort.

Results: Univariable and multivariable logistic regression analyses showed that higher PNI levels were

ORAL ABSTRACTS

independently associated with the presence of significant steatosis. When analyzed as a continuous variable, PNI exhibited a linear relationship with the risk of developing significant steatosis (P for nonlinear =0.209). In contrast, lower PNI levels were significantly associated with moderate-to-severe inflammation, with risk increasing linearly as PNI decreased (P for nonlinear =0.052). Although lower PNI levels were significantly associated with advanced fibrosis in univariable analyses only, RCS analyses indicated a linear increase in the risk of advanced fibrosis with decreasing PNI levels (P for nonlinear =0.068). In the NHANES III cohort, Lower PNI categories were significantly associated with an increased risk of all-cause mortality among patients with MASLD, particularly in those aged over 45 years, with concomitant diabetes, and with a FIB-4 score ≥ 1.3 . In contrast, higher PNI categories were associated with an increased risk of cardiovascular mortality in obese patients with MASLD.

Conclusions: Higher PNI levels were associated with significant steatosis, whereas lower PNI levels were linked to hepatic inflammation, fibrosis, and poorer clinical outcomes in patients with MASLD.

Keyword(s) : Metabolic Dysfunction-Associated Fatty Liver Disease; Prognostic Nutritional Index; steatosis; inflammation; fibrosis

2427 - Endoscopic Ultrasound-Guided Portosystemic Pressure Gradient Measurement To Determine Candidacy For Simultaneous Liver-Kidney Transplantation Vs Renal Transplant Alone In End Stage Renal Disease Patients With Compensated Advanced Chronic Liver Disease or Cirrhosis

Arka De ¹, Arpit Shastri ¹, Suvradeep Mitra ², Malvika Shastri ², Naveen Bhagat ¹, Nipun Verma ¹, Madhumita Premkumar ¹, Sunil Taneja ¹, Ajay Duseja ¹
Post Graduate Institute Of Medical Education And Research, Hepatology, Chandigarh-India ¹ Post Graduate Institute Of Medical Education And Research, Histopathology, Chandigarh-India ²

Background:

In patients with ESRD and suspected cACLD or cirrhosis, assessment of clinically significant portal hypertension(CSPH) is crucial in guiding clinical decisions regarding transplant. Portosystemic pressure gradient(PPG) assessment makes EUS an effective alternative to TJLB and HVP. Since the proprietary digital manometer is unavailable in India, we describe the technical feasibility, efficacy and safety of EUS-PPG using modified non-proprietary setup (after its ex-vivo validation) in ESRD patients [Figure 1].

Materials and Methods:
Data of patients with ESRD and suspected cACLD(post-dialysis LSM>10 kPa) or cirrhosis who underwent EUS-PPG assessment over 3-years were reviewed. EUS-PPG was performed using a modified setup consisting of 25G EUS-FNA needle, pressure transducer and multiparametric monitor with pressure module [Figure 2]. Primary outcome was technical success (at-least 3 concordant readings of systemic and portal pressures). Secondary outcomes included safety of procedure and correlation of PPG with post-dialysis LSM and histological fibrosis.

Results:

EUS-PPG was performed in 29 ESRD patients[males: 79.3%, age: 31.5 (22-39) years]. The mean post-dialysis LSM was 18.33 (15.5-20.3) kPa. Technical success was 100%. Mean PPG was 4.73 ± 3.9 mm of Hg. Portal hypertension was present in 6 patients with CSPH in 3 patients. On histology F1, F2, F3 and F4 fibrosis was present in 2, 21, 3 and 3 patients, respectively. One patient with CSPH (PPG: 20 mm of Hg) had PSVD. After excluding this patient, PPG showed good correlation with fibrosis stage ($\rho: 0.75$, $p<0.001$)[Figure 3]. Based on histology and PPG, 2 patients were allocated to SLKT and 27 patients for renal-transplant. None of the patients had any procedure-related adverse event.

Conclusions:

EUS-PPG measurement using a non-proprietary setup is technically feasible, safe and offers valuable guidance in deciding between SLKT and kidney-only transplantation.

2432 - Endoscopic Ultrasound Guided Ablative Therapies For Hepatocellular Carcinoma

Arka De ¹, Arpit Shastri ¹, Balaraja S ¹, Harish Bhujade ², Naveen Bhagat ¹, Babulal Meena ¹, Nipun Verma ¹, Madhumita Premkumar ¹, Sunil Taneja ¹, Ajay Duseja ¹
Post Graduate Institute Of Medical Education And Research, Hepatology, Chandigarh-India ¹ Post Graduate Institute Of Medical Education And Research, Radiodiagnosis, Chandigarh-India ²

Background

Hypothesis:

ORAL ABSTRACTS

Endoscopic ultrasound (EUS) has emerged as an important modality in endohepatology, offering high-resolution, real-time imaging with therapeutic capabilities. While percutaneous ablation remains the standard approach for hepatocellular carcinoma (HCC), lesions located in anatomically challenging regions such as the caudate lobe, left lateral segments, or periportal and retroperitoneal lymph nodes may be difficult or unsafe to access. This study aimed to evaluate the feasibility, safety, and efficacy of EUS-guided ablation in patients with hepatocellular carcinoma, focusing on technically challenging lesion sites and individualized therapeutic approaches.

Materials and Methods: We retrospectively reviewed data of all HCC patients who underwent EUS-guided thermal or non-thermal ablation at a tertiary care center between 2023 and 2025. The decision to perform EUS-guided ablation was made through multidisciplinary discussion. Patients with CTP >7B, ascites, platelet count <50×10⁹/L, INR > 2.0 were excluded. EUS was performed using linear-array EUS under anesthesia support, with lesion characterization aided by contrast-enhanced EUS. Radiofrequency ablation or ethanol injection was selected based on lesion characteristics and proximity to vascular structures. The primary outcome was radiological response at one month, assessed using mRECIST 1.1 and LI-RADS criteria [Figure 1,2]. Secondary outcomes included technical success, safety, and clinical outcomes.

Results: Five patients underwent EUS-guided ablation during the study period [Table 1]. Two patients underwent radiofrequency ablation for caudate lobe lesions, one patient received ethanol ablation for a segment I lesion, and two patients underwent ethanol ablation for abdominal lymph nodal metastases. Technical success was achieved in all cases (100%). Follow-up imaging demonstrated complete radiological response in four patients, accompanied by biochemical response with normalization of alpha-fetoprotein levels. One patient was lost to follow-up. No peri-procedural or post-procedural adverse events were observed. During follow-up, one patient developed pulmonary metastasis and was initiated on systemic therapy.

Conclusions: EUS-guided ablative therapy appears to be a feasible, safe, and effective option for carefully selected patients

with HCC located in anatomically challenging regions. Although limited by small sample size, these findings support EUS-guided ablation as a valuable complementary approach to percutaneous techniques, warranting further evaluation in larger prospective studies.

2433 - Diagnostic performance of non invasive fibrosis scores in treatment naïve patients with autoimmune hepatitis

Mubin Ozercan¹, **Ali Çağrı Oral**¹, **Sedat Çiçek**¹, **Furkan Kirsoy**¹, **Abdulvahap Hohluoğlu**¹, **Selman Çetin**¹, **Özlem Üçer**², **Selçuk Özercan**², **Mehmet Yalniz**¹, **Ibrahim Halil Bahçecioglu**¹
Firat University, Gastroenterology, Elazığ-Türkiye ¹ Firat University, Pathology, Elazığ- ²

Background / Hypothesis: Autoimmune hepatitis is a chronic immune-inflammatory disease of the liver. The most important stage indicating the progression of chronic liver diseases to these complications is the development of fibrosis in the liver. Due to the invasive nature of liver biopsy and the risk of complications, the use of non-invasive fibrosis markers has become prominent in recent years. Due to its rarity, the number of studies comparing the predictive power of these markers for liver fibrosis in autoimmune hepatitis is extremely limited.

Materials and Methods: Liver biopsy specimens of patients diagnosed with autoimmune hepatitis in our clinic were included in the study. Patients with radiological or laboratory findings suggestive of overlap syndromes were excluded. All liver biopsies were evaluated in a blinded manner according to the METAVIR fibrosis scoring system by an expert hepatopathologist. Laboratory parameters obtained concurrently with liver biopsy were retrospectively collected from the patients' electronic medical records. The APRI, FIB-4, GPR, and eLIFT scores were calculated using standard formulas. The diagnostic performance of these non-invasive scores and serum ferritin levels for predicting the presence of significant fibrosis (METAVIR ≥F2) and advanced fibrosis (METAVIR ≥F3) was assessed using receiver operating characteristic (ROC) curve analysis

Results:

ORAL ABSTRACTS

A total of 161 patients were included in the study. The mean age was 44.9 ± 1.4 years, and 77.6% of the patients were female. Histopathological examination revealed significant fibrosis in 113 patients (70.2%), while advanced fibrosis was present in 53 patients (32.9%).

In correlation analyses, FIB-4, APRI, GPR, and eLIFT scores, as well as ferritin levels, showed statistically significant correlations with METAVIR fibrosis stage (all $p < 0.05$). However, the strength of these correlations was modest, with Spearman's rho coefficients ranging between 0.20 and 0.33. ROC analysis demonstrated that the eLIFT score had a higher diagnostic accuracy than FIB-4, APRI, and GPR for the detection of significant fibrosis, with AUC values of 0.68, 0.65, 0.63, and 0.62, respectively ($p < 0.05$). In contrast, FIB-4 showed the highest diagnostic performance for detecting advanced fibrosis, with an AUC of 0.66 ($p < 0.05$).

Conclusions:

eLIFT demonstrated higher diagnostic accuracy, particularly for the detection of significant fibrosis. In contrast, the AUC values of FIB-4, APRI, and GPR were lower than those reported in studies involving patients with chronic viral hepatitis. This discrepancy may be explained by the distinct pathophysiological characteristics of autoimmune hepatitis, in which fluctuating necroinflammatory activity can substantially influence serum-based fibrosis indices.

Keyword(s) : autoimmune hepatitis, non-invasive, eLIFT, fibrosis

2438 - Long term Serial Liver Stiffness Monitoring Histological Fibrosis and HVPG as Determinants of Disease Progression and Decompensation in MASLD

Ankur Jindal¹, Shiv Sarin²
Institute Of Liver And Biliary Sciences, Hepatology, New Delhi-India¹ Institute Of Liver And Biliary Sciences, Hepatology, New Delhi-India²

Background / Hypothesis:
The impact of disease progression in metabolic dysfunction associated steatotic liver disease (MASLD) on liver outcomes remains poorly understood. We aimed to investigate MASLD progression using longitudinal liver stiffness measurements (LSM) by serial transient elastography (TE), histological fibrosis stage, HVPG and splenic stiffness measurement (SSM) and to evaluate their association with adverse liver outcomes.

Materials and Methods:
All adult patients with MASLD undergoing at least two serial LSM, spaced ≥ 5 years apart (from first to last), were identified from our institutional database for clinical evaluation. Progression and regression were defined as $\geq 19\%$ or $\leq -19\%$ change from baseline LSM, respectively, per QIBA consensus. Associations between baseline LSM-defined MASLD stages (Baveno VII: no cACLD, cACLD, CSPH), biopsy-proven cirrhosis (F4), and Δ LSM with clinical decompensation (CD) after final LSM stratified by HVPG and splenic stiffness response to carvedilol were assessed using time-to-event analysis.

Results:

1119 MASLD participants underwent serial LSMs (76% male, median age 47 years, 28% diabetic, baseline F4 fibrosis, Fib4 and NFS 30.7%, 2.36 and -1.315 respectively). The median time between first to last LSM was 62.3 (49.4–72.1) months. MASLD progression and regression occurred in 388(38%) and 293 (28.7%) participants respectively. Among cACLD participants ($n=634$; 56.7%), 47.7% had cirrhosis (F4 fibrosis) and 73.2% had advanced ($\geq F3$) fibrosis. Participants with F4 fibrosis was associated with more frequent CSPH (Baveno VII criteria) (25.8% vs. 20.6%; $p=0.04$) and lower Δ LSM regression (28.7% vs. 43.8%; $p=0.02$). In MASLD without cirrhosis ($\leq F3$) at baseline, cirrhosis development occurred in 25% of LSM progressors and 11.1% of non-progressors ($p=0.05$) over a median duration of 44(17–78) months. The incidence of CD after the last LSM was higher in participants with baseline CSPH (42.2%) as compared to cACLD alone (37.4%) and no cACLD (4.8%) ($p<0.05$). Participants with incident CD had higher baseline HVPG (14.7 ± 2.8 vs. 12.1 ± 2.9 mmHg; $p<0.001$) and SSM (66.2 vs. 45 kPa; $p<0.001$). A hemodynamic response to carvedilol, defined by a $\geq 20\%$ reduction in HVPG (achieved in 42.7% of patients; median follow-up 21.1 months), but not by SSM criteria, was associated with a significantly lower incidence of variceal bleeding (7.1% vs. 18.1%; $p=0.042$) and new-onset ascites (7.1% vs. 27.7%; $p<0.001$).

Conclusions: Serial liver stiffness measurements over long-term follow up capture disease dynamics in MASLD. Baseline histological fibrosis stage remains a key determinant of portal hypertension severity and subsequent progression. HVPG is the strongest predictor of decompensation and therapeutic benefit.

2439 - A silent threat A case of infiltrative cholangiocellular carcinoma developing without detectable mass

Bilal Altunisik ¹, Abdullah Tanrikulu ¹, Yaren Dirik ¹,
Muahmmet Murat Celik ¹
Siirt University Medical Faculty, Internal Medicine, Siirt-Türkiye ¹

Background:

Cholangiocellular carcinoma (CCA) is an aggressive malignancy arising from the biliary epithelium and typically follows a silent clinical course until advanced stages. Patients present with non-specific symptoms often or isolated laboratory abnormalities. In the infiltrative type, is not detected mass usually on imaging studies. In a patient presenting with ascites, rapid differential diagnosis of malignant causes is critical for early diagnosis and treatment.

Case:

A 64-year-old male complained abdominal distension and pain. Physical examination revealed abdominal distension and generalized tenderness. Laboratory analysis showed elevated CRP (112 mg/L) and CA 19-9 levels (700 U/mL). The high protein content of ascites fluid and low (0.6) serum ascites-albumin gradient (SAA) were consistent with malignancy. Cell count detected 275 PMNL/mm³. Empirical treatment for spontaneous bacterial peritonitis was initiated. PMNL of ascites fluid dropped to 20/mm³. ARB, tuberculosis PCR, and culture were negative. Cytology of the ascite revealed signet-ring like malignant epithelial cells. Immunohistochemically, CK7, MOC31, BERP4, CEA, calretinin were positive; CK20, CDX2, GATA3, TTF-1, PAX8 were negative. Gastroscopy and colonoscopy were normal. Contrast-enhanced abdominal CT showed no mass, but there was widespread peritoneal fluid and increased mesenteric density. PET-CT showed increased FDG uptake (SUVmax 5.3) in the peritoneal surface and omentum. Adenocarcinoma was identified on pathological re-evaluation of the cholecystectomy specimen from one year ago. The patient considered as unresectable CCA, was started on Gemcitabine + Cisplatin chemotherapy.

Discussion:

CCA, is an aggressive malignancy with diagnostic difficulties due to its heterogeneous clinical and radiological features. In this case, the absence of a mass on contrast-enhanced CT, the presence of widespread

fluid in the peritoneum, and increased mesenteric density are typical features of infiltrative CCA, these are significant factors contributing to diagnostic delay. In patients with ascites, low SAAG and high ascites protein level are strong indicators of malignancy. Cytological and immunohistochemical examinations are important in identifying the malignancy. Especially, CK7 positivity and CK20/CDX2 negativity are associated with pancreatobiliary adenocarcinoma. Confirming the diagnosis of malignancy with re-evaluation of cholecystectomy specimen from one year ago, shows insidiousness of CCA. Peritoneal involvement indicates advanced disease and poor prognosis.

Conclusion:

This case is important because it shows the importance of a multidisciplinary approach in patients with CCA with peritoneal involvement and emphasizes the contribution of re-evaluating past pathological samples to the diagnostic and treatment process.

Keyword(s) : Cholangiocellular carcinoma, ascites, serum ascites-albumin gradient

2440 - Clinical outcomes and treatment response in primary biliary cholangitis with and without autoimmune hepatitis features a Thai multicenter 10 year cohort

Kedsiree Sanit ¹, Kanokwan Pinyopornpanish ², Chitchai Rattananukrom ³, Chanavee Toh ⁴, Naichaya Chamrookul ¹, Pimsiri Sripongpun ¹, Apichat Kaewdech ¹

Faculty Of Medicine, Prince Of Songkla University, Gastroenterology And Hepatology Unit, Division Of Internal Medicine, Hatyai-Thailand ¹ Faculty Of Medicine, Chiangmai University, Division Of Gastroenterology And Hepatology, Department Of Internal Medicine, Chiangmai-Thailand ² Faculty Of Medicine, Khon Kaen University, Division Of Gastroenterology And Hepatology, Department Of Medicine, Khon Kaen-Thailand ³ Faculty Of Medicine, Prince Of Songkla University, Division Of Digital Innovation And Data Analytics, Hatyai-Thailand ⁴

Background

Hypothesis: Primary biliary cholangitis is a chronic cholestatic liver disease in which a subset of patients presents with features of autoimmune hepatitis, which is termed PBC-AIH overlap. In such patients, inflammatory activity is more aggressive, treatment requirement is different, and the outcomes might be worse. Data from Southeast Asia remains limited. We aimed to compare treatment

ORAL ABSTRACTS

patterns, 12-month biochemical response, and long-term clinical outcomes between PBC patients with and without AIH features in a Thai multicenter cohort.

Materials and Methods: We performed a retrospective cohort study across Chiang Mai University, Prince of Songkla University, and Khon Kaen University, including all patients diagnosed with PBC from 2015–2024 (n=255). Overlap AIH–PBC was defined by the Paris criteria. The primary outcome was biochemical response at 12 months by AASLD-listed criteria and POISE definition. Secondary outcomes of interest were liver decompensation, HCC, and death. Survival analyses were performed using Kaplan–Meier plots and Cox proportional hazards models.

Results:

Of 255 patients, 104 (41%) had PBC with AIH features (PBC+AIH). These patients were younger, had higher baseline ALT/AST levels, and were more frequently ANA-positive. UDCA was used in 98.8%, and fibrates in 9.1% (13.0% in PBC+AIH vs 6.8% in PBC; $p=0.12$). Biochemical response at 12 months was significantly lower in PBC+AIH by Paris II (72% vs 85%; $p=0.024$) and POISE (40% vs 54%; $p=0.043$). During long-term follow-up, decompensation occurred in 19 patients per group (HR 1.49, 95% CI 0.79–2.81; $p=0.221$), and the incidence of HCC was similar (HR 1.14, 95% CI 0.25–5.11; $p=0.864$). Mortality was higher in PBC+AIH (20 vs 12 patients), with a significantly increased risk (HR 2.77, 95% CI 1.29–5.97; $p=0.009$). In multivariable analysis, independent predictors of decompensation, HCC, or death included PBC+AIH (HR 2.77; $p=0.009$), cirrhosis (HR 2.57; $p=0.011$), elevated INR (HR 5.17; $p<0.001$), and baseline ascites (HR 7.37; $p<0.001$). A biochemical response was predicted to favor outcomes across the Paris I/II, Rotterdam, Toronto, and POISE criteria (HRs 0.19–0.32; all $p<0.05$).

Conclusions:

In this Thai multicenter cohort, PBC with AIH features showed a lower 12-month biochemical response and significantly higher mortality, despite similar risks of decompensation and HCC. Early identification of overlap features and strict assessment of UDCA response at 12 months are critical to guide timely therapy escalation and improve long-term outcomes.

Background / Hypothesis: Spontaneous bacterial peritonitis (SBP), particularly when caused by multidrug-resistant organisms (MDROs) and carbapenem-resistant organisms (CROs), is associated with high short-term mortality in cirrhosis and often necessitates broad-spectrum empiric therapy. Conventional tools (e.g., MELD) do not explicitly incorporate resistance risk, limiting precision in prognostication and antimicrobial decision-making. We developed and validated machine-learning (ML) models to predict (i) mortality, (ii) MDRO infection, and (iii) CRO infection among patients with culture-positive SBP.

Materials and Methods: We conducted a retrospective, multicenter study across 13 centers including consecutive adults admitted with acute decompensation of cirrhosis and culture-positive ascitic fluid (SBP) between 2021–2025 (n=319).

ORAL ABSTRACTS

Candidate predictors included baseline clinical variables, laboratory parameters, and organ failure markers at diagnosis. Outcomes were 30-day mortality, MDRO SBP, and CRO SBP, defined using international criteria. Models were developed using Extreme Gradient Boosting (XGB) with hyperparameter optimization and 10-fold cross-validation. Discrimination was quantified using AUC (95% CI) and calibration using Brier score. Feature importance and top predictors were identified. Mortality model performance was compared against MELD using the DeLong test.

Results:

Among 319 patients, 39% died within 30-days. MDRO SBP occurred in 53% and CRO SBP in 24%. For mortality prediction, XGB achieved an AUC of 0.880 (0.839–0.916) (Brier score:0.13), outperforming MELD (AUC: 0.766; $p<0.05$), and stratified patients into high- vs low-risk groups with mortality prevalence of 71% vs 13% (risk ratio: 5.46). For MDRO prediction, XGB achieved an AUC of 0.705 (0.573–0.759) (Brier score:0.24), stratifying MDRO prevalence as 73% vs 43% (risk ratio: 1.69). For CRO prediction, XGB achieved an AUC of 0.683 (0.570–0.808) (Brier score:0.17), stratifying CRO prevalence as 33% vs 15% (risk ratio: 2.2). Top mortality predictors included SIRS, CLIF-C OF, ALP, MELD, prothrombin time, MAP, bilirubin, urea, SPO2/FPO2, SOFC, ACLF grade, and respiratory failure; MDRO/CRO predictors included type of SBP, SOFC, HE grade, respiratory failure, CVS failure, public hospitalization, CLIF-C OF, bilirubin, SBP prophylaxis, INR, MELD, and rifaximin.

Conclusions:

In this multi-center cohort, XGB provided reasonable prediction of mortality and MDRO/CRO SBP, exceeding MELD for mortality and enabling resistance risk stratification to support antimicrobial decisions and trial enrichment.

2443 - Histological severity is not associated with clinical presentation or outcome in children with autoimmune hepatitis

Aditya Soni¹, Rajeev Khanna², Seema Alam¹, Vikrant Sood¹, Bikrant Bihari Lal¹, Archana Rastogi³
Institute Of Liver And Biliary Sciences, Pediatric Hepatology, New Delhi-India¹ Institute Of Liver And Biliary Sciences, New Delhi, Pediatric Hepatology, New Delhi-India² Institute Of Liver And Biliary Sciences, Pathology, New Delhi-India³

Background / Hypothesis: Pediatric autoimmune hepatitis (AIH) presents with heterogeneous clinical phenotypes ranging from acute liver failure to chronic liver disease. The relationship between histological severity, clinical presentation, treatment response, and outcomes remains unclear. We evaluated whether histological features correlate with presentation patterns and short-term outcomes in children with AIH.

Materials and Methods: We performed a retrospective analysis of prospectively collected data of children diagnosed with AIH between January 2011 and July 2025. AIH was diagnosed based on compatible clinical and laboratory features, elevated IgG, simplified AIH score ≥ 6 , supportive histology, and exclusion of other liver diseases. Liver biopsies ($n=235$) were reviewed and histological features compared across clinical presentations: acute liver failure/acute-on-chronic liver failure (ALF/ACLF; category 1), decompensated cirrhosis (DCLD; category 2), and acute or chronic hepatitis (AH/CH; category 3). Outcomes assessed included death or liver transplantation and difficult-to-treat (DTT) disease.

Results: Of 235 biopsies analyzed, 69 were from ALF/ACLF, 50 from DCLD, and 116 from AH/CH patients. Baseline fibrosis stage was comparable across groups (mean ~ 2.7 ; $p=0.996$). Most histological parameters—including interface hepatitis, lymphoplasmacytic infiltrate, lobular inflammation, emperipolesis, pseudo-rosette formation, and patterns of necrosis (spotty, bridging, confluent, multiacinar, and pan-acinar)—were similarly distributed across clinical categories (all $p>0.05$). Biliary features, including ductular reaction, bile duct injury or loss, cholangiolitis, and periductal fibrosis, did not differ significantly. Cholestasis showed a non-significant trend toward higher frequency in ALF/ACLF. Overlap features were significantly less frequent in ALF/ACLF compared with DCLD and AH/CH ($p<0.01$). Comparing biochemical characteristics, children with ALF/ACLF were characterized by greater biochemical severity (high PELD/MELD scores, high bilirubin, INR, and a lower albumin), while histological and elastographic parameters remained similar across presentations. At 12 months, 30 patients were lost to follow-up; among 202 evaluable children, 9 underwent LT and 28 died. ALF/ACLF patients had higher necro-inflammatory activity index (HAI) ($p=NS$), however this severity did not correlated with outcomes. Remission rates were highest in the AH/CH group ($p=NS$), despite lower baseline HAI. Difficult to treat (DTT) rates were comparable across ALF/ACLF, DCLD, and AH/CH groups (13%, 12%, and

ORAL ABSTRACTS

13%, respectively; p=NS).

Conclusions: Baseline histological severity does not correlate with clinical phenotype or outcomes in pediatric autoimmune hepatitis. These findings highlight that liver histology reflects disease activity but has limited value in predicting disease course or prognosis.

Keyword(s) : histology, AIH, pediatric

2450 - A rare case Sporadic Burkitt lymphoma presenting with high serum ascite albumin gradient and low ascite glucose

Abdullah Tanrikulu ¹, Bilal Altunisik ¹, Yaren Dirik ²,
Muahmmet Murat Celik ¹
Siirt University Medical Faculty, Internal Medicine, Siirt-Türkiye ¹ Siirt Research And Training, Gastroenterology, Siirt-Türkiye ²

Background:

Burkitt lymphoma (BL) is an aggressive B-cell lymphoma with three clinical variants: endemic, sporadic, and immunodeficiency-associated. Endemic BL commonly involves the jaw, abdomen, and central nervous system, whereas abdominal involvement occurs in 60-80% of sporadic cases. Ileocecal BL may mimic Crohn disease, Behçet disease, intestinal tuberculosis.

Case:

An 18-year-old male presented with abdominal pain, nausea, vomiting and diarrhea. He had no fever, night sweats, weight loss. His father had history of Hodgkin lymphoma. Physical examination revealed only diffuse abdominal tenderness. Laboratory tests showed elevated serum LDH (486 U/L) and uric acid (10.8 mg/dL), with other parameters were normal. Ascite analysis demonstrated marked leukocytosis (WBC: $52 \times 10^9/L$), LDH 1627 U/L, extremely low glucose level (simultaneous serum glucose: 69 mg/dL), total protein 3.2 g/dL, albumin 2.1 g/dL. Acid-fast bacilli, tuberculosis PCR, culture were negative. The serum-ascite albumin gradient (SAAG) was 1.5 (>1.1), consistent with mixed ascite. Contrast-enhanced abdominal CT showed widespread free intraperitoneal fluid. Portal Doppler ultrasonography and gastroscopy were normal. Colonoscopy revealed a nodular, fragile mucosal lesion at the cecal base causing ileocecal obstruction. Histopathology showed atypical lymphoid cells positive for CD10, CD20, BCL-6, c-MYC, and negative for CD3, CD5, BCL-2, EBV. Ki-67 100%. The patient diagnosed BL with intestinal involvement.

Discussion:

BL is a rare, aggressive malignancy in adults that frequently involves the abdomen. The patient with nonspecific gastrointestinal symptoms and diffuse ascite, had no classic B symptoms. Although peritoneal lymphomatosis is typically associated with a low SAAG, a high SAAG may occur due to sinusoidal and periportal infiltration, leading to occult portal hypertension. In this case, despite a SAAG ≥ 1.1 , elevated ascite protein and LDH levels were consistent with a mixed ascite pattern. Markedly low ascite glucose level commonly suggests tuberculous peritonitis; however, in this patient, the extreme low level of ascite glucose was attributed to BL and is related to high proliferative activity and Warburg effect. This case highlights that peritoneal lymphomatosis may be overlooked on imaging and emphasize the diagnostic value of ascite analysis.

Conclusion:

BL should be considered in young adults presenting with nonspecific gastrointestinal symptoms and unexplained ascite. Even in the absence of definitive imaging findings, the coexistence of a SAAG ≥ 1.1 and a mixed ascite pattern may indicate peritoneal lymphomatosis with occult portal hypertension. Markedly low ascite glucose should be recognized as a feature not only of tuberculous peritonitis but also of high-turnover aggressive lymphomas.

Keyword(s) : Burkitt lymphoma; mixed ascites; low ascite glucose; peritoneal lymphomatosis; Warburg effect

2454 - Anticancer Effects of Bromelain on HUH7 Hepatocellular Carcinoma Cells through Modulation of the EGFR PI3K Pathway

Onur Durna ¹, Ayşegül Öztürk ²
Sivas Cumhuriyet Üniversitesi, Department Of Physiology, Sivas Cumhuriyet University, Sivas, Türkiye, Sivas-Türkiye ¹ Sivas Cumhuriyet Üniversitesi, Therapy And Rehabilitation, Sivas Cumhuriyet University, Sivas, Türkiye, Sivas-Türkiye ²

Background

Hypothesis: Background: The aim of this study was to evaluate the anticancer effects of bromelain on human hepatocellular carcinoma HUH7 cells and to investigate its potential molecular mechanisms involving the EGFR, PI3K, and apoptotic signaling pathways.

Materials

and

Methods:

HUH7 hepatocellular carcinoma cells were cultured under standard conditions. The cells were treated with

ORAL ABSTRACTS

increasing concentrations of bromelain (25 to 800 μ M), and cell viability was assessed using the CCK-8 assay. The IC₅₀ value of bromelain was calculated based on the cell viability data. Following treatment with the IC₅₀ concentration, the expression levels of EGFR and PI3K, as well as the apoptotic markers caspase-3 and caspase-7, were analyzed and compared to the control group. Statistical significance was set at $p < 0.05$.

Results:

According to the CCK-8 assay, the IC₅₀ value of bromelain in HUH7 cells was determined to be 423 μ M. Treatment with bromelain at this concentration resulted in a significant decrease in EGFR and PI3K expression levels compared to the control group ($p < 0.05$). Conversely, the expression levels of caspase-3 and caspase-7 were significantly increased following bromelain treatment ($p < 0.05$). These findings indicate that bromelain suppresses proliferative signaling pathways and induces apoptosis in HUH7 cells.

Conclusions: This study demonstrates that bromelain reduces cell viability in HUH7 hepatocellular carcinoma cells by inhibiting the EGFR/PI3K signaling pathway and promotes apoptotic cell death through the activation of caspase-3 and caspase-7. These results suggest that bromelain may serve as a potential anticancer agent for the treatment of hepatocellular carcinoma.

Keyword(s) : Bromelain, EGFR, Apoptosis, HUH-7

2457 - Impact of the national Hepatitis B vaccination program on HBsAg seroprevalence in pregnant women and comparison with migrant pregnant women

Yelda Ögütmen¹, Alper Gündüz¹, Özlem Altuntaş Aydın¹

Basaksehir Cam And Sakura City Hospital, Infectious Diseases And Clinical Microbiology, İstanbul-Türkiye¹

Background / Hypothesis: Hepatitis B virus (HBV) is an important infectious agent that may lead to serious outcomes for both the mother and the newborn during pregnancy. In Turkey, routine neonatal HBV vaccination has been performed since 1998. This study aimed to compare HBsAg positivity rates between pregnant women born during the vaccination era (1998 and later) and those born before the introduction of the vaccine (pre-1998). In addition, the prevalence of HBsAg positivity among migrant pregnant women was evaluated.

Materials and Methods: This retrospective descriptive study was conducted using the data of pregnant women who underwent HBsAg testing at single center. Repeated test results from the same individuals, as well as records with missing data, were excluded from the study. Turkish pregnant women were divided into two groups according to birth year: those born in 1998 or later and those born before 1998. HBsAg positivity rates were compared between these groups. Although country-of-origin data were unavailable, HBsAg seroprevalence among migrant pregnant women was evaluated separately and compared with that of Turkish pregnant women.

Results: A total of 66456 pregnant women were included in the study, and HBsAg positivity was detected in 625 individuals (0.94%). Among Turkish pregnant women, the overall HBsAg positivity rate was 0.81%. This rate was 0.41% in those born in 1998 or later and 0.99% in those born before 1998. HBsAg positivity was significantly lower among women born in or after 1998 ($p < 0.001$) (Table 1). Among migrant pregnant women, the HBsAg positivity rate was 1.95%, with 151 positive cases detected among 7758 screened individuals. HBsAg positivity was significantly higher in migrant pregnant women compared with Turkish pregnant women ($p < 0.001$) (Table 2).

Conclusions: HBsAg positivity was found to be significantly lower among pregnant women born in 1998 or later, following the inclusion of the HBV vaccine in the national vaccination program. These findings demonstrate that the effectiveness of the national vaccination program in Turkey. However, the detection of HBsAg positivity, albeit at low rates, even among vaccinated cohorts highlights the continued importance of HBV screening and vaccination strategies in women of reproductive age. The higher HBsAg positivity rate observed among migrant pregnant women further underscores the necessity of maintaining universal HBsAg screening during pregnancy.

Keyword(s) : pregnancy, hepatitis B virus, vaccination

2460 - Comparative Efficacy of Lenvatinib Versus Sorafenib in Advanced Hepatocellular Carcinoma A Meta Analysis of Meta Analyses

ORAL ABSTRACTS

Akshyata Osti¹, Nitesh Kumar Karna¹
B.p. Koirala Institute Of Health Sciences, Medicine,
Dharan-Nepal¹

Background / Hypothesis: Advanced hepatocellular carcinoma (HCC) remains a major therapeutic challenge, with tyrosine kinase inhibitors such as lenvatinib and sorafenib forming the backbone of systemic treatment. Although multiple meta-analyses have compared the efficacy of lenvatinib versus sorafenib across various clinical outcomes, their results show considerable variability. This meta-analysis of meta-analyses aims to synthesize the highest level of available evidence to comprehensively evaluate the comparative efficacy of lenvatinib and sorafenib in patients with advanced HCC.

Materials and Methods: A systematic literature search of PubMed, Embase, Scopus, and the Cochrane Library was conducted up to November 2025. Six eligible meta-analyses encompassing a total of 17,144 participants were included. Pooled hazard ratios (HRs) and odds ratios (ORs) with corresponding 95% confidence intervals (CIs) were extracted for overall survival (OS), progression-free survival (PFS), objective response rate (ORR), and disease control rate (DCR). Statistical heterogeneity was assessed using the I^2 statistic. Publication bias was evaluated using Egger's regression test, which demonstrated no evidence of significant bias.

Results: Lenvatinib was not associated with a statistically significant improvement in overall survival compared with sorafenib (HR = 0.89; 95% CI: 0.69–1.08; I^2 = 96.18%; p < 0.01), with substantial heterogeneity across studies. In contrast, lenvatinib demonstrated a significant benefit in progression-free survival (HR = 0.70; 95% CI: 0.58–0.83; I^2 = 92.64%; p < 0.01). Moreover, lenvatinib showed markedly higher objective response rates (OR = 6.55; 95% CI: 5.75–7.35; I^2 = 98.67%; p < 0.01) and improved disease control rates (OR = 3.14; 95% CI: 1.99–4.28; I^2 = 99.74%; p < 0.01) compared with sorafenib, despite high heterogeneity.

Conclusions: This meta-analysis of meta-analyses consolidates current evidence and indicates that lenvatinib offers superior efficacy over sorafenib in terms of progression-free survival, objective response

rate, and disease control rate in advanced hepatocellular carcinoma, while overall survival appears comparable between the two agents. These findings support the preferential use of lenvatinib in selected patients and underscore the need for further high-quality studies to clarify survival benefits amid substantial heterogeneity.

Keyword(s) : Hepatocellular carcinoma, Lenvatinib, Sorafenib, Meta-analysis

2461 - Early GI Hepatology Subspecialty Access in Cirrhosis and Survival A Retrospective Cohort Analysis

Mohamed Elsaid¹, Yesung Kweon², Joyce Lui³, Electra Paskett⁴, Cecilia Dapino⁵, Na Li⁶, Vinod Rustgi⁷, Khalid Mumtaz⁶

The Ohio State University College Of Medicine, Division Of Biostatistics And Population Health, Department Of Biomedical Informatics, Columbus-United States¹ The Ohio State University, Center For Biostatistics, Columbus-United States² The Ohio State University College Of Medicine, College Of Medicine, Columbus-United States³ The Ohio State University College Of Medicine, Division Of Cancer Prevention And Control, Department Of Internal Medicine, Columbus-United States⁴ Case Western Reserve University, Case Western Reserve University, Cleveland-United States⁵ The Ohio State University College Of Medicine, Division Of Gastroenterology, Hepatology, And Nutrition, Department Of Internal Medicine, Columbus-United States⁶ Rutgers Robert Wood Johnson Medical School, Division Of Gastroenterology And Hepatology, New Brunswick-United States⁷

Background / Hypothesis: Cirrhosis is a common, high-mortality chronic liver disease, and its outcomes depend heavily on timely guideline-based care, management of complications, medication optimization, transplant evaluation when appropriate, and coordination of preventive services, such as hepatocellular carcinoma (HCC) surveillance. However, early access to GI/hepatology care is uneven and may be constrained by patient-, provider-, and system-level barriers. However, real-world evidence on the effects of early access to GI/hepatology subspecialty care and patient outcomes remains limited. Therefore, we sought to (i) quantify the rates of early GI/hepatology subspecialty care among patients with cirrhosis and (ii) estimate the effect of early GI/hepatology subspecialty care on all-cause mortality in cirrhosis.

Materials and Methods: This retrospective cohort study utilized the Ohio State

ORAL ABSTRACTS

University PCORnet electronic health record database to identify adults with cirrhosis between 2011 and 2023. We defined early GI/hepatology subspecialty access as ≥ 1 GI/hepatology encounter occurring before or on the index date of cirrhosis diagnosis or within 90 days after diagnosis. Follow-up was defined as the period from 90 days after cirrhosis diagnosis to the date of death, the last encounter date, or the end of the study, whichever occurred first. Overlap Propensity Score Weighting (OPSW) was applied to account for confounding. Crude and adjusted Cox proportional hazard models with robust standard errors were used to assess the association between GI/hepatology access and survival.

Results:

Among 8,013 patients newly diagnosed with cirrhosis, the mean (STD) age was 55.5 (13.1) years, 55.4% were male, and 77.7% self-identified as non-Hispanic White. Only 37.3% of the patients had access to GI/hepatology care. The median (Q1, Q3) follow-up time was 1.8 years (0.6-4.0 years). The mortality risk was 17 deaths per 100 person-years. GI/hepatology access was significantly associated with lower mortality rates (12.0 vs. 20.7 deaths per 100 person-years; risk difference (RD) = 8.5 deaths per 100 person-years [95%CI: 7.4 to 9.6 per 100 person-years]). On crude analysis, GI/hepatology access was associated with a 41% lower risk of all-cause mortality than no GI/hepatology access (aHR: 0.59; 95%CI: 0.55 to 0.63). GI/hepatology access was associated with a 9% lower adjusted risk of all-cause mortality compared with no GI/hepatology access (aHR: 0.91; 95%CI: 0.84 to 0.98).

Conclusions: In this large cohort of patients with newly diagnosed cirrhosis, timely care from GI/hepatology subspecialists was low. After adjusting for confounders, GI/hepatology access remained associated with a significant reduction in all-cause mortality. These findings position early subspecialty engagement as a potentially modifiable lever to improve outcomes.

Background

/

Hypothesis:

The liver is increasingly being recognized as a target of end-organ damage in patients with longstanding Type 2 diabetes mellitus (T2DM). Uncontrolled DM, commonly defined by hemoglobin A1c (HbA1c) $\geq 7.0\%$ is known to cause several micro- and macrovascular complications however its propensity to cause liver cirrhosis lacks long-term real-world evidence, especially in Filipino populations. This study investigated the effect of glycemic control on the incidence of cirrhosis over a 5-year follow-up period. To date, there are no Philippine studies that have explored this relationship.

Materials

and

Methods:

The study recruited T2DM outpatients from two tertiary-level hospitals – Cardinal Santos Medical Center and Fatima University Medical Center. 551 diabetic patients were identified through clinic records and databases then individually screened using defined inclusion and exclusion criteria, including absence of cirrhosis or significant fibrosis at baseline and absence of other disease processes known to cause liver fibrogenesis. 70 patients qualified for inclusion in the study. A standardized data collection tool was used wherein HbA1c, liver imaging (ultrasound, CT scan, MRI, vibration-controlled transient elastography/VCTE), body mass index, fasting blood sugar, aspartate aminotransferase, alanine aminotransferase, alkaline phosphatase, platelet count, total bilirubin, international normalized ratio, albumin, globulin, lipid profile, blood urea nitrogen, creatinine, and microalbuminuria were recorded over a 5-year follow-up period. Data analysis was performed using Stata SE, Version 13. The association between glycemic control and cirrhosis was assessed using logistic regression. Changes in lab parameters from baseline to the end of follow-up were analyzed using paired t-tests.

Results:

Two out of three (66.7%) patients who developed cirrhosis within the follow-up period had uncontrolled DM while 21 out of 67 (31.3%) patients who did not

ORAL ABSTRACTS

progress to cirrhosis had uncontrolled DM. This translates to an odds ratio of 4.38 ($p=0.238$). Comparing the aforementioned lab parameters taken at baseline with those taken at the end of the follow-up period, none were significantly different between the controlled and uncontrolled DM groups. Moreover, none of the patients developed liver-related complications.

Conclusions:

The results show that the odds of developing cirrhosis over a period of at least 5 years are 4.38 times higher in patients with uncontrolled DM compared to those with controlled DM. The authors therefore recommend interval monitoring of HbA1c for all diabetic Filipino outpatients, with imaging for liver fibrosis, ideally VCTE, done periodically for those with uncontrolled HbA1c ($\geq 7.0\%$) in order to detect and prevent progression to cirrhosis and its complications.

Keyword(s) : type 2 diabetes mellitus, glycemic control, HbA1c, fibrosis, cirrhosis

2483 - Endoscopic treatment for esophagogastric variceal bleeding in acute on chronic liver failure patients

Yanan Sun¹, Peng Li¹, Shibin Zhang¹, Yuening Zhang¹, Chunlei Fan¹, Ajuan Zeng¹, Yanna Liu¹, Huigu Ding¹
Beijing You'an Hospital Affiliated To Capital Medical University, Department Of Gastroenterology And Hepatology, Beijing-China¹

Background / **Hypothesis:**
Endoscopic interventions are vital for managing esophagogastric variceal bleeding (EGVB) in cirrhotic patients with portal hypertension. The role of endoscopic injection sclerotherapy (EIS) remains limited in patients with acute-on-chronic liver failure (ACLF). This study aims to investigate the prognostic factors for patients with EGVB accompanied by ACLF.
Materials and Methods:
In this single-center retrospective cohort study, 106 ACLF patients experiencing EGVB episode between January 1, 2021, and June 30, 2024 were included (Figure A). Patients were assigned to an endoscopic treatment group or a non-endoscopic treatment group. Interventions were performed within 12–24 h after hemodynamic stabilization. The primary endpoints were 6-week mortality, transjugular intrahepatic portosystemic shunt (TIPS) placement, and liver transplantation. Risk factors for early rebleeding (72 h–6 weeks), 6-week mortality, and hemorrhage-related death were assessed by logistic regression.
Results:
Early rebleeding occurred in 36.8% (39/106) of patients.

Moderate-to-severe ascites (OR 3.38, 95%CI 1.38–8.30, $P = 0.008$) and absence of endoscopic treatment (OR 0.27, 95% CI 0.11–0.66, $P = 0.004$) independently predicted early rebleeding (Figure B). Six-week mortality was 46.2% (49/106), which was associated with moderate-to-severe ascites (OR 2.59, 95%CI:1.04–6.42, $P = 0.040$), higher total bilirubin (OR 1.004, 95%CI:1.001–1.008, $P = 0.012$) and non-first episode of gastrointestinal bleeding (OR 0.304, 95%CI:0.12–0.77, $P = 0.012$)(Figure C). Endoscopic treatment did not significantly affect overall survival ($P = 0.734$) but reduced hemorrhage-related mortality (OR 0.186, 95%CI: 0.04–0.86, $P = 0.031$). Among the 49 deceased patients, 20 deaths were attributed to gastrointestinal hemorrhage and 29 to other causes. Besides, patients with portal vein thrombosis (PVT) were more prone to bleeding-related death (OR 8.262, 95%CI:1.51–45.09, $P = 0.015$) (Figure D).

Conclusions:

This study indicates that moderate-to-severe ascites and absence of endoscopic treatment are independent risk factors for early rebleeding in ACLF patients with EGVB, while moderate-to-severe ascites, elevated total bilirubin, and non-first gastrointestinal bleeding increase 6-week mortality. Endoscopic treatment lowered hemorrhage-related mortality; however, it did not significantly improve overall survival.

Keyword(s) :

2484 - CT based Vasomics model for noninvasive diagnosis of Porto sinusoidal vascular disease in patients with portal hypertension

Yanna Liu¹, Ajuan Zeng¹, Yanglan He¹, Ying Han¹, Chunlei Fan¹, Yanjing Wu¹, Hui Liu², Xiaolong Qi³, Huiguo Ding¹
Beijing Youan Hospital, Capital Medical University, Department Of Gastroenterology And Hepatology, Beijing-China¹ Beijing Youan Hospital, Capital Medical University, Department Of Pathology, Beijing-China² Zhongda Hospital, Medical School, Southeast University, Liver Disease Center Of Integrated Traditional Chinese And Western Medicine, Department Of Radiology, Nanjing-China³

Background / **Hypothesis:**
Porto-sinusoidal vascular liver disease (PSVD) is often misdiagnosed as cirrhosis, while liver histopathology remains the diagnostic gold standard—making accurate noninvasive differentiation a key unmet need. This study aims to develop a CT-based vasomics model for noninvasive diagnosis of PSVD.
Materials and Methods:
Patients diagnosed with PSVD were retrospectively

ORAL ABSTRACTS

recruited from our center from January 2018 to December 2023. The control cohort enrolled patients with cirrhotic portal hypertension recruiting consecutively during the same period with a sample size matching ratio of 1:2. Patients were randomly divided into the training cohort and the validation cohort. Using vasomics technique, 64 vascular parameters can be extracted for each patient from contrast-enhanced abdominal CT angiography, covering features of the portal vein, hepatic veins, inferior vena cava, hepatic artery, and abdominal aorta. Parameters showing statistically significant differences between patients with PSVD and those with cirrhosis were first identified by univariate analyses. These variables were then entered into regression analyses to develop a noninvasive diagnostic model for PSVD in the training cohort. The diagnostic performance of the vasomics model for PSVD was evaluated in the validation cohort

Results:
A total of 228 patients were included, of which 76 were PSVD patients and 152 were cirrhosis patients. The training cohort comprised 40 patients with PSVD and 80 with cirrhosis, while the validation cohort included 36 patients with PSVD and 72 with cirrhosis. A CT-based vasomics model for noninvasive diagnosis of PSVD was developed based on 2 vascular features from hepatic artery, and abdominal aorta. The vasomics model a good performance in differentiation of PSVD with the AUCs of 0.762 (95%CI: 0.664-0.861) and 0.819 (95%CI: 0.722-0.917) in the training and validation cohorts, respectively (Figure 1).

Conclusions:

CT-based liver vasomics technique is feasible for PSVD and enables extraction of quantitative vascular biomarkers. A CT-derived vasomics score can support noninvasive differentiation of PSVD from cirrhosis, potentially reducing reliance on biopsy and improving diagnostic confidence in patients presenting with portal hypertension.

2488 - SAFETY OF MIDAZOLAM AND NALBUPHINE IN CIRRHOTIC PATIENTS WHO UNDERGO UPPER GASTROINTESTINAL ENODSCOPY

Lajpat Rai¹, Nazish Butt², Kanwal Butani³
Jam Ghulam Qadir Govt Teaching Hospital,
Gastroenterology Deptt, Hub Chowki-Pakistan¹ Jpmc,
Gastroenterology Deptt, Karachi-Pakistan² Lgh Karachi,
Gastroenterology Deptt, Karachi-Pakistan³

Materials and Methods:

ABSTRACT

Introduction: - Cirrhosis of liver and its complication are the major health problem, due to very high prevalence of hepatitis B and hepatitis C in our community and it is the common cause of mortality among Pakistan population and frequent cause of admission to hospital in Pakistan. Cirrhosis is the result of progressive destruction and regeneration of the liver parenchyma due to chronic liver disease (CLD). This study is to design to measure the safety of midazolam and nalbuphine in cirrhotic patients who undergo upper gastrointestinal endoscopy in our population.

Objective: - To compare the safety of midazolam and nalbuphine in cirrhotic patients who undergo upper gastrointestinal (GI) endoscopy, at a tertiary care Hospital.

Setting: Inpatients and out patients Department

Duration: Six months from January 2019 till to date.

Study design: Randomized controlled trial

Subject and Methods: - A total of 150 patients having cirrhosis of liver were randomly allocated into two groups. 75 were in group A and treated with midazolam and 75 in group B were treated with nalbuphine. Patients in both the groups was observed for side effects of these drugs for one and half hour after EGD, safety of each drug was achieved if no side effects of these drugs was observed. All demography, clinical history was recorded on a predesigned Performa.

Results: - The average age of the patients was 44.91 ± 11.38 years. There were 82(54.7%) male and 68(45.3%) female. Rate of desaturation, bradycardia, hepatic encephalopathy, clamminess and nausea/vomiting were significantly high in group B than groups A. Comparison of the safety of midazolam and nalbuphine in cirrhotic patients who undergo upper gastrointestinal (GI) endoscopy. Midazolam was significantly safe treatment than nalbuphine in reducing the side effect.

Conclusion: - The efficacy of midazolam in cirrhotic patients undergoing endoscopy is superior to those of nalbuphine. In safety and efficacy issues, midazolam is better than nalbuphine in GI endoscopy, especially in patients with liver cirrhosis.

2491 - Hepatocellular Carcinoma in Armenia Liquid Biopsies and Primary Assessment of Molecular Alterations Prevalence

Hasmik Ghazinyan¹, Agnès Marchio², Saro Khemichian³, Hayk Harutyunyan⁴, Elen Hayrapetyan⁵, Pascal Pineau²

Yerevan Scientific Medical Center, Department Of Gastroenterology And Hepatology, Yerevan-Armenia ¹ Institut Pasteur, Université Paris Cité, Unité Organisation Nucléaire Et Oncogénèse, Paris-France ² Kech School Of Medicine, University Of Southern California, Division Of Gastrointestinal And Liver Diseases, Los, Angeles-United States ³ Astghik Medical Center, Department Of Surgery, Yerevan-Armenia ⁴ Yerevan State Medical University Named After Mkhitar Heratsi, Faculty Of General Medicine, Yerevan-Armenia ⁵

Background:

Hepatocellular carcinoma (HCC) exhibits significant geographical variation in incidence, largely driven by differences in underlying risk factors. Among these, mutagenic compounds such as aflatoxin B1 (AFB1), benzopyrene, and aristolochic acid have been linked to specific mutational signatures detectable through DNA sequencing. According to Globocan data, Armenia has the highest incidence of HCC in a vast continental region from Eastern Europe to China.

Materials and Methods:

We focused on detecting risk factors of hepatocellular carcinoma in the Armenian population and major mutations in two key driver genes, TP53 and TERT, in individuals with either HCC (n=112) or liver cirrhosis (LC, n=169).

The study included 112 patients diagnosed with HCC or mixed HCC-CCC between 2018 and 2021, and 169 patients with liver cirrhosis as the control group. Inclusion criteria required a diagnosis of HCC based on clinical, imaging, and biochemical evidence. The methods included DNA and RNA extraction, reverse

transcription, nested PCR, sequencing, droplet digital PCR, phylogenetic analysis, and statistical analysis performed using Prism version 9.3.1.

Results:

Our results showed frequent accumulation of tumor risk factors. Only 15.9% of HCC patients had a single risk factor, while approximately 36% presented with at least 4 risk factors. The predominant genotype among HCV-infected HCC patients was 3a. A particularly high rate of Occult B infection (OBI) was observed among HCC patients (46.6%, $p = 1.058 \times 10^{-5}$). Our results revealed a high frequency of TERT promoter mutations in HCC cases (24%), along with the presence of AFB1-associated TP53 mutations (3%) in free-circulating DNA (fcDNA). In comparison, mutations were significantly less common in LC patients (3% and 7%, respectively, $P=0.0057$). Additionally, the mutation burden (mutated copies/mL) was significantly higher in HCC patients than in those with LC ($P=0.0063$). Among HCC patients, the prevalence of mutations was positively associated with anti-HCV positivity and elevated AFP levels, but inversely correlated with the Hepatic Steatosis Index. These findings suggest a high mutation burden in Armenian HCC patients.

Conclusions:

Circulating mutations in plasma are promising tools for the diagnosis of HCC and for monitoring the treatment of patients in Armenia, and potentially in other populations.

A small proportion of Armenian patients with severe liver disease appears to have been exposed to Aflatoxin B1 (TP53 R249S), suggesting that food products may occasionally be contaminated with Aspergillus species.

2496 - Development and validation of an artificial intelligence driven convolutional neural network for automated stool colour classification to facilitate early diagnosis of biliary atresia

Arjun Maria¹, Vivek Patel², Ashrita Avalareddy³, Kalpana Panda⁴, Vipul Gautam⁵
Amrita Institute Of Medical Sciences, Pediatric Gastroenterology Hepatology, Noida-India ¹ Amrita Institute Of Medical Sciences, School Of Artificial Intelligence, Amrita Vishwa Vidyapeetham, Faridabad-India ² Aster Hospital, Pediatric Hepatology, Bangalore-

ORAL ABSTRACTS

India ³ Sum Hospital, Pediatric Gastroenterology, Bhubaneswar-India ⁴ Max Hospital, Saket, Pediatric Hepatology, Delhi-India ⁵

Background / Hypothesis:

Early recognition of acholic (pale) stools in infants with cholestasis is critical. Misclassification of stool colour by parents and frontline community health workers remains common. To address this gap, we developed and validated an AI-driven convolutional neural network (CNN) capable of automated stool colour classification. The long-term goal is to deploy this tool widely so that caregivers can upload a stool image and receive immediate guidance on whether the stool is pale, prompting earlier medical evaluation.

Materials and Methods:

Pale stools from confirmed biliary atresia patients (2023-2025) were included. Pigmented stools were obtained from healthy infants. Images were captured using parent-owned mobile phones with varying resolution, lighting, and clarity. Stool color was confirmed by 2 pediatric hepatologists. After excluding severely blurred images, 74 pale and 110 pigmented images formed the training set. AI model used a DenseNet121 architecture. A validation cohort of 37 images was labelled by a pediatric hepatologist (gold standard) and compared with classifications by a parent, intern, nurse and the AI model.

Results:

AI model achieved perfect agreement with experts, identical to the nurse ($\kappa = 1.00$; Sensitivity 100%; Specificity 100%; AUROC 1.00). This was followed by stool classification by the intern ($\kappa = 0.94$; Sensitivity 100%, Specificity 93%). Parents showed only moderate agreement ($\kappa = 0.62$) with Sensitivity 74% and Specificity 94%, misclassifying 7/37 stools. AUROC values were 1.00 (AI model and nurse), 0.97 (intern), and 0.84 (parent). Fisher's exact testing confirmed strong association with expert classification for AI model and nurse ($p = 1.6 \times 10^{-10}$) and intern ($p = 3.9 \times 10^{-9}$), with weaker association for parents ($p = 1.1 \times 10^{-4}$)

Conclusions:

Parents show suboptimal correlation with expert, underscoring the need for an automated tool. The DenseNet121 model performed at expert level and can be deployed through QR codes on immunisation cards,

enabling caregivers to upload stool images and receive immediate guidance

Keyword(s) : Biliary atresia, DenseNet121 convolutional learning network, early pale stool identification

2499 - Wilson disease mutation pattern with genotype phenotype correlations in paediatric cohort in south India

Sindhuja Thatti Audikesavalu ¹, Deepa J ¹, Nirmala D ¹, Senthil Kumar R ¹
Institute Of Child Health, madras Medical College, Department Of Paediatric Gastroenterology, Chennai-India ¹

Background / Hypothesis:

Wilson disease (WD) is an autosomal recessive disorder of copper metabolism caused by pathogenic variants in the ATP7B gene. India shows marked genetic heterogeneity, and data focusing on paediatric cohorts from South India remain limited. Understanding regional mutation patterns and genotype-phenotype correlations is important for early diagnosis, family screening, and management.

Objectives:

To describe the spectrum of ATP7B gene mutations and evaluate genotype-phenotype correlation in children diagnosed with Wilson disease in South India

Materials and Methods:

Paediatric patients (<12 years) with a confirmed diagnosis of Wilson disease based on clinical, biochemical, and ophthalmologic criteria were included. Genomic DNA was analyzed using ATP7B gene sequencing. Identified variants were classified as homozygous or compound heterozygous. Clinical phenotype (hepatic, neurological, mixed), age at onset, biochemical parameters, and disease severity were correlated with genotypes.

Results:

Total(n=12)WD patients underwent ATP7B gene analysis. Mean age=10 years, 60% preseted with DCLD. 70% consanguinity present. Pathogenic or likely pathogenic variants were identified in all patients. mutation spectrum demonstrated marked heterogeneity, involving multiple exons across the ATP7B gene, with a predominance of missense variants. Most patients harbored homozygous mutations, reflecting a high rate of autosomal recessive inheritance, while compound heterozygosity was observed in a smaller proportion. Missense mutations constituted the majority of variants,

ORAL ABSTRACTS

followed by nonsense and frameshift mutations. A single intronic variant of uncertain significance was also identified in our cohort. Recurrent mutations were noted in specific exons. c.3182G>A (p.Gly1061Glu) mutation in exon 14 was among the most frequently observed variants, detected both in homozygous and compound heterozygous states.

Another recurrent pathogenic mutation was c.813C>A (p.Cys271Ter) in exon 2, a stop-gain variant leading to premature protein truncation. Variants affecting exon 19, particularly c.4021G>A (p.Gly1341Ser) involving the splice region, were identified in multiple patients, predominantly in the homozygous state. Additional pathogenic or likely pathogenic missense mutations included c.2906G>A (p.Arg969Gln) in exon 13 and c.3236G>T (p.Cys1079Phe) in exon 14. A frameshift mutation, c.528del (p.Ser177HisfsTer25) in exon 2, was identified in the homozygous state and classified as likely pathogenic.

One patient exhibited compound heterozygosity involving variants in exons 13 and 14. An intronic variant c.2731-3T>G in intron 11, classified as a variant of uncertain significance (VUS) and occurred in the homozygous state.

Conclusions:

Overall, no single founder mutation was identified. Despite the presence of recurrent variants, there was no consistent genotype-phenotype correlation across unrelated patients. However, the predominance of homozygous pathogenic variants highlights the importance of genetic testing and family screening in this population.

2504 - Long term outcomes of patients with Hepatitis D recurrence after liver transplantation

Devrim Muge Ozari Gulnar ¹, Ozgur Aktas ², Zeynep Melekoglu ³, Ilker Turan ⁴, Nilay Danis ⁵, Murat Harputluoglu ⁶, Gokhan Kabacam ⁷, Cihan Yurdaydin ¹
Koc University Hospital, Gastroenterology & Hepatology, Istanbul-Türkiye ¹ Koc University Hospital, School Of Medicine, Istanbul-Türkiye ² Ankara University, Gastroenterology & Hepatology, Ankara-Türkiye ³ Ege University, Gastroenterology & Hepatology, Izmir-Türkiye ⁴ Dokuz Eylul University, Gastroenterology & Hepatology, Izmir-Türkiye ⁵ Monu

University, Gastroenterology & Hepatology, Malatya-Türkiye ⁶ Guven University Hospital, Gastroenterology & Hepatology, Ankara-Türkiye ⁷

Background / Hypothesis: Turkey is considered an endemic country for hepatitis D virus (HDV), and liver transplantation (LT) remains an important rescue treatment. Guidelines recommend indefinite hepatitis B immune globulin (HBIG) and nucleos(t)ide analog (NA) treatment to prevent hepatitis D virus (HDV) recurrence after LT. We aimed to present LT outcomes for HDV in Turkey from 6 liver transplantation centres (2010 to 2025).

Materials and Methods: HDV recurrence was defined as becoming HBsAg and HDV-RNA positive after LT. Demographic, serologic, clinical, and virologic parameters were assessed. Patients had received livers from HBsAg negative, anti-HBc-negative donors except for one case who received a HBsAg (+) after talking to patient who accepted the risk. Except one centre (Ege University) at which HBIG was given only for one year all other centres offered HBIG + NA treatment of indefinite duration.

Results: During the 15-year period a total of 4345 LTs were performed (558 cadaveric and 3787 living related). HBV and HBV/HDV associated liver disease were the etiology in 1743 (40%) and 305 (7%) of 4345 LTs, respectively. Post-transplantation HDV recurrence (Post-txR) occurred in 18 patients (5.9%); (median age: 49 [18-66], 16 men, 2 women). LT indication was decompensated liver disease (DLD) in 10 and hepatocellular cancer (HCC) in 8. Post-txR occurred after a median of 27.5 months (1-54 months). HBIG was administered for median 10.5 months (0- 36 months). Except one patient (HBsAg+ donor), post-txR occurred after HBIG discontinuation in all cases. Of 18 patients with post-txR, 10 patients enjoyed a mild disease course despite lack of antiviral treatment. Eight patients died during median 92.5 months follow up (4-158 months). Causes: liver-related (n=2, including one with severe HDV recurrence with ALT >5000U/mL, >100 million and 1 million IU/nmL of HDVRNA and HBVDNA, respectively), biliary stenosis-linked sepsis (n=2), B-cell lymphoma (n=1), COVID-19 (n=1), earthquake (n=1), unknown (n=1). Notably, Koç University had zero HDV recurrence among 11 HDV-related LTs (all living donor, 2018-2025) using their risk-stratified HBIG/NA protocol.

Conclusions: HBsAg recurrence is rare after LT for HDV but can occur with HBIG/NA non-compliance, potentially leading to HDV recurrence. HDV recurrence

ORAL ABSTRACTS

appears to run a mild clinical course in line with early reports from Italy and France (1, 2), though severe recurrence with graft failure may also occur. Latent HDV infection of the liver allograft may be rescued by HBV superinfection up to 4 years after LT as suggested previously (3).

Keyword(s) : Hepatitis D virus, Liver transplantation, Recurrence, HBIg, Prophylaxis

2505 - Lonafarnib as finite treatment for chronic hepatitis D Long term follow up data

Cihan Yurdaydin¹, Muge Ozari Gulnar¹, Olga Metin², Ozgur Aktas³, Esra Yurdcu², Selin Ozer³, Onur Keskin⁴, Mesut Gumussoy², Emin Bodakci², Xheni Deda², Sevda Aghayeva², Genco Gencdal¹, Mujdat Zeybel¹, Ramazan Idilman², Mithat Abdurrahman Bozdayi², Ingrid Choong⁵, Jeffrey S. Glenn⁶
Koc University Hospital, Gastroenterology & Hepatology, Istanbul-Türkiye¹ Ankara University, Gastroenterology & Hepatology, Ankara-Türkiye² Koc University Hospital, School Of Medicine, Istanbul-Türkiye³ Hacettepe University, Gastroenterology & Hepatology, Ankara-Türkiye⁴ Seiger Biopharmaceuticals Inc, Palo Alto, California-United States⁵ Stanford University School Of Medicine, Division Of Gastroenterology And Hepatology, And Department Of Microbiology & Immunology, California-United States⁶

Background / Hypothesis: Hepatitis delta virus (HDV) infection leads to the most severe form of viral hepatitis. New treatment options are urgently needed. The farnesyl transferase inhibitor lonafarnib (LNF) may be an option for finite treatment as it possesses a dual mode of action: it interferes with virion assembly (Glenn et al Science 1992) and also has immunomodulatory properties (Lempp et al, Nat Commun 2019). The aim of this study was to assess if finite treatment with a LNF-based regimen is able to prevent hard endpoints such as complications of liver disease and death from liver disease on long-term follow-up (LTFU).

Materials and Methods: All patients subject to this study had received LNF-based treatment in two phase 2 (LOWR 1 and 2) and one phase 2 (LIFT) studies in Ankara (TR) and NIH (USA), respectively, and one phase 3 (DLIVR) study in Istanbul (TR). LOWR 1 and 2 studies contained 21 and 55 patients, respectively, the LIFT study 26 and the phase 3 Istanbul study contained 27 patients with a LNF-based treatment. Start date used for LTFU (median 79.5 months (0-134, n=97) and survival analysis was EOT date of LNF-based treatment. End of follow-up (EOFU) was set to either the last date of data

collection (March 2025), or the date of liver-related event, the start date of a new potential treatment against HDV or loss to follow-up. Short-term viral response (STVR) was defined as undetectable HDV RNA or a ≥ 2 log decline of HDV RNA compared to baseline and biochemical response (BR) as ALT normalization at off treatment month 6. BR and VR were the co-primary endpoints. Cumulative probabilities of any event occurrence were estimated by the Kaplan-Meier method and compared with the log-rank test. Uni- and multivariate logistic regression models with forward Wald deletion were used to estimate the effect of various on and off-treatment variables on clinical outcome.

Results: STVR was achieved in 12 patients. On LTFU none of these patients developed a clinical event in up to 10 years of follow up. Out of 85 patients without VR+BR, 17(20%) developed an event (Figure, $p < 0.05$ by the log rank test).

Conclusions: Patients achieving a 2 log drop in HDV RNA from baseline and normal ALT at 6 months after stopping any finite lonafarnib-based treatment regimen have no major clinical events (liver decompensation, liver cancer, or death) in up to 10 years of follow up.

Keyword(s) : Hepatitis Delta Virus, Lonafarnib, Chronic Hepatitis Delta, Viral Response, HDV RNA

2506 - Evaluation of anti HCV positivity HCV RNA testing and treatment status among individuals presenting to the hospital

Irem Ciftci¹, Irem Askin Yilmaz¹, Selma Tosun¹
Izmir City Hospital, Infectious Diseases And Clinical Microbiology, Izmir-Türkiye¹

Background / Hypothesis: Hepatitis C virus (HCV) is an infectious disease that can lead to chronic liver disease, cirrhosis and hepatocellular carcinoma (HCC). It can now be easily treated with direct-acting antivirals, yielding high response rates. However, it is known that some patients remain undiagnosed and therefore unable to receive treatment. Identifying and treating these cases is crucial for microelimination programmes. The aim of this study was to evaluate the test results of individuals who underwent anti-HCV testing for various reasons at a tertiary care hospital, and to assess the status of HCV RNA testing and the initiation of treatment in patients who tested positive.

Materials and Methods: Between October 2023 and December 2025, the test results of individuals who applied to Izmir City Hospital and requested anti-HCV

ORAL ABSTRACTS

testing were examined using an automated system. Anti-HCV results were classified as positive, borderline and negative. Duplicate data were excluded from the analysis. The distribution of test results by age was examined, and the treatment status of patients with positive anti-HCV results was evaluated by reviewing HCV-RNA test requests and reports.

Results: During the study period, anti-HCV testing was requested for 213,023 individuals aged 18–114 years. Anti-HCV positivity was detected in 914 individuals (0.43%). Anti-HCV testing was most frequently requested by surgical departments (405/914, 44.3%), followed by internal medicine clinics (320/914, 35%), gastroenterology (84/914, 9.2%), and infectious diseases clinics (75/914, 8.2%). Overall seropositivity was low but increased with age, particularly among individuals aged ≥ 60 years. HCV RNA testing was requested for 1,248 individuals, with most requests originating from internal medicine departments (1,024/1,248, 82%) and the remainder from surgical departments (224/1,248, 18%). Within internal medicine departments, HCV RNA testing was most frequently requested by infectious diseases clinics (248/1,024, 24.2%), followed by gastroenterology (163/1,024, 16%). Of the 1,248 individuals tested for HCV RNA, 85 (6.8%) were positive. HCV RNA positivity was higher among individuals aged ≥ 46 years and showed a progressive increase with advancing age, with a modest secondary increase observed in the 26–35 age group. Treatment status was determined through a review of the hospital information system and reports, revealing that antiviral treatment had been initiated in 56 patients (65.9%) and it was provided by infectious diseases clinics for 39 patients and by gastroenterology clinics for 17 patients.

Conclusions: Anti-HCV seropositivity was 0.43% and increased with age. Anti-HCV tests were most frequently requested by surgical departments, while HCV RNA testing was mainly requested by internal medicine clinics, likely related to routine preoperative screening. Although treatment was initiated in most HCV RNA-positive patients (65.9%), a proportion remained untreated. These findings indicate losses in the transition from diagnosis to treatment and suggest that reflex HCV RNA testing and effective referral systems may be critical for achieving HCV microelimination.

Keyword(s) : Hepatitis C , microelimination, HCV-RNA, Direct-acting antivirals

2507 - High Treatment Adherence Reduces HCC in Cirrhosis with Additional Benefit from TAF Running

title Adherence Lowers HCC Risk in Cirrhosis

Jeong-ju Yoo ¹

Soonchunhyang University Bucheon Hospital, Internal Medicine, Bucheon-South Korea ¹

Background: Adherence to antiviral therapy is essential for viral suppression in chronic hepatitis B (CHB), yet its effect on hepatocellular carcinoma (HCC) remains uncertain. We examined the association between nucleos(t)ide analogue (NA) adherence and HCC risk, focusing on tenofovir alafenamide (TAF) versus entecavir (ETV).

Methods: Treatment-naïve adults with CHB initiating TAF or ETV were identified from the Korean National Health Insurance Service database. Adherence was measured using the medication possession ratio, with high adherence defined as $\geq 90\%$. The primary outcome was HCC incidence.

Results: A total of 28,448 patients were included, of whom 19,001 (66.8%) showed high adherence and 9,447 (33.2%) low adherence. In the overall cohort, HCC incidence was comparable between high- and low-adherence groups (14.89 vs. 13.76 per 1,000 person-years; IRR 1.08, 95% CI 0.95–1.24). Among cirrhotic patients, however, high adherence was associated with substantially lower HCC incidence (32.92 vs. 49.59 per 1,000 person-years; IRR 0.66, 95% CI 0.57–0.78). Multivariate analysis confirmed high adherence as an independent protective factor (HR 0.77, 95% CI 0.66–0.90). Notably, within the high-adherence group, TAF was linked to a significantly lower HCC risk than ETV (HR 0.54 vs. 0.89; log-rank $p < 0.001$), whereas low adherence to either agent conferred no protection. Logistic regression further identified ETV use as a strong predictor of poor adherence (OR 2.80, 95% CI 2.65–2.96).

Conclusions: High adherence to antiviral therapy reduces HCC risk in cirrhotic CHB patients. TAF showed superior outcomes to ETV, reflecting both greater adherence and a potential intrinsic advantage.

2508 - Midodrine with albumin improves ascites control in Acute on chronic liver failure A Double Blind Randomized trial (MIDAS trial)

Anand Kulkarni ¹, **Shantan Venishetty** ¹, **Sridevi Prasanna** ¹, **Sowmya Iyengar** ¹, **Mithun Sharma** ¹, **Manasa Alla** ¹, **Pn**

ORAL ABSTRACTS

Rao¹, Nageshwar Reddy¹
Aig Hospitals, Hepatology, Hyderabad-India¹

Background: Ascites is common in patients with acute-on-chronic liver failure (ACLF) and can complicate the course of ACLF due to circulatory dysfunction and hemodynamic compromise. Oral midodrine has been variably reported to improve hemodynamics and reduce complications of ascites in patients with decompensated cirrhosis, but its role in high Model for End-Stage Liver Disease (MELD) ACLF patients remains unknown, which we, thus, aimed to assess.

Materials and Methods: In this single-centre, double-blind, randomised trial, patients with ACLF were assigned 1:1 to receive midodrine (5-7.5 mg TID) or a placebo for 30 days, alongside standard care. Transplant-free survival (TFS) at 1 month was the primary outcome, while secondary outcomes included TFS at 3 months, the proportion of patients achieving ascites control, changes in mean arterial pressure (MAP) and plasma renin activity (PRA) at 1 month, the incidence of cirrhosis complications, and diuretic-related complications. A sub-group analysis of patients who received albumin was performed.

Results: One hundred and thirty ACLF patients were enrolled. Midodrine use was not associated with improvement in TFS at 1 (hazard ratio [HR], 0.99 [95% CI, 0.37-2.65]) and 3 months (HR, 0.93 [95% CI, 0.48-1.8]). Ascites control at day 30 (placebo: 9.2% [95% CI, 3.5-19] vs. (midodrine: 20% [95% CI, 12.3-33.5]; $P=0.08$) and 90 (placebo: 44.6% [95% CI, 32.2-57.5] vs. (midodrine: 53.8% [95% CI, 41-66.3]; $P=0.055$) was comparable. MAP increased significantly in midodrine arm at day 30 (1.9 mmHg vs. 6.9 mmHg; $P=0.003$) with a reduction in PRA levels (delta change: 0.22 ± 1.6 vs. -1.6 ± 2.2 ; $P=0.09$). Any complication occurred in 74% of patients in the placebo arm and 81.5% in the midodrine arm ($P=0.4$), while diuretic-induced complications were seen in 29% and 24.6%, respectively ($P=0.55$). In the subgroup analysis, 25 patients received only placebo, 40 received only albumin, 26 received midodrine alone, and 39 received a combination of midodrine and albumin. Survival was similar across the four groups. However, on Kaplan Meier analysis, control of ascites was noted in 40% (10/25) in placebo only arm, 47.5% (19/40) in albumin-only arm, 46.5% (12/26) in midodrine only arm and 59% (23/39) in midodrine and albumin arm at day 90 (Log rank $P=0.08$). Further, addition of albumin to midodrine reduced the need of ascitic tapping (15.4% vs. 68% in

placebo).

Conclusions: Midodrine in patients with ACLF can increase MAP but has no clinically relevant TFS benefit at day 30 and 90. However, the addition of albumin to midodrine reduced the need for paracentesis in patients with ACLF.

Keyword(s): ACLF, midodrine, APASL, Ascites

2510 - Efficacy of PegIFN α Add on Therapy in Treatment Experienced CHB Patients with Low Level Viremia A Large Prospective Cohort Study
Bei Jiang¹, Suzhen Jiang², Danli Yang¹, Fengmin Lu¹
Peking University, Peking University Health Science Center, Beijing-China¹ Peking University, Peking University People's Hospital, Beijing-China²

Background: / **Hypothesis:** Low-level viremia (LLV) is increasingly recognized in chronic hepatitis B (CHB) patients undergoing long-term nucleos(t)ide analog (NA) therapy. Despite achieving partial suppression, these patients remain at a heightened risk for liver fibrosis, cirrhosis, and hepatocellular carcinoma (HCC). Effectively managing LLV to achieve complete virological response and potential functional cure remains a critical clinical challenge.

Materials and Methods: In this prospective cohort study, we consecutively enrolled 2,048 treatment-experienced CHB patients with LLV (defined as serum HBV DNA ≥ 10 IU/mL and $< 2,000$ IU/mL) between December 2021 and January 2025. Patients were categorized into three treatment strategy groups: (1) NA Monotherapy (ETV, TDF, or TAF); (2) NA Combination therapy (ETV+TDF or TAF+ETV); and (3) Add-on Peg-IFN α -2b therapy. Clinical outcomes, including virological response and HBsAg/HBeAg clearance, were monitored over a longitudinal follow-up period.

Results: Baseline analysis showed that higher HBV DNA levels correlated positively with HBsAg levels. Interestingly, the highest FIB-4 scores were observed in the 10-100 IU/mL subgroup, suggesting persistent inflammatory progression even at very low viral loads. HBeAg-negative patients achieved significantly higher virological response rates than HBeAg-positive patients. Among the three regimens, the Peg-IFN α -2b add-on group demonstrated superior efficacy, reaching the highest rates of virological response, HBeAg seroconversion, and HBsAg loss. Furthermore, in

ORAL ABSTRACTS

patients aged >35 years, the Peg-IFN α -2b group still showed significantly higher virological response rates compared to both NA monotherapy and combination groups.

Conclusions:

For CHB patients experiencing LLV during NA treatment, switching to or adding Peg-IFN α -2b is more effective than continuing NA monotherapy or switching to NA combination therapy in achieving virological and serological goals. This strategy appears robust across different age groups, suggesting that age should not be a limiting factor when considering interferon-based therapy to mitigate the risks associated with LLV.

Keyword(s) : CHB, NAs, LLV, Virological Response

2511 - Diagnostic accuracy of blood based non invasive tests for screening of varices in children with portal hypertension A systematic review and meta analysis

Kalpana Panda¹, Devi Prasad Dash², Girish Kumar Pati³, Arjun Maria⁴, Vipul Gautam⁵
Institute Of Medical Sciences And Sum Hopsital, Pediatric Gastroenterology And Hepatology, Bhubaneswar-India¹ Kalinga Institute Of Medical Sciences, Critical Care Medicine, Bhubaneswar-India² Institute Of Medical Sciences And Sum Hopsital, Gastroenterology And Hepatology, Bhubaneswar-India³ Amrita Institute Of Medical Sciences, Pediatric Gastroenterology And Hepatology, Faridabad-India⁴ Max Superspecialty Hospital, Pediatric Hepatology, New Delhi-India⁵

Background / **Hypothesis:**
Portal hypertension (PHT) in children is associated with a high risk of esophageal/gastric varices (EV), which may result in life-threatening upper gastrointestinal bleeding, particularly in those with clinically significant varices (CSV). Upper gastrointestinal endoscopy (UGIE) is the reference standard for variceal detection, but is invasive, resource-intensive, and often requires anaesthesia in children. Non-invasive imaging modalities, such as liver and splenic stiffness measurements, show promise but have limited availability and feasibility, particularly in resource-limited settings. Blood-based non-invasive tests represent an attractive alternative; however, their diagnostic performance in children has not been comprehensively synthesised. Therefore, this study was planned to systematically evaluate and meta-analyse the diagnostic accuracy of blood-based non-invasive tests for predicting EV and CSV in pediatric PHT.

Materials and **Methods:**

We conducted this systematic review and diagnostic accuracy meta-analysis following PRISMA-DTA guidelines. PubMed, Embase, and Scopus were searched from inception to October 2025. Studies evaluating APRI, platelet count, Clinical Prediction Rule (CPR), Varices Prediction Rule (VPR), or King's Variceal Prediction Score (K-VaPS) against UGIE in children (≤ 18 years) with PHT were included. Hierarchical summary receiver operating characteristic (HSROC) models were used to pool sensitivity, specificity, diagnostic odds ratios (DOR), and area under the curve (AUC). Subgroup, sensitivity, and publication bias analyses were performed. Risk of Bias was assessed using QUADAS-2 criteria.

Results:

Twenty-four studies were included [APRI-17 studies (N=1355), Platelet count-11 studies (N=1040), CPR-12 studies (N=944), VPR-7 studies (N=655), K-VaPS-5 studies (N=315)]. APRI demonstrated pooled sensitivities & specificities of 0.77 & 0.71 for EV and 0.72 & 0.61 for CSV, with corresponding AUCs of 0.795 and 0.776, respectively. Platelet count showed pooled sensitivities & specificities of 0.69 & 0.77 for EV and 0.66 & 0.72 for CSV, with AUCs of 0.834 and 0.714, respectively. Among prediction scores, VPR showed highest accuracy for CSV prediction (AUC 0.864), followed by K-VaPS (0.727) and CPR (0.717). Substantial heterogeneity was observed across most of the analyses. Diagnostic accuracy was consistently higher in biliary atresia-exclusive cohorts and Asian populations. A high risk of bias was observed in the flow & timing domain of eight studies. The certainty of evidence ranged from moderate to very low.

Conclusions:

Blood-based non-invasive tests demonstrate moderate accuracy for predicting varices in pediatric PHT and may serve as adjunctive triage tools; however, standardised pediatric thresholds and prospective validation are urgently needed.

2514 - Long term Clinical Outcomes of Delta Hepatitis in A Single Center Experience

Furkan Kirsoy¹, Ali Çağrı Oral², Abdulvahap Hohluoğlu¹, Selman Çetin¹, Sedat Çiçek¹, Mübin Özercan¹, Mehmet Yalniz¹, Ibrahim Halil Bahçecioğlu¹
Firat University Faculty Of Medicine, Department Of

ORAL ABSTRACTS

Gastroenterology, Elazig-Türkiye ¹ Elazig Fethi Sekin City Hospital, Department Of Gastroenterology, Elazig-Türkiye ²

Background / Hypothesis:

Delta hepatitis represents the most aggressive form of chronic viral hepatitis and is associated with rapid progression to cirrhosis, a high risk of hepatocellular carcinoma (HCC), and increased mortality. Real-world long-term data are essential to better understand the natural history of the disease and the clinical impact of antiviral treatment strategies. This study aimed to evaluate long-term clinical outcomes, including hepatocellular carcinoma development and mortality, in patients with delta hepatitis followed at a single center.

Materials and Methods:

This retrospective study included 132 patients with delta hepatitis who were followed at a single center over a fifteen-year period. Demographic characteristics, cirrhosis status at diagnosis, development of cirrhosis and HCC during follow-up, histopathological findings, mortality and non-invasive fibrosis scores were analyzed. Appropriate parametric and non-parametric statistical tests were used according to data distribution.

Results:

The median age of the patients was 54.0 years, and 66.7% were male. Cirrhosis was present at diagnosis in 80.5% of patients. HCC was detected in 5.3% of patients at diagnosis and developed in 12.9% during follow-up, resulting in an overall HCC rate of 18.2%. Patients with cirrhosis at diagnosis had a significantly higher rate of HCC compared with those without cirrhosis (21.9% vs 3.7%, $p=0.027$). When cirrhosis subgroups were evaluated, HCC rates increased significantly from non-cirrhotic patients (3.7%) to compensated cirrhosis (19.8%) and reached the highest level in decompensated cirrhosis (75.0%, $p=0.003$). A total of 98 patients received pegylated interferon therapy. Among patients who received pegylated interferon therapy, mortality was significantly lower compared with those who did not receive pegylated interferon therapy, regardless of virological response (12.2% vs 41.2%, $p<0.001$).

Conclusions:

This single-center long-term follow-up study demonstrates that delta hepatitis is associated with a

high burden of cirrhosis, HCC, and mortality. The risk of HCC increases dramatically with advancing cirrhosis stage. Pegylated interferon therapy was associated with a significant reduction in mortality, emphasizing the importance of early diagnosis, close surveillance, and effective treatment strategies in this high-risk patient population.

Keyword(s) : delta hepatitis, cirrhosis, hepatocellular carcinoma, pegylated interferon, mortality

2518 - Antinuclear Antibodies Positivity Indicates a High inflammatory Phenotype in Primary Biliary Cholangitis A Multicenter Retrospective Analysis

Shasha Li ¹, Yongfeng Yang ¹
Clinical Teaching Hospital Of Medical School,
Department Of Liver Disease, Nanjing-China ¹

Background / Hypothesis:

To investigate the impact of antinuclear antibodies (ANAs) status on the clinical and pathological characteristics, short-term treatment response, and long-term prognosis of patients with primary biliary cholangitis (PBC).

Materials and Methods:

A retrospective analysis was performed on 690 PBC patients admitted to eight tertiary medical centers, including Nanjing Second Hospital, from January 2017 to October 2023. Patients were divided into an ANAs-negative group ($n = 96$) and an ANAs-positive group ($n = 594$). Propensity score matching (1:1) was used to balance age and sex between groups. Laboratory parameters, histopathological features, short-term biochemical response, and hepatic decompensation events were compared.

Results:

After matching, each group included 96 patients. Baseline aspartate aminotransferase (AST), γ -glutamyl transpeptidase (GGT), alkaline phosphatase (ALP), and immunoglobulin G (IgG) levels were significantly higher in the ANAs-positive group than in the ANAs-negative group (all $P < 0.05$). The prevalence of gp210 and/or sp100 positivity was also significantly higher in ANAs-positive patients ($P = 0.005$). Histologically, the ANAs-positive group showed a higher incidence of epithelioid granuloma ($P = 0.028$) and more severe interface hepatitis ($P < 0.001$) as well as higher Nakanuma hepatitis activity scores ($P < 0.001$). No significant differences were observed in the 12-month biochemical response rate or hepatic decompensation incidence

ORAL ABSTRACTS

between groups (both $P > 0.05$). Multivariate Cox regression analysis identified platelet count $\leq 0.3 \times \text{ULN}$, albumin $\leq 0.6 \times \text{ULN}$, and fibrosis stage $S \geq S3$ as independent risk factors for hepatic decompensation in PBC patients.

Conclusions:

ANAs-positive PBC patients exhibited a high inflammatory burden phenotype, suggesting that ANAs status may serve as a potential serological marker of disease activity. Its prognostic and therapeutic implications require further confirmation in prospective long-term studies.

2519 - The long term results of EUS guided coil application for fundal varices

Sercan Kiremitci ¹, Gulseren Seven ², Ali Tüzün Ince ¹, Hakan Senturk ¹

Gastroenterology, Bezmialem Vakif University, Istanbul-Türkiye ¹ Gastroenterology, Medicana Hospital, Istanbul-Türkiye ²

Background / Hypothesis: Chronic liver disease and the associated development of portal hypertension and portal vein thrombosis are important causes of morbidity and mortality. As a result of both portal hypertension and portal or splenic vein thrombosis, esophageal and gastric varices may develop. If these varices are not treated, they can cause bleeding with a high risk of mortality. Band ligation of esophageal varices is a well-established method; however, the treatment of fundal varices is difficult and can only be performed using techniques available in advanced centers.

Materials and Methods: In our study, we aimed to investigate the data and long-term follow-up outcomes of 31 patients who underwent coil application for fundal varices at a single center between 2022 and 2025. Results: A total of 31 patients were included in the study. The mean age of the patients was 59.87 ± 12.23 years. Of the cases, 21 (67.7%) were male and 10 (32.3%) were female. When the etiological distribution was analyzed, the most common causes were metabolic dysfunction associated liver disease (MASLD) and portal vein thrombosis (PVT), each identified in 9 patients (29%). This was followed by alcohol-related liver disease in 8 patients (25.8%) and hepatitis B virus (HBV) infection in 5 patients (16.1%). Twenty patients (64.5%) had a prior history of gastrointestinal bleeding. Patients were

followed up median-range 78 (34-112) weeks. The median MELD score of the patients was calculated as 10 [8-12]. The median number of coils applied was 6 [4-7]. During the follow-up period, 30 patients (96.8%) could be evaluated under follow-up. When laboratory parameters were evaluated, the median urea level was 32 [26-47] mg/dL, creatinine level was 0.98 [0.82-1.13] mg/dL, and albumin level was 3.20 [3.10-3.30] g/dL. The median total bilirubin level was 1.03 [0.61-1.74] mg/dL. Upon examination of hematological parameters, the median neutrophil count was $3.49 [2.21-6.09] \times 10^3/\mu\text{L}$, lymphocyte count was $1.00 [0.68-1.71] \times 10^3/\mu\text{L}$, and platelet count was $99 [68-173] \times 10^3/\mu\text{L}$. The median neutrophil-to-lymphocyte ratio (NLR) was 3.10 [2.26-6.08]. At the end of follow-up period one patient expired due to hepatocellular carcinoma and remaining 30 (96%) patients are still going on follow-up. Conclusions: As demonstrated by the results of our study, endoscopic ultrasound-guided coil application to fundal varices is a safe and effective method that protects patients from the potentially severe mortality risk associated with fundal variceal bleeding. When performed by experienced endoscopists in appropriately selected patients, it represents an effective preventive treatment against the possible risks.

Keyword(s) : Coil, Chronic liver diseases, EUS, Fundal varices

2525 - Adherence to an Admission Care Bundle and Its Impact on Outcomes in Decompensated Cirrhosis A Multicenter Analytical Cross Sectional Study

Federico Peralta ¹, Jemimah Andrea Fajardo ², Ma. Felina Rosanna Siray ¹, Ian Homer Cua ¹, Juliet Cervantes ¹ St. Luke's Medical Center - Global City, Institute Of Digestive And Liver Diseases, Aguig City-Philippines ¹ St. Luke's Medical Center - Quezon City, Institute Of Digestive And Liver Diseases, Quezon City-Philippines ²

Background: Decompensated liver cirrhosis is associated with high inpatient mortality and frequent complications. The British Society of Gastroenterology and British Association for the Study of the Liver (BSG/BASL) admission care bundle aims to standardize early inpatient management. However, real-world outcome data from low and middle-income settings like the Philippines remain limited.

Materials and Methods: This study included 146 adult admissions for decompensated cirrhosis at two tertiary referral hospitals between January 2022 and May 2025. Compliance with the BSG/BASL admission care bundle comprising seven evidence-based interventions implemented within 24 hours of admission. Outcomes

ORAL ABSTRACTS

included in-hospital mortality, length of hospital stay (LOS), acute kidney injury (AKI) and nosocomial infection. Disease severity and inflammatory burden were assessed using the MELD-Na score and the systemic immune-inflammatory index (SII). Multivariable logistic regression was used for mortality, AKI, and infection, and linear regression for LOS, adjusting for age and bundle compliance. MELD-Na and SII were modeled separately.

Results: 17.9% achieved full compliance and 82.1% partial compliance. On multivariable analysis adjusting for age and MELD-Na, full compliance was independently associated with improved in-hospital survival compared with partial compliance (OR 4.26, 95% CI 1.13–16.01, $p = 0.032$). MELD-Na was independently associated with mortality (OR 1.05 95% CI 1.00–1.10, $p = 0.048$). In a separate model adjusting for SII, full compliance remained independently associated with survival (OR 5.29, 95% CI 1.42–19.74), while higher SII was associated with mortality (OR 1.0003, 95% CI 1.00002–1.00058). MELD-Na was independently associated with both AKI and nosocomial infection, whereas bundle compliance was not independently associated with these complications after adjustment. Neither MELD-Na nor SII was independently associated with LOS.

Conclusion: Full adherence to the BSG/BASL admission care bundle is independently associated with improved in-hospital survival in decompensated cirrhosis, while AKI and infection appear primarily driven by underlying disease severity.

Keyword(s) : Decompensated cirrhosis; BSG/BASL; MELD-Na; Systemic immune-inflammatory index

2527 - Prognostic Stratification of Non Ischemic Acute Liver Injury in the Emergency Department A Retrospective Cohort Study

Pelin Tellı¹, Gizem Dagci¹, Mehmet Akif Yaglı¹, Asim Gurbanov¹, Besim Fazil Agargun¹, Sabuhi Mammadov¹, Ersel Bilgin¹, Bilger Cavus¹, Asli Cifcibasi Ormeci¹, Filiz Akyuz¹, Kadir Demir¹, Fatih Besisik¹, Sabahattin Kaymakoglu¹

Istanbul University Faculty Of Medicine, Gastroenterology, Istanbul-Türkiye¹

Background / Hypothesis: Patients presenting to the emergency department (ED) with acute liver injury (ALI) represent a heterogeneous group with variable outcomes. While prognosis is well-defined for specific etiologies like paracetamol toxicity or viral hepatitis, the

early risk stratification of undifferentiated ALI remains challenging. Specifically, the utility of complex scoring systems (e.g., MELD-Na) versus simple static markers in the initial ED assessment is debated. We aimed to evaluate the etiology, clinical characteristics, and predictors of in-hospital mortality in a tertiary cohort of patients with non-ischemic ALI.

Materials and Methods: We performed a retrospective observational study of adult patients presenting to a tertiary referral center (2023–2024) with acute liver injury. Inclusion criteria were broadly defined as ALT > 5x ULN to capture early-stage injury, encompassing both Drug-Induced Liver Injury (DILI) Grade 3 criteria and acute viral hepatitis. To focus on primary hepatic injury, patients with ischemic hepatitis ("shock liver") and obstructive jaundice were strictly excluded. The primary outcome was in-hospital mortality. Univariate and multivariate logistic regression analyses were performed to identify independent predictors of mortality.

Results: The final study cohort included 115 patients (median age 45 years; 51% male). The etiology was viral hepatitis in 36.5% (n=42), drug-induced/toxic liver injury in 25.2% (n=29), and indeterminate/seronegative in 20.0% (n=23). The overall in-hospital mortality rate was 13.0% (n=15). Mortality was significantly higher in patients with toxic/drug-induced etiology (24.1%) compared to viral hepatitis (7.1%). In univariate analysis, non-survivors were significantly older (median 67 vs. 41.5 years, $p < 0.001$) and had higher admission INR (1.32 vs. 1.06, $p < 0.001$). Notably, admission ALT levels were significantly lower in non-survivors (234 U/L) compared to survivors (560 U/L, $p = 0.03$), reflecting extensive hepatocellular necrosis ("burned-out" phenotype) in the most severe cases. In ROC analysis, Age (AUROC 0.83) and INR (AUROC 0.78) were robust predictors of mortality. The MELD-Na score (AUROC 0.74) did not demonstrate superior prognostic accuracy compared to INR alone in this cohort. In multivariate analysis, Age (OR 1.09, 95% CI 1.04–1.15) and INR (OR 6.4, 95% CI 1.6–25.4) remained independent predictors of mortality.

Conclusions: In this cohort of non-ischemic acute liver injury, etiology and synthetic function are the primary determinants of outcome. Drug-induced and indeterminate etiologies carry a significantly higher

ORAL ABSTRACTS

mortality risk than viral hepatitis. We confirm that in the acute ED setting, simple admission markers, specifically Age and INR provide robust prognostic information that is comparable to more complex scoring systems like MELD-Na. Clinicians should remain vigilant in elderly patients with coagulopathy.

2531 - Evaluation of Leptospirosis Cases in the Şanlıurfa Region

Velat Aytekin¹, Mahmut Polat², Idris Kirhan¹, Savaş Cumali²

Harran University, Department Of Internal Medicine, Şanlıurfa-Türkiye¹ Harran University, Department Of Gastroenterology, Şanlıurfa-Türkiye²

Background / Hypothesis: Leptospirosis is a globally prevalent zoonotic disease caused by *Leptospira* spirochetes. It usually manifests as a self-limiting febrile illness, but severe Weil's disease occurs in 5–10% of cases. This study aims to assess the etiology, clinical features, and complications of leptospirosis in the Şanlıurfa region to enhance awareness and reduce morbidity and mortality.

Materials and Methods: Between January 2020 and January 2025, medical records of 40 patients diagnosed with leptospirosis and followed in the Gastroenterology Clinic of Harran University Hospital were retrospectively reviewed. Demographic characteristics, occupational and environmental exposure histories, clinical symptoms, laboratory findings, imaging results, treatment protocols, and prognostic data were analyzed. Statistical evaluations were performed using SPSS version 24.0

Results: The median age of 40 patients included in the study was 43 years (18–78), and 85% (n=34) were male. Most cases lived in rural areas with a history of agricultural or contaminated water exposure. The most common symptoms were abdominal pain (60%), fever (47.5%), fatigue (47.5%), and myalgia (40%). Jaundice was detected in 30% of patients, while renal failure (15%) and alveolar hemorrhage (22.5%) were the main complications in severe cases. Intensive care was required in 18 patients (45%), and despite all interventions, 2 patients died.

Conclusions: Leptospirosis peaks in summer–autumn in the Şanlıurfa region, posing a major health concern linked to agriculture and well water. Elevated bilirubin, renal failure, alveolar hemorrhage, and thrombocytopenia were mortality factors. Early diagnosis and preventive measures in farmers and breeders are vital to lowering disease burden. Further multicenter studies are needed to define its true incidence.

Keyword(s) : Leptospirosis, Şanlıurfa, Weil's disease, Spirochet

2533 - Cross study analysis of HBsAg rebound following treatments of elebsiran BRIL 179 in combination with peginterferon alfa

Jidong Jia¹, Zhiliang Gao², Grace Lai-hung Wong³, Man-fung Yuen⁴, Bingliang Lin², Yiwen Liu⁵, Chong Zhu⁵, Ke Cao⁵, Alex Tian⁶, Yue Wu⁶, Xiaofei Chen⁵, David Margolis⁷, Qing Zhu⁸, Zhi Hong⁹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China¹ The Third Affiliated Hospital, Sun Yat Sen University, Department Of Infectious Diseases, Guangzhou-China² The Chinese University Of Hong Kong, Medical Data Analytics Centre, Hong Kong-Hong Kong SAR, China³ Queen Mary Hospital, The University Of Hong Kong, Department Of Medicine, School Of Clinical Medicine & State Key Laboratory Of Liver Research, Hong Kong-Hong Kong SAR, China⁴ Bii Biosciences (beijing) Co. Limited, Clinical Research, Shanghai-China⁵ Bii Biosciences (beijing) Co. Limited, Biometrics, Shanghai-China⁶ Bii Biosciences, Inc., Clinical Management, Durham-United States⁷ Bii Biosciences, Inc., Non-clinical, Durham-United States⁸ Bii Biosciences, Inc., Executive, Durham-United States⁹

Background / Hypothesis: siRNA elebsiran and therapeutic vaccine BRIL-179 are being developed for HBV functional cure. In the randomized phase 2 ENSURE study, elebsiran + peginterferon alfa (PEG-IFN α) achieved higher HBsAg loss rate 24 weeks post end-of-treatment (EOT) compared with PEG-IFN α alone in patients with chronic HBV infection receiving nucleos(t)ide analogues (NAs). In another randomized, phase 2 study (BRIL-179-002), BRIL-179 + PEG-IFN α improved EOT and sustained HBsAg loss compared with PEG-IFN α alone. Eligible patients who met NAs discontinuation criteria (HBsAg loss at two consecutive visits, HBV DNA < LLOQ, ALT < 2 $\times$ ULN and HBeAg negative) in both studies discontinued NAs after a consolidation period (12–24

ORAL ABSTRACTS

weeks) and were followed further.

Materials and Methods: This analysis summarizes post-EOT HBsAg rebound (≥ 0.05 IU/mL) in pooled elebsiran/BRIL-179 + PEG-IFN α cohorts and PEG-IFN α alone cohorts from ENSURE (through 12 weeks off-NAs) and BRIL-179-002 (through 48 weeks off-NAs). Fifty-five patients with HBsAg loss at/after EOT were included: 25 patients received elebsiran + PEG-IFN α , 17 patients received BRIL-179 + PEG-IFN α , and 13 patients received PEG-IFN α alone.

Results:

Among the 55 patients who achieved HBsAg loss, HBsAg rebound occurred in 16 of 42 (38.1%) patients receiving elebsiran/BRIL-179 + PEG-IFN α combinations and 6 of 13 (46.2%) patients receiving PEG-IFN α alone. HBsAg rebound occurred at a similar rate during NAs consolidation and discontinuation periods. The magnitude of HBsAg rebound was limited: the majority of the rebounders in combination cohorts (15/16, 93.8%) had maximum HBsAg level < 10 IU/mL (one at 11.7 IU/mL), and 3/6 rebounders in PEG-IFN α alone cohorts had maximum HBsAg < 10 IU/mL (remaining 3 between 10-100 IU/mL). Across all cohorts, HBsAg rebound accompanied with HBV DNA $\geq$ LLOQ is infrequent (6/55, 10.9%): 5/6 had maximum HBV DNA < 100 IU/mL and normal ALT, 1/6 had maximum HBV DNA of 1210 IU/mL with mild ALT elevation to 93 U/L, and none met protocol-defined NAs retreatment criteria.

Conclusions:

Patients achieving HBsAg loss with elebsiran/BRIL-179 plus PEG-IFN α showed favorable off-treatment clinical outcomes, with most HBsAg rebounds < 10 IU/mL and infrequent HBV DNA rebound without significant ALT elevation. These observations suggest long-lasting post-treatment immunological control and further support safe NAs discontinuation in regimens with novel therapeutic modalities in combination with PEG-IFN α . The clinical profiles of rebounds during NAs consolidation versus post NAs discontinuation were similar, suggesting that potentially shortening or eliminating NAs consolidation may be possible.

2534 - ASSESSMENT OF ACCURACY OF PLATELET COUNT SPLEEN DIAMETER RATIO IN PREDICTING THE PRESENCE OF ESOPHAGEAL VARICES IN FILIPINO PATIENTS WITH CIRRHOSIS AT SLMC QC

Alyssa Chan¹, Cua Ian Homer¹
St. Luke's Medical Center, Gastroenterology, Parañaque-

Philippines

1

Background / Hypothesis: Noninvasive evaluation of esophageal varices (EV) may improve the management of patients with cirrhosis and reduce both the medical and financial burden related to screening. In this single center cross-sectional study, our aim was to retrospectively validate the use of the platelet count/spleen diameter (PC/SD) ratio for the noninvasive diagnosis of esophageal varices.

Materials and Methods: A total of 101 cirrhotic patients underwent screening endoscopy for esophageal varices. In all participants, the platelet count-to-spleen diameter ratio ((N/mm³)/mm) was measured, and its diagnostic accuracy was determined. A cutoff value of 1206 for the platelet count/spleen diameter ratio was calculated in this study using the ROC curve. The diagnostic accuracy of this ratio was also analyzed across subgroups defined by disease severity and etiology.

Results:

The prevalence of esophageal varices was 48.5%. In this study, the calculated cutoff value of 1206 had a sensitivity of 87.76% (95% CI, 75.23-95.37%), 84.62% specificity (95% CI 71.92-93.12%), 84.31% positive predictive value, 88% negative predictive value, 5.70 positive likelihood ratio, and 0.14 negative likelihood ratio for the diagnosis of esophageal varices. Accuracy of the platelet count/spleen diameter ratio was maintained for both severity and etiology of disease subgroups.

Conclusions:

The platelet count/spleen diameter ratio may be a useful noninvasive tool for diagnosing esophageal varices among cirrhotics when endoscopy is unavailable and resources are limited. However, the evidence is insufficient to replace endoscopy as the gold standard for diagnosing esophageal varices in all cirrhotic patients.

2541 - Alcoholic Liver Transplants Performed Due to Liver Disease A Single Center Experience

Hasan Buran¹, Sami Akbulut¹, Nurullah Dag², Sezai Yilmaz¹

1

ORAL ABSTRACTS

Inonu University, Liver Transplantation Institute, Surgery, Malatya-Türkiye ¹ Inonu University, Medical School, Radiology, Malatya-Türkiye ²

Background / **Hypothesis:** This study aimed to analyze the demographic, clinical, biochemical, and survival characteristics of patients who underwent liver transplantation (LT) due to alcoholic liver disease, with a particular emphasis on the differences between acute alcoholic hepatitis and cirrhosis.

Material and methods: The clinical and laboratory data, imaging findings, and postoperative outcomes of a total of 124 LT recipients were retrospectively evaluated. Patients were first divided into two groups according to international diagnostic criteria [acute alcoholic hepatitis (AAH; n=34; 27.4%) and cirrhosis (n=90, 72.6%)]. Then, based on the opinions of our center's KN team and a radiologist experienced in the hepatobiliary system, they were reclassified as AAH and cirrhosis and compared. Statistical analyses were performed using the Mann-Whitney U, Chi-square, and Kaplan-Meier survival tests.

Results: Most patients were male (96.8%) and the median age was 53 years. Living donor liver transplantation accounted for 93.5% of cases, and the median MELD-Na score was calculated as 19. In the AAH group, total bilirubin, AST, AST/ALT ratio, GGT, and lymphocyte levels were significantly higher. According to the classification recommended by the transplant team and radiologist, the radiological volume of livers in the cirrhosis group and the explant liver weight were found to be significantly smaller. Survival rates at 1, 3, and 5 years after LT were calculated as 76.6%, 68.9%, and 66.1% (Figure 1a), respectively. Interestingly, the rate of alcohol initiation after LT was lower in the group that developed mortality (p=0.001). The main causes of mortality after LT were pulmonary (n=43) and biliary (n=23) complications. Although no correlation was found between the three classification systems used for AAH and cirrhosis, similar survival results were obtained (Figure 1b, 1c).

Conclusions: LT performed due to alcoholic liver disease yields acceptable long-term survival outcomes. When evaluated in conjunction with literature data, we believe that since the long-term outcomes of patients defined as AAH and cirrhosis are similar, it is appropriate not to base patient evaluation for KN primarily on alcohol

consumption and cessation periods.

2543 - Prevalence and risk factors of esophageal and gastroesophageal varices in myeloproliferative neoplasm patients with portal hypertension in a tertiary government hospital a 5 year cross sectional study

Sam	Fandood	1	
Eamc,	Gastroenterology,	Apalit-Philippines	1

Background / Hypothesis: Myeloproliferative neoplasms (MPNs) are an established cause of non-cirrhotic portal hypertension and may lead to gastroesophageal varices with significant clinical consequences. However, local data on the burden of varices and associated risk factors among MPN patients remain limited.

Materials and Methods: This cross-sectional study included 40 adult patients diagnosed with MPNs who underwent esophagogastroduodenoscopy at a tertiary government hospital between 2021 and 2025. Sociodemographic, clinical, laboratory, and endoscopic data were obtained through chart review. The prevalence of gastroesophageal varices was determined. Logistic regression analyses were performed to identify clinicodemographic factors associated with the presence of varices.

Results: Varices were identified in 23 patients (57.5%), including esophageal varices alone in 27.5%, gastric varices alone in 2.5%, and combined esophageal and gastric varices in 27.5%. Varices were most prevalent among patients with primary myelofibrosis (78.9%), followed by polycythemia vera (45.5%) and chronic myeloid leukemia (30%). Variceal size differed significantly across MPN subtypes (p=0.001), with larger varices observed in polycythemia vera and primary myelofibrosis. In univariate analysis, age 40–59 years (OR: 0.06; 95% CI: 0.01–0.57; p=0.015) and >60 years (OR: 0.03; 95% CI: 0.00–0.38; p=0.006) were associated with lower odds of varices compared with younger patients. Splenic vein diameter was positively associated with varices (OR: 1.38; 95% CI: 1.05–1.80; p=0.020), while platelet count showed an inverse association (OR: 0.99; 95% CI: 0.99–1.00; p=0.004). On multivariate analysis, only platelet count remained independently associated with varices (adjusted OR: 0.99; 95% CI: 0.98–1.00; p=0.020).

Conclusions: Esophageal and gastroesophageal varices are highly

ORAL ABSTRACTS

prevalent among MPN patients with portal hypertension, particularly in primary myelofibrosis. Thrombocytopenia is an independent factor associated with variceal presence and may serve as a practical marker to guide endoscopic surveillance in this high-risk population.

Keyword(s) : Myeloproliferative Neoplasm, Esophageal varices

2553 - EUS guided liver biopsy for diffuse liver diseases is an emerging alternative to percutaneous liver biopsy

Sercan Kiremitçi ¹, Ahmet Hakan Şahin ², Çisem Şimşek ², Murat Aladağ ¹, Ali Tüzün Ince ¹, Hakan Şentürk ¹
Bezmialem Vakıf University, Gastroenterology, İstanbul-Türkiye ¹ Bezmialem Vakıf University, Internal Medicine, İstanbul-Türkiye ²

Background and Hypothesis : EUS guided liver biopsy for diffuse liver diseases is an emerging alternative to ancillary percutaneous one. We compared the efficacy and adverse events of this new technique in 157 patients against a historical cohort of 1870 patients who had percutaneous biopsy in gastroenterology clinic. **Methods:** Beginning five years ago we suggested EUS-guided biopsy instead of percutaneous one in candidates. We explained advantages for the sake of cost. 157 out of 201 accepted. All EUS examinations were performed using a linear echoendoscope (EG-3870UTK and EG38-J10UT Linear-Array Ultrasound Gastroscope, Pentax Europe GmbH, Hamburg, Germany). For 34 we used 22 G FNB and for the rest (123), 19 G FNB. We performed dry-technique with capillarization method. We did only one pass. For percutaneous biopsy, we performed prior intercostal transabdominal ultrasound examination to choose the site of biopsy in expiration and to look for intervening structures as well as focal liver lesions. After local cleaning, we inject local anesthetic for cutaneous anesthesia in supine position and then we make certain of the site we puncture. Afterwards we made a millimetric cut with scalpel and we introduce either 16 or 18 G needle. We apply negative pressure to the syringe and ask the patient to take a breath, exhale and hold. Finally we push the needle into the liver and withdraw quickly. We disattach the syringe and inject saline to push the tissue, if present, into the bottle filled with formaline. We discard everything if enough tissue is obtained. If not, we repeat the procedure. For EUS-guided biopsy, we performed linear EUS examination in deep sedation. We visualized left lobe of the liver. We chose a site without significant vascularity and we made one pass with either 22 or 19 G FNB

needle (EUS-FNB Trident™ needle; Micro-Tech Medical, Nanjing, China).

Results: The median portal area number was 9 (None to 18) in percutaneous and 57 (range, 8-102) in EUS-guided biopsy. While the number of patients with insufficient tissue was 4% (76/1871) in percutaneous biopsy, it was 3 (all with 22 G needle) in 157 EUS-guided biopsies. Adverse effects happened in 143 out of 1871 percutaneous biopsies (7.6 %): 133 Pain, 5 intraabdominal bleeding, 3 bile peritonitis, 1 pneumothorax, 1 hemobilia. No adverse event happened in EUS-guided biopsies. The number of patients who were admitted overnight was 221/1871 (11%) in percutaneous biopsies while it was none in EUS-guided biopsy.

Conclusion: In comparison to percutaneous one, EUS-guided liver biopsy cutting needle is significantly more yielding and have less (actually none) side effects and 19 G needle should be preferred over 22.

Keyword(s) : EUS guided liver biopsy, Diffuse liver diseases, Percutaneous liver biopsy, Tissue adequacy

2554 - A Preclinical study on Protective Effects of Atorvastatin Against Methotrexate Induced Hepato Renal Toxicity Role of Oxidative Stress and Inflammation

Jayadevan K 1

Aiims New Delhi, Pharmacology, New Delhi-India ¹

Background / Hypothesis: Methotrexate (MTX) is widely used as an immunosuppressive and anticancer agent; however, its clinical utility is often limited by dose-dependent hepatotoxicity and nephrotoxicity. Accumulating evidence suggests that oxidative stress and inflammation are central to MTX-induced organ injury. Atorvastatin, a commonly prescribed HMG-CoA reductase inhibitor, exhibits pleiotropic antioxidant and anti-inflammatory properties beyond lipid lowering. The present study investigated the potential hepatoprotective and nephroprotective effects of atorvastatin in an experimental model of MTX-induced toxicity and compared its efficacy with silymarin, a standard reference drug.

Materials and Methods: Wistar albino rats were divided into six groups (n=6): normal control, atorvastatin alone (10 mg/kg), MTX control (20 mg/kg, single intraperitoneal dose), MTX plus atorvastatin (3 mg/kg), MTX plus atorvastatin (10 mg/kg), and MTX plus silymarin (300 mg/kg). Atorvastatin and silymarin were administered orally for 7 days prior to and 21 days following MTX

ORAL ABSTRACTS

administration. Hepatic and renal function was assessed using serum biochemical markers. Oxidative stress parameters (TBARS, GSH, SOD) and inflammatory mediators (nitrite, MPO, TNF- α , PGE₂) were evaluated in liver and kidney tissues. Histopathological examination was performed to assess structural damage.

Results:

Methotrexate administration resulted in significant hepato-renal injury, evidenced by deranged serum biochemical markers, increased oxidative stress, elevated inflammatory mediators, and pronounced histopathological alterations in both liver and kidney tissues. Atorvastatin treatment significantly attenuated MTX-induced inflammatory responses, as demonstrated by reduced tissue levels of TNF- α , MPO, COX-2, and PGE₂ in both organs. However, in the liver, atorvastatin was associated with a paradoxical increase in oxidative stress, accompanied by persistent elevation of liver function parameters and disruption of redox homeostasis. In contrast, renal tissues showed improvement in oxidative stress markers and functional indices following atorvastatin treatment. Histopathological evaluation supported the biochemical findings, revealing partial restoration of tissue architecture, with more pronounced protection observed in the kidney. Collectively, these results indicate that atorvastatin exerts organ-specific effects in MTX-induced toxicity, providing anti-inflammatory benefits while potentially promoting pro-oxidant effects in the liver under conditions of MTX-associated oxidative stress.

Conclusions:

These findings demonstrate that methotrexate induces significant hepato-renal toxicity mediated by oxidative stress and inflammation. Atorvastatin exhibits marked anti-inflammatory effects in both liver and kidney; however, its influence on oxidative homeostasis is organ-specific. While clear renoprotection is observed, atorvastatin may exacerbate hepatic oxidative stress and functional impairment under methotrexate-induced conditions. This context-dependent response warrants caution when considering atorvastatin as an adjunct to methotrexate therapy and highlights the importance of organ-specific safety evaluation.

2559 - Evaluation of a FIB 4–Based Clinical Pathway for Fibrosis Assessment in Patients with Coronary Disease

Mengge Zhou ¹, Chenlu Yang ², Zehao Zhao ³, Yong Zeng ³

Institute Of Basic Medical Sciences & School Of Basic Medicine, Chinese Academy Of Medical Sciences & Peking Union Medical College, Department Of Epidemiology And Biostatistics, Beijing-China ¹ Vanke School Of Public Health, Vanke School Of Public Health, Beijing-China ² Department Of Cardiology, Department Of Cardiology, Beijing-China ³

Background / Hypothesis: A stepwise clinical pathway using the FIB-4 index as a first-line screening tool, followed by vibration-controlled transient elastography (VCTE), has recently been recommended in a Circulation consensus statement for metabolic dysfunction–associated steatotic liver disease (MASLD) screening among patients with cardiovascular disease. However, real-world validation of this strategy remains limited. We aimed to evaluate the applicability and potential limitations of this FIB-4–guided clinical pathway in patients with coronary heart disease (CHD).

Materials and Methods: Between December 1 and December 30, 2025, consecutive CHD patients hospitalized in the Department of Cardiology at Beijing Anzhen Hospital, China, were prospectively recruited. All patients underwent concurrent FIB-4 calculation and VCTE assessment (iLivTouch, Hisky Medical, China). According to the recommended pathway, patients with low FIB-4 were classified as low risk and not prioritized for elastography, whereas those with elevated FIB-4 were referred for further VCTE evaluation. The proportion and characteristics of patients potentially misclassified by this pathway were analyzed.

Results: Among 346 CHD patients, 71.1%, 25.4%, and 3.5% were classified as low, intermediate, and high risk by FIB-4, respectively. Among patients with intermediate and high FIB-4 risk, 9.0% and 14.0% were confirmed as having intermediate or high fibrosis risk by VCTE. Notably, among patients classified as low risk by FIB-4, 9.35% and 6.5% were reclassified as intermediate and high risk by VCTE, suggesting potential underestimation of fibrosis when relying solely on initial FIB-4 screening. Compared with concordant low-risk patients, these discordant patients were more likely to be aged ≥ 70 years (OR 3.03, 95% CI 1.30–7.06; $p=0.010$) and to have BMI ≥ 28 kg/m² (OR 4.47, 95% CI 1.55–12.89; $p=0.006$).

Conclusions: The FIB-4–guided clinical pathway effectively stratifies fibrosis risk in the majority of CHD patients; however, a clinically meaningful minority may

ORAL ABSTRACTS

be misclassified. Selective incorporation of VCTE in low FIB-4 patients with advanced age or obesity may improve fibrosis detection. These findings support refinement, rather than replacement, of current stepwise assessment strategies for MASLD in CHD populations.

Keyword(s) : MASLD; coronary heart disease; FIB-4; fibrosis assessment; clinical pathway

2560 - Predictive potential of hypermethylation of RASSF1A and CCND2 promoters in hepatitis B virus induced hepatocellular carcinoma

Sumaiya Joadder ¹, Shamim Sultana ¹, Raad Rahmat ², Munira Jahan ¹

Bangladesh Medical University, Department Of Virology, Dhaka-Bangladesh ¹ Brac University, Department Of Biotechnology, Dhaka-Bangladesh ²

Background / **Hypothesis:**
Hepatitis B virus (HBV) infection is a major cause of hepatocellular carcinoma (HCC) globally; however, the epigenetic mechanisms driving chronic hepatitis' progression to cirrhosis and HCC remain elusive. Hypermethylation of the promoters of the cell cycle regulators RASSF1A (tumour suppressor gene) and CCND2 (proto-oncogene), leading to their dysregulation, has been correlated with uncontrolled cell proliferation and detected in various cancer types. Since research examining a possible link between promoter methylation of these genes and HCC in HBV-infected patients is sparse in Bangladesh, this study aimed to bridge that gap and investigate a potential correlation between promoter hypermethylation of RASSF1A and CCND2 and HBV-induced HCC.

Materials and **Methods:**
A total of 140 participants, including patients with different stages of HBV-driven liver diseases: chronic hepatitis, liver cirrhosis, and HCC, along with healthy controls, were recruited, with each group having 35 individuals. Methylation-specific PCR of RASSF1A and CCND2 promoters was performed using methylation- and unmethylation-specific primers, followed by gel electrophoresis. Afterwards, their mRNA expression levels were quantified by qPCR. Differences in methylation levels of these two genes between the groups were subsequently analysed using Fisher's Exact Test. Bonferroni's Post-Hoc analysis was conducted to evaluate the differences in the expression levels between the groups. Finally, the diagnostic performance of RASSF1A and CCND2 promoter methylation for distinguishing HCC from liver cirrhosis and chronic hepatitis was evaluated by a Receiver Operating

Characteristic curve. $P < 0.05$ was considered statistically significant.

Results:

The study found that 37% of the HCC patients and 26% of the cirrhotic individuals had methylation in the RASSF1A promoter ($p < 0.001$), while it was 29% and 17%, respectively, in the promoter of CCND2 ($p < 0.001$). Moreover, RASSF1A in HCC patients was significantly downregulated compared to healthy controls (0.12 ± 0.10 versus 1.00 ± 0.94 , $p < 0.001$). Contrastingly, CCND2 expression increased with disease severity (6.17 ± 5.35 in HCC versus 1.00 ± 0.79 in healthy controls, $p < 0.001$). Interestingly, RASSF1A-methylated samples consistently exhibited lower expression levels than unmethylated counterparts in both HCC and cirrhosis, whereas CCND2 mRNA levels remained high irrespective of methylation status in patients. Both genes' promoter methylation correlated with elevated alpha-fetoprotein (AFP, a standard tumour marker) levels; however, individually offered limited diagnostic specificity (AUC 0.557-0.686 vs AFP AUC > 0.949).

Conclusions: These results highlight hypermethylation of RASSF1A and CCND2 promoters as epigenetic drivers of HBV-associated liver diseases and support their potential inclusion in multi-marker panels for early HCC detection.

2562 - Successful Endoscopic Ultrasound-Guided Ethanol Ablation of a 7 mm Non Functional Pancreatic Neuroendocrine Tumor in a High Risk Surgical Candidate

Irshad Batool ¹
Aga Khan University, Gastroenterology, Karachi-Pakistan ¹

Background / **Hypothesis:**

Pancreatic neuroendocrine tumors (p-NETs) are frequently asymptomatic and are often discovered incidentally or during evaluation of nonspecific constitutional symptoms. The decision-making process in managing p-NETs (< 2 cm) concerning whether to follow up or intervene is difficult, especially in those patients who have significant medical comorbidities and therefore have an increased risk of surgical complications. 5% of low-grade tumors NETs

ORAL ABSTRACTS

metastasize early to distant organs on follow-up. Endoscopic Ultrasound (EUS)-Guided Ethanol Ablation offers a minimally invasive therapeutic approach to treating these patients along with biopsy in the same sitting.

Case Presentation
We describe the case of a 70-year-old man diagnosed with Type II Diabetes Mellitus; he had also recently received an automated implantable cardioverter defibrillator (AICD) due to tachy-brady arrhythmias. He presented to our institution over the course of approximately 8 months with progressive unexplained weight loss and generalized fatigue. His laboratory studies were notable for a mild elevation in his CA 19-9 (62.9 U/mL → 68.4 U/mL); all endocrine studies were normal, further supporting that this represented tumor on contrast-enhanced computed tomography (CT) scan of the abdomen demonstrated a 7.8 x 7 mm arterially enhancing mass in the pancreatic tail; this finding was suggestive of a p-NET. EUS confirmed a well-defined hypoechoic lesion without vascular invasion away from the main pancreatic duct. Fine needle biopsy (FNB) was performed using a single-pass 22-gauge FNB, and 2.5 mL of absolute ethanol was injected into the lesion in the same sitting for a diagnostic and therapeutic approach.

Intervention and **Outcome**
Following the ablative therapy, post-ablation imaging studies demonstrated intralesional hyper-echogenicity consistent with coagulative necrosis. Additionally, the patient reported subjective improvement in fatigue and a weight gain of approximately 1.5 kg within a week. However, given the nonspecific nature of these symptoms and potential confounders like the use of semaglutide, a causal relationship cannot be established. There were no complications associated with the procedure, and repeat imaging studies in the form of a GA-68 DOTATE PET/CT scan one month after the procedure reported no hypermetabolic lesion.

Conclusions:
This case study demonstrates the feasibility and clinical benefit of EUS-guided ablation as a safe and organ-preserving alternative to surgical treatment of selected patients with small p-NETs. The early symptomatic improvement experienced by this patient suggests that minimally invasive ablative therapies may represent a viable option for patients at high risk for surgical complications or who prefer non-surgical treatment

strategies.

Keyword(s) : Pancreatic Neuroendocrine Tumor; Endoscopic Ultrasound; Ethanol Ablation.

2564 - The relationship between the systemic immune inflammation index and hepatitis C virus infection NHANES 2005 to 2012
Yuyu Zeng¹, Kaige Zhang², Yuchen Peng¹, Xiaoping Wu¹

The First Affiliated Hospital, Jiangxi Medical College, Nanchang University, Department Of Infectious Disease, Nanchang-China¹ The Second Affiliated Hospital, Jiangxi Medical College, Nanchang University, Department Of Gastroenterology, Nanchang-China²

Background / **Hypothesis:**
The systemic immune-inflammation index (SII), a contemporary biomarker indicative of inflammatory processes, captures the localized immune reactions and systemic inflammatory responses within the human body. Evidence has established correlations between SII and the incidence as well as the gravity of a range of hepatic pathologies. Nonetheless, the extant literature presents a paucity of studies exploring the SII's role and its clinical significance in the context of hepatitis C virus (HCV) infection. The objective of this research is to scrutinize the correlation between SII and HCV infection.

Materials and **Methods:**
Our research utilized data extracted from the National Health and Nutrition Examination Survey (NHANES). Owing to the asymmetric distribution of SII values, a natural logarithm transformation was implemented to achieve a more normal distribution. A Logit regression analysis was employed to assess the relationship between the natural logarithm of the SII (LN SII) and HCV infection. This cross-sectional analysis included 29,546 participants from 4 cycles of NHANES data.

Results:
The results of the Logit model indicated that lower values of LN SII were linked to a higher probability of HCV infection. This relationship remained significant in the fully adjusted model (OR = 0.455; 95% CI: 0.381-0.543, P <.001). Furthermore, the analysis of the smoothly fitted curve unveiled a relationship resembling an inverted U-shape between LN SII and HCV infection, featuring a turning point value of 6.12.

Conclusions:
This study established a link between lower LN SII levels

ORAL ABSTRACTS

and the occurrence of HCV infection. To validate these findings, further large-scale and prospective studies are required.

Keyword(s) : NHANES; hepatitis C; systemic immune-inflammation index.

2572 - Short Course Adjuvant Tislelizumab plus Tyrosine Kinase Inhibitor Following Curative Ablation for Early Stage Hepatocellular Carcinoma A Prospective Cohort Study

Xuanxuan Duan ¹, Chuyue Xiong ¹, Yingying Yu ¹, Siyu Wang ¹, Fanping Meng ¹

The Fifth Medical Center Of PLA General Hospital, Senior Department Of Infectious Diseases, Beijing-China ¹

Background / Hypothesis: Hepatocellular carcinoma (HCC) patients at high risk of recurrence after curative ablation currently lack a standard adjuvant therapy. This study aimed to evaluate the efficacy and safety of a short-course, 3-month adjuvant regimen combining tislelizumab and a tyrosine kinase inhibitor (TKI). **Materials and Methods:** In this prospective, parallel-controlled study, 59 consecutive patients with high-risk early-stage HCC following curative ablation were assigned to receive either a 3-month short-course of adjuvant tislelizumab (200 mg intravenously every 3 weeks for 4 cycles) combined with a TKI (n=29) or active surveillance (n=30) based on patient preference. The primary endpoint was recurrence-free survival (RFS). Secondary endpoints included recurrence rates and safety.

Results: At the time of the primary analysis (November 1, 2025), the median RFS was significantly prolonged in the tislelizumab plus TKI group compared with the active surveillance group (Not reached [95% CI, 21.8–NR] vs. 8.5 months [95% CI, 5.4–11.7]; HR 0.43 [95% CI, 0.20–0.91], P = 0.022). Recurrence rates at 1 and 2 years were 24.1% vs. 60.0% (P = 0.008) and 37.9% vs. 63.3% (P = 0.069) in the tislelizumab plus TKI vs. active surveillance groups, respectively. Subgroup analyses showed that patients aged >60 years, with α -fetoprotein <20 ng/mL, BCLC stage 0/A, or microvascular invasion particularly benefited from tislelizumab plus TKI in terms of RFS. The treatment effect was generally consistent across all pre-specified subgroups (all P interaction > 0.05). Regarding safety, the most common adverse events (AEs) in the adjuvant group were leukopenia (41.4%), thrombocytopenia (37.9%), increased AST (37.9%), hypertension (27.6%), and rash (27.6%). Grade 3–4 AEs occurred in 27.6% of patients, primarily involving thrombocytopenia (17.2%), leukopenia (10.3%), and increased AST (10.3%). No treatment-related deaths were reported.

Conclusions: Short-course adjuvant therapy with tislelizumab plus a TKI significantly reduced the risk of recurrence while demonstrating a manageable safety profile in patients with early-stage HCC following ablation. This regimen represents a novel and promising strategy for HCC adjuvant therapy. Further validation in large-scale, multi-center randomized controlled trials is warranted.

Keyword(s) : Hepatocellular Carcinoma; Adjuvant Therapy; Tislelizumab; Tyrosine Kinase Inhibitor; Recurrence-free Survival

2574 - Plasma microRNA based non invasive stratification of clinically significant and advanced fibrosis in metabolic dysfunction associated steatotic liver disease among Arab adults

Ammal Metwally ¹, Haleama Al Sabbah ², Radwan Qasrawi ³, Wafaa Bayumi ⁴, Wael Hafez ⁵, Noha Eltaweel ⁶, Joanne Sadier ⁷, Issa Ishtiah ⁸
National Research Centre (nrc), Community Medicine Research Department,, Ad Doqi-Egypt ¹ University, Public Health Department, Abu Dhabi-United Arab Emirates ² Faculty Of Engineering & Natural Sciences, Istinye University/ Science And Technology, Al-quds University, Biomedical Engineering/ Computer Science And Information Technology/, Al-quds-Palestine ³ National Research Centre (nrc), Internal Medicine Department Medical Research And Clinical Studies Institute, Giza-Egypt ⁴ Nmc Royal Hospital, Khalifa City,, Internal Medicine Department, Abu Dhabi-United Arab Emirates ⁵ National Research Centre (nrc), Molecular Genetics/human Genetics And Genome Project Institute, Giza-Egypt ⁶ Abu Dhabi University, Genetics And Biomedical Sciences, Abu Dhabi-United Arab Emirates ⁷ An-najah National University, Faculty Of Science, Al-quds-Palestine ⁸

Background / Hypothesis: Metabolic dysfunction–associated steatotic liver disease (MASLD) is a major cause of chronic liver disease and fibrosis in low- and middle-income countries, including Arab settings with high burdens of obesity and type 2 diabetes. Identifying clinically significant fibrosis ($\geq F2$) and advanced fibrosis ($\geq F3$) is difficult where access to liver biopsy is limited and non-invasive scores are not consistently implemented. We hypothesize that circulating plasma microRNA (miRNA) signatures, combined with routine clinical data, can provide a non-invasive multi-marker score to stratify $\geq F2$ and $\geq F3$ fibrosis in MASLD and reduce the need for liver biopsy.

Materials and Methods:

ORAL ABSTRACTS

This two-phase cross-sectional study is conducted over 24 months in Egypt, Palestine and the United Arab Emirates. Adults aged 25–60 years, native to the participating country, are recruited from hepatology, internal medicine and metabolic clinics. Fibrosis stage of MASLD is classified using standardized non-invasive algorithms (including FIB-4, NAFLD Fibrosis Score, elastography and liver biochemical profile). In Phase I, plasma from 30 participants (10 per country; MASLD with $\geq$ F2, MASLD with F0–F1 and healthy controls) undergoes whole-transcriptome RNA sequencing to identify differentially expressed mRNAs and miRNAs associated with $\geq$ F2 and $\geq$ F3. In Phase II, top candidate miRNAs are quantified by qRT-PCR in 150 Egyptian adults (50 MASLD with $\geq$ F2, 50 MASLD with F0–F1, 50 healthy controls). Multivariable logistic models and receiver operating characteristic (ROC) analyses will internally validate composite scores for: (1) $\geq$ F2 vs F0–F1/healthy and (2) $\geq$ F3 vs F2 within the $\geq$ F2 subgroup. Phase I is funded by the Arab Research & Innovation Co-Funded Alliances (ARICA) Initiative under the Federation of Arab Scientific Research Councils and Phase II is funded by the Academy of Scientific Research and Technology of Egypt.

Results:

Recruitment and laboratory analyses are ongoing. Expected outputs include: (1) a ranked panel of fibrosis-associated plasma miRNAs differentiating $\geq$ F2 and $\geq$ F3 from lower-stage disease and healthy controls; (2) ROC-based estimates of discrimination (area under the curve, sensitivity and specificity) for miRNA–clinical composite scores targeting $\geq$ F2 and $\geq$ F3; and (3) comparison of these scores with established non-invasive fibrosis indices to inform their added value in clinical practice.

Conclusions:

This fibrosis-focused liquid biopsy approach aims to deliver simple, blood-based tools to detect clinically significant and advanced fibrosis in MASLD in Arab adults. If diagnostic performance is confirmed, the miRNA-based scores could support earlier risk stratification, guide intensive follow-up, and complement existing non-invasive algorithms in resource-constrained hepatology services.

Keyword(s) : metabolic dysfunction-associated steatotic liver disease, fibrosis, microRNAs, liquid biopsy, non-invasive diagnosis, Arab populations

2576 - Point of care HBcrAg testing to identify high viral replication in chronic hepatitis B a tool for supporting the WHO simplified treatment strategy

in resource limited settings
Takako Inoue¹, Alexandra M Famiglietti², Etsuko Iio³, Yusuke Shimakawa², Takehisa Watanabe³, Katsuya Nagaoka³, Olivia Garrigou⁴, Valérie Ortonne⁴, Takanori Suzuki⁵, Kentaro Matsuura⁵, Stéphane Chevaliez⁴, Yasuhito Tanaka³
Nagoya City University Hospital, Department Of Clinical Laboratory Medicine, Nagoya-Japan¹ Université Paris Cité, Unité D'épidémiologie Des Maladies Émergentes, Institut Pasteur, Paris-France² Kumamoto University, Department Of Gastroenterology And Hepatology, Faculty Of Life Sciences, Kumamoto-Japan³ Hôpital Henri Mondor (ap-hp), Université Paris-est, French National Reference Center For Hepatitis B, C And Delta Viruses, Department Of Virology, Créteil-France⁴ Nagoya City University Graduate School Of Medical Sciences, Department Of Gastroenterology And Metabolism, Nagoya-Japan⁵

Background / Hypothesis:
In 2024, the World Health Organization (WHO) expanded and simplified treatment eligibility criteria for chronic hepatitis B, including recommendations to reduce reliance on HBV DNA testing. However, in many high-burden settings, limited molecular diagnostic capacity results in some individuals initiating lifelong antiviral therapy without virological confirmation. There is therefore an urgent need for simple, accurate, and scalable tools to identify individuals at risk of high viral replication. We evaluated the diagnostic performance of a rapid test for hepatitis B core-related antigen (HBcrAg-RDT) as a point-of-care alternative to laboratory-based antigen and HBV DNA testing.
Methods:

We assessed the diagnostic accuracy of HBcrAg-RDT in two independent adult cohorts in Japan and France. Among 1,246 enrolled participants, 516 were hepatitis B surface antigen (HBsAg)-positive, including 309 untreated individuals. HBcrAg-RDT and hepatitis B e antigen enzyme-linked immunosorbent assay (HBeAg-ELISA) were compared with reference chemiluminescent immunoassays (CLIA/CLEIA) for HBeAg detection (n = 1,240). Secondary analyses evaluated the ability of HBcrAg-RDT to identify individuals with high viral loads (HBV DNA $\geq$ 5.3 log IU/mL; n = 305). Concordance across serum, plasma, and whole blood was also examined to assess point-of-care applicability.

Results:

HBcrAg-RDT demonstrated high sensitivity (97.9–98.5%) and specificity (97.6–98.0%) for detecting HBeAg. When benchmarked against HBeAg-CLIA/CLEIA, accuracy was comparable to that of HBeAg-ELISA. In key clinical

ORAL ABSTRACTS

populations, such as HBsAg-positive individuals, HBcrAg-RDT achieved statistically higher area under the receiver operating characteristic (AUROC) values than HBeAg-ELISA, despite modest absolute differences, indicating a diagnostic advantage. For identifying high-viral-load infections, sensitivity was 96.9% and specificity 93.1% (AUROC 0.95). Performance was preserved in both HBeAg-positive and HBeAg-negative infections, with complete concordance across serum, plasma, and whole blood.

Conclusions:

HBcrAg-RDT provides a highly accurate, practical, and operationally feasible method to identify individuals with high viral replication. Its compatibility with whole blood supports true point-of-care use in resource-limited settings. These findings suggest that HBcrAg-RDT could meaningfully support implementation of the 2024 WHO simplified treatment strategy in adult HBV care by enabling rational treatment decisions where virological testing is unavailable.

Keyword(s) : Chronic hepatitis B; Hepatitis B core-related antigen rapid diagnostic test (HBcrAg-RDT); Point-of-care diagnostics; Treatment eligibility; the World Health Organization (WHO) simplified guidelines; Low-resource settings.

2577 - Using Rose to Improve the Accuracy of Diagnosis of Biliary Tract Diseases through ERCP guided Biopsy

Yunzhi Shen¹, Chengyu Lv¹, Tong Bai¹, Jing Liang²
Central Hospital, Tianjin University, Hepatobiliary Surgery, Tianjin-China¹ Central Hospital, Tianjin University, Gastroenterology Department, Tianjin-China²

Background / Hypothesis:
To evaluate the diagnostic efficacy of rapid on-site evaluation (ROSE)- enhanced endoscopic retrograde cholangiopancreatography (ERCP)- guided biopsy for biliary strictures, and develop a predictive model for diagnostic accuracy.

Materials and Methods:
This retrospective study included 200 patients undergoing ERCP- guided biopsy (ROSE cohort, n=100; NON-ROSE cohort, n=100). Diagnostic performance metrics (accuracy, sensitivity, specificity, positive predictive value [PPV], negative predictive value [NPV]), specimen adequacy, biopsy attempts, procedure duration, and complications were compared between

groups. Logistic regression identified independent predictors of diagnostic accuracy. A prediction model was developed and internally validated through receiver operating characteristic (ROC) curve analysis, calibration curves, decision curve analysis (DCA), and constructed as a nomogram.

Results:

The ROSE cohort demonstrated significantly higher accuracy (92.0% vs. 78.0%), sensitivity (97.2% vs. 74.7%), and NPV (91.6% vs. 48.7%) (all $P < 0.05$). ROSE required fewer biopsy passes (2.43 vs. 3.61; $P < 0.001$), shorter sampling time (2.71 vs. 4.33 min; $P < 0.001$), without increased complications ($P > 0.05$). Multivariate analysis confirmed ROSE as an independent predictor (OR=4.0, $P=0.032$).

Conclusions: The validated predictive model showed good discrimination (AUC=0.80) and clinical utility. ROSE significantly enhances diagnostic yield and procedural efficiency in ERCP- guided biopsy for biliary strictures. The developed nomogram provides an evidence-based tool for individualized prediction, supporting clinical decision-making.

Keyword(s) : Biliary stricture, Endoscopic retrograde cholangiopancreatography (ERCP), Rapid on-site evaluation (ROSE), Biopsy

2579 - YTHDF1 high cancer associated fibroblasts derived kynurenine promotes tumor progression by supplying an immunosuppressive niche

Liren Zhang¹, Qing Li¹, Jingjing Dai², Jiali Xu³
Jiangsu Province Hospital/the First Affiliated Hospital Of Nanjing Medical University, Hepatobiliary Center, Nanjing-China¹ Jiangsu Province Hospital/the First Affiliated Hospital Of Nanjing Medical University, Infectious Diseases, Nanjing-China² Jinling Hospital Affiliated To Nanjing University School Of Medicine, Anesthesiology, Nanjing-China³

Background / Hypothesis:
Dysregulation of epigenetic RNA modifications is a hallmark of cancer; however, how these alterations shape anti-tumor immunity within the tumor microenvironment (TME) remains poorly understood. Cancer-associated fibroblasts (CAFs) are key stromal components that actively regulate immune suppression.

Materials and Methods:
CAF subsets were characterized based on YTHDF1 expression. Epigenetic regulation of YTHDF1 was

ORAL ABSTRACTS

investigated under lactate-enriched conditions. RNA methylation-dependent translational control was examined using m6A profiling and ribosome association analyses. Protein interactions and ubiquitination were assessed biochemically, and metabolic and immune consequences were evaluated in vitro and in vivo. Therapeutic targeting was tested alone and in combination with programmed cell death protein 1 (PD-1) blockade.

Results:

CAFs with high YTHDF1 expression promoted the differentiation of immunosuppressive regulatory T cells (Tregs). Lactate accumulation in the TME induced YTHDF1 upregulation in CAFs through histone H3 lysine 9 lactylation. Elevated YTHDF1 enhanced the translation of ovarian tumor domain-containing protein 5 (OTUD5) by binding to m6A-modified OTUD5 mRNA. OTUD5 directly interacted with indoleamine 2,3-dioxygenase 1 (IDO1) and inhibited its K48-linked ubiquitin-mediated degradation, resulting in enhanced tryptophan catabolism and kynurenine accumulation, thereby reinforcing an immunosuppressive TME. Pharmacological inhibition of YTHDF1 synergized with PD-1 blockade to enhance antitumor immune responses in multiple models.

Conclusions:

YTHDF1high CAFs remodel the tumor microenvironment through epigenetically regulated tryptophan metabolism, fostering immune suppression. Targeting stromal YTHDF1 represents a promising strategy to enhance the efficacy of cancer immunotherapy.

Keyword(s) : Tumor microenvironment, RNA methylation, ubiquitination, lactylation, immunotherapy

2580 - PYGL A novel non invasive biomarker for diagnostic and prognostic of HEV ALF patients

Luyu Wang¹, Siyu Feng², Changyi Ji¹, Mengmeng Gu³, Jian Wu³

Bengbu Medical University, School Of Laboratory Medicine, Suzhou-China¹ Suzhou Guangji Hospital, Department Of Medical Laboratory, Suzhou-China² The Affiliated Suzhou Hospital Of Nanjing Medical University, Department Of Clinical Laboratory, Suzhou-China³

Background

/

Hypothesis:

Hepatitis E virus (HEV) is a major cause of acute viral hepatitis globally. Although usually self-limiting in healthy individuals, it can progress to severe hepatitis or

acute liver failure (ALF). This study aims to evaluate the prognostic value of glycogen phosphorylase L (PYGL) in patients with HEV-related acute liver failure (HEV-ALF).

Materials

and

Methods:

A total of 280 subjects were enrolled, including 100 patients with acute hepatitis E (AHE), 100 with HEV-ALF, and 80 healthy elderly controls. Serum PYGL levels were measured by ELISA. To assess the diagnostic and prognostic value of GP73, receiver operating characteristic (ROC) curves, orthogonal partial least squares-discriminant analysis (OPLS-DA), and decision curve analysis (DCA) were employed to evaluate its efficacy in diagnosing HEV-ALF and predicting 30-day mortality. The correlation between serum PYGL levels and the number of organ failures and disease progression in patients.

Results:

Serum PYGL levels were significantly elevated in patients with HEV-ALF compared to those with AHE and healthy controls (13.84 (12.93, 14.64) vs. 9.13 (6.97, 10.99) vs. 3.04 (2.54, 3.98), $P < 0.001$). In distinguishing HEV-ALF, PYGL demonstrated an area under the curve (AUC) of 0.911, with 89% sensitivity and 85% specificity. Decision curve analysis confirmed its consistent net clinical benefit across a broad range of threshold probabilities. Over a 30-day follow-up, non-survivors exhibited significantly higher PYGL levels than survivors (17.62 (15.10, 18.33) vs. 13.65 (12.83, 14.31), $P < 0.001$). PYGL also showed strong prognostic performance for mortality, with an AUC of 0.859 (sensitivity 77.3%, specificity 92.3%), supported by favorable clinical decision curve findings. Furthermore, PYGL levels were significantly higher in patients with >3 organ failures compared to those with ≤ 3 failures ($P < 0.05$), and in patients with disease progression compared to those with stabilization or improvement ($P < 0.05$).

Conclusions: PYGL is a potential diagnostic and prognostic biomarker of HEV-ALF patients, and its high level suggests poor prognosis, which provides a new basis for early intervention.

Keyword(s) : patients with hepatitis E infection; Acute liver failure; glycogen phosphorylase L; Biomarker; Prognosis

2583 - Head to Head Comparison Between MRI and A Novel Portable VCTE Device (Liverscan) A Pilot Study

Zhuoru Jiang¹, Zihao Huang², Yongping Zheng², Jie Li

ORAL ABSTRACTS

1

Nanjing Drum Tower Hospital, Infectious Diseases, Nanjing-China ¹ The Hong Kong Polytechnic University, Biomedical Engineering, Hong Kong-China ²

Background / **Hypothesis:**
Vibration-controlled transient elastography (VCTE) is widely used for liver fibrosis assessment. While the diagnostic accuracy of standard VCTE, particularly Fibroscan, has been extensively compared to magnetic resonance elastography (MRE), Liverscan is a novel, portable, phased array transducer-based VCTE system whose diagnostic performance remains to be rigorously validated. This study aimed to perform a head-to-head comparison between this novel portable VCTE device vs. the MRE for liver stiffness measurement and Liverscan-derived multi-domain attenuation parameter (MAP) vs. MRI-proton density fat fraction (PDFF) for fat measurement, specifically investigating physiological factors driving measurement discordance.

Materials and **Methods:**
We performed a cross-sectional analysis of 48 participants, including 22 metabolic dysfunction-associated steatotic liver disease (MASLD) patients and 26 healthy controls (HC), who underwent concurrent liver stiffness measurement (LSM) using the portable Liverscan (Eieling Technology Limited, Hong Kong, China) and MRE (uPMR 790, United Image, Shanghai, China). Liver fat quantification was also compared between the Liverscan-derived MAP and MRI-PDFF. Agreement was assessed using Spearman's correlation.

Results:

The correlation between LSM by Liverscan and MRE was significant ($r_s = 0.62$, $p < 0.001$). Similarly, liver fat quantification demonstrated strong concordance with MRI-PDFF ($r_s = 0.76$, $p < 0.001$). Importantly, this diagnostic performance was sustained in the MASLD subgroup, where LiverScan maintained significant correlations with MRE for stiffness ($r_s = 0.57$, $p = 0.0051$) and with MRI-PDFF for fat quantification ($r_s = 0.45$, $p = 0.037$).

Conclusions:

Liverscan demonstrates robust diagnostic concordance with MRE and MRI-PDFF, providing a reliable point-of-care solution for the simultaneous assessment of liver fibrosis and steatosis. However, due to the limited sample size and heterogeneous etiologies of

participants, the results are preliminary and inconclusive. Future research should compare the diagnostic accuracy of MRI-based techniques against Liverscan for the diagnosis of liver fibrosis and steatosis using histology as the reference standard.

Keyword(s) : Liverscan, vibration-controlled transient elastography, magnetic resonance elastography, multi-domain attenuation parameter, MRI-proton density fat fraction

2590 - The Predictive Value of Platelet Derived Growth Factor for Evaluating Antiviral Therapy Response and Liver Stiffness Trajectory in Chronic Hepatitis B

Fadhyl Zuhry Lubis¹, Suyata Suyata¹, Imam Suprianto¹, Vidi Orba Busro¹, Muhammad Ayus Astoni¹, Anjab Akmal Sya'roni¹
Faculty Medicine Of Sriwijaya University/mohammad Hoesin Hospital, Internal Medicine, Palembang-Indonesia¹

Background / **Hypothesis:**
Chronic hepatitis B virus (HBV) infection is a major contributor to progressive liver fibrosis and cirrhosis. Although nucleos(t)ide analogues (NAs) are effective in suppressing viral replication, a portion of patients exhibits primary non-response, increasing the risk of fibrotic progression. Platelet-Derived Growth Factor-BB (PDGF-BB), a key mediator in hepatic fibrogenesis, has shown potential as a biomarker for fibrosis severity, yet its role in predicting treatment response remains underexplored. This Study want to assess the predictive value of PDGF-BB for identifying primary non-response and tracking liver stiffness changes in patients with chronic hepatitis B undergoing antiviral therapy.

Materials and **Methods:**
This prospective observational study involved 40 treatment-naïve patients with chronic HBV infection monitored over 48 weeks of antiviral therapy. Serum PDGF-BB levels and liver stiffness measurements (LSM) using FibroScan® were recorded at baseline and 6-months follow-up. Fibrosis was staged from F0 to F4, and primary non-response was defined as $<1 \log_{10}$ IU/mL decline in HBV DNA at week 12. ANOVA was used to analyze differences in PDGF-BB across fibrosis stages.

Results:

PDGF-BB levels increased progressively with higher fibrosis stages ($p = 0.000$). The mean PDGF-BB in F0 patients was 208.5 ± 110.2 pg/mL, significantly lower than in F4 patients (1582.3 ± 206.6 pg/mL). A stepwise

ORAL ABSTRACTS

elevation was observed from F1 (486.4 ± 111.2 pg/mL) to F3 (1278.9 ± 72.2 pg/mL), indicating a strong correlation between PDGF-BB levels and fibrosis severity. Median PDGF-BB values also rose across stages, from 188.5 pg/mL in F0 to 1516.2 pg/mL in F4. For predicting primary non-response, ROC analysis showed PDGF-BB levels had sensitivity 85% and specificity 78%, with an AUC of 0.82. Non-responders exhibited significantly higher baseline PDGF-BB levels (1367.2 ± 215.7 pg/mL) compared to responders (783.5 ± 130.3 pg/mL).

Conclusions:

PDGF-BB demonstrates strong potential as a prognostic biomarker for identifying antiviral treatment non-response and predicting liver stiffness progression in chronic hepatitis B patients. Its integration into clinical monitoring could support earlier intervention and individualized therapy adjustments.

Keyword(s) : Platelet-Derived Growth Factor-BB, chronic hepatitis B, fibrosis severity, primary non-response, antiviral therapy, liver stiffness, prognostic biomarker, fibrosis progression, sensitivity, specificity.

2593 - Spermidine suppresses liver fibrosis by remodeling the communication signal between liver sinusoidal endothelial cells and hepatic stellate cells
Running title Spermidine suppresses liver fibrosis by downregulation of LSEC derived BGN

Cheng Zeng¹, Jiao Liu¹, Zhiqiang Jin¹, Yang Yang¹, Zhi Zhou¹

The Second Affiliated Hospital Of Chongqing Medical University, Department Of Infectious Diseases, Key Laboratory Of Molecular Biology For Infectious Diseases (ministry Of Education), Institute For Viral Hepatitis, Chongqing-China¹

Background / Hypothesis: Hepatic fibrosis represents a crucial pathological stage in the progression of chronic liver disease, where reversible liver injury evolves into irreversible decompensated liver dysfunction. Liver sinusoidal endothelial cells (LSECs) play a pivotal role in the regulation of hepatic stellate cells (HSCs) activation through paracrine signaling. Therefore, preserving the physiological function of LSECs is essential for preventing the development of fibrosis. Spermidine (SPD) has emerged as a potential antifibrotic agent, but the specific mechanisms by which SPD modulates LSEC function and how it exerts its antifibrotic effects remain poorly understood.

Materials and Methods: To investigate the relationship between SPD intake and liver fibrosis, we utilized data from the National Health and Nutrition Examination Survey (NHANES) and identified an inverse correlation between dietary SPD intake and the risk of fibrosis. In vitro and in vivo models were used to assess the impact of SPD on LSEC function and fibrosis progression. Integrative analyses using proteomics, single-cell RNA sequencing data and machine learning-based prioritization were conducted to identify SPD targets in LSECs.

Results: Our results showed that SPD significantly improved LSEC function and inhibited fibrosis progression. Biglycan (BGN), an extracellular matrix protein from LSECs, was identified as a key target of SPD. Overexpression of BGN diminished the effect of SPD in restoring LSEC dysfunction and promoted HSC activation. Mechanistically, SPD activated NRF2 to increase UBE2G2 expression, thereby enhancing UBE2G2-dependent ubiquitination and degradation of BGN. UBE2G2 knockdown abrogated SPD-induced BGN downregulation and attenuated the protective effects of SPD against LSEC capillarization and HSC activation. Additionally, BGN overexpression in the CCl₄-induced mice model also markedly attenuated the ability of SPD to improve LSECs dysfunction and its antifibrotic efficacy.

Conclusions: This study uncovers a novel mechanism by which SPD ameliorates LSEC dysfunction and inhibits fibrosis progression through modulation of LSEC-derived BGN. These findings suggest that targeting LSEC-derived BGN may represent a promising therapeutic strategy for hepatic fibrosis.

2594 - Risk factors for low level viremia in Tenofovir Disoproxil Fumarate (TDF) treated patients with chronic hepatitis B complicated by advanced hepatic fibrosis compensated liver cirrhosis

Haiying Zhang¹, Runling Zhang¹, Huiying Rao¹
Peking University People's Hospital, Peking University Hepatology Institute, Beijing-China¹

Background

/

Hypothesis:

Patients with chronic hepatitis B (CHB) complicated by advanced hepatic fibrosis/compensated cirrhosis are at

ORAL ABSTRACTS

a high risk of disease progression.. Even with first-line nucleos(t)ide analog therapy, a subset of these patients still develops low-level viremia (LLV). Moreover, LLV is associated with the progression of liver fibrosis and an elevated risk of hepatocellular carcinoma. Currently, clinical research on precise predictive markers for LLV in this patient population remains relatively scarce. Therefore, this study aims to identify the high-risk factors associated with LLV in patients with CHB complicated by advanced hepatic fibrosis/compensated cirrhosis.

Materials and Methods:

A retrospective cohort study was conducted on 141 patients with CHB complicated by advanced hepatic fibrosis/compensated cirrhosis who were treated with Tenofovir Disoproxil Fumarate (TDF). According to the virological response at week 48 post-treatment, the patients were divided into two cohorts: LLV (HBV DNA 20–2000 IU/mL) cohort and complete virological response (CVR) (HBV DNA < 20 IU/mL) cohort. Baseline clinical characteristics were extracted from electronic medical records. Univariate and multivariate logistic regression analysis were performed to evaluate the indicators associated with the development of LLV.

Results:

A total of 141 patients were enrolled, male patients accounted for 74.5% (105/141); the median age was 43 years; the mean HBV DNA level was 5.67 Log₁₀ IU/mL. Among them, 17.0% (24/141) experienced LLV. Significant differences were observed between the LLV and CVR groups in terms of baseline HBV DNA, HBV RNA, hepatitis B e antigen (HBeAg) positivity, alanine aminotransferase (ALT), ALT exceeding the upper limit of normal (ULN), aspartate aminotransferase (AST), total bilirubin (TBIL) > ULN, direct bilirubin (DBIL) > ULN, HBV DNA ≥ 5.0 Log₁₀ IU/mL, HBV DNA ≥ 6.0 Log₁₀ IU/mL, HBV DNA ≥ 7.0 Log₁₀ IU/mL, HBV RNA ≥ 5.0 Log₁₀ copies/mL. Multivariate logistic regression analysis showed that HBV DNA ≥ 7.0 Log₁₀ IU/mL (OR = 0.078, 95% CI: 0.024-0.252, p = <0.001), HBV RNA ≥ 5.0 Log₁₀ copies/mL (OR = 0.107, 95% CI: 0.013-0.898, p = 0.039) and TBIL > ULN (OR = 0.154, 95% CI: 0.034-0.695, p = 0.015) at baseline were independently associated with the development of LLV.

Conclusions:

In TDF-treated patients with CHB complicated by advanced hepatic fibrosis/compensated liver cirrhosis, HBV DNA ≥ 7.0 Log₁₀ IU/mL, HBV RNA ≥ 5.0 Log₁₀

copies/mL and TBIL > ULN are the high-risk factors associated with the development of LLV.

2596 - Baseline Determinants of Inadequate Ursodeoxycholic Acid Response in Primary Biliary Cholangitis A POISE Based Real World Cohort Study

Phool Chand ¹, Vinod Arora ¹, Satender Pal Singh ¹, Archana Rastogi ², Chhagan Bihari ², Ankit Bhardwaj ³, Mahima Chaudhary ³, Sangeeta Yadav ³, Zeenat Naz ³, Shiv Kumar Sarin ¹

Institute Of Liver And Biliary Sciences (ilbs), Department Of Hepatology, Delhi-India ¹ Institute Of Liver And Biliary Sciences (ilbs), Department Of Pathology, New Delhi-India ² Institute Of Liver And Biliary Sciences (ilbs), Department Of Clinical Research, New Delhi-India ³

Background and Aims: Ursodeoxycholic acid (UDCA) is the first-line therapy for primary biliary cholangitis (PBC); however, a substantial proportion of patients fail to achieve adequate biochemical response and remain at risk for disease progression. Identification of baseline predictors of inadequate response is essential for early risk stratification.

Methods: Electronic records of 453 patients with PBC treated between January 2011 and September 2025 were reviewed. After exclusions, 392 patients initiated on UDCA were included. Biochemical response at 12 months was assessed using POISE criteria (alkaline phosphatase ≤ 1.67× upper limit of normal with ≥ 15% reduction from baseline and total bilirubin ≤ upper limit of normal). Baseline demographic, biochemical, elastographic, bone density, serologic, and histologic variables were compared between POISE responders and non-responders. Independent predictors were identified using multivariable logistic regression, and discrimination assessed using receiver operating characteristic analysis.

Results: At 12 months, 212 of 392 patients (54%) achieved POISE-defined biochemical response, while 180 (46%) were non-responders. The cohort was predominantly female (91.8%) with a mean age of 57.6 ± 13.6 years. Non-responders were older (68.1 ± 5.6 vs 48.7 ± 11.9 years; p < 0.001) with higher baseline liver stiffness (median 17.2 vs 13.9 kPa; p = 0.016). Cholestatic enzymes were higher among non-responders, including alkaline phosphatase (583.6 ± 150.9 vs 299.5 ± 168.1 U/L; p < 0.001) and gamma-glutamyl transferase (539.7 ± 191.8 vs 210.7 ± 167.0 U/L; p < 0.001), with lower platelet counts (100.2 ± 30.5 vs 186.8 ± 86.5 × 10⁹/L; p < 0.001). Transaminases, bilirubin, albumin, international normalized ratio, renal function, and immunoglobulin G

ORAL ABSTRACTS

levels were comparable. Osteopenia was present in 40.8% and osteoporosis in 26.8%, more frequent among non-responders (32.2% vs 22.2%). Extra-hepatic comorbidities and autoantibody profiles, including antimitochondrial antibody positivity (93.4%), were similar. Histology showed more advanced disease among non-responders across Scheuer, Ludwig, and Nakanuma systems, with greater fibrosis, bile duct loss, and orcein-positive copper deposition (all $p < 0.001$). On multivariable analysis, younger age (OR 0.747, 95% CI 0.682–0.818), lower alkaline phosphatase (OR 0.990, 95% CI 0.986–0.994), and lower gamma-glutamyl transferase (OR 0.992, 95% CI 0.989–0.996) independently predicted POISE response (all $p < 0.001$). ROC analysis confirmed excellent discrimination for age (AUC 0.931; specificity 100%), alkaline phosphatase (AUC 0.905; 98.3%), and gamma-glutamyl transferase (AUC 0.902; 100%) (all $p < 0.001$). Conclusions: Nearly half of patients with PBC show inadequate biochemical response to UDCA. Baseline age, SAP, and GGT reliably identify those at high risk of non-response, enabling early risk stratification.

2600 - Hepatitis B virus recurrence in liver transplant recipients receiving subcutaneous hepatitis B immunoglobulin

Mustafa Duru ¹, Muhsin Murat Muhip Harputluoğlu ², Sezai Yılmaz ³, Muhammed Furkan Keser ¹
Inonu University, Department Of Gastroenterology, Malatya-Türkiye ¹ Inonu University-liver Transplant Institute, Department Of Gastroenterology, Malatya-Türkiye ² Inonu University-liver Transplant Institute, Department Of General Surgery, Malatya-Türkiye ³

Background

/

Hypothesis:

Prophylaxis with hepatitis B immunoglobulin (HBIG) combined with nucleos(t)ide analogues (NUCs) remains the standard approach to prevent hepatitis B virus (HBV) recurrence after liver transplantation. Subcutaneous HBIG (sc HBIG) allows outpatient self-administration and sustained immunoprophylaxis; however, real-world data regarding serological dynamics and recurrence rates remain limited. This study aimed to evaluate HBV recurrence in liver transplant recipients receiving sc HBIG.

Materials

and

Methods:

This retrospective, single-center study included 302 adult patients who underwent liver transplantation for

HBV-related liver disease and received sc HBIG in combination with NUC therapy. Baseline demographic and clinical variables included age, sex, pre-transplant HBV DNA status, presence of hepatocellular carcinoma (HCC), hepatitis D virus (HDV) serology and RNA status, MELD-Na score, donor type, and antiviral regimens. Serological markers, including hepatitis B surface antigen (HBsAg) and anti-HBs titers, were assessed at baseline and at months 3, 6, 12, and 24 following transplantation. Post-transplant positive HBsAg and/or HBV-DNA levels were considered HBV recurrence.

Results:

The mean age of the cohort was 57.6 ± 9.2 years, and 78.5% of patients were male. Pre-transplant HCC was present in 42.1%, while anti-HDV or HDV RNA positivity was observed in 59.6% of patients. The majority of transplants were from living donors (97%). The frequency of HBV recurrence at 12 and 24 months post-transplant was 2% and 4.8%, respectively.

Conclusions:

Our findings suggest that sc HBIG administration is an effective method for preventing HBV recurrence after liver transplantation.

2601 - Diagnostic Accuracy and Long Term Prognostic Value of FIB 4 Index and De Ritis Ratio in Chronic Hepatitis C Patients A Comparative Kaplan Meier Analysis with MELD 3.0

Ilyas Ethem Şenocak ¹, Yunus Güneğül ¹, Mesut Aslan ¹, Ahmet Tarik Eminler ¹
Sakarya University, Gastroenterology, Serdivan-Türkiye ¹

Background / Hypothesis: Accurate non-invasive assessment of cirrhosis and long-term prognosis is crucial in chronic hepatitis C (HCV) management. We aimed to evaluate the diagnostic and prognostic value of the FIB-4 index and De Ritis ratio in HCV patients and compare their performance with the MELD 3.0 score.

Materials and Methods: In this retrospective study, 303 chronic HCV patients (86 cirrhotic, 217 non-cirrhotic) were followed for a median of 1,906 days (extending up

ORAL ABSTRACTS

to 13 years). Diagnostic accuracy was assessed using ROC-AUC analysis. Long-term survival was analyzed using Kaplan-Meier curves and Cox proportional hazards regression models.

Results:The FIB-4 index and De Ritis ratio showed high diagnostic accuracy for cirrhosis (AUC: 0.871 and 0.803, respectively; $p < 0.001$). For predicting long-term mortality, the FIB-4 index (AUC: 0.641) performed comparably to the MELD 3.0 score (AUC: 0.654). Kaplan-Meier analysis revealed significantly lower survival rates in patients with a baseline FIB-4 score > 6.08 (Log-rank $p = 0.049$). Univariate Cox regression analysis demonstrated that a FIB-4 score > 6.08 was associated with a 2.03-fold increase in the hazard of long-term mortality (HR: 2.031, 95% CI: 1.06–3.87, $p = 0.031$). Multivariate analysis identified FIB-4 as an independent predictor of cirrhosis, while age and albumin remained independent predictors of survival.

Conclusions:The FIB-4 index is a reliable and cost-effective tool that demonstrates prognostic discrimination comparable to MELD 3.0 for long-term mortality risk stratification.

2602 - Effect of Midodrine on Short Term Mortality and Liver Function in Patients with Cirrhosis and Ascites A Systematic Review and Meta analysis

Gizem Dağci¹, Mehmet Akif Yağlı¹, Besim Fazil Ağargün¹, Asim Gurbanov¹, Bilger Çavuş¹, Filiz Akyüz¹, Kadir Demir¹, Selman Fatih Beşişik¹, Sabahattin Kaymakoğlu¹

Istanbul University Istanbul Faculty Of Medicine, Department Of Internal Medicine, division Of Gastroenterology, Istanbul-Türkiye¹

Background / **Hypothesis:** Midodrine, an $\alpha 1$ -adrenergic agonist, has been proposed as a vasoconstrictor therapy to counteract circulatory dysfunction in patients with cirrhosis and ascites. Its potential impact on clinical outcomes, particularly mortality and liver function, remains under active investigation.

Materials and **Methods:**

A systematic search was conducted for randomized controlled trials comparing midodrine (with or without rifaximin) to standard medical therapy or albumin in cirrhotic patients with ascites. RevMan 5.4 was used to conduct meta-analyses of mortality (binary outcome)

and MELD scores (continuous outcome). Heterogeneity was evaluated using I^2 statistics. Patient baseline characteristics are summarized in Table 1.

Results

Four RCTs, including a total of 729 patients (464 midodrine, 265 control), met the inclusion criteria. Midodrine significantly reduced short-term (12 weeks) mortality compared to SMT (OR: 0.22; 95% CI: 0.11–0.44; $p < 0.0001$; $I^2 = 29\%$). Midodrine was also associated with a greater reduction in MELD score (MD: -2.49; 95% CI: -2.74 to -2.25; $p < 0.00001$; $I^2 = 0\%$). Heterogeneity was low for both outcomes. No serious adverse effects were reported. Mild symptoms such as thirst and abdominal discomfort were noted in two studies. Midodrine was generally used at 7.5–12.5 mg TID. One study combined midodrine with rifaximin.

Results:

Four RCTs, including a total of 729 patients (464 midodrine, 265 control), met the inclusion criteria. Midodrine significantly reduced short-term (12 weeks) mortality compared to SMT (OR: 0.22; 95% CI: 0.11–0.44; $p < 0.0001$; $I^2 = 29\%$). Midodrine was also associated with a greater reduction in MELD score (MD: -2.49; 95% CI: -2.74 to -2.25; $p < 0.00001$; $I^2 = 0\%$). Heterogeneity was low for both outcomes. No serious adverse effects were reported. Mild symptoms such as thirst and abdominal discomfort were noted in two studies. Midodrine was generally used at 7.5–12.5 mg TID. One study combined midodrine with rifaximin. **Conclusions:**Midodrine is associated with significant improvements in both short-term mortality and liver function, as assessed by MELD score, in patients with cirrhosis and ascites. These findings support the consideration of midodrine as a therapeutic adjunct in selected patients. Further large-scale, multicenter trials are warranted to validate these results.

Keyword(s) : midodrine, cirrhosis, liver

2604 - Research on artificial liver support system for non hepatocellular carcinoma patients with severe immune checkpoints related liver injury

Hua Liu¹, Junjun Cai¹, Lei Liu¹, Ying Liu¹, Jing Wen¹
Central Hospital, Tianjin University, Gastroenterology And Hepatology, Tianjin-China¹

Background:

As immunotherapy is widely applied in various tumors, immune-related liver injury, as an important part of drug-induced liver injury, has attracted increasing attention. The majority of patients recover liver function after glucocorticoid treatment, but patients with poor response to hormone therapy pose a challenge for

ORAL ABSTRACTS

clinicians.

Materials and Methods:

This study reviewed 18 patients with liver injury caused by immune checkpoint inhibitors who were admitted to Tianjin Third Central Hospital after October 2020. We have meticulously documented the patients' anti-tumor medication usage, clinical biochemical indicators, and artificial liver conditions, and will continue to follow up until December 31, 2025.

Results:

There were 17 males and 3 females with an average age of 62.20 ± 11.18 years. The tumors included 8 cases of lung cancer, 6 cases of gastric cancer, 1 case of esophageal cancer, 1 case of colon cancer, 1 case of soft tissue malignancy, and 1 case of bile duct cancer. Among them, there were 2 patients with chronic viral hepatitis B and 1 patient with liver metastasis. The immune checkpoint drugs used included Tislelizumab, Indilimumab, Carilimumab, Tremelimumab, and Soolilimumab. Upon admission, the patients' liver function tests showed ALT $148.21(25.07, 271.35)$ U/L, AST $194.47(92.66, 296.29)$ U/L, ALP 487.95 ± 291.49 U/L, GGT 637.35 ± 440.93 U/L, TBIL 221.89 ± 98.84 μ mol/L, total bile acid 265.41 ± 150.95 μ mol/L, BUN 7.20 ± 4.44 mmol/L, Cr 73.79 ± 45.92 μ mol/L, NR 1.13 ± 0.44 , IgG 17.41 ± 6.39 g/L, ANA 1:100 in 5 cases, and ANA 1:320 in 1 case. The patients did not respond well to glucocorticoid treatments and were all given artificial liver support system. The modes of artificial liver support system included plasma exchange, plasma adsorption, dual plasma molecular adsorption, and dual plasma molecular adsorption combined with plasma exchange. The number of treatments ranged from 1 to 20. Among them, 12 patients died, 8 patients survived, and 3 patients resumed immunotherapy.

Conclusions:

Immune checkpoint-related liver injury is a significant adverse reaction affecting the survival of cancer patients. On the one hand, patients may have underlying chronic liver disease that is not screened before cancer treatment. On the other hand, various combination therapies such as chemotherapy and targeted therapy may exacerbate liver injury. Therefore, glucocorticoid therapy is ineffective, and patients may even progress to liver failure, with a high mortality rate. Given that cancer patients often do not have the opportunity for liver transplantation, artificial liver support system may become an important treatment method for rescuing immune-related liver injury.

2605 - Mobile Ablation for Secondary Hypersplenism in Hepatocellular Carcinoma Patients

with Liver Cirrhosis A Safety and Efficacy Study

Yong Xu Xu ¹, Huikai Li Li ², Tongguo Si ³, Rui Xia Xia ⁴, Xing Li Li ¹, Rentao Li ⁵, Yang Liu ⁶
Tianjin Medical University Cancer Institute & Hospital, Department Of Ultrasound Diagnosis And Treatment, Tianjin-China ¹ Tianjin Medical University Cancer Institute & Hospital, Department Of Hepatobiliary Cancer, Tianjin-China ² Tianjin Medical University Cancer Institute & Hospital, Department Of Interventional Therap, Tianjin-China ³ Tianjin Medical University Cancer Institute & Hospital, Intensive Care Unit, Tianjin-China ⁴ Tianjin Cancer Hospital Airport Hospital, Department Of Hepatobiliary And Pancreatic Oncology, Tianjin-China ⁵ Tianjin Medical University Cancer Institute & Hospital, Department Of Hepatobiliary Cancer,, Tianjin-China ⁶

Background / Hypothesis: Secondary hypersplenism is common in patients with hepatocellular carcinoma (HCC) and liver cirrhosis, leading to cytopenia, immune dysfunction, and limited access to antitumor therapies. Although splenectomy can improve hematologic parameters, it carries substantial perioperative risk in cirrhotic patients. Minimally invasive splenic interventions have therefore emerged as alternatives. This study aimed to further evaluate the efficacy and safety of mobile ablation combined with splenic artery balloon occlusion for cirrhosis-related secondary hypersplenism.

Materials and Methods: Between August 2023 and June 2025, 47 patients with HCC and cirrhosis complicated by secondary hypersplenism were prospectively enrolled. Preoperative assessment included routine laboratory tests and liver function grading (Child-Pugh class A, n = 27; class B, n = 20). All patients underwent temporary splenic artery balloon occlusion followed by percutaneous splenic ablation. Treatment outcomes were assessed by ablation volume, dynamic changes in peripheral blood cell counts, postoperative complications, and changes in splenic volume on imaging during follow-up.

Results: A total of 47 ablation procedures were successfully performed, targeting approximately 60–70% of total splenic volume. Fixed dual-electrode ablation was used in 7 patients, while 40 patients underwent single-electrode mobile ablation. Preoperative platelet count was $(51.24 \pm 16.45) \times 10^9$ /L. Platelet levels increased significantly after ablation, reaching a peak at postoperative day 7 (211.57 ± 147.08) $\times 10^9$ /L. Although platelet counts gradually declined at 3, 6, and 12 months, they remained significantly higher than baseline ($P < 0.05$). Leukocyte

ORAL ABSTRACTS

and erythrocyte counts showed no significant long-term differences compared with baseline ($P > 0.05$). Lymphocyte percentage and absolute counts demonstrated an initial decrease followed by recovery, with significant differences compared with preoperative values ($P < 0.05$). Contrast-enhanced ultrasound showed a mean immediate ablation volume of $(72.81 \pm 9.86)\%$ of total splenic volume. MRI follow-up at 6 months revealed a median splenic volume reduction of 67%. No procedure-related mortality occurred. Postoperative complications were mostly mild and manageable, including fever, pain, and hemoglobinuria. Major complications included bleeding ($n = 6$), perisplenic fluid or abscess ($n = 5$), renal failure ($n = 1$), and splenic vein thrombosis ($n = 2$).

Conclusions: Mobile ablation combined with splenic artery balloon occlusion is a safe and effective minimally invasive treatment for secondary hypersplenism in patients with HCC and liver cirrhosis. The technique significantly reduces splenic volume, improves thrombocytopenia, and may contribute to immune function reconstruction, making it a promising alternative for patients unsuitable for splenectomy.

Keyword(s) : Secondary hypersplenism; Hepatocellular carcinoma; Liver cirrhosis; Splenic ablation; Balloon occlusion

2606 - A Simple Five Variable Model Integrating GWAS Variants Predicts Chronic Outcomes in Drug Induced Liver Injury

Weiwei Lou ¹, Jingjing Jang ¹, Weiqian Lou ¹, Xichen Zhu ², Rongtao Lai ¹, Qing Xie ¹
Ruijin Hospital, Shanghai Jiao Tong University School Of Medicine, Department Of Infectious Diseases, Shanghai-China ¹ Shanghai Jiao Tong University School Of Medicine, Shanghai Jiao Tong University School Of Medicine, Shanghai-China ²

Objective:

In clinical practice, progression to chronic liver injury occurs in 6-39% of drug induced liver injury (DILI) cases. However, reliable prognostic tools remain lacking. We aimed to investigate whether genetic variants associated with DILI susceptibility may predict chronic outcomes and thus fill the gap between genetic discovery and clinical translation.

Methods:

Between 2018 and 2023, we prospectively enrolled 338 well characterized DILI patients at Shanghai Ruijin Hospital. Chronic DILI

was defined as persistent liver test abnormalities beyond 6 months. It developed in 167 (49.4%) patients. We analyzed the genotype of two significant single nucleotide polymorphisms (rs72631567, rs28531257), which were combined with routinely available laboratory parameters. These lab parameters included peak alanine aminotransferase, low-density lipoprotein cholesterol, and monocyte count. A light gradient boosting machine learning algorithm was trained on 270 patients and validated independently on 68 patients.

Results:

Both genetic variants at rs72631567 and rs28531257 showed significant associations with chronic DILI progression. The integrated model achieved an area under the curve (AUC) of 0.92 (95% confidence interval 0.89-0.95) in the training cohort and 0.81 (0.70-0.91) in validation, substantially outperforming clinical variables alone (AUC, 0.57, $P < 0.001$). SHAP analysis revealed that rs72631567 contributed the greatest predictive weight, followed by peak transaminase levels.

Conclusion:

The current work demonstrates that susceptibility variants from genome-wide association studies can be prognostic. Our five-variable tool requires only standard blood tests and straightforward genotyping. Early identification of high-risk patients may help determine the intensity of monitoring and therapeutic decisions, thus making precision medicine practical for DILI management.

2607 - Inhibition of FKBP10 attenuates hepatic stellate cell activation and liver fibrosis via RAS signaling

Jingyu Zhang ¹, Jiahao Yuan ¹, Wei Cheng ¹, Min Cong ¹
Beijing Friendship Hospital, Capital Medical University, Liver Research Center, Beijing-China ¹

Background: Hepatic stellate cell (HSC) activation is a central driving force of liver fibrogenesis. FKBP10, a collagen-associated chaperone involved in extracellular matrix remodeling, has not yet been fully characterized in the context of liver fibrosis. Here, we comprehensively investigated the functional role of FKBP10 and its

ORAL ABSTRACTS

underlying regulatory mechanisms in HSC activation and fibrotic progression.

Methods: The expression and localization of FKBP10 were examined in liver tissues from patients with cirrhosis of various etiologies and in multiple experimental fibrosis models. Gain- and loss-of-function approaches using FKBP10 siRNA and overexpression plasmids were applied in LX-2 cells to assess its effects on HSC activation, apoptosis, and extracellular matrix (ECM) production. The therapeutic potential of FKBP10 inhibition was further evaluated in vivo using AAV6-GFAP-shFKBP10 delivery in fibrotic mouse models. Primary HSCs isolated from CCl₄-induced fibrotic livers were subjected to transcriptomic sequencing to identify downstream pathways regulated by FKBP10. In addition, LC-MS/MS combined with co-immunoprecipitation was performed to identify FKBP10-interacting proteins, and pharmacological inhibitors targeting RAS signaling or VPS4A were employed for mechanistic validation.

Results: FKBP10 expression was markedly upregulated in human cirrhotic livers across multiple etiologies and in several mouse fibrosis models. Receiver operating characteristic analysis based on FKBP10 expression suggested its potential value as an auxiliary diagnostic biomarker for liver cirrhosis. In vitro, FKBP10 silencing significantly suppressed HSC activation, reduced ECM synthesis, and promoted apoptosis, whereas FKBP10 overexpression produced opposite effects. Notably, pharmacological inhibition of RAS signaling effectively reversed FKBP10 overexpression-induced HSC activation and ECM production, indicating that RAS acts as a critical downstream effector of FKBP10. In vivo, AAV6-GFAP-shFKBP10-mediated knockdown of FKBP10 resulted in thinner and more discontinuous fibrotic septa, reduced inflammatory cytokine expression, and overall attenuation of liver injury. Transcriptomic profiling of primary HSCs revealed that FKBP10 deficiency predominantly suppressed the RAS signaling pathway and its downstream profibrotic cascades. Furthermore, LC-MS/MS and co-immunoprecipitation identified VPS4A as a potential binding partner of FKBP10. Importantly, pharmacological inhibition of VPS4A abolished FKBP10-induced RAS activation, suggesting that FKBP10 regulates RAS activity through a VPS4A-dependent mechanism involving RAS membrane-cytoplasmic cycling.

Conclusion: Collectively, these findings demonstrate that FKBP10 promotes HSC activation and liver fibrogenesis by interacting with VPS4A to modulate RAS signaling. Targeting the FKBP10-VPS4A-RAS axis may therefore represent a promising therapeutic strategy for the treatment of liver fibrosis.

Keyword(s) : FKBP10, Liver fibrosis, Hepatic stellate cell activation, RAS signaling pathway, VPS4A, AAV-mediated gene silencing

2608 - Optimizing Pegylated Interferon Consolidation Therapy and Predicting Recurrence After Functional Cure in Chronic Hepatitis B A Study Based on Updated Definitions

Yuchen Peng¹, Xiaoping Wu¹

The First Affiliated Hospital Of Nanchang University, Department Of Infectious Diseases, Nanchang-China¹

Background / Hypothesis: Despite achieving functional cure (FC), some chronic hepatitis B (CHB) patients experience HBsAg recurrence. This study aimed to identify the optimal consolidation duration and predictors of recurrence based on the updated FC definition.

Materials and Methods: This study enrolled 443 CHB patients treated with Pegylated interferon (PEG-IFN)-based therapy at the First Affiliated Hospital of Nanchang University between November 2020 and May 2023. A total of 113 patients achieved FC, the patients were divided into a training cohort and a validation cohort via time series partitioning method. Patients in each cohort were grouped by recurrence status. Clinical characteristics and longitudinal changes in HBV DNA and HBsAg levels were compared. Independent predictors were identified using multivariate logistic regression. Cutoff values were determined using receiver operating characteristic curve analysis, and the cumulative recurrence rate was estimated by Kaplan-Meier survival analysis. A nomogram was constructed based on independent predictors.

Results:

Consolidation therapy duration, PEG-IFN monotherapy, and end-of-treatment (EOT) HBsAb level were independently associated with recurrence (all $P < 0.05$). The combined model showed high predictive accuracy (AUC=0.913, 95% CI: 0.830–0.964). The optimal cutoff value for consolidation therapy duration was 13.50 weeks. For EOT HBsAb, the cutoff value was 2.03 log₁₀ mIU/mL. The nomogram model demonstrated good predictive performance.

Conclusions:

A consolidation duration of ≥ 13.5 weeks, antiviral therapy with PEG-IFN in combination with nucleos(t)ide

ORAL ABSTRACTS

analogues, and an EOT HBsAb level $2.03 \log_{10}$ mIU/mL were associated with sustained FC. Post-treatment virological monitoring remains essential to allow early detection of HBsAg reappearance and timely intervention. The nomogram model may provide a reference for clinical decision-making and individualized risk assessment.

2609 - Acetylation modification of PKM2 promotes macrophage reprogramming and accelerates the progression of MAFLD

Huiling Cao¹, Shujun Ma², Miaomiao Tian³, Jianni Qi¹
Shandong Provincial Hospital Affiliated To Shandong First Medical University, Immunology, Jinan-China¹
University Town Hospital, Affiliated Hospital Of Shandong University Of Traditional Chinese Medicine, Critical Care Medicine, Jinan-China²
Shandong Provincial Hospital Affiliated To Shandong First Medical University, Digestion, Jinan-China³

Background / **Hypothesis:** Cholesterol homeostasis is vital, yet its disruption in Metabolic Dysfunction-Associated Fatty Liver Disease (MAFLD) triggers mitochondrial dysfunction and oxidative stress. Liver macrophages, highly sensitive to cholesterol overload, undergo a metabolic shift from oxidative phosphorylation to glycolysis, driving a pro-inflammatory phenotype that exacerbates hepatic inflammation and fibrosis. As a central glycolytic regulator, Pyruvate Kinase M2 (PKM2) is a key candidate for sensing this stress. However, the role of post-translational modifications (PTMs), specifically PKM2 acetylation, in lipid-induced macrophage dysfunction remains poorly understood. Investigating this mechanism is crucial to elucidating how metabolic reprogramming drives MAFLD, potentially offering novel biomarkers and therapeutic strategies. **Materials** and **Methods:** In this study, RAW264.7 cells and primary PEMs/BMDMs were challenged with 20 μ g/mL cholesterol. siRNA knockdown of ATF2 and LPCAT1, combined with PKM2 mutation (K62R, K305R, K433R), was used for functional analysis. Western blot, IP, qRT-PCR, and ELISA were performed to measure protein, gene, and cytokine levels. Filipin III and BODIPY staining helped detect lipid accumulation and ROS production. The in vivo model involved HFHC-fed mice with macrophage-specific PKM2 knockdown, followed by the adoptive transfer of WT or K433R-PKM2 macrophages. Liver damage and M1 macrophage polarization were assessed as the final endpoints.

Results:

Cholesterol overload triggers macrophage lipid accumulation, oxidative stress, and glycolysis. While total PKM2 remains stable, cholesterol enhances its phosphorylation and acetylation at K433. Mechanistically, the p38-ATF2-LPCAT1 axis drives this modification. In vivo, macrophage-specific PKM2 knockdown mice on HFHC diets showed that WT-PKM2 rescue exacerbates MAFLD pathology, whereas the acetylation-deficient K433R mutant alleviates liver lipid buildup, fibrosis, and M1 polarization. These findings identify PKM2 K433 acetylation as a molecular switch driving metabolic reprogramming, positioning the p38-ATF2-LPCAT1-PKM2 axis as a therapeutic target for MAFLD and lipid-related disorders.

Conclusions

Our study identifies a novel p38-ATF2-LPCAT1-PKM2 signaling axis that drives immunometabolic reprogramming in macrophages under cholesterol stress. We demonstrate that cholesterol overload activates the p38 MAPK pathway, leading to the ATF2-mediated transcriptional upregulation of the acetyltransferase LPCAT1. This cascade enhances the acetylation of PKM2 at the K433 site, acting as a molecular switch that shifts macrophage metabolism toward glycolysis and amplifies pro-inflammatory responses. These findings elucidate a precise mechanistic link between lipid stress-activated signaling and the post-translational modification of metabolic enzymes. By characterizing this regulatory network, our research provides a novel theoretical framework for understanding how cholesterol dysregulation drives macrophage dysfunction and offers potential therapeutic targets for treating lipid-associated inflammatory and metabolic diseases, such as MAFLD.

2612 - Accuracy of D dimer Levels in Predicting Clinical Outcomes of Patients with Decompensated Liver Cirrhosis in a Philippine Tertiary Hospital

Saul Suaybaguio¹, Sarah Preza¹, Marilyn Te¹
East Avenue Medical Center, Gastroenterology, Quezon City-Philippines¹

Background / **Hypothesis:** Decompensated liver cirrhosis is associated with high morbidity, mortality, and prolonged hospitalization, particularly in tertiary public hospitals. Early risk stratification remains challenging in resource-limited settings. D-dimer, a fibrin degradation product reflecting coagulation and inflammatory abnormalities,

ORAL ABSTRACTS

has emerged as a potential prognostic biomarker in cirrhosis; however, local evidence from the Philippine setting remains limited.

Materials and Methods: A prospective cohort study was conducted among 150 adult patients with decompensated liver cirrhosis admitted to East Avenue Medical Center from January to December 2025. Serum D-dimer levels measured within 24 hours of admission were evaluated against two outcomes: in-hospital mortality and prolonged hospitalization (>7 days). Receiver operating characteristic (ROC) curve analysis was used to identify optimal cutoff values. Diagnostic accuracy parameters, including sensitivity, specificity, predictive values, likelihood ratios, diagnostic odds ratio (OR), and area under the curve (AUC), were calculated. Logistic regression was used to determine diagnostic ORs, and ROC curve significance was tested against the null hypothesis of AUC = 0.5.

Results:

A total of 150 patients with decompensated liver cirrhosis were included in the analysis. For predicting in-hospital mortality, an optimal D-dimer cutoff of ≥ 2.38 mg/L yielded a sensitivity of 74.2% and specificity of 60.2%, with an area under the ROC curve (AUC) of 0.691 (95% CI: 0.612–0.770) and a diagnostic odds ratio of 4.35. The positive and negative predictive values were 56.8% and 76.8%, respectively.

For prolonged hospitalization (>7 days), a D-dimer cutoff of ≥ 3.00 mg/L demonstrated 100% specificity and positive predictive value, with a sensitivity of 48.7%. The AUC for prolonged hospitalization was 0.714 (95% CI: 0.635–0.793), indicating good discriminative ability. Elevated D-dimer levels were consistently associated with adverse clinical outcomes.

Conclusions:

Serum D-dimer demonstrates statistically significant and clinically relevant prognostic value in predicting both in-hospital mortality and prolonged hospitalization among patients with decompensated liver cirrhosis. Its good discriminative ability and strong rule-in performance support its use as an adjunctive risk stratification tool in tertiary public hospital settings, particularly where early identification of high-risk patients is critical.

2614 - A Cross Section Study on the Co prevalence of MAFLD and HBV Infection Among Adult Residents in Maojian District Shiyan City.

Jiaxin Xie ¹, Deping Ding ¹, Xueqin Qin ¹, Li Liu ¹, Sen Luo ¹, Jian Dai ¹, Yuandong Li ¹, Mengzhu Zhang ¹, Shaojie Zhang ¹, Yunzhen Xu ¹, Ying Luo ¹, Zhongji Meng ²
Taihe Hospital, Hubei University Of Medicine, Department Of Infectious Diseases, Shiyan-China ¹ Taihe Hospital, Hubei University Of Medicine, Hubei Provincial Clinical Research Center For Precise Diagnosis And Treatment Of Liver Cancer, Shiyan-China ²

Background / Hypothesis: To investigate the epidemiological characteristics of co-occurrence of metabolic associated fatty liver disease (MAFLD) and hepatitis B virus (HBV) infection among adult residents in Maojian District, Shiyan City, Hubei Province, China, and to identify risk factors for the co-occurrence of MAFLD in those with HBV infection.

Materials and Methods: A community-based cross-sectional survey was conducted among residents aged ≥ 18 years in Maojian District. Data on demographics, lifestyle, and dietary habits were collected via an online questionnaire. On-site measurements included measurements of height, weight, and waist/hip circumference. Morning fasting blood samples were obtained for liver function tests, lipid profiles, and hepatitis B surface antigen (HBsAg) detection using colloidal gold method. Hepatic steatosis and fibrosis were evaluated by transient elastography (FibroScan®) to determine liver fat content (controlled attenuation parameter, CAP) and liver stiffness measurement (LSM). Statistical analysis was performed to assess the prevalence, clinical characteristics, and associated risk factors of MAFLD-HBV co-occurrence.

Results: Among 2,105 adults initially surveyed 341 were excluded based on ineligibility criteria; and finally 1,764 participants (mean age: 42.7 ± 17.3 years) were included in the analysis. The prevalence rates of MAFLD, HBsAg positivity, and MAFLD-HBV co-occurrence were 31.7% (535 cases), 4.4% (78 cases), and 1.4% (24 cases), respectively. Compared with HBsAg -positive individuals without MAFLD, those with MAFLD-HBV co-occurrence exhibited significant worse metabolic profiles, including

ORAL ABSTRACTS

higher levels of body mass index (BMI), waist circumference, hip circumference, systolic blood pressure, triglycerides, uric acid, alanine aminotransferase (ALT), gamma-glutamyl transferase (GGT), serum creatinine, and cystatin C (all $P < 0.01$). Hypertension (70.83% vs. 11.11%), diabetes (70.83% vs. 22.22%), abdominal obesity (62.50% vs. 12.96%), and insulin resistance (58.33% vs. 22.22%) were also markedly more prevalent in the co-occurrence group (all $P < 0.01$). Multivariate analysis identified suboptimal animal-based food intake as an independent risk factor ($P = 0.012$), whereas regular breakfast consumption served as an independent protective factor ($P = 0.012$) for MAFLD development among HBV-infected individuals.

Conclusions: The prevalence of HBV infection in this community population is lower than the national estimates. The co-occurrence rate of MAFLD and HBV infection is 1.4%, with an increasing trend with age, particularly among males. We recommend assessment of liver steatosis and metabolic parameters in males over 40 years and in individuals with underlying metabolic abnormalities. This study provides insights into the characteristics and potential risk factors for MAFLD-HBV co-occurrence. Future multi-center large-sample studies are needed to clarify risk factors and optimize intervention strategies, including routine metabolic screening and enhanced dietary health management in this population.

2617 - Spirulina Prevents Hepatic Steatosis by Promoting Macrophage M2 Polarization via Gut Microbiota Derived 2-Hydroxy-3-Methylbutyrate
Feihu Bai Bai Feihu¹, Daya Zhang Zhang Daya¹
The Second Affiliated Hospital Of Hainan Medical University, Department Of Gastroenterology, Haikou-China¹

Background / Hypothesis:

Spirulina, a microalgae renowned for its nutrient density, shows promise in modulating glucose and lipid metabolism. However, its efficacy and underlying mechanisms against metabolic dysfunction-associated steatotic liver disease (MASLD) remain unclear. We hypothesized that spirulina exerts its hepatoprotective effects by reshaping the gut microbiome and its associated metabolome.

Materials and Methods:

We conducted an 8-week pilot study in 23 patients with MASLD receiving spirulina supplements (1g TID), assessing changes in liver fat, enzymes, and metabolic parameters. To establish causality and elucidate mechanisms, we employed two distinct murine models of steatohepatitis: a Western diet model and a choline-deficient diet model. Interventions included spirulina gavage, antibiotic-induced microbiota depletion, fecal microbiota transplantation (FMT), and administration of the microbial metabolite 2-hydroxy-3-methylbutyrate (2H3MB). Multi-omics approaches (16S rRNA sequencing, metabolomics, single-cell RNA sequencing) and flow cytometry were utilized.

Results:

Spirulina supplementation significantly alleviated hepatic steatosis in both human subjects and murine models. This was accompanied by a restoration of gut microbial ecology, characterized by enriched beneficial genera (e.g., Akkermansia, Bacteroides, Blautia). Metabolomic profiling identified a marked increase in the gut microbiota-derived metabolite 2H3MB in the feces and liver. Critically, the protective effects of spirulina were abolished in microbiota-depleted mice and could not be transferred via FMT from spirulina-treated donors to naïve recipients, indicating a dependency on an intact and active microbiome. Direct administration of 2H3MB was sufficient to recapitulate the anti-steatotic effects of spirulina in high-fat diet-fed mice. Mechanistically, single-cell RNA sequencing and flow cytometry revealed that 2H3MB reshaped the hepatic immune microenvironment by specifically promoting the M2 polarization of macrophages, which in turn ameliorated lipid accumulation.

Conclusions:

Our findings unveil a novel gut-liver axis pathway through which spirulina prevents hepatic steatosis. Spirulina enhances the production of 2H3MB by specific gut microbes, which then signals to the liver to drive an anti-inflammatory, pro-resolutive M2 macrophage polarization, ultimately mitigating lipid deposition. This work highlights gut microbial metabolites, particularly 2H3MB, as promising therapeutic targets for MASLD.

2623 - Transcriptomic Profiling Identifies Anti Inflammatory and Anti Steatotic Programs Mediated by ShenGe Formula in MAFLD

Zhu Xiaoning¹, Zhi Shang¹, Xin Zhang¹, Yunfeng Guan¹, Xiaohui Liang¹, Man Li¹, Yueqiu Gao¹
Shuguang Hospital Affiliated To Shanghai University Of Traditional Chinese Medicine, Hepatology Diseases, Shanghai-China¹

Background / Hypothesis: Metabolic dysfunction-Associated Fatty Liver Disease (MAFLD) is becoming the most common liver disease worldwide. The discovery of medicines that combine anti-inflammatory and steatosis effects is the hottest area of MAFLD treatment. ShenGe Formula (SGF) is a Traditional Chinese medicine formula for treating MAFLD, with clear clinical efficacy and a Chinese patent. This study aims to investigate the roles of anti-inflammatory and anti-steatotic efficacy mediated by SGF in MAFLD. **Materials and Methods:** The principal constituents of SGF were identified using UPLC-MS. The HFHC-induced murine MAFLD model was generated over 16 weeks, followed by an 8-week treatment phase with SGF. Liver sections were analyzed by histopathology. The primary hepatocytes and liver macrophages were respectively isolated and purified. RNA-seq was used for the transcriptomic analysis of these cells. Candidate mRNA and pathways were verified both in vivo and in vitro through RT-qPCR, Western blot, and immunohistochemistry.

Results: Thirty-nine chemicals were identified in SGF extraction, animal serum, and liver, which are considered to be the key components in treating MAFLD. The hepatic steatosis and inflammation were significantly reduced in the livers of animal models by SGF treatment. Transcriptomic analysis of primary hepatocytes identified 817 different expressed genes (DEGs) associated with SGF treatment, whereas 469 DEGs were identified in primary macrophages. Bioinformatic analysis revealed that SGF improved insulin resistance and lipid metabolism in hepatocytes via the Insulin Receptor and SREBP signaling pathways, while it inhibited the activity of liver macrophages via AMPK and PI3K signaling pathways. Furthermore, Fasn, Scd1, and Tsc2 were identified as potential targets of SGF for reducing lipid accumulation, while Prkaa1, Ppargc1a, and Pik3cb were found as potential targets of SGF for inhibiting the activity of macrophages. Ultimately, the in vivo and in vitro results established that SGF inhibits Fasn expression and elevates Prkaa1 expression to mitigate hepatic lipid accumulation and inflammation in MAFLD.

Conclusions: Our findings confirmed the potential anti-

inflammatory and anti-steatotic programs mediated by ShenGe Formula in MAFLD.

2625 - Procedural Related Bleeding Among Patients with Liver Cirrhosis in a Tertiary Hospital in the Philippines A Five Year Review

Jeremie Manarang¹, Edhel Tripon¹
The Medical City, Section Of Gastroenterology, Pasig City-Philippines¹

Background / Hypothesis: Patients with liver cirrhosis are at high risk of bleeding following both surgical and non-surgical procedures. However, there are currently no reliable tests or scoring systems to predict procedure-related bleeding in cirrhotic patients, nor is there consensus on hemostatic thresholds to minimize bleeding risk.

Materials and Methods: This study is a hospital-based retrospective cohort which aimed to determine the relationship between incidence of post-procedural bleeding and patients' baseline demographics, comorbidities, clinical status, liver disease etiology, and liver function. The study included 275 patients diagnosed with liver cirrhosis who underwent at least one procedure during their hospitalization. Medical records were retrospectively reviewed to collect patient characteristics and the incidence of post-procedural bleeding. Data were analyzed using point-biserial correlation and chi-square tests.

Results:

Procedure-related bleeding occurred in 5 of the 275 patients (1.82%). Patients who experienced post-procedural bleeding were more likely to have a lower INR ($r = -0.15$, $p = 0.01$), presence of malignancy ($r = 0.13$, $p = 0.03$), and metabolic dysfunction-associated fatty liver disease (MAFLD) as the etiology of cirrhosis ($r = 0.33$, $p < 0.001$), compared with those without bleeding. No significant associations were found between procedure-related bleeding and age, Child-Turcotte-Pugh or MELD-Na scores, platelet count, use of antiplatelet or anticoagulant therapy, medical thromboprophylaxis, presence of acute or chronic kidney disease, or concurrent infection.

Conclusions:

Procedure-related bleeding was uncommon in this cohort. Although certain factors were associated with bleeding events, the low incidence limits

ORAL ABSTRACTS

generalizability. Larger studies are needed to validate these findings.

2626 - Clinical characteristics of colorectal polyps in patients with non alcoholic fatty liver disease in high altitude areas

Chunyan Wang¹, Lin Ma²
Tianjin Second People's Hospital, Gastroenterology,
Tianjin-China¹ Tianjin Medical University, Graduate
School, Tianjin-China²

Background / Hypothesis: Colorectal cancer has high global incidence and mortality rates. Colorectal polyps are relatively common, with adenomatous polyps having a higher risk of malignant transformation. Non-alcoholic fatty liver disease (NAFLD) has been identified as a risk factor for the development of colorectal adenomas. Here, inpatients with NAFLD from the Second People's Hospital of Xining, in Qinghai Province, and the Second People's Hospital of Tianjin were investigated, comparing the biochemical indicators, colonoscopy findings, and pathological results of polyps between patients from low-altitude (Tianjin) and high-altitude (Qinghai Province) areas. Risk factors associated with the occurrence of adenomatous polyps in NAFLD patients from high-altitude areas were also explored. **Materials and Methods:** A total of 848 patients with NAFLD were enrolled. Of these, 118 underwent colonoscopy between January 2021 and January 2024 at the Second People's Hospital of Tianjin (low-altitude), while the remaining 730 patients were assessed during the same period at the Second People's Hospital of Xining, Qinghai (high-altitude). All enrolled patients met the diagnostic criteria for NAFLD, and the excised colorectal polyps were analyzed pathologically. **Results:** Colorectal polyps were found in 585 cases (80.1%) in the Qinghai cohort and 91 patients (77.1%) in the Tianjin group, indicating a slightly higher incidence in the Qinghai group, although the difference was non-significant ($P > 0.05$). The two groups showed significant difference in the proportion of younger patients ($P < 0.01$). The significant differences were found between the ≤ 0.5 cm and > 1 cm and ≤ 2 cm proportions in both regions ($P < 0.05$). Polyp locations also differed significantly ($P < 0.05$). Patients in Qinghai were more prone to adenomatous polyps, accounting for 89.2% of polyps, compared to those from Tianjin ($P < 0.05$). Patients in Qinghai had a higher incidence of tubular adenomas with low-grade dysplasia, while tubular adenomas with high-grade dysplasia predominated in patients from Tianjin ($P < 0.05$). Multivariate logistic regression indicated that sex (OR = 1.695, 95%CI: 1.131-

2.536), smoking (OR = 0.604, 95%CI: 0.406-0.897), hypertension (OR = 0.683, 95%CI: 0.471-0.991), and white blood cell counts (WBC) (OR = 1.091, 95%CI: 1.015-1.173) were risk factors for the occurrence of adenomatous polyps in patients with NAFLD in high-altitude areas.

Conclusion: Patients with NAFLD from high-altitude regions have a higher incidence of colorectal polyps, with a significantly higher incidence of adenomatous polyps compared to other polyp types. Sex, smoking, hypertension, and WBC are risk factors for adenomatous polyps in NAFLD patients in high-altitude regions.

2627 - ZIP1⁺ CAFs Shape the Immunosuppressive Microenvironment to Drive Hepatocellular Carcinoma Progression

Wang Hao¹, Liu Jiangxi², Lu Ling²
Hepatobiliary Center Of The First Affiliated Hospital,
Nanjing Medical University; Research Unit Of Liver
Transplantation And Transplant Immunology, C, General
Surgery, Nanjing-China¹ Jiangsu Key Laboratory Of
Organ Transplantation And Transplant Immunology
And Hepatobiliary Center, The Affiliated Hospital Of
Xuzhou Medical Universi, General Surgery, Xuzhou-
China²

Background / Hypothesis: The stroma of hepatocellular carcinoma (HCC) is dominated by cancer-associated fibroblasts (CAFs) and collagen deposition. These interconnected CAFs form a robust physical and immunological barrier that not only promotes the exhaustion of anti-tumor effector cells but also recruits immunosuppressive populations, thereby driving tumor progression and metastasis. ZIP1 is a membrane protein responsible for zinc ion transport, known to modulate cell proliferation via intracellular zinc regulation. However, the specific mechanisms by which ZIP1 orchestrates CAF activation and mediates the remodeling of the HCC immune microenvironment remain obscure. This study investigates the role of ZIP1⁺ CAFs in shaping the immunosuppressive landscape of HCC.

Materials and Methods: We analyzed the prognostic significance of ZIP1 in HCC patients using the GEO and TCGA databases. To characterize CAF heterogeneity, we utilized public single-cell sequencing data to identify differentially expressed genes between ZIP1⁺ and ZIP1⁻ CAFs, validated by multiplex immunofluorescence for the activation marker FAP. Spatial transcriptomic

ORAL ABSTRACTS

sequencing was performed on a cohort of HCC patients treated with immunotherapy at our center to analyze the spatial architecture of the immune niche. Furthermore, an orthotopic liver cancer mouse model was established by co-injecting Hepa53.4 cells with ZIP1⁺ or ZIP1⁻ CAFs to evaluate tumor progression and immune cell infiltration in vivo.

Results:
Our results identify ZIP1 as a critical driver of CAF activation and the transition toward an extracellular matrix (ECM)-rich phenotype. ZIP1⁺ CAFs were significantly enriched in HCC tissues and correlated with poorer clinical outcomes. Mechanistically, ZIP1 promotes the expression of cell migration-inducing hyaluronidase (CEMIP), which subsequently functions to generate low molecular weight hyaluronan (LMW-HA). This accumulation of LMW-HA triggers the secretion of C-C Motif Chemokine Ligand 22 (CCL22), a potent chemokine that recruits Regulatory T cells (Tregs) to the tumor region, thereby establishing an immunosuppressive microenvironment. In an orthotopic mouse model, tumors co-injected with ZIP1⁺ CAFs exhibited significantly accelerated progression compared to controls. Consistently, spatial transcriptomics revealed that the presence of ZIP1⁺ CAFs correlates with a dampened response to immunotherapy.

Conclusions:
This study establishes ZIP1 as a critical regulator of CAF activation and a key architect of the immunosuppressive microenvironment in HCC. By fostering Treg accumulation, ZIP1⁺ CAFs facilitate immune evasion and tumor growth. These findings suggest that targeting ZIP1⁺ CAFs holds promise as a therapeutic strategy to remodel the stroma and enhance the efficacy of immune checkpoint inhibitors in hepatocellular carcinoma.

2630 - Single cell transcriptomes reveal the immune characteristics of patients with chronic hepatitis B at different stages of disease progression

Liu Yang ¹, Wentao Kuai ², Liang Xu ²
The Second People's Hospital Affiliated To Tianjin Medical University, No, Tian Jin-China ¹ Tianjin Institute Of Hepatology, tianjin Second People's Hospital, Three Departments Of Liver Diseases, Tian Jin-China ²

Background / **Hypothesis:**
The progression of chronic hepatitis B (CHB) is closely related to the host immune system. However, traditional techniques are difficult to reveal the highly heterogeneous immune microenvironment of CHB. At

present, the dynamic changes of local and systemic liver immunity in different stages of the natural process of CHB and their interrelations are still unclear.

Materials and Methods:
In this study, single-cell RNA sequencing (scRNA-seq) was performed based on paired liver tissue and peripheral blood mononuclear cell (PBMC) samples of CHB patients in the immune tolerant phase (IT) and immune clearance phase (IC) in public databases. Seurat and other tools were used for quality control, cell typing, reclustering, differential expression, enrichment analysis, depletion score, cell communication analysis, and multiple immunofluorescence technology was used for protein level verification to systematically compare the composition and function differences of intrahepatic and peripheral immune cells.

Results:
A total of 45,890 hepatocytes and 40,143 PBMC cells were analyzed. Liver tissue analysis identified 15 major cell populations. Deep reclustering of T cells identified 12 functional subsets. Compared with the IT group, the proportion of terminally differentiated effector CD8⁺ T cells and Th17 cells was significantly increased, while the proportion of exhausted CD8⁺ T cells was decreased in the liver tissues of the IC group, indicating that a strong antigen-specific immune response occurred in the liver. However, these significant intrahepatic T-cell changes were not observed in paired peripheral blood T cells. The T cells in PBMC were mainly of naive phenotype, and there was no significant difference in each subpopulation between IT and IC groups.

Conclusions:
The antigen-specific T cell response and inflammatory response in the immune clearance phase of CHB are mainly limited to the local liver microenvironment, and peripheral blood monitoring may be difficult to fully reflect their dynamic changes. This finding highlights the necessity of liver tissue analysis to evaluate the immune status and pathological mechanism of CHB, and provides an important theoretical basis for the development of new immunotherapy strategies targeting the local liver microenvironment.

2634 - A Novel Murine Model of MetALD Recapitulates the Synergistic and Aggressive Phenotype of Combined Metabolic Dysfunction and Alcohol Consumption

Yingying Nie ¹, Xiaoyu Xie ², Han Ding ³, Qiang Zhu ⁴
The First Affiliated Hospital Of Shihezi University, Digestion, Jinan-China ¹ Qilu Hospital Of Shandong

ORAL ABSTRACTS

University, Digestion, Jinan-China ² Shandong Provincial Hospital Affiliated To Shandong First Medical University, Gastroenterology, Jinan-China ³ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Digestion, Jinan-China ⁴

Background / **Hypothesis:**
The 2023 Delphi consensus defined MetALD as the intersection of metabolic dysfunction and alcohol consumption, highlighting a growing population with poor prognosis. However, the absence of standardized preclinical models mimicking voluntary drinking and metabolic stress limits mechanistic understanding of this "double-hit" pathology. We aimed to establish and characterize a novel murine MetALD model that recapitulates key human disease features.

Materials and **Methods:**
Male and female C57BL/6J mice (8-10 weeks old) underwent a two-bottle choice voluntary alcohol paradigm combined with high-fat diet (HFD) feeding. Behavioral interactions between alcohol preference and caloric intake were monitored. Liver injury, oxidative stress, inflammation, and fibrogenesis were comprehensively evaluated.

Results:
Voluntary alcohol intake and HFD consumption showed reciprocal inhibition, reducing calories from each source. Nevertheless, their combination triggered a synergistic, aggressive phenotype distinct from single-hit controls. MetALD mice exhibited a unique "lean but severe" profile with profound steatohepatitis and advanced fibrosis, marked by elevated ALT/AST, extensive apoptosis, overwhelming oxidative stress (elevated MDA, depleted GSH), intense inflammation (immune infiltration), and accelerated fibrogenesis (upregulated Col1a1/ α -SMA; extensive Sirius Red staining).

Conclusions:
This robust MetALD model demonstrates synergistic acceleration of liver injury, fibrosis, and apoptosis by alcohol and metabolic stress, independent of obesity. It fills a critical translational gap, offering an essential platform for dissecting MetALD pathogenesis and testing targeted therapies.

Keyword(s) : MetALD; Murine model; Synergistic toxicity; Liver fibrosis; Oxidative stress; Steatohepatitis

2635 - Endothelial RGS16 Attenuates Hepatic Fibrosis by Restricting Pathological

Yuzhu Song ¹ Miaomiao Tian ², Han Ding ², Zhen Yang ¹
Shandong Provincial Hospital Affiliated To Shandong First Medical University, Infectious Diseases, Jinan-China ¹ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Digestion, Jinan-China ²

Background / Hypothesis: Liver fibrosis is a leading cause of mortality in chronic liver diseases, yet effective therapies remain limited. Liver sinusoidal endothelial cells (LSECs) orchestrate hepatic homeostasis by maintaining fenestration and releasing nitric oxide (NO) to suppress hepatic stellate cell (HSC) activation. Chronic injury disrupts this balance, triggering LSEC capillarization and angiocrine signaling that drive pathological neovascularization and fibrogenesis. While Regulator of G-protein Signaling 16 (RGS16) modulates GPCR pathways, its specific role in LSEC-mediated vascular remodeling during fibrosis remains undefined. We investigated the mechanistic contribution of endothelial RGS16 to pathological angiogenesis and hepatic fibrosis.

Materials and Methods: We employed complementary in vivo and in vitro approaches. In vivo, LSEC-specific RGS16 knockdown was induced in mice using AAV-Oit3-shRNA vectors, followed by 8 weeks of CCl₄ administration. Fibrosis severity and neovascularization were quantified via qPCR, Western blot, and immunofluorescence. In vitro, C166 endothelial cells were transduced to stably knockdown RGS16. Proliferative, migratory, and angiogenic capacities were assessed using CCK-8, Transwell, and Matrigel tube formation assays.

Results: RGS16 expression was markedly upregulated in LSECs within the CCl₄-induced fibrotic microenvironment, indicating a compensatory protective response. Selective deletion of endothelial RGS16 aggravated liver injury (elevated ALT/AST) and significantly upregulated pro-fibrotic markers (α -SMA, TIMP-1, TGF- β) and pro-angiogenic factors (SDF-1, bFGF). Immunofluorescence confirmed intensified pathological neovascularization in RGS16-deficient livers. In vitro, RGS16 knockdown directly enhanced endothelial proliferation, migration, and tube formation, thereby fueling the angiocrine crosstalk required for HSC activation.

ORAL ABSTRACTS

Conclusions: Endothelial RGS16 functions as a critical protective checkpoint in hepatic fibrogenesis by restraining pathological angiogenesis and subsequent HSC activation. Potentiating RGS16 signaling in LSECs offers a novel therapeutic strategy to normalize the hepatic vascular niche and ameliorate liver fibrosis.

Keyword(s) : Liver fibrosis; LSECs; Pathological angiogenesis; RGS16; Therapeutic target

2639 - Machine learning(ML) based models predict beta blocker response using non invasive tests(NITs) in patients with acute variceal bleed BE RESPONSE STUDY

Harsh Vardhan Tevethia ¹, Aditya Chaturvedi ¹, Esha Baidiya ¹, Akhil Desmukh ¹, Guresh Kumar Kumar ², Shiv Kumar Sarin ¹
Ilbs, Hepatology, New Delhi-India ¹ Ilbs, Statistics, New Delhi-India ²

Background / Hypothesis: Hepatic venous pressure gradient (HVPG) has prognostic and therapeutic value in patients with acute variceal bleed (AVB). Six-week rebleeding and mortality is close to 20% post-AVB. Non-selective beta-blockers (NSBB) are the mainstay of secondary prophylaxis; however, response is observed in only about 50%. Serial HVPG measurement to assess NSBB response, being invasive, is not feasible. We investigated the diagnostic accuracy of non-invasive tests (NITs) in predicting NSBB response in AVB patients at 3 and 6 weeks using machine learning (ML)-based models

Materials and Methods: This prospective study assessed cirrhosis patients with AVB having HVPG, liver stiffness measurement (LSM), and spleen stiffness measurement (SSM) measured within 5 days of bleed, followed by carvedilol therapy. NITs were measured at 0, 3, and 6 weeks, and HVPG at 0 and 6 weeks, with rebleeding followed up for 90 days (NCT05166317). The primary objective was to determine NIT accuracy in predicting NSBB response at 6 weeks; secondary goals included correlating NITs with HVPG and rebleeding. Associations were determined using Cox proportional hazards regression analysis. A Gradient Boosting classifier was developed using 107 engineered features reduced to 51 via consensus selection. Model performance was assessed using 5-fold stratified cross-validation with bootstrap 95% confidence intervals.

Results:

220 patients with AVB [age 49.56 ± 10.34 years, 91.4% male, predominantly ethanol-related (45%) cirrhosis] with mean MELD 15.13 ± 2.75 , baseline HVPG 18.66 ± 2.2 mmHg, LSM 59.24 ± 15.44 kPa, and SSM 84.06 ± 15.74 kPa were included. At 6 weeks, 86 (39%) were HVPG responders; mean carvedilol dose was 11.91 ± 2.03 mg/d. Rebleeding occurred in 31 (14.1%) patients, predominantly in HVPG non-responders (18.6% vs 7.1%; $p=0.027$). A two-threshold decision strategy was developed: delta SSM at 3 weeks ≥ 5 kPa predicted HVPG response (RULE-IN, PPV 78.7%), while delta SSM < 0 kPa predicted non-response (RULE-OUT, NPV 88.6%). The model achieved AUC 0.858 (95% CI: 0.80–0.91) with MCC 0.60 and high-confidence RULE-IN (PPV 88%) and RULE-OUT (NPV 89%) at extreme probability thresholds. Patients with 3-week SSM > 94 kPa had a response rate of only 7.5% (4/53), ruling out HVPG response at 6 weeks

Conclusions:

ML Driven models based on SSM reliably reflect the HVPG responders in patients with AVB. These models can be used as an alternative to HVPG to make accurate prediction of NSBB response at week 3 itself rather than the standard 6 weeks which would help in patient stratification, dose modification or alternative interventions such as TIPS.

Keyword(s) :

2640 - Necrolytic migratory erythema without glucagonoma An unusual association with chronic pancreatitis and hepatic dysfunction

Ebru Celik ¹, Mehmet Demir ²
Siirt Training And Research Hospital, Dermatology, Siirt-Türkiye ¹ Hatay Mustafa Kemal University Faculty Of Medicine, Gastroenterology, Siirt-Türkiye ²

Background

Necrolytic migratory erythema (NME) is a rare paraneoplastic dermatosis most commonly associated with glucagonoma, an alpha-cell tumor of the pancreatic islets. It is characterized by superficial epidermal necrosis and erythematous lesions with a centrifugal distribution. More rarely, NME has been reported in association with non-neoplastic conditions, including liver disease, intestinal malabsorption, and pancreatitis. In this report, we describe a case of NME as a rare cutaneous manifestation of chronic pancreatitis with hepatic dysfunction.
Case Report

ORAL ABSTRACTS

A 57-year-old female patient presented with complaints of redness, dryness, and painful swelling in both legs and ankles, as well as pain and burning of the tongue. The skin lesions appeared as patchy, sharply demarcated discolorations with localized peeling, spreading to the body within one month. Her medical history revealed that she underwent cholecystectomy eight years ago due to gallstones and subsequently developed chronic pancreatitis. She had undergone several ERCP procedures, including common bile duct stent placement, without detection of a tumor. Two years prior, she received a celiac plexus nerve block severe abdominal pain. Physical examination revealed cachexia, subicteric sclera, painful stomatitis, glossitis, angular cheilitis, widespread edema and erythema of the ankles and feet, sharply demarcated brown-red hyperpigmented xerotic lesions on hips and trunk, diffuse macular lesions, generalized xerosis, and erosive intertriginous lesions (Figure 1,2). Other systemic examinations were unremarkable. Laboratory investigations revealed anemia on complete blood count and prolonged PT/INR. Serum albumin levels were decreased. Hepatic enzymes, including ALT, AST, GGT, along with total and direct bilirubin levels, were mildly elevated. Blood glucose, glucagon, and zinc levels were within normal limits. Radiological evaluation demonstrated no evidence of a tumor. Skin biopsy demonstrated hydropic degeneration of keratinocytes in the upper stratum spinosum, consistent with NME (Figure 3). Despite supportive care, the patient died secondary to *Acinetobacter baumannii* sepsis.

Discussion

Necrolytic migratory erythema is a rare and distinctive dermatologic manifestation, most commonly recognized as a paraneoplastic syndrome associated with glucagonoma. More rarely, NME may occur in the absence of a glucagonoma, referred to as pseudoglucagonoma syndrome. Previous reports have described NME in association with intestinal malabsorption, liver cirrhosis, inflammatory bowel disease, chronic pancreatitis, and various malignancies, including small cell lung carcinoma and duodenal neoplasms.

Conclusion

This case emphasizes the importance of recognizing gastrointestinal and systemic diseases that may present with cutaneous manifestations such as NME, a highly rare but clinically significant condition. Early identification of NME may facilitate prompt evaluation for underlying disorders and improve clinical outcomes.

Keyword(s) : Necrolytic migratory erythema, chronic pancreatitis, hepatic dysfunction, pseudoglucagonoma syndrome, cutaneous manifestation, paraneoplastic dermatosis

2641 - Prevalence of Metabolic Associated Fatty Liver Disease in Patients with Rheumatoid Arthritis

A	Cross	Sectional	Study
Eman Fares ¹ , Essam A. Hassan ¹	Nourhan S Ahmed ²	Nermeen A Foad ³	
Fayoum University, Endemic Medicine, Fayoum-Egypt ¹	Fayoum University, Endemic Medicine, Fayoum-Egypt ²	Fayoum University, Rheumatology & rehabilitation, Fayoum-Egypt ³	

Background / Hypothesis:

Rheumatoid arthritis (RA) is a chronic inflammatory disease frequently associated with metabolic and cardiovascular comorbidities. Increasing evidence suggests a link between RA and metabolic-associated fatty liver disease (MAFLD); however, data on the prevalence and the burden of liver fibrosis in RA patients remain limited. The study aimed to determine the prevalence of MAFLD and liver fibrosis in patients with rheumatoid arthritis and to identify associated risk factors.

Materials and Methods:

This cross-sectional study included 154 patients with rheumatoid arthritis recruited between July 2024 and February 2025. All patients underwent detailed clinical assessment, including anthropometric measurements [body mass index (BMI), waist circumference (WC), hip circumference, waist-hip ratio, and waist-height ratio]. Disease activity was assessed using the Disease Activity Score in 28 joints (DAS28). Liver steatosis and fibrosis were evaluated using transient elastography (FibroScan) with controlled attenuation parameter (CAP) and liver stiffness measurement (LSM). Laboratory investigations included liver biochemical profile, lipid profile, glycated hemoglobin (HbA1c), and inflammatory markers

Results:

The median age was 45 years, with a predominance of females (88.3%). MAFLD was identified in 79 patients (51%). Among those with MAFLD, steatosis was graded as mild in 27 (34.2%), moderate in 49 (62%), and severe in 3 (3.8%). Liver fibrosis was detected in 34 patients (22%); most cases were mild (F1: 20.8%), while advanced fibrosis (F2–F4) was rare (1.8%). Univariate analysis showed that age, BMI, WC, triglyceride (TG) levels, and HbA1c were associated with MAFLD. In multivariate analysis, WC (OR = 1.070; 95%

ORAL ABSTRACTS

CI: 1.012–1.132; $p = 0.017$) and TG levels (OR = 1.021; 95% CI: 1.009–1.033; $p = 0.001$) remained independent predictors, whereas HbA1c lost significance. Liver fibrosis was associated with age, BMI, WC, HbA1c, and hepatic steatosis on Univariate analysis; however, after adjustment, only age remained independently associated with fibrosis (OR = 1.050; $p = 0.016$). DAS28 scores were not significantly associated with MAFLD ($p = 0.091$) or liver fibrosis ($p = 0.142$).

Conclusions:

MAFLD is highly prevalent among patients with rheumatoid arthritis, affecting approximately half of the studied population, with predominantly moderate steatosis. Liver fibrosis was present in about one-fifth of patients, mostly mild. Central obesity and hypertriglyceridemia are key independent predictors of MAFLD, while increasing age is the main determinant of liver fibrosis. These findings emphasize the importance of metabolic risk assessment and liver disease screening in patients with rheumatoid arthritis.

Keyword(s) : Metabolic-associated fatty liver disease; Liver fibrosis; Rheumatoid arthritis; Prevalence; FibroScan

2643 - IL 24 attenuates hepatocyte apoptosis and ameliorates metabolic associated steatohepatitis by activating the autophagy lysosome pathway

Jiawei Cui¹, Zhandong Lin¹, Mengjiao Sun¹, Yuyuan He¹, Yaoyao Mao¹, Congyue Zhang¹, Yuemin Nan¹
Third Hospital Of Hebei Medical University, Department Of Traditional And Western Medical Hepatology, Shijiazhuang-China¹

Background / Hypothesis:

Impaired autophagy is closely associated with metabolic-associated steatohepatitis (MASH), but its underlying mechanisms remain incompletely understood. This study aimed to investigate the regulatory role and potential mechanisms of the cytokine IL-24 on autophagy and apoptosis during the progression of MASH.

Materials and Methods:

The differentially expressed gene IL-24, closely related to NAFLD, was screened through bioinformatics analysis. A mouse model of MASH was established using a high-fat, high-fructose diet (HFFD), and hepatic overexpression of IL-24 was mediated via adeno-

associated virus vectors. In vitro, lipotoxic injury was simulated by treating AML12 hepatocytes with palmitic acid, and a stable IL-24-overexpressing cell model was established via lentiviral transduction. Histopathological staining, Western blot, TUNEL staining, and mRFP-GFP-LC3 dual-fluorescence autophagy flux analysis were employed to assess the effects of IL-24 on liver pathology, autophagy flux activity, and cell apoptosis.

Results:

IL-24 expression was significantly downregulated in the livers of MASH mice. Exogenous IL-24 intervention effectively alleviated HFFD-induced hepatic steatosis, inflammatory infiltration, and fibrosis. Mechanistic studies revealed that IL-24, by activating the AMPK signaling pathway and inhibiting mTOR activity, promoted the nuclear translocation of the transcription factor TFEB, thereby restoring the overall function of the autophagy-lysosome pathway and significantly reducing hepatocyte apoptosis.

Conclusions: This study demonstrates that IL-24, as a key regulatory factor in MASH progression, activates the AMPK/mTOR/TFEB axis to restore autophagy-lysosome function and inhibit hepatocyte apoptosis, thereby mitigating hepatic lipid accumulation and injury. IL-24 holds promise as a potential novel therapeutic target for the prevention and treatment of MASH.

Keyword(s) : Metabolic dysfunction-associated steatohepatitis; IL-24; Autophagy-lysosome; Metabolism; AMPK/mTOR/TFEB axis

2644 - FKBP10⁺ CAFs Shape the Immunosuppressive Microenvironment to Drive Hepatocellular Carcinoma Progression

Liu Jiangxi¹, Wang Hao²
Jiangsu Key Laboratory Of Organ Transplantation And Transplant Immunology And Hepatobiliary Center, The Affiliated Hospital Of Xuzhou Medical University, General Surgery, Xuzhou-China¹ Hepatobiliary Center Of The First Affiliated Hospital, Nanjing Medical University; Research Unit Of Liver Transplantation And Transplant Immunology, C, General Surgery, Nanjing-China²

Background / Hypothesis:

The stroma of hepatocellular carcinoma (HCC) is dominated by cancer-associated fibroblasts (CAFs) and collagen deposition. These interconnected CAFs form a robust physical and immunological barrier that not only promotes the exhaustion of anti-tumor effector cells but also recruits immunosuppressive populations, thereby driving tumor progression and metastasis. FKBP10 is an

ORAL ABSTRACTS

important molecular chaperone that primarily functions within the endoplasmic reticulum. It plays a crucial role in the synthesis, folding, and secretion of collagen proteins. However, the specific mechanisms by which FKBP10 orchestrates CAF activation and mediates the remodeling of the HCC immune microenvironment remain obscure. This study investigates the role of FKBP10⁺ CAFs in shaping the immunosuppressive landscape of HCC.

Materials and Methods: We analyzed the prognostic significance of FKBP10 in HCC patients using the GEO and TCGA databases. To characterize CAF heterogeneity, we utilized public single-cell sequencing data to identify differentially expressed genes between FKBP10⁺ and FKBP10⁻ CAFs, validated by multiplex immunofluorescence for the activation marker α -SMA. Spatial transcriptomic sequencing was performed on a cohort of HCC patients treated with immunotherapy at our center to analyze the spatial architecture of the immune niche.

Results: Our results identify FKBP10 as a critical driver of CAF activation and the transition toward an extracellular matrix (ECM)-rich phenotype. FKBP10⁺ CAFs were significantly enriched in HCC tissues and correlated with poorer clinical outcomes. Mechanistically, FKBP10 promotes the expression of cytoskeleton-associated protein 4 (CKAP4), which subsequently functions to connect CAFs with each other via gap junctions. This connection of CAFs by CKAP4 elevates the stiffness of the extracellular matrix, which stimulates hepatocellular carcinoma cells to secrete TGF- β . Then TGF- β functions to activate CAFs to create more extracellular matrix, which forms a positive feedback loop. The increased physical barrier reduces CD8⁺ T cell infiltration, thereby establishing an immunosuppressive microenvironment. In an orthotopic mouse model, tumors co-injected with FKBP10⁺ CAFs exhibited significantly accelerated progression compared to controls. Consistently, spatial transcriptomics revealed that the presence of FKBP10⁺ CAFs correlates with a dampened response to immunotherapy.

Conclusions: This study establishes FKBP10 as a critical regulator of CAF activation and a key architect of the immunosuppressive microenvironment in HCC. By reducing CD8⁺ T cell infiltration, FKBP10⁺ CAFs facilitate immune evasion and tumor growth. These findings suggest that targeting FKBP10⁺ CAFs holds promise as a therapeutic strategy to

Keyword(s):

2647 - Quercetin ameliorates MASLD progression through the inhibition of the hexosamine biosynthesis pathway mediated TAB2 protein O-GlcNAcylation

Yang Yang¹, Yi Huang¹, Huabao Liu¹
The First Affiliated Hospital Of Chongqing University Of Chinese Medicine, Department Of Liver Diseases, Chongqing-China¹

Background / Hypothesis: Metabolic dysfunction-associated steatotic liver disease (MASLD) is a prevalent chronic liver disease spanning MAFL to MASH, an inflammatory stage that accelerates fibrosis and heightens the risk of cirrhosis and hepatocellular carcinoma, yet effective therapies for established MASH remain limited. Dysregulated glucose metabolism—particularly the hexosamine biosynthetic pathway (HBP), which produces UDP-GlcNAc as the donor substrate for protein O-GlcNAcylation—has been implicated in insulin resistance, lipogenesis, inflammation, and fibrogenesis. Based on preliminary evidence that quercetin improves metabolic dysfunction and lowers circulating UDP-GlcNAc, mechanisms were investigated across clinical specimens, animal models, and cellular systems to define quercetin-mediated regulation of the HBP-O-GlcNAc axis and to identify O-GlcNAc-modified proteins relevant to MASLD/MASH progression.

Materials and Methods: Quercetin formulations were quality-controlled by HPLC. Efficacy was evaluated in a MASH mouse model treated with graded oral quercetin, with outcomes assessed by serum biochemistry/ELISA and histopathology. In vitro, quercetin was applied to FFA-induced MIHA cells and MIHA-HSC co-cultures, and lipid accumulation and HSC activation were quantified by Oil Red O staining, ELISA, and RT-qPCR. LC-MS metabolomics interrogated key metabolic pathways, while global protein O-GlcNAcylation and related enzymes were assessed by immunoblotting, sWGA pull-down, and RT-qPCR. Label-free O-GlcNAc proteomics was used to identify differentially modified proteins. TAB2-OGT interaction was validated by IP, co-IP and immunofluorescence. WT and mutant TAB2 were compared for stability, ubiquitination, and downstream signaling, and in vivo efficacy was tested by AAV-mediated TAB2 overexpression followed by quercetin treatment in MASH mice.

Results: Quercetin consistently ameliorated MASLD/MASH in diet-induced MASH mice models and cellular models,

ORAL ABSTRACTS

which was evidenced by improvements in BMI and lipid profiles, along with reductions in markers of liver injury and fibrosis. Quercetin also suppressed hepatic lipid accumulation, inflammation, and fibrosis both in vivo and in vitro. Through metabolomics, the HBP was identified as a critical axis, with reduced levels of UDP-GlcNAc observed in patient serum, MASH liver, and cellular models, accompanied by decreased global O-GlcNAcylation. O-GlcNAc proteomics identified TAB2 as the key O-GlcNAcylated target. TAB2 was O-GlcNAcylated by OGT on Thr180. Mutation of Thr180 led to the destabilization of TAB2 through enhanced ubiquitin-dependent degradation without affecting its localization, and attenuated MAPK/NF- κ B activation. Functionally, TAB2 knockdown resulted in reduced steatosis and hepatic stellate cell activation, which could be rescued by wild-type but not mutant TAB2. In vivo, quercetin or DON alleviated MASH in AAV-Tab2 mice, supporting a mechanism dependent on TAB2 O-GlcNAcylation.

Conclusions: Quercetin ameliorated MASLD through downregulation of the HBP-derived metabolite UDP-GlcNAc-mediated reduced O-GlcNAcylation of TAB2.

Keyword(s) : quercetin, MASLD, hexosamine biosynthesis pathway, O-GlcNAcylation, TAB2

2649 - Microsomal Glutathione S Transferase 2 Links Copper Toxicity to Hepatic Inflammation via Leukotriene C4 in Wilson's Disease

Jie Bai¹, Yongguo Li¹

The First Affiliated Hospital Of Chongqing Medical University, Department Of Infectious Diseases, Chongqing-China¹

Background / Hypothesis: Wilson's disease (WD) causes severe liver injury and inflammation due to aberrant copper accumulation. Although oxidative stress plays a central role in WD pathogenesis, the precise molecular mechanisms linking copper overload to specific inflammatory pathways remain unclear. This study aims to identify key molecular mediators of inflammation in WD and assess their therapeutic potential.

Materials and Methods: We analyzed the transcriptome of liver tissues from Atp7b-/- mice to identify key inflammatory mediators. The functional role of the identified target in copper-induced inflammation was assessed using copper-treated hepatocytes. In vivo studies were conducted in both Atp7b-/- mice and an exogenous copper-overload mouse model. Thirty-one WD patients were enrolled in the study to validate clinical relevance using liver biopsies and serum

samples.

Results: We found that microsomal glutathione S-transferase 2 (MGST2) was significantly upregulated in the livers of Atp7b-/- mice. Copper-induced oxidative stress triggered NRF2, which drove the transcriptional upregulation of Mgst2 through direct promoter binding. This upregulation promoted leukotriene C4 (LTC4) biosynthesis, which subsequently activated NOX4 to initiate pro-inflammatory signaling. Importantly, pharmacological blockade of this axis with the CysLT1 receptor antagonist Montelukast or the NOX4 inhibitor GLX351322 significantly attenuated liver injury and inflammatory cell infiltration in both Atp7b-/- mice and exogenous copper-overload mice. Consistently, WD patients exhibited activation of the MGST2/LTC4/NOX4 axis and systemic inflammation.

Conclusions: These findings reveal a novel role for MGST2 in copper-induced hepatic inflammation and provide proof of concept for targeting the MGST2/LTC4/NOX4 axis as a therapeutic strategy in WD.

Background

Hypothesis:

ORAL ABSTRACTS

Liver fibrosis and cirrhosis of various aetiologies is significant global burden. Although liver biopsy is a gold standard for the diagnosis of liver fibrosis and cirrhosis, it is an invasive procedure with complex process, high price, and poor compliance. We aimed to compare the diagnostic performance of Magnetic resonance elastography (MRE), liver stiffness measurement (LSM) evaluated by FibroScan, the aspartate transaminase-to-platelet ratio index (APRI), and the fibrosis index based on four factors (FIB-4) for detecting liver fibrosis in chronic liver diseases across all aetiologies.

Materials and Methods:

A total of 424 patients of chronic liver disease across various aetiologies were prospectively included from three hospitals in China. All patients underwent liver biopsy, MRE, Fibroscan, and routine laboratory tests. Using liver histology as gold standard, we compared the performance of MRE, Fibroscan, APRI, and FIB-4 for detecting liver fibrosis and cirrhosis.

Results:

For the total cohort of chronic liver disease patients across various aetiologies (424 patients), the AUROCs for MRE, LSM evaluated by FibroScan, APRI, and FIB-4, were 0.93, 0.82, 0.71, and 0.66 for the diagnosis of significant liver fibrosis; and 0.96, 0.87, 0.77, and 0.73 for cirrhosis, respectively. For the subgroup of patients with CHB (128 patients), the AUROCs for MRE, LSM evaluated by FibroScan, APRI, and FIB-4, were 0.91, 0.81, 0.71, and 0.65 for the diagnosis of significant liver fibrosis; and 0.97, 0.86, 0.80, and 0.73 for cirrhosis, respectively. For the subgroup of patients with MAFLD (126 patients), the AUROCs for MRE, LSM evaluated by FibroScan, APRI, and FIB-4, were 0.90, 0.76, 0.70, and 0.66 for the diagnosis of significant liver fibrosis; and 0.97, 0.87, 0.80, and 0.80 for cirrhosis, respectively. For the subgroup of patients with AIH (116 patients), the AUROCs for MRE, LSM evaluated by FibroScan, APRI, and FIB-4, were 0.95, 0.88, 0.71, and 0.70 for the diagnosis of significant liver fibrosis; and 0.96, 0.92, 0.73, and 0.68 for cirrhosis, respectively.

Conclusions: MRE is more accurate than Fibroscan in diagnosing liver fibrosis and cirrhosis in chronic liver disease patients across all aetiologies.

2660 - The Silent Summer Threat Significant Seasonal Worsening of Electrolyte Imbalance in

Cirrhosis Patients in a Tropical Climate Calls for Dynamic Diuretic Dosing

Md. Shakhawat Hossain¹, Khondoker Monirul Alam²,
Makhsudul Alam¹
Rangpur Medical College Hospital, Gastroenterology,
Rangpur-Bangladesh¹ Rangpur Medical College
Hospital, Medicine, Rangpur-Bangladesh²

Background / Hypothesis:

Electrolyte imbalances in cirrhosis, driven by diuretics and disease progression, are key predictors of mortality and hepatic encephalopathy. However, the impact of environmental stress is overlooked. We hypothesized that the persistent heat and humidity of a tropical climate would significantly disrupt electrolyte homeostasis. This study aimed to quantify the seasonal variation of serum sodium and potassium in a large cohort of stable cirrhotic patients.

Materials and Methods: We conducted a prospective, observational study of 300 consecutive cirrhotic patients at the Department of Gastroenterology, Rangpur Medical College Hospital, Rangpur, Bangladesh. Each patient underwent two standardized assessments: once in midsummer and once in midwinter. Serum electrolytes were measured, and the prevalence of hyponatremia ($\text{Na}^+ < 135 \text{ mmol/L}$) and hypokalemia ($\text{K}^+ < 3.5 \text{ mmol/L}$) was compared. Statistical analysis included paired t-tests and ROC curve analysis.

Results: The cohort (mean age 55.5 years, 68% male) included 60% patients on diuretics. We found a dramatic seasonal decline in mean serum sodium (Winter: 135.9 vs. Summer: 133.6 mmol/L, $p < 0.001$) and potassium (4.0 vs. 3.7 mmol/L, $p < 0.001$). This translated into a near-doubling of clinical prevalence:

- Hyponatremia: 22.7% in winter vs. 45.0% in summer ($p < 0.001$).
- Hypokalemia: 8.7% in winter vs. 18.3% in summer ($p < 0.001$).

The effect was profoundly amplified in patients on diuretics, who had significantly lower summer levels than those not on diuretics (Na^+ : 131.9 vs. 136.2 mmol/L; K^+ : 3.5 vs. 4.0 mmol/L). ROC analysis identified $\text{Na}^+ \leq 134.5 \text{ mmol/L}$ and $\text{K}^+ \leq 3.75 \text{ mmol/L}$ as optimal cut-offs for predicting summer-associated depletion.

Conclusion: For the first time, we demonstrate a striking

ORAL ABSTRACTS

"Summer Effect"—a significant seasonal worsening of hyponatremia and hypokalemia in cirrhosis, critically exacerbated by diuretics. This mandates a paradigm shift towards seasonal stewardship in management, including pre-emptive dose adjustments and intensified summer monitoring, to prevent electrolyte-driven complications in vulnerable cirrhotic patients.

2663 - High Prevalence of MASLD and MASH in Chronic Hepatitis B Patients A Cross Sectional Study

Deniz Gür Altunay ¹, Müge Toygar Deniz ², Orçun Barkay ³, Şule Damlacı ⁴, Ayşe Yüksel ⁵, Sila Akhan ²
Kocaeli City Hospital, Infectious Diseases And Clinical Microbiology, İzmit-Türkiye ¹ Kocaeli University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Kocaeli-Türkiye ² Erzincan Binali Yıldırım University Faculty Of Medicine, Infectious Diseases And Clinical Microbiology, Erzincan-Türkiye ³ Afyonkarahisar State Hospital, Infectious Diseases And Clinical Microbiology, Afyonkarahisar-Türkiye ⁴ University Of Health Sciences Fatih Sultan Mehmet Training And Research Hospital, Infectious Diseases And Clinical Microbiology, İstanbul-Türkiye ⁵

Background / **Hypothesis:**
Hepatitis B virus (HBV) is a major cause of chronic liver disease worldwide. Recently, metabolic dysfunction-associated steatotic liver disease (MASLD) and metabolic dysfunction-associated steatohepatitis (MASH) have gained increasing importance among metabolic liver disorders. However, data regarding the prevalence and risk factors of MASLD and MASH in patients with HBV infection remain limited.

Materials and **Methods:**
This study included patients aged ≥ 18 years with chronic hepatitis B (CHB) and documented HBsAg positivity for at least six months. Patients with hepatitis C or D coinfection, excessive alcohol consumption (>30 g/week for men and >20 g/week for women), hepatocellular carcinoma, or pregnancy were excluded. Laboratory, ultrasound, liver biopsy findings, and anthropometric parameters obtained during routine follow-up were evaluated. MASLD was defined as hepatic steatosis with at least one cardiometabolic risk factor. Body mass index (BMI) was categorized as <25 kg/m² (normal/underweight), 25–29.9 kg/m² (overweight), and ≥ 30 kg/m² (obese). Thrombocytopenia was defined as a platelet count $<150 \times 10^9/L$.

Results:

The study encompassed 272 patients of CHB. The prevalence of MASLD detected by ultrasonography was 55.9% (152/272). In patients diagnosed with MASLD; BMI, waist circumference, fasting plasma glucose, plasma triglycerides, low density lipoprotein (LDL)-cholesterol, and aspartate transaminase (AST) were significantly higher, while high density lipoprotein (HDL)-cholesterol was significantly lower than in the MASLD-negative group ($p < 0.005$) (Table 1). Furthermore, MASLD prevalence was significantly higher in obese and overweight patients, those with type 2 DM, those using statins for dyslipidaemia, and anti-HBe-positive patients ($p < 0.005$). MASLD prevalence was significantly lower in patients receiving antiviral therapy ($p = 0.001$) (Table 2). Among patients receiving antiviral therapy, 32 (11.8%) received tenofovir disoproxil fumarate, 31 (11.4%) tenofovir alafenamide fumarate, and 67 (24.6%) entecavir; MASLD rates did not differ according to drug used ($p = 0.324$). The 109 patients who underwent liver biopsy were evaluated for MASH. Twenty-seven cases (24.8%) had MASH. In these patients, triglyceride levels were significantly higher ($p = 0.02$) and HDL levels significantly lower ($p = 0.005$). Moreover, MASH prevalence was significantly higher in patients with MASLD ($p < 0.001$). Multivariate regression analysis identified being overweight and obese, statin use for dyslipidaemia, and AST level as independent risk factors for MASLD, while antiviral therapy was found to be potentially protective (Table 3).

Conclusions:

This study demonstrates that MASLD and MASH are prevalent comorbidities in KHB patients and are closely associated with metabolic risk factors. Comprehensive management of these factors and the administration of antiviral therapy when necessary are considered important.

Keyword(s) : Chronic Hepatitis B, MASLD, MASH

2664 - Integrating genetic omics and functional omics to identify clinically actionable gut microbiota-host interface targets in MASLD

Weixuan Liang ¹, Zhuofeng Wen ², Ziyang Yang ³, Jiahui Lai ³, Qi Zhang ⁴, Jingwen Deng ³, Jing Yang ², Jiyuan Zhou ¹

The Second Affiliated Hospital, Guangzhou Medical University, Gastroenterology, Guangzhou-China ¹ Guangzhou Medical University, The Sixth School Of Clinical Medicine, Guangzhou-China ² Guangzhou Medical University, The Third School Of Clinical Medicine, Guangzhou-China ³ Guangzhou Medical

ORAL ABSTRACTS

University, Nanshan School, Guangzhou-China ⁴

Background / Hypothesis:

To identify clinically actionable gut microbiota–host interface targets for metabolic-associated steatotic liver disease (MASLD) by integrating human genetic and functional multi-omics evidence.

Materials and Methods:

We intersected TWAS signals for MASLD with curated microbiota–host interaction data from the gutMGene database to identify microbiota-regulated candidate targets. These candidates were further characterized by integrating methylation- and splicing-based QTLs, immune cell–specific single-cell TWAS (scTWAS), and liver single-cell and spatial transcriptomics to delineate their genetic architecture and cellular spatial context. Phenome-wide Mendelian randomization (PheW-MR) and structure-based molecular docking were employed to assess pleiotropic safety and druggability.

Results:

Intersecting MASLD TWAS signals with gutMGene identified 11 microbiota-regulated host targets (CGN, CXCL10, CXCR2, GPBAR1, IL24, MUC1, PTGS2, SIGIRR, IL4, IL6 and TNF). Multi-layer QTL evidence and immune-cell scTWAS supported their genetic involvement and revealed cell type–specific effects. Liver single-cell and spatial transcriptomics showed compartmentalized remodeling of these genes across hepatocyte, myeloid, lymphoid and mesenchymal niches. PheW-wide MR separated broadly pleiotropic hubs (TNF, IL6) from more tractable interface nodes (GPBAR1, CXCR2, PTGS2, MUC1, CGN, SIGIRR), while docking suggested broad druggability for these targets.

Conclusions:

Integrating genetic omics with multi-layer functional omics, we delineated a small set of gut microbiota–regulated host interface targets with convergent evidence, highlighting GPBAR1, CXCR2, PTGS2, MUC1, CGN and SIGIRR as promising, clinically actionable candidates for MASLD and providing a generalizable framework for microbiota-informed target discovery.

2666 - Outcomes of cholangiocarcinoma (ICC) or combined hepatocellular cholangiocarcinoma after liver transplantation

Dali Zhang¹, Xiaofeng Zhang¹, Lixin Li¹, Hongbo Wang¹, Yudong Wang², George Lau², Zhenwen Liu¹
Senior Department Of Hepatology, The Fifth Medical Center Of Chinese People's Liberation Army General Hospital, Beijing, China., Liver Disease, Beijing-China¹
Humanity And Health Medical Group, Hong Kong Sar, China, Humanity And Health Clinical Trial Center, Hong Kong Sar, China-²

Background / Hypothesis:

To investigate the characteristics and outcomes of patients with cholangiocarcinoma (ICC) or combined hepatocellular-cholangiocarcinoma (ICC-HCC) following liver transplantation.

Materials and Methods:

This study included patients diagnosed with ICC or ICC-HCC who underwent liver transplantation at a tertiary hospital between June 2015 and August 2018. Clinical characteristics and post-transplant outcomes were analyzed.

Results:

Seven patients were enrolled (6 males, 1 female), with a mean age of 55.1 ± 2.2 years. Prior to transplantation, 5 patients were diagnosed with hepatocellular carcinoma (HCC) and 2 with ICC-HCC. The mean maximum tumor diameter was 6.7 ± 1.3 cm, and the median AFP level was 134.2 (IQR 59.8–596.8) ng/mL. Two patients had a single tumor, while five had multiple tumors. Pre-transplant evaluation indicated that 2 patients met the Milan criteria, and 5 exceeded them. All patients had cirrhosis, with no evidence of extrahepatic malignancy. Post-transplant histopathology confirmed ICC in 2 cases and ICC-HCC in 5 cases. All patients exhibited microvascular invasion, and 3 had lymphatic metastasis. During follow-up, all 7 patients experienced tumor recurrence, with a mean recurrence interval of 2.8 ± 0.6 months and a mean overall survival of 6.0 ± 0.9 months. Among the two patients initially assessed as meeting Milan criteria, both were upstaged post-transplant due to lymphatic metastasis, multiple tumors, and vascular invasion. Another patient initially within Milan criteria was found to have multiple tumors with a maximum diameter of 5 cm. One additional case, with multiple tumors (maximum diameter 2.5 cm), recurred first in the lung and retroperitoneal lymph nodes. Recurrence involved multiple organs in all cases: 85.7% (n=6) presented with initial lymphatic metastasis, 71.4% (n=5) with liver recurrence, 42.9% (n=3) with lung

ORAL ABSTRACTS

metastasis, and 14.3% (n=1 each) with adrenal or peritoneal metastasis. Patients received various treatments including radiation therapy, transarterial chemoembolization, and tyrosine kinase inhibitors. All patients died within 11 months after transplantation.

Conclusions: ICC or ICC-HCC is frequently associated with lymphatic metastasis and microvascular invasion, leading to high recurrence rates after liver transplantation. The most common sites of recurrence are lymph nodes, followed by the liver and lungs. Post-recurrence survival remains poor following transplantation.

2670 - Endoscopic Ultrasound Guided Partial Splenic Embolization in Hypersplenism A Novel Approach Validated in a pilot study

Changqing Guo¹, Ying Su², Shanshan Zhu¹, Yifan Guo³, Ping Liu¹

The First Affiliated Hospital Of Zhengzhou University, Department Of Gastroenterology, Zhengzhou-China¹ Henan Infectious Diseases Hospital, Department Of Critical Liver Diseases, Zhengzhou-China² The First Affiliated Hospital Of Zhengzhou University, Department Of Radiology, Zhengzhou-China³

Objective: To evaluate the safety, feasibility, and preliminary efficacy of endoscopic ultrasound-guided partial splenic embolization (EUS-PSE) in patients with decompensated cirrhosis and hypersplenism.

Materials and Methods: This pilot study enrolled patients with decompensated liver cirrhosis and hypersplenism who underwent EUS-PSE between September 2023 and April 2025 at two tertiary medical centers in China. Demographic and clinical data, changes in hematologic parameters, and perioperative and postoperative complications were recorded and analyzed.

Results: Thirteen patients (8 males, 5 females; mean age 53.5 ± 10.0 years) were included. According to the Child-Pugh classification, 5 (38.5%) were class A, 7 (53.8%) were class B, and 1 (7.7%) was class C. In 10 patients (76.9%), the post-procedural splenic infarction

ratio was <30%. In the remaining 3 patients (23.1%) with infarction ratios >30%, significant increases in platelet and leukocyte counts were observed. The success rate of the operation was 100%. The platelet level of the four patients increased significantly after the operation, and the clinical success rate was 30.7%. 4 patients developed post-procedural complications, including new or worsening pleural effusion and/or ascites. One patient developed a localized splenic abscess. All complications resolved with conservative management.

Conclusions: EUS-PSE appears to be a feasible and safe therapeutic option for managing hypersplenism in patients with cirrhosis. Hematologic improvement is more prominent when the splenic infarction ratio exceeds 30%. EUS-PSE may offer a minimally invasive alternative to conventional transarterial embolization. Further multicenter studies are warranted to confirm long-term efficacy and to determine the optimal infarction range (potentially 50%–70%).

2671 - Mechanistic Study of Resmetirom in Treating MAFLD Mouse Model Gut Microbiota Remodeling and Metabolic Regulation

Hang Chen¹, Mingshan Huang¹, Lanqing Ma¹ Kunming Medical University, Digestion, 中国-China¹

Background / **Hypothesis:**

The pathogenesis of metabolic associated fatty liver disease (MAFLD) is closely related to gut microbiota, but its specific mechanisms remain unclear. Resmetirom, as the first drug approved for the treatment of MASH with fibrosis, has not yet been studied in relation to gut microbiota. This study aims to investigate the role and mechanisms of gut microbiota in Resmetirom's treatment of MAFLD using multi-omics approaches.

Materials and **Methods:**

We established a MAFLD mice model with a high-fat diet (HFD) and treated mice with Resmetirom for 8 weeks. An FMT model was also constructed. Liver fat and lipid deposition were evaluated with HE and Oil Red O staining. Blood serum indicators were measured, and ileal contents were analyzed for metagenomics and untargeted metabolomics.

Results:

ORAL ABSTRACTS

1. Resmetirom and FMT Alleviate Metabolic Disorders and Hepatic Steatosis

Resmetirom and FMT improved glucose intolerance, insulin resistance (Fig1 A-C), hepatic steatosis, lipid deposition (Fig1 D-E), serum indicators (ALT, AST, TG, TC, LDL-C, HDL-C, Fig1F-K), liver weight, fat distribution, and adipose tissue weights (Fig1 L-Q). They also restored ZO-1 and Occludin levels in intestinal tissues (Fig2 Q-S).

2. Fecal Microbiota Composition and Key Taxa

Significant differences were found among groups (Fig2 A-B). Lefse identified 62 taxa between Control and HFD (Fig 2C), 53 between HFD and Resmetirom (Fig 2D), and 49 between HFD and FMT (Fig 2E). Parabacteroides was enriched in HFD but reduced in Resmetirom and FMT groups (Fig 2F).

3. Fecal Metabolites and Metabolic Pathways

3,475 metabolites across eight classes were identified (Fig 2G). Significant differences in fecal metabolites were observed among the Control, HFD, Resmetirom, and FMT groups (Figure 2H). The metabolic pathways involved in the differential metabolites between the HFD and Resmetirom or FMT groups were distinct (Figure 2I-N). Resmetirom increased butyric acid, indole derivatives, and deoxycholic acid but reduced palmitic and stearic acid (Fig 2O). FMT increased rosmarinic acid, citric acid, and indole-3-methyl acetate but reduced dimethyl hexasulfide, methyl methylthio selenide, and uracil (Fig 2P).

Conclusions: This study explored the role and mechanisms of Resmetirom in treating MAFLD using a HFD mice model and FMT experiments. Resmetirom improved glucose intolerance, insulin resistance, hepatic steatosis, blood lipid profiles, body weight, and fat tissue distribution. Its therapeutic effects were mediated by regulating specific bacterial taxa, restoring gut microbiota balance, and reversing MAFLD progression. Resmetirom also modulated key metabolic pathways linked to gut microbiota, enhancing host metabolic regulation. This study offers new molecular insights and preclinical evidence for Resmetirom in MAFLD treatment.

2672 - Predictors of Post TIPS Persistent Ascites
Shiv Kumar Sarin ¹, Vinod Arora ¹, Amar Mukund ¹,

Yaswant Patidar ¹, Jayashree Biswas ¹
ILBS, Hepatology, New Delhi-India ¹

Background / **Hypothesis:** TIPS is used to lower portal pressure in patients presenting with acute variceal bleeding or refractory ascites. Some patients who undergo TIPS still require therapeutic paracentesis despite adequate portal pressure reduction and optimum tolerable doses of diuretics. Persistence of ascites post-one month of TIPS placement was defined as patients requiring LVP one month after the procedure, despite maximum tolerable doses of diuretics with no evidence of shunt stenosis. Shunt stenosis was diagnosed by angiographic evaluation showing greater than 50% stenosis, an increase in PSG to over 12 mm Hg or Doppler US criteria such as shunt peak systolic velocity less than 90 cm/sec indicating functional stenosis, absence of flow on color Doppler, main portal vein velocity less than 18-20 cm/sec.

Hypothesis: Determine the persistence of ascites after TIPS and identify variables contributing to its cause.

Materials and Methods: This retrospective cohort study was conducted at ILBS, New Delhi between March 2020 and March 2025, following institutional ethics approval. All cirrhotic patients undergoing TIPS for refractory ascites were screened. Patients who underwent TIPS for other indications, had acute Budd–Chiari syndrome, or lacked adequate follow-up or pre-TIPS data were excluded. Of 384 TIPS procedures, 107 patients met the inclusion criteria. Persistent ascites was defined as the requirement for LVP one month after TIPS despite optimal diuretic therapy and absence of shunt stenosis. Patients were divided into Group A (persistent ascites) and Group B (ascites controlled). Data included demographics, laboratory parameters, echocardiographic indices, renin and NT-proBNP levels, and TIPS procedural details. Statistical analyses were performed using parametric and non-parametric tests, and $p < 0.05$ was considered significant.

Results:

Of 107 patients analysed, 40 (37%) required therapeutic paracentesis at one month post-TIPS. Patients with persistent ascites had significantly higher pre-TIPS MELD scores, indicating more advanced liver disease. Echocardiographic parameters, including E/A ratio, E/e', ejection fraction, and TAPSE were comparable between

ORAL ABSTRACTS

groups, suggesting that overt cardiac dysfunction was not a major determinant. Renal function and synthetic parameters were similar between both groups. Smaller TIPS stent diameter and lesser portosystemic gradient (PSG) reduction were significantly associated with persistence of ascites. Hormonal analysis showed divergent renin responses post-TIPS, while NT-proBNP increased in both groups without statistical significance.

Conclusions:

.Persistent ascites post-TIPS was not related to cardiac diastolic dysfunction (E/A, E/e', TAPSE) or underlying baseline renal parameters
.MELD score and smaller TIPS diameter emerged as key factors influencing persistence of ascites

2673 - Parallel Comparison of Two HBV pg RNA Detection Assays

Yuyuan Jia¹, Haiying Zhang¹, Huiying Rao¹, Runling Zhang¹

Peking University People's Hospital, Peking University Hepatology Institute, Infectious Disease And Hepatology Center Of Peking University People's Hospital, Beijing Key Laboratory Of Hep, Beijing-China¹

Background / **Hypothesis:**
Serum HBV RNA levels have been recognized as an effective biomarker for treating HBV patients. Currently, HBV RNA detection kits from different manufacturers exhibit inconsistent performance. This study aims to evaluate the performance of HBV RNA detection.

Materials and **Methods:**
We included patients treated with tenofovir disoproxil fumarate (TDF) for chronic hepatitis B (CHB) with advanced liver fibrosis/compensated cirrhosis at Peking University People's Hospital from January 2015 to December 2020, as well as patients undergoing HBV RNA serological testing at Peking University People's Hospital from December 2024 to January 2025. We performed performance validation on Reagent A. HBV RNA detection was conducted using both Reagents A and B on fresh samples, frozen samples, and non-concurrent refrigerated samples collected during the same period to assess correlation between the two reagents. Concurrently, levels of HBV DNA, HBsAg, HBsAb, HBeAg, HBeAb, and HBcAb were measured. Reagent A was compared on the ABI 7500 and ABI Q5 amplifiers for 16 low-concentration samples.

Pearson correlation coefficients (R) assessed linear correlation between quantitative results from both reagents. Simple linear regression fitted equations (R^2 evaluated model goodness-of-fit), combined with negative/positive results across sample groups, positive results above detection limits, and positive rates, analyzed detection consistency and detection capability.

Results:

Performance validation of Brand A reagent met all evaluation criteria.

Brand A reagent has a detection limit of 50 copies/mL, while Brand B reagent has a detection limit of 300 copies/mL.

Comparing 133 concurrent fresh samples, the two brands showed a common positive rate of $R \approx 0.9719$, with overall consistency at 88.7%. For samples above Brand B's detection limit, the positive agreement rate between the two brands reached 100%. Among jointly positive samples exceeding 300 copies/mL, the HBeAg positivity rate was 84.2% ($R \approx 0.98$). Samples with inconsistent low detection limits were predominantly HBeAg-negative, while HBeAg-positive samples demonstrated superior consistency and positivity rates. We compared 134 frozen samples. Brand B reagents detected samples above 300 copies/mL, while Brand A detected all such samples ($R \approx 0.9714$), achieving 92.53% overall concordance. For samples above the detection limit of Brand B reagents, the concordance rate between the two brands was 100%. Among 16 low-concentration samples tested on different instruments, the ABI 7500 amplifier demonstrated higher detection rates than the ABI Q5, indicating superior performance for detecting low-concentration HBV RNA.

Conclusions:

Comparative testing of fresh samples and frozen samples from both brands yielded satisfactory results. Reagent A met performance validation standards, and both brands of reagents satisfied testing requirements. The ABI 7500 demonstrated higher accuracy in results.

2678 - HBV recurrence in patients with hepatocellular carcinoma and cholangiocarcinoma following liver transplantation

Xi He¹, Zhijie Li¹, Xiaofeng Niu¹, Hui Ren¹, Yudong Wang², George Lau², Zhenwen Liu¹
The Fifth Medical Center Of Chinese People's Liberation Army General Hospital, Senior Department Of Hepatology, Beijing-China¹ Humanity And Health Medical Group, Humanity And Health Clinical Trial

ORAL ABSTRACTS

Center, Hong Kong-Hong Kong SAR, China ²

Background / **Hypothesis:**
To investigate risk factors for hepatitis B virus (HBV) recurrence following liver transplantation in patients with HBV-related hepatocellular carcinoma (HCC) or cholangiocarcinoma.

Materials and **Methods:**
This study included patients with cirrhosis due to chronic HBV infection who underwent liver transplantation for HCC or cholangiocarcinoma between February 2015 and February 2019 at a tertiary hospital. Participants were stratified based on post-transplant HBV recurrence status. Inter-group comparisons for categorical variables were performed using the chi-square test, while continuous variables were analyzed using Student's t-test or the Mann-Whitney U test, as appropriate. Univariate and multivariate Cox proportional hazards regression analyses were conducted to identify independent risk factors.

Results:

Among 112 enrolled patients, 109 had HCC and 3 had cholangiocarcinoma. Compared to patients without HBV recurrence, those with recurrence had significantly higher rates of detectable HBV DNA pre-transplantation (75.0% vs. 27.0%, $P=0.001$), microvascular invasion (100% vs. 67.8%, $P=0.020$), and more advanced TNM stages (Stage III+IV: 58.3% vs. 16.5%, $P=0.001$). They also exhibited larger maximum tumor diameter (6.3 cm vs. 2.5 cm, $P<0.001$) and were more likely to exceed the "Up-to-seven" criteria (83.3% vs. 22.0%, $P<0.001$). No significant differences were found in age ($P = 0.362$), sex ($P = 0.480$), or MELD score ($P = 0.678$). Post-transplantation, HBV recurrence occurred in 12 patients (10.71%) after a median interval of 15.0 months (IQR: 6.5-21.1). Of these, 11 cases (10.1% of HCC patients) followed HCC recurrence, and 1 case (33.3% of cholangiocarcinoma patients) followed cholangiocarcinoma recurrence. Overall, 33 patients experienced tumor recurrence, and 30 died. Among the 12 with HBV recurrence, 11 died due to tumor progression, while 1 remains alive with HCC under treatment. Multivariate analysis identified exceeding the "Up-to-seven" criteria (OR: 7.99, 95% CI: 1.19-53.49, $P=0.032$) and the presence of cholangiocarcinoma (OR: 116.7, 95% CI: 6.06-2250.5, $P=0.002$) as independent risk factors for HBV recurrence.

Conclusions:

HBV recurrence is closely associated with tumor recurrence post-liver transplantation. Patients presenting with larger or multiple tumors, or with cholangiocarcinoma before transplantation, are at significantly higher risk for HBV recurrence. Mortality in this cohort was primarily driven by tumor progression rather than HBV recurrence itself.

Keyword(s) : HBV; HCC; liver transplantation; cholangiocarcinoma

2679 - Outcomes of cholangiocarcinoma (ICC) or combined hepatocellular cholangiocarcinoma after liver transplantation

Dali Zhang¹, Xiaofeng Zhang¹, Lixin Li¹, Hongbo Wang¹, Yudong Wang², George Lau², Zhenwen Liu¹
The Fifth Medical Center Of Chinese People's Liberation Army General Hospital, Senior Department Of Hepatology, Beijing-China ¹ Humanity And Health Medical Group, Humanity And Health Clinical Trial Center, Hong Kong-Hong Kong SAR, China ²

Background / **Hypothesis:**
To investigate the characteristics and outcomes of patients with cholangiocarcinoma (ICC) or combined hepatocellular-cholangiocarcinoma (ICC-HCC) following liver transplantation.

Materials and **Methods:**
This study included patients diagnosed with ICC or ICC-HCC who underwent liver transplantation at a tertiary hospital between June 2015 and August 2018. Clinical characteristics and post-transplant outcomes were analyzed.

Results:

Seven patients were enrolled (6 males, 1 female), with a mean age of 55.1 ± 2.2 years. Prior to transplantation, 5 patients were diagnosed with hepatocellular carcinoma (HCC) and 2 with ICC-HCC. The mean maximum tumor diameter was 6.7 ± 1.3 cm, and the median AFP level was 134.2 (IQR 59.8–596.8) ng/mL. Two patients had a single tumor, while five had multiple tumors. Pre-transplant evaluation indicated that 2 patients met the Milan criteria, and 5 exceeded them. All patients had cirrhosis, with no evidence of extrahepatic malignancy. Post-transplant histopathology confirmed ICC in 2 cases and ICC-HCC in 5 cases. All patients exhibited microvascular invasion, and 3 had lymphatic metastasis. During follow-up, all 7 patients experienced tumor recurrence, with a mean recurrence interval of 2.8 ± 0.6

ORAL ABSTRACTS

months and a mean overall survival of 6.0 ± 0.9 months. Among the two patients initially assessed as meeting Milan criteria, both were upstaged post-transplant due to lymphatic metastasis, multiple tumors, and vascular invasion. Another patient initially within Milan criteria was found to have multiple tumors with a maximum diameter of 5 cm. One additional case, with multiple tumors (maximum diameter 2.5 cm), recurred first in the lung and retroperitoneal lymph nodes. Recurrence involved multiple organs in all cases: 85.7% (n=6) presented with initial lymphatic metastasis, 71.4% (n=5) with liver recurrence, 42.9% (n=3) with lung metastasis, and 14.3% (n=1 each) with adrenal or peritoneal metastasis. Patients received various treatments including radiation therapy, transarterial chemoembolization, and tyrosine kinase inhibitors. All patients died within 11 months after transplantation.

Conclusions:

ICC or ICC-HCC is frequently associated with lymphatic metastasis and microvascular invasion, leading to high recurrence rates after liver transplantation. The most common sites of recurrence are lymph nodes, followed by the liver and lungs. Post-recurrence survival remains poor following transplantation.

Keyword(s) : Cholangiocarcinoma; Liver transplantation; Histopathology; Hepatocellular-cholangiocarcinoma

2681 - Characteristics of Autoimmune Hepatitis in elderly patients

Lili Zhao¹, Pin Han², Jie Liu³, Jia Li³
Tianjin Second People's Hospital, Department Of Gastroenterology And Hepatology, Tianjin-China¹
Tianjin First Central Hospital, Department Of Gastroenterology And Hepatology, Tianjin-China²
Tianjin Second People's Hospital, Department Of Gastroenterology And Hepatology, Tianjin-China³

Background: The prevalence and incidence of autoimmune hepatitis (AIH) are increasing yearly, and AIH in the elderly is also rising significantly. This study aims to investigate the characteristics of elderly AIH patients and explore the relationship between ALT levels and liver pathology.

Methods: A retrospective analysis was conducted on AIH patients who underwent liver biopsy and were diagnosed with autoimmune hepatitis (with an International Autoimmune Hepatitis Group (IAIHG) score > 15 or a simplified score > 6) at Tianjin Second People's Hospital from January 2011 to June 2025. Based on the preliminary results of the 2020 decennial

population census in China and the "World Health Statistics" published by the World Health Organization, patients were divided into two groups according to their age at diagnosis, using 60 years as the cutoff. Exclusion criteria included concurrent infections such as hepatitis B or C, alcoholic liver disease, drug-induced liver injury, non-alcoholic fatty liver disease, primary biliary cholangitis, primary sclerosing cholangitis, and others. Clinical data were retrieved from electronic medical records, including gender, age at diagnosis, presence of cirrhosis, and timing of liver biopsy. Laboratory test data, such as liver function parameters, collected within one week before the liver biopsy were also recorded. Patients with an onset age of ≥ 60 years were analyzed and compared with those aged <60 years. Results: A total of 356 patients were included in this study. The elderly group comprised 131 cases (36.8%), while the young and middle-aged group comprised 225 cases (63.2%). At the time of AIH diagnosis, liver pathology indicated cirrhosis in 27.5% (36/131) of the elderly group and 8.4% (19/225) of the young and middle-aged group, with the former being significantly higher than the latter ($\chi^2 = 54.674$, $P = 0.000$). Concurrent extrahepatic immune diseases were present in 22.1% (29/131) of the elderly group, which was higher than the 17.8% (40/225) in the young and middle-aged group, but the difference was not statistically significant ($\chi^2 = 1.007$, $P = 0.316$). Compared to the young and middle-aged group, the elderly group had lower levels of alanine aminotransferase (ALT) and aspartate aminotransferase (AST) ($P = 0.012$, $P = 0.021$). Conclusion: In elderly patients with AIH, elevated serum ALT levels are often not significant, while liver histopathology may reveal more pronounced interface hepatitis and fibrosis. Relying solely on ALT levels to assess disease severity can easily lead to an underestimation of disease activity, thereby delaying diagnosis and intervention. Therefore, it is recommended to actively consider liver biopsy.

Keyword(s) : Autoimmune hepatitis, elderly, serum alanine aminotransferase, interface hepatitis, liver fibrosis

2690 - TACE plus Lenvatinib and Envafolimab for Conversion Therapy in Unresectable HCC A Prospective Phase II Study

Yuhao Su¹, Yuxin Liang¹, Deyuan Zhong¹, Xiaolun Huang¹

Sichuan Cancer Hospital & Institute, Sichuan Cancer Center, School Of Medicine, University Of Electronic Science And Technology Of China, Liver Transplantation Center And Hbp Surgery, Chengdu-China¹

ORAL ABSTRACTS

Background / **Hypothesis:**
Most patients with hepatocellular carcinoma (HCC) are diagnosed at intermediate or advanced stages, when curative resection is not feasible. Conversion therapy aiming to downstage tumors and enable surgical resection has emerged as a potential strategy. We conducted a prospective phase II study to evaluate the efficacy and safety of transarterial chemoembolization (TACE) combined with lenvatinib and the subcutaneous PD-L1 inhibitor envafolimab in patients with unresectable HCC.

Materials and **Methods:**

This single-center, open-label, single-arm phase II trial enrolled patients with Barcelona Clinic Liver Cancer stage B or C unresectable HCC between April and September 2024. Patients received conventional TACE combined with oral lenvatinib and subcutaneous envafolimab until surgical conversion, disease progression, unacceptable toxicity, or death. The primary endpoint was the conversion rate to curative-intent resection. Secondary endpoints included objective response rate (ORR), disease control rate (DCR), pathological response, progression-free survival (PFS), overall survival (OS), and safety.

Results:

Fifteen patients were enrolled. According to mRECIST criteria, the ORR was 53.3% and the DCR was 86.7%. Nine patients (60.0%) achieved sufficient tumor downstaging to undergo curative-intent surgery, and all achieved R0 resection. Pathological complete or major response was observed in five resected patients (55.6%). After a median follow-up of 16 months, the estimated median PFS was 12.0 months. One patient died during follow-up, yielding a 1-year OS of 100% and an 18-month OS of 93.3%. Treatment-related adverse events were manageable, with no unexpected safety signals.

Conclusions: TACE combined with lenvatinib and envafolimab demonstrated encouraging antitumor activity, a high conversion-to-surgery rate, and acceptable safety in unresectable HCC. These findings support further evaluation of this multimodal regimen as a conversion therapy strategy.

Keyword(s) : Hepatocellular carcinoma; Conversion therapy; Transarterial chemoembolization; Lenvatinib; Envafolimab

2691 - Splenic Stiffness Measurement to PREdict Decompensation in Patients with Compensated Advanced Chronic Liver Disease in India (SPRED c ACLD study)

Sayan Malakar¹, Akriti Bhardwaj¹, Vishwas Kapoor², Sumit Rungta¹
King George Medical University, Gastroenterology, Lucknow-India¹ Sgpgims, Biostatistics, Lucknow-India²

Background / **Hypothesis:**
Splenic stiffness measurement (SSM) is an emerging non-invasive modality for stratifying patients with compensated advanced chronic liver disease (c-ACLD). Herein, we aimed to determine the utility of SSM to predict one-year decompensation in patients with c-ACLD

Materials and **Methods:**
In this prospective study, all patients with c-ACLD (Baveno VII) were recruited from 2022 to 2024 at a tertiary care centre in north India. Subsequently, they underwent baseline SSM by vibration-controlled transient elastography method using a 100 Hz spleen-dedicated probe. They were followed up for a year to document decompensation and death.

Results:

Over three years, a total of 271 patients were recruited, and 40 were excluded. 231 patients were included in the final analysis. The mean age was 45.18 ± 9.73 years, and the majority were women (58.4%). The most common etiology of c-ACLD was chronic hepatitis C infection [75 (32.5%)]. One year- decompensation and death rate were 8.26% (19 patients) and 2.17% (five patients), respectively. The patient who decompensated had higher SSM, LSM, APRI, and FIB-4 (69.61 ± 16.27 kPa vs 43.99 ± 14.81 kPa, $p < 0.001$, 30.77 ± 11.26 kPa vs 22.68 ± 7.02 kPa, $p < 0.001$; respectively). In the Cox proportional hazards model, SSM predicted one-year decompensation [HR: 1.073 (1.049 - 1.097), $p < 0.001$]. With a cut-off 57.5 kPa, SSM has the highest sensitivity (82%), specificity (87.5%), positive predictive value (98.26%), negative predictive value (36.21%) and diagnostic accuracy (82.61%) for predicting decompensation in patients with c-ACLD. SSM did not predict the mortality in patients with c-ACLD

Conclusions:

SSM is a useful tool in predicting decompensation in patients with c-ACLD. A cut-off of 57.5 kPa has a sensitivity and specificity of 82% and 87.5%,

ORAL ABSTRACTS

respectively, for predicting one-year decompensation in these patients.

2693 - Muscle Matters Impact of Sarcopenia on Mortality and Clinical Outcomes in Pediatric Liver Transplantation

Jyoti Bhutani ¹, Karunesh Kumar ¹, Smita Malhotra ¹, Reva Mehta ², Neerav Goyal ³, Anupam Sibal ¹
Indraprastha Apollo Hospital, Pediatric Gastroenterology And Hepatology, New Delhi-India ¹
Indraprastha Apollo Hospital, Radiology, New Delhi-India ²
Indraprastha Apollo Hospital, Liver Transplant, New Delhi-India ³

Background / Hypothesis: The impact of sarcopenia on outcomes following pediatric liver transplantation (LT) remains poorly defined. This study evaluated the association between the psoas muscle index (PMI) and post-transplant outcomes, including mortality, serious infections, surgical complications, and hospital length of stay (LOS), in pediatric LT recipients.

Materials and Methods: We performed a retrospective analysis of 293 pediatric LT recipients from January 2017 to January 2026. Sarcopenia was assessed using PMI (cm²/m²) calculated from preoperative CT imaging at the L3–L4 vertebral level. Patients were stratified into PMI quartiles. Outcomes analyzed included mortality, serious infections, surgical complications, and LOS. Multivariate logistic regression was used to identify independent predictors of adverse outcomes, adjusting for potential confounders including age and Pediatric End-Stage Liver Disease (PELD) score. Receiver operating characteristic (ROC) analysis was performed to identify the optimal PMI cut-off for mortality prediction.

Results: Valid PMI measurements were available for 255 patients. An inverse association was observed between muscle mass and adverse outcomes. Patients in the lowest PMI quartile (Q1, severe sarcopenia) had higher mortality compared with those in the highest quartile (Q4) (9.3% vs. 2.8%). The incidence of serious infections was also greatest in Q1 (75.0%) compared with Q4 (58.3%). Lower PMI was associated with longer hospital LOS (median 24 days in Q1 vs. 20 days in Q4). ROC analysis identified a PMI threshold of 4.89 cm²/m² for mortality prediction. In multivariate analysis, PMI below this threshold was associated with increased odds of mortality (OR 2.66; 95% CI 0.55–13.7; p=0.20), although statistical significance was not reached, likely due to low

overall mortality.

Conclusions: Low PMI is associated with increased infection rates, prolonged hospitalization, and higher mortality in pediatric LT recipients. A PMI cut-off of <4.89 cm²/m² may help identify high-risk children who could benefit from targeted pre-transplant nutritional intervention. Further studies examining long-term outcomes are ongoing.

Keyword(s) : Pediatric liver transplantation, Sarcopenia, Psoas muscle index, Post-transplant outcomes, Pediatric End-Stage Liver Disease

2695 - Candidemia in Liver Transplant Recipients A

Ten	Year	Retrospective	Study
Adem Kose ¹ , Ferhat Ozer ¹ , Yasar Bayindir ¹ , Elif Seren Tanriverdi ² , Ertugrul Karabulut ³			
Faculty Of Medicine, Inonu University, Infectious Diseases And Clinical Microbiology, Malatya-Türkiye ¹ Faculty Of Medicine, Inonu University, Medical Microbiology, Malatya-Türkiye ² Faculty Of Medicine, Inonu University, General Surgery And Liver Transplantation Institute, Malatya-Türkiye ³			

Background

Candidemia is one of the most severe forms of invasive fungal infections in liver transplant recipients and is associated with high morbidity and mortality. This study aimed to determine the incidence of candidemia in liver transplant recipients, to analyze the distribution of causative Candida species, to evaluate clinical risk factors and antifungal treatment approaches, and to assess the impact of candidemia on clinical outcomes and mortality.

Materials and Methods

The medical records of 1,880 adult patients who underwent liver transplantation at our center between January 2015 and January 2025 and were regularly followed were retrospectively reviewed. A total of 80 patients with Candida species isolated from blood cultures and diagnosed with candidemia were included in the study. Demographic, clinical, and laboratory data were obtained from patient records. Identification of Candida species was performed using matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF MS). Antifungal treatment strategies were evaluated according to culture and antifungal susceptibility results.

ORAL ABSTRACTS

Results

The incidence of candidemia was found 4.25%. Of the patients, 67.5% were male, and candidemia most frequently developed during intensive care unit hospitalization. Non-albicans *Candida* species accounted for 62.5% of the isolates, with *Candida glabrata* and *Candida parapsilosis* being the most commonly identified species. Early initiation of antifungal therapy was significantly associated with a shorter time to blood culture clearance ($p = 0.003$) and lower mortality ($p = 0.032$). The overall mortality rate during candidemia was found to be 31.25% among patients with candidemia and no significant relationship was observed between mortality and causative candida agent.

Conclusions

Candidemia remains a serious complication associated with a high risk of mortality in liver transplant recipients. The predominance of non-albicans *Candida* species and the significant impact of early antifungal therapy on clinical outcomes highlight the need for continuous monitoring of center-specific epidemiological data and the implementation of risk-based empirical antifungal treatment strategies.

Keyword(s) : liver transplantation; candidemia; non-albicans *Candida*; MALDI-TOF MS; antifungal therapy

2699 - RAPID Procedure Enables Safe Use of Small Left Lobe Grafts A Two Center Experience

Emre Aray¹, Elvan Onur Kirimker², Meltem Koloğlu³, Kaan Karayalçın², Deniz Balci⁴

Bahcesehir University, General Surgery, Kadıköy-Türkiye

¹ Ankara University, General Surgery, Ankara-Türkiye

² Ankara University, Pediatric Surgery, Ankara-Türkiye

³ Bahcesehir University, General Surgery, Istanbul-Türkiye

Background

Resection and Partial Liver Segment Transplantation with Delayed Hepatectomy (RAPID) has been introduced as an innovative surgical strategy to enable liver transplantation using small grafts in carefully selected recipients. By combining staged hepatectomy with partial graft implantation, RAPID aims to overcome conventional graft size limitations while minimizing the risk of small-for-size-related complications. This study presents a two-center experience evaluating the feasibility and outcomes of RAPID transplantation using living-donor left lobe grafts.

Hypothesis:

Materials

and

Methods:

Between 2019 and 2026, 11 patients who underwent RAPID transplantation at two transplant centers were retrospectively analyzed. The median recipient age was 58 years (range: 23–64), with 5 female and 6 male patients. The median MELD-Na score was 18 (range: 8–29). All recipients received living-donor left lobe grafts, with graft weights ranging from 257 to 609 g. Recipient hepatectomy consisted of left lobectomy in 3 patients and left lateral sectionectomy in 8 patients. Biliary reconstruction was achieved using duct-to-duct anastomosis in 3 patients and hepaticojejunostomy in 8 patients. The actual graft-to-recipient weight ratio (GRWR) ranged from 0.35 to 0.58, with a median value of approximately 0.45. Inflow modulation strategies, including shunt narrowing, somatostatin infusion, and closure of splenorenal shunts, were selectively applied during the first stage to optimize portal inflow.

Results:

During the postoperative course, graft function demonstrated progressive adaptation and stabilization following the staged RAPID protocol. Portal inflow modulation strategies effectively supported graft perfusion and regeneration in selected recipients with low GRWR values. Across the cohort, no cases of small-for-size syndrome or early allograft dysfunction were observed. The interstage period allowed for controlled graft hypertrophy and functional recovery, facilitating safe progression within the RAPID framework. Overall, postoperative outcomes supported the technical feasibility of RAPID transplantation using small left lobe grafts under carefully controlled surgical and hemodynamic conditions.

Conclusions: RAPID transplantation represents a feasible and highly promising approach for extending the use of small left lobe grafts in liver transplantation. The absence of small-for-size syndrome and early allograft dysfunction underscores the reliability of this staged strategy when combined with meticulous surgical planning and tailored inflow modulation. RAPID has the potential to redefine graft size thresholds, expand the living donor pool, and provide a valuable alternative for complex transplant scenarios. Further prospective multicenter studies with larger cohorts are warranted to establish standardized indications and long-term outcomes.

2700 - Does Primary Biliary Cholangitis and Autoimmune Hepatitis Increase the Risk of Precancerous Colon Polyps

Ayşe Sena Oguz¹, Muhammed Bahaddin Durak², Cem Simsek²

Medical University Of Vienna, Medicine Of Faculty, Vienna-Austria¹ Hacettepe Medicine Of Faculty, Gastroenterology, Ankara-Türkiye²

Background / Hypothesis: To evaluate the relationship between primary biliary cholangitis (PBC), autoimmune hepatitis (AIH), and colonic polyps.

Materials and Methods: The study included patients aged 18–65 with noncirrhotic primary biliary cholangitis and autoimmune hepatitis who underwent consecutive colonoscopies from January 2014 to July 2024. Patients were divided into three groups: those with PBC, those with AIH, and a control group. Patients with three or more adenomas, high-grade intraepithelial neoplasia, ≥ 10 mm tubular adenomas, or tumors with a villous component were classified as having high-risk polyps.

Results: The study included 42 patients with PBC and 42 with AIH. 142 consecutive patients who underwent screening colonoscopies comprised the control group. The average age at the time of colonoscopy was 58 years (51–63) in the control group, 53 years (44–60) in the AIH group, and 54.5 years (45–60) in the PBC group. Adenomatous polyps were detected in 40.5% of PBC patients, 16.7% of AIH patients, and 21.1% of the control group. The adenomatous polyp rate in PBC was statistically higher than in all other groups ($p=0.015$). When analyzing polyp location, polyps in PBC were more likely to be located in the transverse colon compared to those in AIH ($p<0.026$), while no differences were observed between the control group. Multiple adenomas were more prevalent in the control group compared to the other groups ($p=0.016$). Large adenomas (≥ 20 mm in diameter) were more frequently detected in the AIH group ($p<0.001$). High-risk polyps were present in 23.8%, 7.8%, and 2.4% of AIH, control group, and PBC patients, respectively, demonstrating a statistically significantly higher frequency in the AIH group ($p=0.002$).

Conclusions: Personalizing screening protocols to

account for individual risk factors may be a crucial step in enhancing screening effectiveness. The current study revealed an increased incidence of adenomatous polyps in patients with PBC and a higher risk of high-risk polyps in those with AIH. Future large-volume prospective studies will help inform decisions about screening colonoscopy at earlier ages and possibly at more frequent intervals in patients with AIH and PBC.

2706 - A Novel Non invasive Model to Identify High Risk Varices in Patients with HBV related Cirrhosis

Haiyu Wang¹, Jinjun Chen², Peishuang Xu¹
Nanfang Hospital, Liver Disease Center, Guangzhou-China¹ Department Of Infectious Disease, 2nd Affiliated Hospital, Chongqing Medical University, Liver Disease Center, Chongqing-China²

Background / Hypothesis: Early detection of high-risk varices (HRV) in cirrhosis is critical for prognostic improvement. Over the past decade, several non-invasive diagnostic models of HRV in patients with advanced chronic liver disease have been developed. However, these models can only be used to exclude HRV patients but cannot effectively rule in HRV patients. This study aimed to develop a non-invasive model, for ruling out and ruling in HRV in patients with HBV-related cirrhosis.

Materials and Methods: This prospective study enrolled 616 consecutive patients with compensated HBV-related cirrhosis from July 2021 to April 2024 and followed until December 2025. Variables selected through least absolute shrinkage and selection operator regression were subsequently analyzed by multivariable logistic regression to construct the model.

Results:

Participants were randomly divided into training and validation cohorts (7:3 ratio). The model consisting of spleen stiffness measurement@100Hz, platelets, spleen diameter, spleen thickness, and sex, named PASS model, performed robustly in training and validation cohorts (AUROC: 0.94 and 0.92). Dual optimal cut-off values (4.84, 78.28) were selected for discriminating HRV. For ruling out HRV, PASS model spared 53.47% (231/432) unnecessary esophagogastroduodenoscopy (EGD) with a HRV missed rate of 1.11% (1/90), with sensitivity and negative predictive value were 98.89% and 99.57%, respectively. For ruling in HRV, 92.50% (37/40) of positive patients were correctly classified (specificity 99.12%, positive predictive value 92.50%). These results

ORAL ABSTRACTS

were then confirmed in validation cohort. The PASS model can also stratify the risk of decompensation events ($p < 0.001$). The 4-year cumulative incidences of liver decompensation were 0.93%, 4.59%, 21.93% in the HRV, gray zone, non-HRV groups, respectively.

Conclusions:

The PASS model is an accurate, novel, and non-invasive HRV diagnostic criterion with dual cut-off values in patients with compensated HBV-related cirrhosis. It is based on five routine laboratory and clinical parameters. PASS can identify patients with an extremely low probability of HRV (HRV misclassification rate $< 5\%$), allowing them to safely avoid EGD. At the same time, it can also accurately identify HRV patients (PPV $> 92\%$), enabling the timely initiation of primary prevention treatment. We also have provided evidence that the PASS model could accurately stratify the risk of decompensation.

2711 - Related Factors for Low Level Viremia and the Comparative Efficacy of Management Strategies in Treatment Naïve Chronic Hepatitis B Patients Receiving Entecavir or Tenofovir Amibufenamide A Real World Study

Mireyi Suwanbai ¹, Yu Gou ¹, Chaoyue Pang ¹, Guangde Yang ¹, Li Li ¹, Xia Wang ¹, Xiucheng Pan ¹
The Affiliated Hospital Of Xuzhou Medical University, Xuzhou Medical College, Department Of Hepatology And Infectious Diseases, Jiangsu, Xuzhou, China-China ¹

Background / Hypothesis: We aimed to investigate the related factors for low-level viremia (LLV) in treatment-naïve chronic hepatitis B (CHB) patients receiving entecavir (ETV) or Tenofovir Amibufenamide (TMF) and compare the efficacy of subsequent management strategies.

Materials and Methods: A total of 743 treatment-naïve CHB patients (467 receiving ETV and 276 receiving TMF) were enrolled. After 48 weeks of follow-up, patients were categorized into complete virological response (CVR) or LLV. Multivariate logistic regression was used to identify related factors for LLV. LLV patients then received different management strategies. Patients with LLV after ETV monotherapy (ETV-LLV) received one of three interventions: continued ETV monotherapy, switched to tenofovir

alafenamide/tenofovir amibufenamide (TAF/TMF) monotherapy, or add-on TAF/TMF. Patients with LLV after TMF monotherapy (TMF-LLV) received either continued TMF monotherapy or add-on ETV. Antiviral treatment effects were compared after 48 weeks of follow-up.

Results: After propensity-score matching (PSM), the week-48 complete virological response (CVR) rate was significantly higher in the TMF group than in the ETV group (76.80% vs. 62.50%, $P < 0.001$). Multivariate analysis of the matched cohort ($n=544$) identified that HBV DNA (aOR=1.209, 95%CI=1.034–1.412, $P=0.017$), HBsAg (aOR=3.675, 95%CI=2.242–6.025, $P < 0.001$), HBeAg (positive with high COI) (aOR=8.149, 95%CI=3.188–20.831, $P < 0.001$), liver cirrhosis (aOR=2.823, 95%CI=1.287–6.194, $P=0.010$), and fatty liver (aOR=3.485, 95%CI=1.936–6.270, $P < 0.001$) at baseline were independent risk factors for LLV. Conversely, initial therapy with TMF (vs. ETV) was a significant protective factor (aOR=0.236, 95%CI=0.135–0.413, $P < 0.001$). Among patients with ETV-LLV, the add-on TAF/TMF strategy achieved a higher CVR rate than continued ETV (72.3% vs. 40.4%, $P=0.003$), with significantly greater reductions in HBV DNA and HBsAg (both $P < 0.05$). For patients with TMF-LLV, adding on ETV did not significantly improve the CVR rate compared to continuing TMF (67.6% vs. 50.0%, $P=0.167$), nor did it enhance reductions in viral markers. No significant changes in lipid profiles or renal function were observed with any strategy.

Conclusions: Elevated baseline HBsAg, fatty liver, cirrhosis, higher HBV DNA, and high HBeAg COI are independent risk factors for LLV, while initiating therapy with TMF (vs. ETV) is a protective factor. For patients developing LLV on ETV, add-on TAF/TMF therapy significantly improves virological response and is a preferred strategy. In contrast, add-on ETV offers no clear benefit for TMF-LLV patients, highlighting the need to explore alternative management approaches.

2714 - Exposure to Legacy and Replacement PFAS Is Associated with Metabolic Dysfunction-Associated Steatotic Liver Disease in Women

ORAL ABSTRACTS

Guanjing Lang¹, Junwei Su¹
The First Affiliated Hospital Of Zhejiang University,
Infectious Diseases, Hangzhou-China¹

Background / **Hypothesis:**
Endocrine-disrupting chemicals (EDCs) are increasingly recognized as metabolic risk factors, yet their contribution to metabolic dysfunction-associated steatotic liver disease (MASLD) in women, particularly for emerging chemical substitutes, remains unclear. We applied a stepwise translational framework to investigate the epidemiologic association, phenotypic relevance, and mechanistic pathways linking EDC exposure to MASLD in women.
Materials and Methods:
First, we analyzed 476 women from NHANES 2017–2018 (217 MASLD cases; 259 controls) to examine associations between circulating EDCs and MASLD using multivariable logistic regression and Bayesian kernel machine regression. Second, an independent hospital-based female cohort (N = 74) was used to confirm exposure–phenotype concordance, with targeted measurement of PFOA, PFPeA, and HFPO-DA. Third, female C57BL/6J mice were exposed to PFOA and its replacements PFPeA and HFPO-DA to interrogate hepatic injury and metabolic pathway perturbations. Finally, data-independent acquisition–based serum proteomics in the clinical cohort was used to validate exposure-linked metabolic mechanisms in humans.
Results:

In NHANES, higher serum PFOA concentrations were associated with increased odds of MASLD (adjusted odds ratio, 1.73; 95% confidence interval, 1.01–2.97), and mixture analyses demonstrated a positive overall exposure–response relationship dominated by PFOA. In the clinical cohort, women with MASLD exhibited higher circulating levels of PFOA, PFPeA, and HFPO-DA. In mice, PFOA and HFPO-DA induced hepatomegaly, inflammatory activation, fibrotic marker elevation, and transcriptomic disruption of fatty acid and bile acid metabolism, whereas PFPeA elicited weaker but consistent pathway alterations. Serum proteomics in women identified differential abundance of lipid- and bile acid-related proteins (FASN, FABP5, SULT1A1, SULT1A3, ALDOB) that correlated with PFAS exposure.
Conclusions:

Using a human–animal–human translational framework, we demonstrate that both legacy and replacement PFAS are associated with MASLD in women through disruption of lipid and bile acid metabolic pathways, highlighting that chemical substitution does not necessarily eliminate hepatic metabolic risk.

Keyword(s) : Metabolic dysfunction–associated steatotic liver disease; Per- and polyfluoroalkyl substances; Endocrine-disrupting chemicals; Women; Lipid and bile acid metabolism

2729 - Lactate triggers HBV Specific CD8+ T cell exhaustion through mitophagy suppression mediated mitochondrial dysfunction

Yuhao Wang¹, Zhipeng Liu¹, Shihong Zhong¹, Libo Tang¹, Yongyin Li¹
Nanfang Hospital, Southern Medical University, Key Laboratory Of Infectious Diseases Research In South China (southern Medical University), State Key, Department Of Infectious Diseases, Guangzhou-China¹

Background / **Hypothesis:**
Hepatitis B virus (HBV) -specific T cells exhibit an exhausted phenotype associated with glycolytic metabolic disruption and perturbation of mitochondrial homeostasis. However, their relationship and underlying mechanisms remain elusive. Since lactate, a key glycolytic metabolite that can modulate immune response, we investigated its role in HBV-specific T cell dysfunction during chronic HBV infection.

Materials and Methods:
We recruited 242 patients with chronic HBV infection and 78 health controls. The metabolic characteristics of peripheral blood mononuclear cells (PBMCs) were comprehensively analyzed using RNA-seq, metabolomics and scRNA-seq. Additionally, we systematically evaluated the glucose uptake, mitochondrial function, autophagy flux, and mitophagy activity of HBV-specific CD8+ T cells using flow cytometry from both PBMC and liver mononuclear cells (LMCs). To investigate lactate-mediated T cell exhaustion, we performed exogenous stimulations with Bay-876, lactate, Oligomycin, and Midivi-1, and assessed through multiparametric cytokine profiling and functional assays.

Results:

The glucose metabolic status in PBMC was significantly activated during HBV infection, accompanied by the accumulation of lactate. Specifically, HBV-specific CD8+ T cells exhibited more dramatically increased Glut1 expression and 2-NBDG uptake than global T cells, especially in intrahepatic HBV-specific CD8+ T cells. Restraining glucose uptake via Bay-876 improved HBV-specific T cell function, while lactate accelerated their dysfunction. Mechanistically, lactate elicited aberrant mtROS production and mitochondrial membrane

ORAL ABSTRACTS

potential via suppressing mitophagy dysfunction. Meanwhile, reversing mitochondrial dysfunction by MitoQ and MitoTempo restored the HBV-specific T cells function. However, aggravating mitophagy impairment by Midivi-1 blunted the production of IFN- γ and TNF- α in HBV-specific T cell. Concurrently, dysfunctional autophagy also significantly contributed to HBV-specific T cells dysfunction, but this effect was independent of the lactate-mediated exhaustion pathway.

Conclusions: Lactate drives HBV-specific T cell exhaustion by disrupting mitochondrial function via restraining mitophagy. These results highlight lactate metabolism as a potential therapeutic target for chronic HBV infection.

Keyword(s) : HBV-Specific CD8⁺ T cell; Lactate; Mitophagy; Mitochondrial dysfunction

2731 - Tbx1 alleviated hepatic encephalopathy by promoting meningeal lymphangiogenesis and drainage of senescent astrocytes via a CCL21 dependent manner

Guqing Luo¹, Zhenghao Wu¹, Mengting Li¹, Meng Luo¹, Chihao Zhang¹
Shanghai Ninth People's Hospital, School Of Medicine, Shanghai Jiao Tong University, Department Of General Surgery, Shanghai-China¹

Background / Hypothesis: Emerging evidence suggested that meningeal lymphatic vessels (mLVs) were involved in intra-cranial drainage including senescent astrocytes in CNS disorders. Enhanced lymphangiogenesis was reported in hepatic encephalopathy (HE), when astrocyte senescence was potentially related to irreversible cognitive decline in HE. Therefore, based on single-cell RNA sequencing (scRNA-seq) of meninges, we aimed to investigate the role of mLVs in HE. We hypothesized that mLVs could drain senescent astrocytes from HE brain, when enhancing lymphangiogenesis and drainage by Tbx1 would be a potential therapeutic target to help reversing the cognitive impairment in HE.

Materials and Methods: scRNA-seq was performed on meninges from the rat model of HE induced by common bile duct ligation (BDL). mLVs and senescent astrocytes were visualized by immunofluorescence (IF) staining. To trace the drainage pathway, fluorescent labeled senescent astrocytes were injected into hippocampus. Intra-cranial lymphatic drainage efficiency was evaluated by OVA-FITC distribution in deep cervical lymph nodes (dCLNs).

Results:

scRNA-seq analysis suggested significant lymphangiogenesis and glial cell migration in HE meninges. In vivo study demonstrated that HE rats exhibited significant hippocampal accumulation of senescent astrocytes, which were further detected in mLVs and dCLNs. Exogenous tracer confirmed the direct drainage of senescent astrocytes from hippocampus to dCLNs through mLVs. Ligation of dCLN impeded senescent astrocyte efflux via mLVs and exacerbated HE. Tbx1 overexpression enhanced meningeal lymphangiogenesis and senescent astrocyte drainage, improving cognitive impairment and neuroinflammation, which were partially reversed by CCL21 neutralization.

Conclusions:

Our findings demonstrated that mLVs mediated drainage of hippocampal senescent astrocytes to dCLNs in HE rats, which played a vital role in ameliorating cognitive decline and neuroinflammation in HE. Tbx1 emerged as a novel regulator of mLVs, attenuating HE by promoting senescent astrocyte clearance through a CCL21-dependent manner.

Keyword(s) : Tbx1, Hepatic encephalopathy, Lymphangiogenesis, Meningeal lymphatic system, Astrocyte senescence, CCL21

2733 - Joint Association of C Reactive Protein and the Triglyceride Glucose-Chinese Visceral Adiposity Index with Incident Chronic Liver Disease A National Cohort Study

Runci Jiang¹, Lu Jiang¹, Shuqin Cheng¹, Mingwei Sheng¹, Fengmei Wang¹
Tianjin First Central Hospital, Department Of Gastroenterology And Hepatology, Tianjin-China¹

Background / Hypothesis:

Chronic liver disease (CLD) is a major global health burden driven by the interplay of metabolic dysfunction and chronic inflammation. However, the long-term co-evolution of these processes—captured by the joint trajectories of biomarkers such as the triglyceride glucose-Chinese visceral adiposity index (TyG-CVAI) and C-reactive protein (CRP)—and its link to incident CLD risk remain unknown.

Materials and Methods:

In 4,078 participants from the China Health and Retirement Longitudinal Study (CHARLS) who were free of CLD at baseline, we identified joint CRP and TyG-CVAI trajectories using Kml3D clustering. Associations with

ORAL ABSTRACTS

incident CLD were assessed with generalized estimating equations (GEE), while generalized additive mixed models (GAMMs) examined nonlinear associations and interactions. Annual CLD incidence densities were calculated, and restricted cubic splines (RCS) within Cox models were used to determine risk thresholds for the time-weighted average TyG-CVAI.

Results:

Three distinct trajectory groups were identified: Low Inflammation–Metabolic Fluctuation (LI-MF), Low Inflammation–Persistently High Metabolism (LI-PHM), and Transient High Inflammation (THI). The LI-PHM was independently associated with a 33% increased CLD risk (OR=1.33, 95% CI: 1.05–1.6). Nonlinear relationships and a significant interaction between CRP and TyG-CVAI were confirmed by GAMMs ($p=0.043$). This group also showed the highest annual CLD incidence (peak 53.37/1000 person-years in 2018). RCS indicated two risk thresholds for time-weighted TyG-CVAI: HR=1.3 at 1193.08 and an inflection point at 1801.98 (HR=2.35). Subgroup analyses revealed the LI-PHM–associated risk was strongest in older adults, those with lower socioeconomic status, and sedentary individuals.

Conclusions:

Our findings demonstrate that sustained elevation of TyG-CVAI, even in the context of low-grade inflammation, is a significant driver of incident chronic liver disease, underscoring the need for early risk stratification and intervention based on long-term metabolic profiling.

2736 - Thalidomide reduces transfusion requirements due to gastrointestinal vascular malformations in patients with liver cirrhosis

Manu Rajeev¹, Ananthu Narayan¹, Sudhir Kumar¹, Rohit Wagh¹, Ayush Jain¹, Gursimran Singh Rana², Imran Khan¹, Satyakam Pandey¹, Vinod Arora¹, Shiv Kumar¹, Sarin¹

Institute Of Liver And Biliary Sciences, Department Of Hepatology, New Delhi-India¹ Institute Of Liver And Biliary Sciences, Department Of Biostatistics, New Delhi-India²

Background / Hypothesis: Gastrointestinal vascular malformations (GIVM), such as gastric antral vascular ectasia (GAVE) and gastrointestinal angiodysplasia (GIAD) are important

causes of chronic, transfusion-dependent bleeding in patients with liver cirrhosis. Standard endoscopic therapies often have limited success and high recurrence rates. Thalidomide, an anti-angiogenic agent, is a potential treatment, though evidence regarding its use in cirrhotic populations is limited. We aimed to evaluate the clinical response and safety of thalidomide in reducing transfusion requirements in cirrhotic patients with GIVM-related, transfusion-dependent anemia.

Materials and Methods:

This retrospective, single-center study included adults with liver cirrhosis and transfusion-dependent anemia due to GIVM who received thalidomide for at least three months. The primary endpoint was the change in packed red blood cell (PRBC) transfusion requirements following thalidomide therapy. Secondary endpoints included hemoglobin levels, endoscopy rates, endotherapy sessions, hospitalization rates, and treatment-related adverse events.

Results:

Fifty-seven patients with liver cirrhosis and transfusion-dependent anemia due to GIVM were included, most of whom were Child-Turcotte-Pugh (CTP) Class B (68.4%). Thalidomide was initiated at 50 mg/day and titrated to a maximum of 100 mg/day. The predominant etiologies were GAVE (59.6%) and GIAD (31.6%). Among the 54 patients with paired data, median PRBC units over a 3-month period decreased from 2.0 units (IQR 2.0–4.0) at baseline to 0.5 units (IQR 0.0–2.0) at the endpoint ($p < 0.001$). Mixed-effects negative binomial regression model demonstrated a 69% reduction in transfusion rate at 12 months (IRR 0.31, 95% CI 0.23–0.42; $p < 0.001$). This benefit was consistent across most subgroups, although it did not reach statistical significance in patients with Child C cirrhosis. Significant increase in mean hemoglobin levels was noted $\{7.32 \pm 1.38$ g/dL to 8.57 ± 1.53 g/dL ($p < 0.001$)}. Thalidomide therapy was also associated with a significant reduction in endoscopy procedures, daycare admissions and argon plasma coagulation sessions during the one-year post-treatment period. Peripheral neuropathy necessitating treatment cessation occurred in 5 patients (8.8%). No treatment-related cytopenias, serious adverse events ($> \text{CTCAE Grade 2}$), or mortalities were observed.

Conclusions:

ORAL ABSTRACTS

Thalidomide appears to be an effective and well-tolerated therapy for reducing transfusion requirements in cirrhotic patients with GIVM, even when administered at low doses.

2739 - D TACE Combined with HAIC Versus D TACE in BCLC Stage C HCC A Randomized Controlled Trial

Shuguang Ju ¹, Xuhua Duan ¹, Hao Li ¹, Daqian Han ¹, Yangyang Niu ¹, Gezhen Wang ¹
The First Affiliated Hospital Of Zhengzhou University, Department Of Interventional Radiology, Zhengzhou-China ¹

Background / Hypothesis: While both drug-eluting bead transarterial chemoembolization (D-TACE) and hepatic arterial infusion chemotherapy (HAIC) are recommended treatments for advanced hepatocellular carcinoma (HCC), definitive evidence on whether their combination improves survival in patients with Barcelona Clinic Liver Cancer (BCLC) stage C HCC remains uncertain. To compare the efficacy and safety of D-TACE combined with HAIC (D-TACE+HAIC) versus D-TACE alone in patients with BCLC stage C HCC

Materials and Methods: This multicenter, open-label, phase III randomized clinical trial was conducted across five hospitals in China. From April 2023 to April 2024, 220 patients with unresectable BCLC stage C HCC were included. Patients were randomized (1:1) to receive either D-TACE (oxaliplatin 100 mg or raltitrexed 4 mg, followed by embolization with 100-300 or 300-500 µm CalliSpheres® beads preloaded with 40-60 mg of doxorubicin or epirubicin) plus HAIC (oxaliplatin 85 mg/m², leucovorin 400 mg/m², 5-fluorouracil 400 mg/m² each infused over 2 hours, and 5-fluorouracil 2400 mg/m² infused for 46 hours) or D-TACE. The primary endpoint was progression-free survival (PFS). Secondary endpoints included overall survival (OS), objective response rate (ORR), disease control rate (DCR), and adverse events (AEs).

Results:

Median PFS was 6.4 months (95% confidence interval [CI], 5.8-8.4) with D-TACE and 10.2 months (95% CI, 9.2-13.5) with D-TACE+HAIC (hazard ratio [HR], 0.63; 95% CI, 0.47-0.85; P = 0.003). Median OS was 14.0 months

(95% CI, 12.4-17.7) versus 20.5 months (95% CI, 15.8-not reached), respectively (HR, 0.60; 95% CI, 0.42-0.85; P = 0.004). ORR was higher in the combination group (67.3%, 95% CI, 57.7%-75.9%) than in the D-TACE group (50.9%; 95% CI, 41.2%-60.6%, P = 0.014). Elevated transaminases were more frequent with D-TACE+HAIC, but other AEs were similar. No treatment-related deaths occurred.

Conclusions:

Compared with D-TACE alone, D-TACE+HAIC improved survival and tumor response in BCLC stage C HCC with a comparable safety profile.

Background / Hypothesis: Nosocomial infections (NI) are associated with high rate of mortality in inpatients with cirrhosis and vary globally. However, prediction of NI is hampered due to poor global representation and is unsatisfactory using traditional regression. This study aimed to develop NI predictive models using machine learning (ML) in a global inpatient cirrhosis cohort.

Materials and Methods: The CLEARED consortium includes globally-derived cirrhosis inpatientpatients with globally derived cirrhosis admitted non-electively.

ORAL ABSTRACTS

Demographics, cirrhosis details, inpatient course including NI development across income levels (high income, upper middle, low/low-middle income countries: HIC, UMIC, & LMICs) were recorded. Patients with/without NI were compared. Three ML models [Random Forest (RF), XGBoost & Neural Networks (NN)] were used for NI prediction. Data was split randomly 80/20 for training/testing. Model performance was assessed using AUC and compared with logistic regression (LR).

Results: A total of 8,263 patients were included from 127 centers and 37 countries (55.9 yrs, 64% men, 41% alcohol); 34% were from HIC, 42% UMIC & 24% L/LMICs. 19% had infections in 6 months prior to admission, 21% were admitted for an infection. 10.5% pts developed NI; these pts were younger (55 vs 57, $p<0.001$), from U/LMIC vs HICs (70 vs 64%, $p=0.03$) & alcohol etiology (45 vs 40%, $p=0.02$). NI pts had higher prior ascites/infections, SBP prophylaxis (15 vs 12%), admission MELD-Na (25 vs 19), albumin (2.7 vs 2.9 g/dl) & WBC (7.6 vs 5.9/mm³); all $p<0.001$). Admission with infections (30 vs 20%, $p<0.001$), especially SBP (13 vs 8%) & respiratory infections (8 vs 5%), and liver-related admissions (45 vs 35%) all $p<0.001$ were higher in those who developed NI. Machine-Learning Analysis: 6610 pts were in the training & 1653 pts were in the testing sets. 75 variables were included in the model. The models for NI prediction were suboptimal, but RF (AUC: 0.69 [0.65-0.74]) performed the best vs XGB (0.66 [0.62-0.70]) & NN (0.66 [0.62-0.70]), & was significantly stronger versus LR (AUC: 0.66 [0.61-0.70], $p=0.043$, Fig 2A). Prominent variables are in Fig 2B.

Conclusions: Nosocomial infections were found in 10% of cirrhosis inpatients in a prospective global cohort. Despite baseline differences, day of admission variables did not satisfactorily predict the NI development despite machine learning techniques, with the highest AUC of 0.69. However, these were significantly better than logistic regression. The suboptimal day of admission model performances shows that all inpatients with cirrhosis are at risk for nosocomial infections and should be monitored aggressively.

2748 - A Retrospective Cohort Study on the Adherence to American Association for the study of Liver Diseases (AASLD) Quality Measures in Cirrhosis for Variceal Bleeding and its Association with Clinical Outcomes

Mario Rafael Estella¹, Janus Ong¹
University Of The Philippines – Philippine General Hospital, Gastroenterology, Metro Manila-Philippines¹

Background / Hypothesis: Acute variceal bleeding is a major cause of morbidity and mortality in patients with decompensated liver cirrhosis. The American Association for the Study of Liver Diseases (AASLD) has established evidence-based quality measures to guide management, yet real-world adherence and its effect on outcomes remain variable. The objective is to evaluate adherence to AASLD quality measures in the management of acute variceal bleeding and to assess its association with short-term clinical outcomes.

Materials and Methods: This retrospective cohort study included adult patients with decompensated cirrhosis admitted for endoscopy-confirmed acute variceal bleeding at a tertiary referral center from January 2021 to December 2025. Adherence to five AASLD quality measures—early antibiotic prophylaxis, vasoactive therapy, early endoscopy, endoscopic hemostasis, and nonselective beta-blocker prescription for secondary prophylaxis—was assessed. Clinical outcomes included inpatient mortality, infectious complications, early rebleeding within five days, and length of hospital stay.

Results:

A total of 152 patients were analyzed (mean age 52.3 ± 15.2 years; 59.2% male), predominantly Child–Pugh class B (80.9%). Adherence to individual measures was high for antibiotic prophylaxis (92.8%), vasoactive therapy (88.8%), endoscopic hemostasis (99.3%), and secondary prophylaxis (94.7%), but lower for early endoscopy within 12 hours (73.7%). Full adherence to all measures was achieved in 61.8% of patients. Inpatient mortality was 10.5%, early rebleeding occurred in 1.3%, and infections in 18.4%. Full adherence was not significantly associated with mortality, infection, early rebleeding, or length of hospital stay. Ceftriaxone and octreotide use independently predicted full guideline adherence.

Conclusions:

Adherence to AASLD quality measures was generally high, though timely endoscopy remains a key area for improvement. Early initiation of cornerstone therapies may serve as a surrogate marker for comprehensive guideline-centered care.

2753 - Clinical and biochemical predictors of Hepatocellular Carcinoma A Five Year Cohort Study from a Tertiary Care Center in Pakistan

Gulzar Khan¹, Nazish Butt²
Bmc, Gastroenterology And Heatology, Quetta-Pakistan
¹ Jpmc, Gastroenterology And Heatology, Karachi-Pakistan²

Background / Hypothesis:

Hepatocellular carcinoma (HCC) has become one of the major causes of cancer related morbidity and mortality globally, especially in countries where chronic liver disease is highly prevalent. The Timely diagnosis, accurate staging, and appropriate treatment of the disease can be achieved by the early identification of clinical and laboratory predictors within the context of disease progression. This study evaluates the demographic, clinical, and biochemical profiles of patients diagnosed with HCC and to identify independent predictors associated with advanced-stage disease based on the Barcelona Clinic Liver Cancer (BCLC) classification.

Materials and Methods:

A five-year prospective study was conducted at Jinnah Postgraduate Medical Centre, Karachi, involving 516 patients diagnosed with HCC. Data were collected on demographic profiles, clinical features, laboratory investigations, imaging findings, tumor characteristics, and staging. Logistic regression analysis was performed to identify independent predictors of advanced-stage HCC (BCLC stage C-D).

Results:

The mean age of participants was 52.2 ± 9.6 years, with a male predominance (68%). The most common etiology was hepatitis C virus infection (61.8%), followed by hepatitis B (21.7%). Among patients, 43.4% had ascites, and 46.5% had portal vein thrombosis. A significant proportion (32%) presented with terminal-stage disease (BCLC D). Multivariable logistic regression analysis identified longer duration of risk factor exposure ($p = 0.010$), lower hemoglobin levels ($p < 0.001$), higher platelet counts ($p < 0.001$), reduced serum albumin ($p < 0.001$), elevated total bilirubin ($p < 0.001$), and higher serum potassium levels ($p < 0.001$) as independent predictors of advanced-stage HCC (BCLC C-D).

Conclusions: This study highlights key clinical and laboratory predictors associated with advanced hepatocellular carcinoma. The findings underscore the importance of early risk factor identification and routine monitoring of hematological and biochemical parameters for timely diagnosis and staging. These insights may assist clinicians in optimizing screening strategies and improving disease outcomes in resource-limited settings.

Keyword(s) : Hepatocellular carcinoma, BCLC staging, clinical predictors, laboratory markers, liver cancer, Pakistan

2756 - Locoregional Therapy Combined with Continuing or Switching Systemic Therapy for Intrahepatic Oligoprogression in Hepatocellular Carcinoma A Multicenter Retrospective Study

Hongli Yu¹, Qiqi Liu², Hang Zheng³, Qiang Zhu⁴, Jiamin Cheng⁵, Yinyin Li¹, Shuai Wang¹, Caiyun Peng¹, Yinying Lu¹

Chinese Pla General Hospital, Senior Department Of Hepatology, Beijing-China¹ Shandong Provincial Hospital, Cheeloo College Of Medicine, Shandong University, Department Of Gastroenterology, Jinan-China² The First Affiliated Hospital Of Wenzhou Medical University, Department Of Gastroenterology, Wenzhou-China³ Shandong Provincial Hospital Affiliated To Shandong First Medical University, Department Of Infectious Diseases, Jinan-China⁴ Chinese Pla General Hospital, Senior Department Of Hepatologysenior Department Of Hepatology, Beijing-China⁵

Background / Hypothesis: The optimal management of intrahepatic oligoprogression during first-line immune checkpoint inhibitor-based therapy for advanced hepatocellular carcinoma (HCC) remains unclear. This study compared the outcomes of continuing first-line systemic therapy combined with locoregional therapy (FLST+LRT), switching to second-line systemic therapy combined with LRT (SLST+LRT), or switching to SLST alone.

Materials and Methods: This multicenter, retrospective study enrolled 168 patients. Patients were stratified into FLST+LRT ($n = 67$), SLST+LRT ($n = 64$), and SLST alone ($n = 37$) groups. Overall survival (OS) and progression-free survival were analyzed. Factors associated with OS were identified.

ORAL ABSTRACTS

Results: The median OS was significantly longer in both the FLST+LRT (31.7 months) and the SLST+LRT (37.2 months) group compared to SLST alone (11.2 months; $p = 0.004$ and $p = 0.001$, respectively). Subgroup analysis demonstrated that among durable responders, the median OS was significantly longer in the FLST+LRT group (not reached, $p = 0.004$) and the SLST+LRT group (27.5 months, 95% CI, 15.0 - 40.1, $p = 0.048$) than in the SLST alone group (15.6 months, 95% CI, 5.8 - 25.4). In non-durable responders, SLST+LRT resulted in longer median OS than both FLST+LRT ($p = 0.040$) and SLST alone ($p = 0.006$). Multivariate analysis identified that the absence of LRT following intrahepatic oligoprogression (HR 2.173, $p = 0.007$), increased ALBI grade (HR 2.979, $p = 0.006$), and AFP > 200 ng/mL (HR 2.208, $p = 0.006$) were independent risk factors for poorer OS.

Conclusions: Integrating locoregional therapies for HCC patients with intrahepatic oligoprogression significantly improves survival compared to switching systemic therapy alone.

2759 - α KB downregulates miRNA 363 3p and targets SERCA2b to alleviate hepatic endoplasmic reticulum stress and steatosis in MAFLD

Da Wang¹, Mengwei Li¹, Dan Zhang¹, Lanqing Ma¹
The First Affiliated Hospital Of Kunming Medical University, Yunnan Institute Of Digestive Disease, Kunming-China¹

Background: Metabolic-associated fatty liver disease (MAFLD) has become a global health concern due to its high prevalence and extensive health consequences. Our previous study revealed that the serum levels of α -ketobutyrate (α -KB), a key metabolite in the transsulfuration pathway, are significantly reduced in MAFLD patients. However, the therapeutic potential and underlying mechanisms of α -KB in MAFLD remain largely unexplored.

Methods: HepG2 cells exposure to lipid mixture (LM) were used as vitro model. In vivo, MAFLD mouse model was induced by HFD intervention. The therapeutic effects of α -KB on MAFLD was evaluated through physiological, biochemical, and pathological analyses.

RNA sequencing was used to identify key regulatory pathways, which were then validated using real-time PCR (RT-PCR), immunofluorescence, and Western blotting. Prediction algorithms, dual luciferase reporter assays, adeno-associated viruses, siRNA, or inhibitors were used to verify the regulatory relationships of this pathway. Moreover, both in vivo and in vitro experiments were conducted to confirm the regulatory effect of α -KB on this pathway. Results: α -KB significantly alleviates hepatic steatosis and lipid metabolism disorders in both in LM-induced HepG2 cells and HFD-fed mice. Transcriptome sequencing, combined with in vitro and in vivo validation, identified the "protein processing in endoplasmic reticulum" pathway is the core pathway through which α -KB exerts its protective effects, with sarcoplasmic reticulum calcium ATPase 2b (SERCA2b) acting as its key regulatory target. α -KB treatment not only upregulated SERCA2b expression but also enhanced its ATPase activity. Mechanistically, SERCA2b was identified as a direct target of miR-363-3p. In the MAFLD model, α -KB suppressed miR-363-3p expression, thereby relieving its post-transcriptional inhibition of SERCA2b, which in turn alleviated endoplasmic reticulum stress and improving lipid metabolism abnormalities. The causal role of this axis was further confirmed by the findings that inhibiting miR-363-3p expression mimicked the protective effects of α -KB, while knockdown of SERCA2b largely abolished these therapeutic effects.

Conclusions: This study reveals for the first time that α -KB alleviates MAFLD by modulating the miR-363-3p/SERCA2b axis to mitigate ER stress and lipid metabolism abnormalities. These findings not only expand our understanding of the physiological functions of TSP but also provide a novel therapeutic target for MAFLD intervention.

2760 - Real world Biochemical Responses to First line Azathioprine versus Mycophenolate and Upon Switching from Azathioprine to Mycophenolate in Autoimmune Hepatitis Patients

Astrid Amador¹, Stephen Wong¹, Frederick Dy¹, Rommel Romano¹, Alvin Brian Velasco¹, Carmelita Dalupang¹, Estrellita Ruiz¹, Melchor Chan¹, Albert Ismael¹

University Of Santo Tomas Hospital, Medicine - Section Of Gastroenterology, Quezon City-Philippines¹

Background

Hypothesis:

ORAL ABSTRACTS

Mycophenolate mofetil (MMF) has been found to be comparable to azathioprine (AZA) in achieving biochemical remission in autoimmune hepatitis (AIH). We aimed to compare real-world biochemical responses of first-line AZA and MMF, and responses after switching from AZA to MMF in AIH patients.

Materials and Methods: We analyzed a retrospective cohort of AIH patients treated with AZA or MMF. Patients received concomitant steroids 0-14 days prior to AZA or MMF. Biochemical responses were defined as: complete response (CR) = alanine aminotransferase (ALT) normalization; partial response (PR) = $\geq 50\%$ ALT reduction but above normal upper limits (ULN); non-response (NR) = $< 50\%$ ALT reduction or ALT increase. We analyzed a subset who switched from AZA to MMF.

Results:

Overall, 67 (AZA) and 12 (MMF) patients were included. CR progressively increased after 3 (AZA=52% vs. MMF=55.6%; $p=0.236$), 6 (AZA=61.7% vs. MMF=100%; $p=0.760$), and 12 months (AZA=76.9% vs. MMF=100%; $p=1.0$) of treatment, with no difference in NR rates (AZA=5.1% vs. MMF=0%; $p=1.0$) after 12 months. Despite similar response rates, AZA demonstrated greater median ALT reduction at 3 months vs. MMF (Δ ALT -111.8 vs -1.0 U/L; $p=0.008$). The reasons for AZA to MMF switch were AZA unavailability ($n=16$; 76.2%) and side effects to AZA ($n=5$; 23.8%). Following switching, most patients maintained biochemical stability after 6 months (87.5%). However, biochemical flare ($\text{ALT} \geq 2 \times \text{ULN}$) occurred in 3 (14.3%) patients, prompting reversion to AZA.

Conclusions:

Our data support the effectiveness of MMF as first-line therapy. However, switching from AZA to MMF may be associated with biochemical flare in a subset of patients, highlighting the need for cautious use in clinical practice with close biochemical monitoring.

2762 - The Effects of Nomenclature Change on the Epidemiology of Fatty Steatotic Liver Disease
Danielle Lucero ¹, Stephen Wong ¹, Frederick Dy ¹, Rommel Romano ¹, Alvin Brian Velasco ¹, Carmelita Dalupang ¹, Estrelita Ruiz ¹, Ann Margaret Navarroza ¹, Maria Fleurdeliz Goco-sitan ¹
University Of Santo Tomas Hospital, Medicine - Section

Of Gastroenterology, Manila-Philippines ¹

Background / Hypothesis: The transition from non-alcoholic fatty liver disease (NAFLD) to metabolic dysfunction-associated steatotic liver disease (MASLD) reflects the growing recognition of metabolic drivers of this disease. However, the effects of this change on local epidemiology are not well-studied.

Materials and Methods: To describe the distribution and compare the clinical characteristics of NAFLD, MASLD, and metabolic and alcohol-associated liver disease (MetALD) patients. This retrospective study reviewed outpatient records of consecutive patients diagnosed with NAFLD, MASLD, or MetALD from January 2002 to August 2025. Demographic data, metabolic parameters, and noninvasive fibrosis measures including Fibrosis-4 (FIB-4), NAFLD Fibrosis Score (NFS), and FibroScan were collected.

Results:

Total of 1449 patients were included, 80% had MASLD, 11% NAFLD, and 9% Met-ALD. Mean age was similar across groups (≈ 51 years). MASLD and Met-ALD patients had higher mean BMI (27.79 and 27.31 kg/m²) compared with NAFLD (20.69 kg/m²). Liver enzymes were highest in the Met-ALD group. Mean ALT levels were 65.51 IU/L in Met-ALD, compared with 59.57 IU/L in MASLD and 46.52 IU/L in NAFLD. A similar pattern was seen with AST (48.46 IU/L in Met-ALD, 41.75 IU/L in MASLD, and 44.48 IU/L in NAFLD). Mean platelet counts were comparable across groups (MASLD $258 \times 10^9/L$, NAFLD $248 \times 10^9/L$, Met-ALD $241 \times 10^9/L$). Mean albumin levels were slightly lower in Met-ALD (4.26 g/dL) compared with MASLD (4.45 g/dL) and NAFLD (5.06 g/dL). For fibrosis markers, FIB-4 scores were lower in MASLD (1.23) than in NAFLD (1.51) ($p=0.039$) and Met-ALD (1.58) ($p=0.016$). In contrast, NFS indicated higher fibrosis risk in MASLD (-2.20) compared with NAFLD (-3.34) ($p=0.004$) and similar risk to Met-ALD (-1.46) ($p=0.055$). FibroScan values were numerically higher in MASLD (8.35) and Met-ALD (8.80) than in NAFLD (6.28), but differences were not statistically significant.

Conclusions:

This study shows that a multimodal assessment combining liver enzymes, synthetic function markers, metabolic risk profiling, and more than one noninvasive fibrosis tool may better identify patients at risk for progression who need closer follow-up, early intervention, and timely referral to hepatology.

2765 - Disability Adapted Digital Therapeutics as a Precision Strategy for MASLD Risk Modulation Longitudinal Neuromuscular in Lower Limb Amputees

Muh Syaiful Akbar¹, Mushawwir Taiyeb¹, Muhammad Syafar²

State University Of Makassar, Biology, Makassar-Indonesia¹ Hasanuddin University, Public Health, Makassar-Indonesia²

Background / Hypothesis: Metabolic dysfunction associated steatotic liver disease (MASLD) is strongly influenced by skeletal muscle inactivity, insulin resistance, and autonomic imbalance. While structured exercise is a recognized strategy for metabolic liver risk reduction, conventional programs are primarily designed for the general population and often do not accommodate the biomechanical and functional constraints of individuals with physical disabilities. Lower limb amputees represent a metabolically vulnerable yet underserved group in hepatology research. We developed a disability-adapted mobile health (mHealth) digital therapeutic specifically engineered to align with amputee biomechanics and functional capacity, aiming to restore adaptive muscle activation and metabolic demand.

Materials and Methods: Twenty two adults with unilateral lower limb amputation completed a 12 week structured, disability specific digital exercise program integrating progressive strength conditioning and functional adaptation. Longitudinal muscle strength was assessed using Manual Muscle Testing (MMT), and exercise capacity was quantified by total repetitions performed. Quality of life (WHOQOL) was evaluated pre and post intervention. Repeated measures were analyzed using non-parametric methods (Friedman and Wilcoxon tests).

Results: Muscle strength increased significantly over time (Friedman $X^2 = 80.99$, $p < 0.001$; Kendall's $W = 0.74$), indicating sustained neuromuscular adaptation. Training load rose more than threefold from a median of 10 repetitions at week 2 to 36 at week 10 ($X^2 = 110.00$, $p < 0.001$; $W = 1.00$) demonstrating progressive physiological conditioning. Total quality of life improved

significantly (median 55.9 to 67.4; $p = 0.001$; $r = 0.66$).

Conclusions: A disability adapted digital therapeutic program successfully induced sustained neuromuscular remodeling and increased exercise capacity in a high risk amputee population. By aligning exercise design with biomechanical limitations, this precision mHealth strategy re-engages skeletal muscle as a metabolic regulator, targeting key drivers of MASLD. These findings support inclusive, translational approaches to metabolic liver disease prevention in populations historically underrepresented in hepatology research.

2773 - Mechanistic Role of MFN2 FSP27 Mediated Lipid Droplet-Mitochondria Interactions in Metabolic Dysfunction associated Steatohepatitis

Qiqian Zheng¹, Shaoya Li¹, Yikang Song¹, Yuemin Nan¹

Department Of Traditional And Western Medical Hepatology, Third Hospital Of Hebei Medical University, Shijiazhuang City-China¹

Background / Hypothesis: Lipid metabolism disorder and mitochondrial dysfunction are key drivers of metabolic dysfunction-associated steatohepatitis (MASH), but the mechanisms by which lipid droplets (LDs) and mitochondria coordinate lipid metabolism remain unclear. This study aimed to investigate the role of the MFN2-FSP27 complex in mediating LD-MT interactions in fatty acid oxidation and metabolic reprogramming in MASH.

Materials and Methods: Liver tissues from MASH patients and controls were analyzed using immunofluorescence, confocal microscopy, and transmission electron microscopy to observe LD-MT contact sites. Western blot and co-immunoprecipitation were performed to assess MFN2 and FSP27 expression and complex formation. In vitro adipocyte and hepatocyte models with MFN2 or FSP27 knockdown/overexpression were used to examine fatty acid oxidation and metabolic reprogramming using metabolic assays and metabolomics.

Results: MFN2 expression was significantly downregulated in MASH liver tissues, accompanied by reduced LD-MT contacts and impaired FSP27-MFN2 complex formation. Restoration of the MFN2-FSP27 complex in vitro enhanced LD-MT interactions, promoted fatty acid delivery to mitochondria, and significantly increased fatty acid oxidation. Conversely,

ORAL ABSTRACTS

complex dysfunction led to abnormal fatty acid oxidation, metabolic reprogramming, and exacerbated lipid accumulation and inflammatory responses. Conclusions: The MFN2-FSP27 complex is crucial for LD-MT interactions, maintaining fatty acid oxidation and metabolic homeostasis. Its dysfunction contributes to lipid metabolism disorder and metabolic reprogramming in MASH, providing a potential target for therapeutic intervention.

2774 - Adipose derived FABP5 drives myeloid bias in hematopoietic stem cells and promotes tumor progression.

Wanyue Cao¹, Gaowei Jin¹, Ziyang Wei¹, Tingbo Liang¹, Qi Zhang¹
The First Affiliated Hospital, Zhejiang University School Of Medicine, Department Of Hepatobiliary And Pancreatic Surgery, Zhejiang-China¹

Background / Hypothesis: While obesity is a well-established risk factor for increased cancer incidence and mortality, the mechanisms driving this association, including how soluble factors or adipokines exacerbate tumorigenesis, remain elusive. Materials and Methods: We analyzed a clinical cohort of patients with hepatocellular carcinoma (HCC) to evaluate the association between body mass index (BMI) and overall survival (OS). To investigate the causal impact of obesity on tumor progression, diet-induced obesity (DIO) mouse models were combined with orthotopic liver tumor implantation. Flow cytometry, single-cell RNA sequencing (scRNA-seq), and bone marrow proteomics were used to characterize obesity-associated alterations in hematopoietic stem and progenitor cell (HSPC) fate and tumor progression. Subsequent functional validation of Fabp5 was conducted through bone marrow transplantation assays, Seahorse metabolic flux analysis, transgenic mouse models, and pharmacological inhibition to delineate the underlying regulatory mechanisms and define its functional role. Results: Clinical analyses revealed significantly poorer outcomes in obese patients with HCC. In mouse models, obesity accelerated HCC progression, accompanied by marked expansion of myeloid cells—particularly PMN-MDSCs—in peripheral blood, bone marrow, and tumors, along with impaired CD8⁺ T-cell responses. Obesity profoundly remodeled hematopoiesis, characterized by reduced hematopoietic stem cells (HSCs) and

multipotent progenitors and expansion of myeloid progenitors, indicating a strong myeloid bias. Single-cell transcriptomic and functional analyses showed that HSPCs under obese conditions exhibited metabolic reprogramming, enhanced endoplasmic reticulum stress, and loss of stemness. Proteomic profiling identified Fabp5 as markedly upregulated in the bone marrow niche and hematopoietic cells, with circulating levels positively correlating with obesity severity. Functionally, exogenous FABP5 promoted myeloid-biased differentiation, metabolic activation, and stress responses in HSCs, thereby accelerating tumor progression, whereas adipose- or hematopoietic-specific deletion of Fabp5 alleviated hematopoietic remodeling, immunosuppression, and tumor growth. Mechanistically, FABP5 activated the TLR4-MAPK/NF- κ B signaling axis, reprogramming the transcriptional and epigenetic landscape of HSCs to drive inflammatory, myeloid-skewed hematopoiesis under metabolic stress. Conclusions: This study identifies a systemic mechanism by which obesity promotes HCC progression through adipose tissue-derived circulating signals that remodel bone marrow hematopoiesis and the immune microenvironment. Fabp5 emerges as a key molecular hub linking metabolic dysregulation, inflammatory signaling, and tumor-associated immunosuppression across tissues. These findings provide new mechanistic insights into obesity-related hepatocarcinogenesis and highlight systemic metabolic-immune crosstalk as a promising therapeutic target.

2779 - Re evaluation of Liver Biopsy Specimens Performed for Presumed Chronic Hepatitis B and Investigation of the Prevalence of MASLD

Mert Metin Can¹, Mehmet Demir², Ammar Alramadan², Kübra Berat Yavuz Ergin³
Dörtöyl State Hospital, Internal Medicine, Hatay-Türkiye¹ Hatay Mustafa Kemal University, Gastroenterology, Hatay-Türkiye² Hatay Mustafa Kemal University, Internal Medicine, Hatay-Türkiye³

Background / Hypothesis: The interaction between chronic hepatitis B (CHB) and metabolic dysfunction-associated steatotic liver disease (MASLD) has emerged as a clinically relevant entity in the era of rising metabolic burden. However, MASLD may remain under-recognized in CHB patients, even when liver biopsy is performed. We aimed to determine the histological prevalence of MASLD in CHB patients and evaluate both pathological reporting patterns and

ORAL ABSTRACTS

patient

awareness.

Materials and Methods: In this retrospective study, 100 consecutive CHB patients who underwent liver biopsy between January 2018 and November 2021 were included. Clinical, anthropometric, metabolic, and laboratory parameters were recorded. All biopsy specimens were blindly re-evaluated by two pathologists for hepatic steatosis and scored using the NAFLD Activity Score (NAS). MASLD diagnosis was defined according to current metabolic dysfunction criteria.

Results:

Of the patients, 52% were female and 17% were HBeAg-positive. Steatosis was identified in 32% of cases in the initial pathology reports. Upon re-evaluation, MASLD was detected in 34% of patients, with no statistically significant difference between the two assessments ($p=0.764$). However, steatosis was not explicitly stated in the diagnostic section of the original pathology reports. Patients with MASLD were significantly older and had higher body weight, BMI, waist and hip circumferences, and waist-to-hip ratio (all $p<0.01$). HbA1c, triglycerides, total cholesterol, LDL cholesterol, GGT, and uric acid levels were significantly higher in the MASLD group. Metabolic comorbidities—including diabetes, hyperlipidemia, hypertension, chronic kidney disease, metabolic syndrome, and obesity—were more prevalent in patients with MASLD. Notably, 97% of patients with biopsy-confirmed MASLD were unaware of their condition.

Conclusions:

MASLD affects approximately one-third of patients with CHB and is strongly associated with metabolic risk factors. Despite biopsy-based detection, it is frequently underreported and clinically unrecognized. Systematic assessment and explicit reporting of steatosis in CHB patients are essential to improve risk stratification and long-term management.

Keyword(s) : Chronic hepatitis B; MASLD; liver biopsy; metabolic dysfunction; steatosis awareness

2781 - Dual noninvasive prediction of esophageal varices in cirrhosis using transient elastography and echocardiographic parameters an interim machine learning analysis

Eina Marie Li¹, Diana Payawal¹
Cardinal Santos Medical Center, Gastroenterology, San Juan-Philippines

Background / Hypothesis: Screening endoscopy

remains the standard for detecting esophageal varices (EV) in cirrhosis, although many patients undergo unnecessary invasive procedures. The Baveno VII consensus recommends transient elastography (TE) combined with platelet count to identify patients at low risk of varices requiring treatment (VRT), allowing avoidance of screening endoscopy in selected cases. However, portal hypertension reflects both structural liver stiffness and systemic hemodynamic alterations that may not be fully captured by TE alone. We aimed to evaluate whether integrating echocardiographic parameters with TE improves noninvasive prediction of EV.

Materials and Methods: We prospectively analyzed adults with cirrhosis who underwent TE, transthoracic echocardiography, and screening endoscopy ($n=106$). EV prevalence was 6.6% (7/106). Data were divided into training and independent test datasets. To address class imbalance, synthetic minority oversampling was applied to the training dataset only. Logistic regression, naïve Bayes, random forest, and artificial neural network models were developed. Model performance in the independent test dataset was evaluated using sensitivity, specificity, accuracy, predictive values, likelihood ratios, and area under the receiver operating characteristic curve (AUC). Feature contribution was assessed using mean decrease in impurity and Shapley additive explanations.

Results: Patients with EV demonstrated significantly higher liver stiffness (24.37 ± 23.72 vs 6.12 ± 5.09 kPa, $p=0.008$), higher international normalized ratio ($p<0.001$), lower serum albumin ($p=0.024$), hyponatremia ($p=0.026$), and greater prevalence of portal hypertensive gastropathy ($p<0.001$).

In interim analysis, the random forest classifier demonstrated complete separation in both training and independent test datasets, achieving 100% sensitivity, 100% specificity, 100% accuracy, and AUC 1.00. Naïve Bayes showed good discrimination with 92.1% test accuracy and AUC 0.895. Logistic regression and neural network models demonstrated poor minority-class detection with 0% test sensitivity. Liver stiffness consistently emerged as the most influential predictor, demonstrating the highest feature importance and greatest Shapley contribution. Model discrimination remained stable across probability thresholds, although calibration could not be reliably assessed due to the low event rate.

ORAL ABSTRACTS

Conclusions: A dual noninvasive model integrating TE and echocardiographic parameters demonstrated promising predictive performance for EV. This multidimensional approach may complement Baveno VII criteria by refining risk stratification—particularly among patients outside established rule-out thresholds—and may help reduce unnecessary screening endoscopy while maintaining diagnostic safety. However, given the small event number and interim design, results must be interpreted cautiously. Prospective validation, calibration analysis, and external multicenter evaluation are required prior to clinical implementation.

2784 - The Effect of HALP Score on Predicting Post Transplant Outcomes in Patients with Hepatocellular Carcinoma

Sertac Usta ¹, Fuat Aksoy ², Yasin Dalda ¹, Volkan Ince ¹, Harika Gozukara Bag ³, Brian I. Carr ¹, Sezai Yilmaz ¹
Inonu University, Liver Transplantation Institute, General Surgery, Malatya-Türkiye ¹ Uludag University, Medical School, General Surgery, Bursa-Türkiye ² Inonu University, Medical School, Biostatistics, Malatya-Türkiye ³

Background:

This study evaluated the utility of the hemoglobin-albumin-lymphocyte-platelet (HALP) score in predicting disease-free survival (DFS) and recurrence in patients with hepatocellular carcinoma (HCC) undergoing liver transplantation (LT), and assessed its potential role as a prognostic biomarker in this population.

Methods:

A total of 476 patients who underwent LT for HCC between 2006 and 2024 were retrospectively analyzed. HALP scores were calculated, and a cut-off value of 29 for recurrence was determined by ROC analysis. Patients were stratified into HALP ≥ 29 and HALP < 29 groups. DFS and recurrence rates were compared. Prognostic performance was evaluated using the concordance index (C-index) and area under the ROC curve (AUC). Outcomes of patients with HALP ≥ 29 were also compared with those meeting the Milan Criteria and the Expanded Malatya Criteria.

Results:

Among 476 patients, 335 had HALP ≥ 29 and 141 had HALP < 29 . The 5- and 10-year DFS rates were significantly higher in the HALP ≥ 29 group than in the

HALP < 29 group (67.1% vs. 58.5% and 49.5% vs. 33.5%, respectively; $p < 0.001$). Recurrence rates were 14% (14/335) in the HALP ≥ 29 group and 31.9% (45/141) in the HALP < 29 group ($p < 0.001$) (Figure 1a). Patients within the Milan Criteria showed superior 5- and 10-year DFS (78.4% and 63.8%) and lower recurrence (3.3% [8/243]) compared with the HALP ≥ 29 group ($p \leq 0.017$) (Figure 1b). Similarly, patients meeting the Expanded Malatya Criteria demonstrated higher 5- and 10-year DFS (76.3% and 63.8%) and lower recurrence (4.9% [16/325]) than those with HALP ≥ 29 ($p \leq 0.037$) (Figure 1c). HALP ≥ 29 was associated with lower LTD, TTD, NLR, PLR, platelet count, Child, and MELD scores (Table 1), indicating more favorable tumor biology and hepatic functional reserve. However, C-index and AUC analyses showed inferior prognostic discrimination of HALP compared with established transplant criteria (Table 2).

Conclusion:

The HALP score predicts disease-free survival and recurrence after transplantation without including tumor-specific variables such as tumor size, number, or AFP levels. However, because its discriminative performance is lower than the Milan and Extended Malatya Criteria, it is not yet suitable for routine use as a selection criteria for liver transplantation.

Keyword(s) :

2785 - Metabolic Dysfunction Increases the Risk of Liver related Events in Virologically Suppressed HBV Related Compensated Cirrhosis Refining Prognostication with the Baveno VI SSM Model

Ling Zhou Zhou ¹, Mingchen Wang Wang ¹, Jiankang Song Song ¹, Qiaoping Wu Wu ¹, Huan Cheng Cheng ², Peishuang Xu Xu ¹, Biao Wen Wen ³, Haiyu Wang Wang ¹

Nanfang Hospital, Southern Medical University, Department Of Infectious Diseases, Guangzhou-China ¹ Gannan Medical University, The First School Of Clinical Medicine, Ganzhou-China ² The First Affiliated Hospital Of Chengdu Medical College, Department Of Gastroenterology, Chengdu-China ³

Background

The independent prognostic role of metabolic dysfunction (MD) in virologically suppressed HBV-related cirrhosis remains unclear. This study aimed to evaluate the prognostic value of MD and its components by combining them with the Baveno VI-SSM model for risk stratification of liver-related events (LREs; hepatic decompensation and hepatocellular carcinoma [HCC]).

Hypothesis:

ORAL ABSTRACTS

Materials and Methods:

Patients with HBV-related compensated cirrhosis and etiology control were prospectively enrolled and post-hoc analyzed to explore the potential impact of MD components on cumulative incidence of LREs. The MD component combined with the Baveno VI-SSM model was further adopted to stratify the risk of LRE in these etiology-controlled cirrhosis patients.

Results:

A total of 855 patients were enrolled, of whom 75.8% (n=648) had at least one MD component. Overall, 49 LREs occurred during a median follow-up of 31.0 months (IQR 26.5–43.5), including 12 decompensation events and 37 hepatocellular carcinoma (HCC) cases. Patients with MD had a higher cumulative LRE incidence than those without MD (7.1% vs. 1.4%; HR 5.02, log-rank $P=0.003$). All 12 decompensation events occurred in patients with MD ($P=0.035$), who also exhibited a higher incidence of HCC than those without MD. MD independently increased the risk of LRE (adjusted HR 3.48, 95% CI 1.07–11.33). Risk escalated dose-dependently by glycemic status (HR for prediabetes: 2.46, 95% CI 2.17–5.17; $P=0.007$; HR for diabetes: 4.01, 95% CI 1.63–9.89; $P<0.001$). By 48 months, the cumulative incidence of LRE was higher in patients with both MD and unfavorable Baveno VI-SSM criteria than in those with MD and favorable Baveno VI-SSM criteria (13.9% vs. 2.4%, HR 6.24, $P<0.001$).

Conclusions:

Metabolic dysfunction, particularly glycemic abnormalities (encompassing prediabetes and diabetes), independently predicts liver-related events in patients with etiology-controlled HBV-related compensated cirrhosis. Integrating metabolic assessment with the Baveno VI-SSM model further enhances risk stratification.

Mohan⁴, Mradul Daga⁵, Deepak Tempe⁴, Manoj Kumar Sharma¹, Shiv Kumar Sarin¹
Ilbs, Hepatology, Delhi-India¹ Ilbs, Epidemiology, Delhi-India² Ilbs, Radiology, Delhi-India³ Ilbs, Anaesthesia And Critical Care, Delhi-India⁴ Ilbs, Internal Medicine, Delhi-India⁵

Background / Hypothesis: Sepsis-associated acute kidney injury (SA-AKI) in cirrhosis is marked by circulatory dysfunction and frequent cardiopulmonary complications. Fixed-dose albumin may cause more pulmonary complications. We compared a point-of-care ultrasound (POCUS)-guided tailored albumin strategy with fixed-dose albumin in cirrhosis patients with SA-AKI.

Materials and Methods: In this single-centre, open-label, randomised controlled trial, adults with cirrhosis and SA-AKI with proven or suspected sepsis were randomised 1:1 to POCUS-guided tailored 25% albumin or fixed-dose albumin (1 g/kg/day). The primary outcome was AKI resolution at 48 hours without cardiopulmonary complications.

Results: Altogether 100 patients were analysed (tailored, n = 50; fixed, n = 50). Baseline characteristics were comparable, including age (years: 53.4 ± 12.3 vs 52.6 ± 12.5 ; $p = 0.821$), MELD-Na (28.9 ± 5.25 vs 28.8 ± 5.23 ; $p = 0.796$), SOFA score (8.38 ± 1.48 vs 7.86 ± 1.58 ; $p = 0.12$), lactate (2.05 ± 0.44 vs 2.10 ± 0.64 ; $p = 0.62$), and proven sepsis ([86%] vs [84%]; $p = 0.98$). The majority had spontaneous bacterial peritonitis (58% vs 52%; $p = 0.64$), and nosocomial acquisition was seen in 30% vs 28% ($p = 0.89$). AKI resolution (complete/partial) at 48 hours without cardiopulmonary complications was significantly higher with tailored dosing (42% vs 14%; $p = 0.03$). By day 7, AKI recovery remained superior in the tailored group (78.0% vs 52%; $p = 0.02$). Cumulative albumin dose was significantly lower in the tailored arm at 48 hours (107.1 ± 35.5 g vs 147.0 ± 24.8 g; $p < 0.001$) and at day 7 (162.1 ± 77.5 g vs 228.4 ± 80.8 g; $p < 0.001$). Cardiopulmonary complications were markedly reduced with tailored dosing (22% vs 78%; $p < 0.001$). On multivariate analysis, POCUS-guided tailored strategy (OR = 4.81, 0.94–24.62), lower SOFA score (OR = 0.53, 0.30–0.95), and NT-proBNP (OR = 0.997, 0.995–1.000, and lower urea (OR = 0.94, 0.90–0.98), and Δ change in inferior vena cava diameter (OR = 0.34, 0.16–0.73) independently predicted AKI resolution. The patients who needed oxygen support were significantly lower in the tailored-dose versus fixed-dose group (22% vs 80%; $p < 0.001$). The time to initiation of vasopressor

ORAL ABSTRACTS

therapy was delayed in the tailored-dose group [80 h (78–86) vs 42 h (29–50); $p < 0.001$].

Conclusions: POCUS-guided, tailored albumin therapy reduces the need for albumin infusion, leading to early AKI resolution and a significantly lower incidence of cardiopulmonary complications and dialysis in cirrhosis with SA-AKI. Lower SOFA score and NT-proBNP, the

Keyword(s) : SA-AKI, POCUS, CIRRHOSIS, NT-proBNP,

2793 - 4 1BB Costimulation Restore Tfh1 Function to Augment HBV Specific Humoral Immunity in Chronic Infection

Yanchen Ma¹, Xiaoyi Liu¹, Haonan Lou¹, Hui Zhang¹, Jinyan Jiang¹, Libo Tang¹, Yongyin Li¹
Nanfang Hospital, Southern Medical University, Department Of Infectious Diseases, Guang Zhou-China¹

Background / Hypothesis:Chronic HBV infection is closely associated with dysregulated humoral immunity. Although our study demonstrated that Mother-to-child transmission (MTCT) could be dramatically reduced by the comprehensive interventions among HBV-infected pregnant women (Nature Medicine,2024), how intrauterine HBV antigen exposure shapes host humoral immunity remains incompletely understood. Here, we investigated the humoral immune profile in cord blood from neonates born to HBV-infected mothers to identify potential therapeutic targets and validate whether targeting these pathways could restore HBV-specific humoral immunity through clinical cohorts with persistent chronic infection.

Materials and Methods:We analyzed cord blood samples from 73 neonates born to HBsAg-positive mothers and 24 counterpart controls (HBsAg-negative mothers) within our previously reported clinical cohort(NCT05172453). B cell and CD4+ T cell phenotypes and transcriptomes were analyzed by flow cytometry and RNA-seq. HBV-specific B cells were quantified via ELISPOT and ELISA. Additionally, peripheral blood from 85 untreated chronic HBV patients (aged 1–65 years) was evaluated by full-spectrum flow cytometry to determine Tfh1-cell functional dominance and age-related distribution.

Results:Cord blood from HBV antigen-exposed

neonates exhibited enhanced HBV-specific B cell responses along with significantly elevated frequencies of type 1 follicular T helper cells (Tfh1) compared to controls. In vitro, HBsAg could induced naïve CD4+ T cells to differentiate into Tfh1 cells, but not the other T helper cells (Th1/Th2/Th17) or alternative follicular T helper cells (Tfh2/Tfh17) subsets. These Tfh1 cells secrete both IFN- γ and IL-21, which synergistically enhanced HBsAb production by B cells via the activation of mTORC1-STAT1/STAT3 pathway. These data demonstrate that primary HBV antigen exposure preferentially induces a Tfh1-polarized immune response that initiates HBV-specific humoral immunity. To assess Tfh1 dynamics in chronic infection, we performed full-spectrum flow cytometry on a clinical HBV cohort, revealing an age-dependent decline in both Tfh1 frequency and 4-1BB expression, which positively correlated with HBsAb-secreting B cell counts. Strikingly, 4-1BB stimulation in vitro restored Tfh1 function, rescuing IFN- γ and IL-21 production and enhancing B cell help.

Conclusions:Tfh1-derived IFN- γ and IL-21 potentiate HBsAb production by activating mTORC1-STAT1/STAT3 signaling in B cells. The age-dependent decline in Tfh1 frequency and 4-1BB expression suggests progressive immune dysfunction in chronic HBV infection. Targeting 4-1BB may rejuvenate Tfh1 activity, offering a novel strategy to restore HBV-specific humoral immunity.

Keyword(s) : HBV, 4-1BB, Humoral immunity

2796 - Interferon α programs HBsAg specific humoral immunity through the monocyte IL6 Tfh cell axis to facilitate functional cure of hepatitis B

Shihong Zhong¹, Yang Zhou², Libo Tang¹, Xiaofang Li³, Jianhua Li³
Department Of Infectious Diseases, Nanfang Hospital, Southern Medical University, Guangzhou, China, Department Of Infectious Diseases, Guangzhou-China¹ State Key Laboratory Of Ophthalmology, Zhongshan Ophthalmic Center, Sun Yat-sen University; Guangzhou 510060, China, Ophthalmology, Guangzhou-China² Key Laboratory Of Medical Molecular Virology, Department Of Medical Microbiology, School Of Basic Medical Sciences, Shanghai Medical College, Fudan Un, Medical Molecular Virology, Shanghai-China³

Background / Hypothesis: Achieving a functional cure for chronic hepatitis B virus (HBV) infection remains an unmet challenge. Our recent clinical trial demonstrated the combination of siRNA

ORAL ABSTRACTS

with peg-IFN α resulted in a higher rate of functional cure compared to siRNA monotherapy (New Engl J Med. 2024). This finding substantiates an important role of IFN α in mediating functional cure, however, its underlying mechanisms remain poorly defined, particularly in how IFN α shaping antiviral humoral immunity. Herein, we aimed to elucidate how IFN α regulates B cell immunity to facilitate functional cure.

Materials and Methods: We longitudinally followed CHB patients receiving Peg-IFN α therapy and stratified them based on virological outcomes at week 72: HBeAg-non-seroconversion (eAg-NSC, n = 11), HBeAg-seroconversion (eAg-SC, n = 7), and HBsAg seroconversion (sAg-SC, n = 6). In addition, 3 CHB patients who achieved HBsAg seroconversion after five years of nucleos(t)ide analogues therapy (NAs-sAg-SC) were enrolled for comparison. Peripheral blood was collected for scRNA-seq and flow cytometry. The effects of IFN α on immune subsets and HBV-specific B cell responses were further examined through in vitro cytokine stimulation assays and in vivo validation using IL6 $^{-/-}$, IL21 $^{-/-}$, Ccr2 $^{-/-}$ chimeric, and Cxcl13 $^{-/-}$ HBV mouse models with IFN α plasmid.

Results: scRNA-seq and flow cytometry revealed that Peg-IFN α selectively expanded Tfh and plasma cells specifically in sAg-SC patients. However, in vitro stimulation of purified CD19 $^{+}$ B cells with IFN α showed minimal effects indicating the involvement of intermediary cells. Given the robust upregulation of IL6-related gene programs in monocytes, we further investigated IFN α 's effects on these cells and confirmed that IFN α enhanced humoral immunity by augmenting monocyte-derived IL6 secretion. Intriguingly, while IL-6 failed to directly activate B cells, subsequent analyses revealed that IFN α enhanced IL6-mediated Tfh cell interactions and promoted IL6 ST -high Tfh subsets with elevated IL21 expression in sAg-SC patients. In vitro IL6 stimulation increased IL21 production in CXCR5 $^{+}$ CD4 $^{+}$ T cells, whereas IL21 induction was abolished in IL6 $^{-/-}$ or monocyte-deficient mice. Transcriptomic profiling of IL21-stimulated B cells showed significant enrichment of humoral response. scRNA-seq further revealed elevated IL21-IL21R signaling between Tfh and GC-like/plasma B cells exclusively in IFN α -treated sAg-SC patients. Finally, spatial analysis demonstrated that IFN α promoted GC formation via CXCL13-CXCR5 signaling. Notably, GC development was abrogated in IL6 $^{-/-}$, Ccr2 $^{-/-}$ chimeric, and Cxcl13 $^{-/-}$ mice.

Conclusions:

IFN α promotes anti-HBV humoral immunity via a monocyte-Tfh-B cell axis, strategically bridging innate and adaptive immunity to facilitate HBV cure. These findings provide mechanistic insights and identify potential targets to optimize IFN α -based therapeutic strategies.

Keyword(s) : Interferon α , HBV, functional cure, humoral immune, germinal center

2799 - Cathepsin K Attenuates Liver Fibrosis by Suppressing TGF β Smad Signaling via T β R I Degradation

Zhandong Lin ¹, Jiawei Cui ¹, Yaoyao Mao ¹, Congyue Zhang ¹, Yuemin Nan ¹
Third Hospital Of Hebei Medical University, Traditional And Western Medical Hepatology, Shijiazhuang-China ¹

Background & Aims: Liver fibrosis, driven by hepatic stellate cell (HSC) activation, lacks effective therapy. Cathepsin K (CTSK) has context-dependent roles in fibrosis, but its function in liver fibrosis remains unclear. This study investigated the role and underlying mechanisms of CTSK in liver fibrosis. **Methods:** CTSK expression was analyzed in human fibrotic livers via transcriptomics and confirmed in murine fibrosis models. Its function was investigated in primary HSCs and LX-2 cells by assessing the effects of CTSK overexpression on cell activation and signaling pathways. The therapeutic potential was evaluated using AAV8-mediated CTSK overexpression in two etiologically distinct murine fibrosis models. **Results:** CTSK was upregulated in activated HSCs and fibrotic livers. Mechanistically, CTSK mediated a negative feedback loop that inhibited TGF- β /Smad signaling by promoting Smad7/Smurf2-dependent T β R-I degradation, thereby suppressing HSC activation. Notably, AAV8-mediated CTSK overexpression attenuated liver fibrosis in multiple murine models. **Conclusions:** CTSK functions as an endogenous protective factor that attenuates liver fibrosis by negatively regulating the TGF- β pathway via T β R-I degradation. These findings identify CTSK as a promising therapeutic target for liver fibrosis.

Keyword(s) : Liver fibrosis; Hepatic stellate cells; TGF- β /Smad signaling; Cathepsin K

2809 - Long Term Survival in De Novo Liver Metastatic Colorectal Cancer A Descriptive Cohort Study

Ankara University School Of Medicine, Department Of Nuclear Medicine, Nuclear Medicine, Ankara-Türkiye ⁵

Background / Hypothesis: Historically, the prognosis for metastatic colorectal cancer (mCRC) has been poor. Nevertheless, modern systemic therapy and aggressive local treatment strategies have enabled a subgroup of patients to achieve long-term survival. The objective of this study was to describe clinical, molecular, and treatment characteristics of patients with de novo liver-metastatic mCRC who achieved long-term (>5 years) survival.

Materials and Methods: We performed a retrospective descriptive cohort analysis of patients with histologically confirmed colorectal adenocarcinoma who were diagnosed at a tertiary cancer center from January 2015 to September 2025, had de novo liver-metastatic disease at diagnosis, and achieved overall survival >5 years. Clinical, molecular, and treatment data were collected from electronic health records. Variables were summarized using descriptive statistics (median [IQR] and n [%]).

Results: A total of 27 patients were included. The median age at diagnosis was 56.9 years (IQR 52.2–64.3), and 63.0% were men. Primary tumor location was 25.9% right colon, 55.6% left colon, and 18.5% rectum. At diagnosis, 44.4% had distant lymph node involvement; peritoneal metastasis and lung metastasis were uncommon (3.7% each). According to hepatic metastatic burden classification at diagnosis, 44.4% of patients had oligometastatic liver disease, and 55.6% had multiple liver metastases. Primary tumor resection was performed in 92.6% of patients, and metastasectomy in 70.4%. 61.5% of patients had RAS wild-type tumors, whereas RAS mutations were detected in 38.5%; MSI-high status was identified in 3.8%. First-line chemotherapy was most commonly FOLFOX (74.1%), followed by FOLFIRI (11.1%). Median number of systemic therapy lines in the metastatic setting was 2 (IQR 1–3). Regorafenib was used in 18.2% of patients. Metastatic disease-directed local therapy was administered in 44.4% of patients; among locally treated patients, the most common modalities were

radiotherapy (66.7%) and radiofrequency ablation (50.0%), with combined local therapy (≥2 modalities) used in 33.3%. Median follow-up from diagnosis to last contact was 75.4 months (IQR 63.9–106.0), and 75.0% of patients were alive at last follow-up.

Conclusions: Long-term survival beyond 5 years is achievable in selected patients with de novo liver-metastatic mCRC. High rates of surgical management and the use of local therapies—including multimodality approaches—support the potential value of an aggressive, multidisciplinary treatment strategy in this population.

2810 - Sodium Glucose Co Transporter 2 Inhibitors Use in Diabetic Patients with Cirrhosis Improves Liver related Outcomes and Survival

Sajid Jalil ¹, Ahmed Ibrahim ², Talal Khurshid ³, Khalid Mumtaz ⁴, Paul Kwo ¹
Stanford University, Gastroenterology & Hepatology, Stanford-United States ¹
Musc, Internal Medicine, Charleston-United States ²
Northwell University, Internal Medicine, New York-United States ³
The Ohio State University, Gastroenterology & Hepatology, Columbus-United States ⁴

Background / Hypothesis:

Sodium glucose cotransporter-2 inhibitors (SGLT2is) are widely used to treat type 2 diabetes mellitus (T2DM). The health outcomes of SGLT-2i in T2DM patients with cirrhosis have not been studied.

Materials and Methods:

We performed a retrospective analysis from 1/1/2010 to 12/31/2025 by utilizing two databases.

Adults with T2DM aged 18-90 with history of cirrhosis, for at least 90 days and newly started on SGLT-2i were identified in two separate databases. The two cohorts (T2DM with cirrhosis on SGLT-2i and T2DM with cirrhosis without SGLT-2i) were compared at baseline and after using propensity score matching (PSM). The primary aim was to compare adverse liver-related outcomes (ALO) among patients with T2DM with cirrhosis on SGLT-2i (intervention group) with those without SGLT-2i (control group).

Clinical outcomes were reported as incident rate ratios (IRRs), and compared using a Poisson regression model

ORAL ABSTRACTS

for binary variables. Survival probability was analyzed using Kaplan-Meier (KM) survival curves and hazard ratios (HR) calculated using Cox proportional hazards regression. Statistical significance was determined using a priori p-value of < 0.05.

Results:

The intervention group consisted of 14,231 SGLT-2i users and the control group consisted of 249,746 non-SGLT-2i users. After 1:1 PSM, use of SGLT-2i was associated with reduced composite outcome of hepatic decompensation compared to control group at 1 year (9.9% vs. 12.5%, $p=0.001$), at 3 years (16.4% vs. 18.1%, $p<0.001$) and 5 years (19.9% vs 21.9%, $p<0.001$). HCC rates were significantly lower in the SGLT-2i users at 1 year (2.3% vs. 3.5%, $p=0.001$), at 3 years (2.9% vs. 4.2%, $p=0.001$) and at 5 years (3.4% vs. 4.8%, $p=0.001$). There was a 31% reduction in mortality in the SGLT-2i arm (HR: 0.69; CI: 0.56- 0.83, $p<0.001$), as compared to the non-SGLT-2i arm.

These findings were validated in the EVERSANA database.

Conclusions:

Use of SGLT-2i was associated with a reduced composite outcome of hepatic decompensation and mortality among patients with T2DM and cirrhosis compared with non-SGLT-2i users across two independent datasets. Prospective randomized controlled trials are needed to confirm these findings.

2814 - Etiological distribution clinical phenotypes and six month outcomes of drug induced liver injury

a single center cohort study
Duygu Birinci¹, Yasemin Gökden²

Prof. Dr. Cemil Taşcıoğlu City Hospital, Department Of Internal Medicine, Sanliurfa-Türkiye¹ Prof. Dr. Cemil Taşcıoğlu City Hospital, Department Of Gastroenterology, Istanbul-Türkiye²

Background / Hypothesis:
Drug-induced liver injury (DILI) is a leading cause of acute liver dysfunction with variable outcomes. Identifying high-risk phenotypes and common causative agents may improve early detection and management. We aimed to evaluate etiological distribution, clinical phenotypes, disease severity, and

six-month outcomes in patients with DILI.

Materials and Methods:
Between 2021 and 2024, 5012 inpatients and outpatients from internal medicine and gastroenterology clinics were retrospectively screened using ICD codes R94.5 (abnormal liver function tests) and K71 (toxic liver disease). Patients meeting laboratory-based American Association for the Study of Liver Diseases (AASLD) criteria for drug- or herbal-induced liver injury were identified. Drug or herbal/dietary supplement exposure within six months was assessed, and cases with Roussel Uclaf Causality Assessment Method (RUCAM) scores ≥ 3 that were concordant with LiverTox data were included ($n=198$). Patients with viral hepatitis, biliary obstruction, sepsis, heart failure, autoimmune or metabolic liver disease were excluded.

Results:

Fifty-four percent of patients were managed as outpatients, while 46% required hospitalization. According to RUCAM grading, 3% were possible, 86% probable, and 11% highly probable. Nearly half of the patients (44%) were asymptomatic at diagnosis. Hepatocellular injury was the predominant pattern (62%), followed by mixed (24%) and cholestatic (14%) patterns. Diabetes mellitus and higher serum glucose levels were more frequent in the cholestatic pattern, whereas multiple-drug exposure was more common in the mixed pattern. Anti-infective agents were the most common exposures (41%), followed by musculoskeletal (30%) and nervous system drugs (27%). Most cases were mild (82%; Drug-Induced Liver Injury Network [DILIN] severity grade 1), whereas 13% were moderate (DILIN severity grades 2–3) and 5% were severe or fatal (DILIN severity grades 4–5). Hy's law criteria were met in 8.6% of patients and were confined to moderate and severe cases. Six-month mortality was 4%, and chronic liver injury developed in 7% of patients.

Conclusions:

DILI remains a diagnosis of exclusion and should be suspected in patients with unexplained liver test abnormalities. Widely prescribed medications—particularly anti-infective, musculoskeletal, and nervous system drugs—were the predominant causes, often in the context of multi-drug exposure. Although most cases were mild, clinically significant presentations occurred. Careful drug history and structured causality assessment are essential to guide management and improve patient outcomes.

2815 - Associations Between Dietary recommendations diet quality and Steatotic Liver Disease Prevalence and Severity in U.S. Adults 2017–2023

Nicholas Dunn ¹, Sheel Patel ¹, Luis Antonio Díaz ², Robert J Wong ³, Juan Pablo Arab ⁴, Shira Zelber-sagi ⁵, Aleksander Krag ⁶, Zobair M Younossi ⁷, Ashwani K. Singal ¹

University Of Louisville, Internal Medicine, Mission Hills-United States ¹ University Of California San Diego, Internal Medicine, San Diego-United States ² Stanford University School Of Medicine, Internal Medicine, Palo Alto-United States ³ Virginia Commonwealth University School Of Medicine, Stravitz-sanyal Institute For Liver Disease And Metabolic Health, Richmond-United States ⁴ University Of Haifa, School Of Public Health, Haifa-Israel ⁵ Centre For Liver Research Department Of Gastroenterology And Hepatology, Odense University Hospital, Internal Medicine, Odense-Denmark ⁶ Inova Health System, Beatty Liver And Obesity Research Program, Falls Church-United States ⁷

Background / Hypothesis:

The 2025–2030 Dietary Guidelines for Americans (DGA-2025) introduced substantive changes to national nutrition guidance, including expanded emphasis on total protein intake and omission of prior alcohol recommendations. We evaluated how individual dietary components—derived from both the Healthy Eating Index-2020 (HEI-2020) and energy-adjusted z-score models—relate to steatotic liver disease (SLD), fibrosis, and cirrhosis in U.S. adults.

Materials and Methods:

We analyzed data from 10,944 adults (NHANES 2017–2023) with complete 24-hour dietary recall and liver assessment via vibration-controlled transient elastography (VCTE). Dietary exposures included HEI-2020 component scores and z-scores derived from food group densities aligned with DGA-2025 structure. Alcohol intake was assessed using a 6-point Alcohol Adherence Score, reflecting thresholds previously established in DGA-2020. Multivariable logistic regression and stepwise selection models were adjusted for age, sex, race/ethnicity, education, poverty-income ratio, diabetes, obesity, caffeine intake, and NHANES survey weights.

Results:

Across both HEI-2020 and z-score models, several components were consistently associated with liver outcomes. High intake of total fruit, whole fruit, vegetables, greens and beans, whole grains, and seafood/plant protein was associated with significantly lower prevalence of SLD and fibrosis. In contrast, higher intake of red and processed meats, sodium, total protein, saturated fat, and added sugars was associated with greater disease prevalence. Alcohol adherence was independently protective across all outcomes. In stepwise models, components retained as independent predictors of liver disease included greens and beans, seafood and plant protein, saturated fat, and alcohol adherence. Notably, whole grain and sodium—both retained in DGA-2025—were associated with favorable liver outcomes. However, components with consistent protective associations, such as greens and beans, seafood and plant protein, and alcohol moderation, were omitted or de-emphasized in the updated guidelines. Conversely, total protein—now strongly promoted—was independently associated with higher fibrosis and cirrhosis prevalence.

Conclusions:

Multiple dietary components associated with liver health are either omitted or misaligned in the DGA-2025 framework. While several elements—such as whole grains and sodium—remain appropriately emphasized, the removal of alcohol guidance and de-emphasis on protein source may obscure key risk-reducing behaviors for steatotic liver disease and fibrosis. These findings underscore the need for liver-specific dietary guidance that distinguishes protein quality, reinforces sodium and saturated fat limits, and explicitly integrates alcohol-related risk.

Background / **Hypothesis:**
Narlaprevir (NVR) is a NS3 protease inhibitor of HCV used for hepatitis C therapy in combination with ritonavir (RTV) and other direct-acting antivirals (DAAs). The effectiveness of NVR/RTV + Sofosbuvir (SOF) once-daily for 12 weeks was assessed in a large population of Russian people who are infected with HCV (GT 1) and living with HIV (PLWH). HIV/AIDS clinical centers from 8 Russian Regions were involved in the study.

Materials and **Methods:**
Adults treated with NVR 200 mg co-administered with

RTV 100 mg + SOF 400 mg for 12 weeks were included in this prospective observational study. All HCV patients reaching Week 12 post-treatment were assessed for SVR12. All PLWH initiated antiretroviral therapy before starting therapy with NVR/RTV + SOF.

Results:

Overall, 1472 patients with co-infection HIV/HCV who received at least one dose of NVR/RTV+SOF were included in this analysis: 61.55% male, 63.62% with fibrosis F0-F2 (METAVIR score), 57.95% with HIV viral load < 50 copies/ mL; 71.54% with HIV stage 3 (WHO clinical staging), 48.5% current/former alcohol or intravenous drug use. Most patients were white men (99.73%). Median age was 42 years (range 38–47 years).

Conclusions: According to Russian clinical guidelines patients with HIV coinfection are considered a priority population for the treatment of hepatitis C with DAAs. Genotype-specific treatments for HCV are being actively employed in national plan for eliminating HCV infection in Russia. NVR/RTV + SOF in HIV/HCV co-infection was highly effective and tolerable in clinical practice, drug use is a potential barrier to reach HCV elimination in PLWH.

2832 - Immune Excluded CD4⁺ and CD8⁺ T Cell Depletion Predicts Early Recurrence in Hepatocellular Carcinoma with Microvascular Invasion

Lianda Siregar¹, Rino Alvani Gani¹, Toar J.m. Lalisang², Irsan Hasan¹, Heriawan Soejono¹, Siti Boedina Kresno³, Nurjati Chairani Siregar⁴, Begawan Bestari⁵
Faculty Of Medicine, Universitas Indonesia, Department Of Internal Medicine, South Jakarta-Indonesia¹ Faculty Of Medicine, Universitas Indonesia, Department Of Digestive Surgery, Central Jakarta-Indonesia² Faculty Of Medicine, Universitas Indonesia, Department Of Clinical Pathology, Central Jakarta-Indonesia³ Faculty Of Medicine, Universitas Indonesia, Department Of Pathological Anatomy, Central Jakarta-Indonesia⁴ Faculty Of Medicine, Universitas Padjajaran, Department Of Internal Medicine, Bandung-Indonesia⁵

Background / Hypothesis: Early recurrence within six months after resection continues to pose a major clinical challenge in hepatocellular carcinoma (HCC) patients, occurring in approximately 31.9% of patients. This study aims to investigate whether reduced immune cell infiltration across intratumoral and peritumoral compartments with early HCC recurrence among

ORAL ABSTRACTS

patients exhibiting high angiogenic activity and microvascular invasion.

Materials and Methods: A multicenter nested case-control study was conducted using liver tissue samples from 49 patients with HCC who underwent surgical resection. Clinical data were retrieved from medical records. Pathological and immunological parameters were assessed using hematoxylin-eosin [H&E] staining for tumor-infiltrating lymphocytes (TILs), and immunohistochemistry for VEGF, CD4, CD8, and regulatory T cells. The analytical approach included ROC curve analysis, Kaplan-Meier survival estimation, and multivariate Cox regression.

Results: Early recurrence occurred in 11 of 49 (22.45%) patients, all showing high VEGF and most with microvascular invasion. Patients with early recurrence had markedly lower intratumoral CD4⁺ T-cell density and reduced peritumoral CD8⁺ T-cell, while peritumoral CD4⁺ and overall TILs remained high than intratumoral. Multivariable analysis identified low intratumoral CD4⁺ (HR 7.98; 95% CI: 1.63–39.07) and decreased peritumoral CD8⁺ (HR 4.98; 95% CI: 1.14–21.70) as independent predictors. Intratumoral and peritumoral Treg densities showed no significant association.

Conclusions: Low intratumoral CD4⁺ and peritumoral CD8⁺ infiltration were identified as independent predictors of early HCC recurrence, reflecting an immune-excluded tumor phenotype characterized by high peritumoral CD4⁺ and TILs. In this context, angiogenesis-driven stromal and vascular barriers impede effective T-cell trafficking into the tumor core, facilitating early recurrence, particularly in tumors with microvascular invasion. These findings underscore the need for intensified post-resection surveillance and may define a high-risk subgroup for future evaluation of adjuvant therapies.

Keyword(s) : angiogenesis, CD4, CD8, early recurrence, hepatocellular carcinoma, microvascular invasion, TILs, Treg

2833 - Hyperinsulinemia Establishes a Pathogenic Feedback Loop between Pyroptotic Hepatocytes and MDSCs in MAFLD

Huilian

Shi

¹

Affiliated Hospital Of Nanjing University Of Chinese Medicine, Department Of Hepatology, 南京-China ¹

Background and Scientific Question: Metabolic dysfunction-associated fatty liver disease (MAFLD) is a prevalent chronic liver disorder whose progression can lead to cirrhosis and even hepatocellular carcinoma. Hyperinsulinemia is a common clinical feature in MAFLD patients; however, whether and how it directly drives disease progression, along with its underlying molecular mechanisms, remains unclear.

Main Results and Conclusion: This study demonstrates that hyperinsulinemia is a key driver of MAFLD exacerbation. Mechanistically, hyperinsulinemia downregulates the demethylase FTO, increases m6A modification of the antioxidant transcription factor NRF2 mRNA, and promotes its degradation. The loss of NRF2 subsequently activates the NLRP3/Caspase-1/GSDMD signaling pathway, inducing hepatocyte pyroptosis. The pyroptosis-related cytokines IL-1 β and IL-18 released from hepatocytes promote the aberrant generation and hepatic recruitment of myeloid-derived suppressor cells (MDSCs). These MDSCs further exacerbate hepatocyte pyroptosis, thereby forming a pathogenic feedback loop of "hepatocyte pyroptosis-MDSC expansion" that continuously drives hepatic inflammation and injury.

Significance: This study is the first to reveal a novel mechanism by which hyperinsulinemia induces hepatocyte pyroptosis via the "FTO/m6A-NRF2 axis" and forms a vicious cycle with the immunosuppressive microenvironment. These findings provide a new perspective for understanding MAFLD pathogenesis and identify FTO, NRF2, and MDSCs as potential therapeutic targets, laying an important theoretical foundation for developing precise treatment strategies against MAFLD.

2834 - Epidemiologic and Clinical Trends in Hepatocellular Carcinoma A Glimpse Through the Lens of Systemic Therapy Availability

Ma. Angelica Goldamier Cannu ¹, Stephen Wong ¹, Frederick Dy ¹, Rommel Romano ¹, Alvin Velasco ¹, Fleurdeliz Goco-siatan ¹, Usth, Gastroenterology, Manila-Philippines ¹

Background / Hypothesis: Recent global shifts in epidemiology and diversity of treatment options for Hepatocellular Carcinoma (HCC) may affect its prognosis. Documenting these changes

ORAL ABSTRACTS

may help address gaps in the care of HCC patients. We aimed to analyze temporal trends in epidemiology and prognosis across three treatment eras: the pre-tyrosine kinase inhibitor (TKI) era (Period 1= <2008), the post-TKI era (Period 2= 2008–2019), and the immunotherapy era (Period 3= >2019).

Materials and Methods:

Consecutive HCC patients diagnosed between 2000-2025 from a single hepatology database were included. Demographics, tumor and treatment characteristics, and survival data were recorded

Results:

A total of 1068 patients were included (Period1=202 vs. Period 2=633 vs. Period 3=233). There was an increase in age of patients ($p<0.001$) and number of tumors/patient ($p<0.001$) over time. More patients presented with Child-Pugh A and Barcelona Clinic Liver Cancer (BCLC) 0-B in the latter years ($p<0.05$). There was a shift in the etiology with viral hepatitis decreasing (Period 1=62.2% vs. Period 2=29.3% vs. Period 3=33.5%) and steatohepatitis increasing (Period 1=1.0% vs. Period 2=27.3% vs. Period 3=40.5%) over the years. Less patients were left untreated (Period 1=42.6% vs. Period 2=31.4% vs. Period 3=23.3%) while more patients received systemic therapy (Period 1=6.5% vs. Period 2=9.7% vs. Period 3=43.6%) through the years. Encouragingly, median overall survival (OS) improved (Period 1=43.4weeks vs. Period 2=118.9weeks vs. Period3=109.9weeks; $p<0.001$). OS improvement was seen in BCLC 0-A but not in BCLC B-D patients.

Conclusions:

We have demonstrated a remarkable shift in etiology of HCC, with steatohepatitis becoming the most prevalent. The shift in lower BCLC stage and earlier use of systemic therapy may be contributing to the increased survival rate.

2839 - CAN EARLY CHANGES IN ALPHA FETOPROTEIN PREDICT RADIOLOGIC RESPONSE AND OVERALL SURVIVAL IN IMMUNE CHECKPOINT INHIBITOR BASED THERAPY OF HEPATOCELLULAR CARCINOMA

Jann Christian Solis¹, Frederick Dy¹, Rommel Romano¹, Alvin Brian Velasco¹, Carmelita Dalupang¹, Estrellita

Ruiz¹, Stephen Wong¹, Maria Fleurdeliz Goco-siatan¹
Ust Hospital, Gastroenterology, Metro Manila-Philippines¹

Background / Hypothesis: On-treatment alpha-fetoprotein (AFP) dynamics have been proposed as early biomarkers of response in hepatocellular carcinoma (HCC) treated with immune checkpoint inhibitors (ICIs). We aimed to determine the prognostic significance of AFP response in HCC patients treated with ICIs.

Materials and Methods: We conducted a retrospective study of consecutive patients with HCC treated with ICIs with at least 1 follow-up imaging from January 2021 to December 2025. AFP response was assessed at 4 and 12 weeks and categorized as responder (>20% decrease) versus non-responder (<20% decrease). Radiologic responses using RECIST 1.1 were classified as complete response(CR), partial response(PR), stable disease(SD), and progressive disease(PD). Overall survival (OS) was estimated using Kaplan-Meier method.

Results:Majority (n=27;87.1%) received atezolizumab-bevacizumab while the rest received durvalumab or pembrolizumab-based treatment. At 4 weeks, there was a trend for better radiologic response in AFP responders vs. non-responders (PR=28.6% vs. 17.6%; SD=57.1% vs. 41.2%; PD=14.3% vs. 41.2%; $p=0.272$), although this was not statistically significant. A similar trend was observed with AFP response at 12 weeks ($p=0.138$). There was a trend for OS to be associated more with radiologic response ($p=0.09$) than AFP response at 4 ($p=0.894$) and 12 ($p=0.280$) weeks. None of the baseline characteristics predicted OS.

Conclusions:AFP responses at 4 and 12 weeks were neither significant predictors of radiologic response nor OS in HCC patients treated with ICIs. The lack of a significant association between radiologic response and OS points to the need for a bigger study to better elucidate the relationship between AFP and radiologic responses with survival.

Keyword(s) : Hepatocellular carcinoma, AFP, Immune checkpoint inhibitors

2841 - PLPP2 drives liver repair and regeneration via remodeling phosphatidylethanolamine metabolism after acute liver injury

ORAL ABSTRACTS

Fan Li ¹, Ming Ni ¹, Ling Lu ¹
The First Affiliated Hospital Of Nanjing Medical
University, Hepatobiliary Center, Nanjing-China ¹

Background / **Hypothesis:**
Acute liver injury is commonly caused by overdose-drug, toxins, or ischemia. The liver possesses a remarkable regenerative capacity, wherein metabolic remodeling plays a crucial role. However, the specific metabolic shift that initiates hepatocyte regeneration remains unclear. We aimed to identify the key metabolic process driving the transition from liver injury to regeneration.

Materials and **Methods:**
We employed multi-time-point proteomic and metabolomic profiling to identify the key metabolic pathway and associated regulatory genes. We analysed liver samples from DILI patients and employed gene-modified mice. Transcriptomic and metabolomic were applied to validate the underlying mechanism.

Results:
Multi-time-point multi-omics analyses demonstrated that phosphatidylethanolamine undergoes a dynamic metabolic reprogramming, with PLPP2 exhibiting synchronous changes among the enzymes regulating PE metabolism. Liver biopsy samples from patients with drug-induced liver injury corroborated the PLPP2 alterations. In murine models, hepatocyte-specific deletion of PLPP2 demonstrated its protective effect against ALI. Mechanistically, the resolution of ER stress was accompanied by a robust upregulation of PLPP2 during the regenerative phase. This shift promotes liver repair and regeneration by initiating the PE biosynthesis. PE, upon binding to PEBP1, modulated its affinity and strengthened its interaction with GLI1, thereby disrupting the association between ITCH and GLI1 and preventing the ubiquitination and degradation of GLI1. Additionally, PE promotes autophagy by facilitating the lipidation of LC3B. The increase of in ER-localized PE mediated by PLPP2 also contributed to alleviation of ER stress, thus establishing a positive feedback loop. Pharmacologic activation of PLPP2 may represent a promising therapeutic strategy for ALI.

Conclusions:
The transition from reduction to elevation of PE maps to the pathological shift of liver from injury to regeneration following ALI, wherein PLPP2 serves as a switch initiating PE biosynthesis. Thus, targeting PLPP2 may represent a promising therapeutic strategy for ALI.

2844 - AARS1 promotes tumor progression and immune evasion via ATF6 lactylation-mediated tryptophan metabolism in hepatocellular carcinoma
Yiming Wang ¹, Fan Li ¹, Hao Wang ¹, Ling Lu ¹
Nanjing Medical University, Surgery, Nanjing-China ¹

Background / **Hypothesis:**
Hepatocellular carcinoma (HCC) remains a leading cause of cancer-related death, and many patients derive limited benefit from systemic and immunotherapies owing to a strongly immunosuppressive tumor microenvironment. Regulatory T cells (Tregs) are central to this state and correlate with poor prognosis and resistance to immune checkpoint blockade, yet how tumor-intrinsic metabolic and stress programs are converted into stable Treg-promoting signals in HCC is unclear. Alanine-tRNA synthetase 1 (AARS1) was recently identified as a lactate-sensitive protein lactyltransferase, revealing a noncanonical role in coupling glycolysis to protein modification. However, its clinical relevance in HCC and how its lactylation activity shapes tumor biology and Treg-mediated immune evasion are unknown. The tryptophan-catabolizing enzyme TDO2 is a key inducer of Treg accumulation in HCC, but its upstream regulation by tumor lactylation has not been defined. This study aims to clarify the role of AARS1 in HCC progression by (i) defining its clinical and functional impact, (ii) determining how AARS1-mediated ATF6 lactylation drives TDO2-dependent tryptophan metabolism, (iii) establishing how this axis promotes Treg accumulation and tumor growth, and (iv) testing whether targeting the AARS1-ATF6-TDO2 pathway provides therapeutic benefit in experimental HCC models.

Materials and **Methods:**
1. Single-cell and spatial RNA-seq from HCC patients defined AARS1 expression patterns and associated programs. 2. HCC was induced in hepatocyte-specific Aars1/Atf6/Tdo2 knockout mice by DEN/CCl₄ and Myc/Ras. 3. Tumor glycolysis was assessed by micro-PET/CT and ECAR in HCC and tumor-derived cells. 4. AARS1 lactyltransferase activity was evaluated by PPi/AMP and ATF6 K424 lactylation. 5. Immune subsets were profiled by flow cytometry and CyTOF.

Results:
AARS1 was upregulated in HCC and associated with glycolysis, Treg accumulation and poor prognosis. Mechanistically, AARS1 lactylated ATF6 K424 to drive TDO2-kynurenine signaling and Treg expansion, which

ORAL ABSTRACTS

in turn enhanced glycolysis. β -alanine inhibition of AARS1 broke this loop, restrained HCC and improved anti-PD-1 response.

Conclusions:

We identify AARS1 as a lactylation-dependent hub linking tumor glycolysis to ATF6–TDO2–kynurenine signaling and Treg-mediated immunosuppression in HCC. Disrupting this AARS1–ATF6–TDO2 axis with β -alanine remodels the tumor microenvironment, restrains HCC progression, and enhances anti-PD-1 efficacy, highlighting a tractable metabolic–epigenetic therapeutic target.

Keyword(s) : AARS1, lactylation, Treg, ER stress, tryptophan metabolism, immune evasion

2848 - Physician–Patient Dual Track Follow Up Care Bundle in Hepatology A Multidisciplinary Practice Model Integrating Clinical Care and Research Coordination

Hong-li Liu ¹, Xia Wang ², Jun-fa Liu ¹, Hai-fan Wang ¹, Jian-hua Liu ¹, Yong-feng Yang ¹, Wei Ye ¹
The Second Hospital Of Nanjing, Nanjing Hospital Affiliated To Nanjing University Of Chinese Medicine, Department Of Infectious Disease And Liver Disease & Outpatient, Follow-up Center, Nanjing Key Laboratory Of Hepatology,, Nanjing-China ¹ The Second Hospital Of Nanjing, Nanjing Hospital Affiliated To Nanjing University Of Chinese Medicine, Department Of Nutrition, Nanjing-China ²

Background / Hypothesis:

Long-term follow-up is essential for patients with chronic liver disease, yet structured systems that support both patients and physicians in routine practice are not well described. We developed a physician-led multidisciplinary follow-up care bundle to improve coordination of patient management and clinical research activities. To describe the development and real-world implementation of a Physician–Patient Dual-Track Follow-Up Care Bundle in a specialized hepatology program.

Materials and Methods:

A physician-led team including physician assistants, nurses, and dietitians established a structured follow-up workflow within an infectious disease–based hepatology service. The care bundle included five core components: standardized follow-up coordination, patient navigation, physician-directed supportive care with dietitian-assisted nutritional assessment,

structured patient–physician communication support, and clinical trial screening coordination.

Results:

Since February 2025, the care bundle has supported follow-up of 785 patients with chronic liver disease over one year. The structured workflow helped centralize follow-up coordination and streamline communication between patients and clinicians. From January 2026 onward, the program assisted two patients in entering clinical trial screening. These experiences suggest that the bundle is feasible in routine practice and may help align clinical care with research activities.

Conclusions:

The Physician–Patient Dual-Track Follow-Up Care Bundle provides a practical, physician-led multidisciplinary approach to organizing long-term hepatology follow-up. This model may offer a structured way to support both patient care and research coordination in specialized clinical settings.

Keyword(s) : Physician–Patient Dual-Track Follow-Up Care Bundle

2851 - From Synthetic to Clinical The Effect of Domain Shift on Decision Support Systems

Nazli Tokatli ¹, Yusuf Bünyamin Ketenci ², Faisal Abaalkhalil ³, Muhammed Kamran ⁴, Sümeyye Ağır ¹, Arzu Yaprak ¹, Nurşen Akay ⁵, Özgül Rana Çokkayışlı ¹, Muhammed Sadik Tekbaş ¹, Halis Altun ⁵, Necati Örmeci ⁶

Istanbul Health And Technology University, Department Of Computer Engineering, Istanbul-Türkiye ¹ Ondokuz Mayıs University, Gastroenterology, Samsun-Türkiye ² King Faisal Specialist Hospital, Consultant Gastroenterology, Riyadh-Saudi Arabia ³ International Islamic University, Management And Quality Sciences, Islamabad-Pakistan ⁴ Istanbul Health And Technology University, Department Of Software Engineering, Istanbul- ⁵ Istanbul Health And Technology University, Department Of Internal Medicine, Istanbul- ⁶

Background / Hypothesis: Chronic liver diseases, especially cirrhosis and hepatocellular carcinoma, pose a severe clinical burden. Early risk stratification strictly dictates the treatment process. Artificial intelligence models trained on synthetic datasets often show high internal validity. However, their clinical translation is frequently hindered by domain shift due to heterogeneous real-world data. This proof-of-concept study evaluates the domain shift effect. It assesses

ORAL ABSTRACTS

hybrid decision support systems in a pilot clinical setting
to explore feasibility.

Materials and Methods: This feasibility study analyzed a dataset of 301 patients. The cohort included 284 synthetic cases and a critically small pilot sample of 17 clinically validated real-world cases. Classical machine learning models were trained on synthetic data. They underwent external testing on the real-world cohort without retraining to observe domain shift. Controlled data augmentation preserving distribution variance was applied due to the limited clinical sample. Probabilistic risk analyses from a MedGemma-based foundation model were compared with classical model outputs. Furthermore, a multimodal architecture combining MRI and laboratory data was evaluated.

Results: Classical models exhibited a significant performance drop during external testing. Accuracy fell to approximately 53% on the 17 real cases. This quantitatively demonstrated the domain shift effect. Controlled data augmentation successfully reduced these performance fluctuations. The foundation model showed 84.62% concordance with clinical evaluations in fibrosis prediction. In the multimodal benchmarking for hepatocellular carcinoma, the hybrid architecture produced consistent results in 14 of 17 cases (82.3%). The segmentation module achieved a 92% Dice score. The fibrosis staging module reached 93.13% accuracy. However, a 17–18% error rate persisted in morphologically atypical cases.

Conclusions: This pilot study demonstrates the critical impact of domain shift. Models trained solely on synthetic data struggle significantly in real-world clinical environments. High internal validation performance does not guarantee clinical readiness without real-patient testing. Hybrid benchmarking and multimodal integration offer a more balanced decision framework. However, algorithm capacity cannot substitute for actual data representativeness. Expanding to larger, multicenter datasets is strictly essential to achieve robust clinical integration.

2859 - Profile of Hepatocellular Carcinoma in India

A Five Year Prospective Study

Sathwika Pasham ¹, Dr.anand V Kulkarni ¹, Dr. Rao P N ¹, Dr. Mithun Sharma ¹, Dr. D N Reddy ²
Aig Hospitals, Hepatology, Gachibowli-India ¹ Aig Hospitals, Gastroenterology, Gachibowli-India ²

Background / Hypothesis: Hepatocellular carcinoma (HCC) represents the most common primary liver malignancy and is an emerging public health concern in India. Viral hepatitis was considered dominant cause of HCC. Prospective Indian data describing demographic, etiological, and staging characteristics remain limited which we aimed to describe in this study.

Materials and Methods:

This prospective observational study included consecutive patients diagnosed with HCC between January 2020 and December 2025. Demographic parameters, Comorbidities, underlying etiology, cirrhosis status, Child–Pugh class, Albumin-Bilirubin (ALBI) score, and Barcelona Clinic Liver Cancer (BCLC) stage were recorded. Continuous variables were expressed as median with interquartile range (IQR), and categorical variables as frequencies and percentages.

Results: A total of 1028 patient included. The median age at diagnosis was 60 years (IQR 52–67). A majority of patients were men (N=880, 85.6%). Among the 1028 HCC patients, 524 (51%) had diabetes, 403 (39.2%) had hypertension, and 83 (8.1%) had hypothyroidism. MASLD was the most common etiology, observed in 438 patients (42.6%), followed by hepatitis B virus infection in 258 (25.1%), hepatitis C virus infection in 113 (11%), ethanol-related liver disease in 60 (5.8%), cryptogenic liver disease in 145 (14.1%), and other causes in 14 (1.4%) patients. Underlying cirrhosis was present in 654 patients (63.6%), while 374 (36.4%) had non-cirrhotic HCC. Based on Child–Pugh classification, 280 patients (42.8%) were class A, 300 (45.9%) class B, and 74 (11.3%) class C. Among cirrhotic Child A patients, the median ALBI score was –2.33 (IQR –2.66 to –2.05) and in median ALBI score among Non Cirrhosis -2.28 (-2.75 - -2.01). According to BCLC staging, among the cirrhosis patients, 17 patients (2.6%) were stage 0, 195 (29.8%) stage A, 224(34.3%) stage B, 166 (25.4%) stage C, and 52 (8%) stage D.

ORAL ABSTRACTS

Conclusions: MASLD is now the most common cause of HCC in India, surpassing viral hepatitis. Every second individual had diabetes as a concomitant comorbidity. These findings highlight the rising role of metabolic risk factors and the need for better screening and early detection in high-risk populations.

2860 - Advances in Artificial Intelligence for Liver Disease Research: Algorithmic Applications and Technical Challenges

Yao Yunlong¹, Zhang Xi¹, Huang Shuo¹, Shao Mingyan², Zheng Yanfei²

Beijing University Of Chinese Medicine, School Of Traditional Chinese Medicine, Beijing-China¹ Beijing University Of Chinese Medicine, National Institute Of Traditional Chinese Medicine Constitution And Preventive Medicine, Beijing-China²

Background / Hypothesis: Artificial intelligence (AI) has rapidly expanded in hepatology, offering novel solutions for data integration, imaging interpretation, and risk prediction. With the growing complexity of liver disease diagnostics, AI-driven algorithms provide opportunities to enhance accuracy and efficiency. This review summarizes recent algorithmic advances in AI applications for liver disease research and diagnostics.

Materials and Methods: A structured literature review was conducted using PubMed, Web of Science, and IEEE Xplore (2012–2024). Eligible studies focused on machine learning (ML), deep learning (DL), and natural language processing (NLP) models applied to liver disease datasets. Methods were categorized into imaging analysis (CNN-based models), clinical data modeling (logistic regression, random forest, XGBoost), and text mining approaches. Performance metrics including accuracy, AUC, sensitivity, and F1-score were comparatively evaluated.
